6.7.6 QR Decomposition with column Pivoting

`ctx.mat_col_piv_householder_qr`(*matA*, *Query*, *matB*, *threshold*)

Returns the QR decomposition of the symmetric matrix *matA* $= A = QR$, with column pivoting.

Writing `matA.ColPivHouseholderQR(Query, matB, threshold)` has the same effect

See also: Eigen [219], Wikipedia [1438], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

matB
Optional. A general n-by-m matrix of the same type as A. You need to specify B only if you want to solve the linear equation $AX = B$

threshold
Optional. The threshold that will be used by certain methods such as rank().

Results:

info
An integer indicating whether the decompsition was successful(=0) or not(=1).

dimofkernel
An integer returning the dimension of the kernel of A.

rank
An integer returning the rank of A, which need to determine when pivots are to be considered nonzero. This is not used for the QR decomposition itself.

nonzeropivots
An integer returning the number of non-zero ivots in the decomposition.

isinjective
A boolean indicating whether A is injective.

isinvertible
A boolean indicating whether A is invertible.

issurjective
A boolean indicating whether A is surjective.

signdet
A scalar of a return type matching A. The sign of the determinant of A.

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

logabsdet
A scalar of a return type matching A. The logarithm of the absolute value of the determinant of A.

maxpivot
A scalar of the same return type as det. The absolute value of the biggest pivot, i.e. the biggest diagonal coefficient of R.

X
A general matrix of the same type and dimension as B. The solution to $AX = B$.

Inv
A square matrix of the same type and dimension as A. The inverse of A, A^{-1}.

P
A square matrix of the same type and dimension as A. The matrix P contains the column permutation matrix.

Q
A square matrix of the same type and dimension as A. The matrix Q as a sequence of householder transformations.

R
A square matrix of the same type and dimension as A, containing the matrix R.

QR
A square matrix of the same type and dimension as A, containing the matrix QR.

This class performs a rank-revealing QR decomposition of a matrix A into matrices P, Q and R such that

AP = QR

by using Householder transformations. Here, P is a permutation matrix, Q a unitary matrix and R an upper triangular matrix.

This decomposition performs column pivoting in order to be rank-revealing and improve numerical stability. It is slower than HouseholderQR, and faster than FullPivHouseholderQR.

solve: This method finds a solution x to the equation Ax=b, where A is the matrix of which this is the QR decomposition, if any exists.

Parameters: b the right-hand-side of the equation to solve.

Returns a solution. Note: The case where b is a matrix is not yet implemented. Also, this code is space inefficient.This method just tries to find as good a solution as possible. If you want to check whether a solution exists or if it is accurate, just call this function to get a result and then compute the error of this result, or use

MatrixBase::isApprox() directly, for instance like this:

bool a_solution_exists = (A*result).isApprox(b, precision);

This method avoids dividing by zero, so that the non-existence of a solution doesn't by itself mean that you'll get inf or nan values. If there exists more than one solution, this method will arbitrarily choose one.

6.7.6.1 Example for a real matrix

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)

```

6.7.7 QR Decomposition with full Pivoting

`ctx.mat_full_piv_householder_qr`(*matA*, *Query*, *matB*, *threshold*)

Returns the QR decomposition (with full pivoting) of the general matrix *matA* such that`PAP'`` = QR` by using Householder transformations. Here, P and P' are permutation matrices, Q is a unitary matrix and R is an upper triangular matrix.

Writing `matA.FullPivHouseholderQR(Query, matB, threshold)` has the same effect

See also Eigen [223], Wikipedia [1438], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

B
Optional. A general n-by-m matrix of the same type as A. You need to specify B only if you want to solve the linear equation $AX = B$

threshold
Optional. The threshold that will be used by certain methods such as rank().

Results:

info
An integer indicating whether the decompsition was successful(=0) or not(=1).

dimofkernel
An integer returning the dimension of the kernel of A.

rank
An integer returning the rank of A, which need to determine when pivots are to be considered nonzero. This is not used for the QR decomposition itself.

nonzeropivots
An integer returning the number of non-zero ivots in the decomposition.

isinjective
A boolean indicating whether A is injective.

isinvertible
A boolean indicating whether A is invertible.

issurjective
A boolean indicating whether A is surjective.

signdet
A scalar of a return type matching A. The sign of the determinant of A.

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

logabsdet
A scalar of a return type matching A. The logarithm of the absolute value of the determinant of A.

maxpivot
A scalar of the same return type as det. The absolute value of the biggest pivot, i.e. the biggest diagonal coefficient of R.

X
A general matrix of the same type and dimension as B. The solution to $AX = B$.

Inv
A square matrix of the same type and dimension as A. The inverse of A, A^{-1}.

P
A square matrix of the same type and dimension as A. The matrix P contains the column permutation matrix.

P'
A square matrix of the same type and dimension as A. The matrix P' contains the rows transpositions matrix.

Q
A square matrix of the same type and dimension as A. The matrix Q as a sequence of householder transformations.

R
A square matrix of the same type and dimension as A, containing the matrix R.

QR
A square matrix of the same type and dimension as A, containing the matrix QR.

This class performs a rank-revealing QR decomposition of a matrix A into matrices P, P', Q and R such that`PAP' = QR` by using Householder transformations. Here, P and P' are permutation matrices, Q a unitary matrix and R an upper triangular matrix.

This decomposition performs full pivoting in order to be rank-revealing and achieve optimal numerical stability. The trade-off is that it is slower than HouseholderQR and ColPivHouseholderQR.

solve: This method finds a solution x to the equation Ax=b, where A is the matrix of which this is the QR decomposition, if any exists.

Parameters: b the right-hand-side of the equation to solve.

Returns the exact or least-square solution if the rank is greater or equal to the number of columns of A, and an arbitrary solution otherwise. Note: The case where b is a matrix is not yet implemented. Also, this code is space inefficient.This method just tries to find as good a solution as possible. If you want to check whether a solution exists or if it is accurate, just call this function to get a result and then compute the error of this result, or use MatrixBase::isApprox() directly, for instance like this:

bool a_solution_exists = (A*result).isApprox(b, precision);

This method avoids dividing by zero, so that the non-existence of a solution doesn't by itself mean that you'll get inf or nan values. If there exists more than one solution, this method will arbitrarily choose one.

6.7.7.1 Example for a real matrix

```

6.7.8 Complete orthogonal decomposition (COD)

`ctx.mat_cod_householder_qr`(*matA*, *results*, *matB*)

Returns a rank-revealing complete orthogonal decomposition (COD) of the general matrix *matA* $= A$ into matrices P, Q, T, and Z such that

Writing `matA.CODHouseholderQR(results, matB)` has the same effect

$$\mathbf{A\,P} = \mathbf{Q} \begin{bmatrix} \mathbf{T} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix} \mathbf{Z}$$

by using Householder transformations. Here, P is a permutation matrix, Q and Z are unitary matrices and T an upper triangular matrix of size rank-by-rank. A may be rank deficient.

See also Eigen [220], Wikipedia [1436], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

B
Optional. A general n-by-m matrix of the same type as A. You need to specify B only if you want to solve the linear equation $AX = B$

Results:

info
An integer indicating whether the decompsition was successful(=0) or not(=1).

dimofkernel
An integer returning the dimension of the kernel of A.

rank
An integer returning the rank of A, which need to determine when pivots are to be considered nonzero. This is not used for the QR decomposition itself.

nonzeropivots
An integer returning the number of non-zero ivots in the decomposition.

isinjective
A boolean indicating whether A is injective.

isinvertible
A boolean indicating whether A is invertible.

issurjective
A boolean indicating whether A is surjective.

signdet
A scalar of a return type matching A. The sign of the determinant of A.

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

logabsdet
A scalar of a return type matching A. The logarithm of the absolute value of the determinant of A.

maxpivot
A scalar of the same return type as det. The absolute value of the biggest pivot, i.e. the biggest diagonal coefficient of R.

X
A general matrix of the same type and dimension as B. The solution to $AX = B$.

pseudoInverse
A square matrix of the same type and dimension as A. The pseudo-inverse of A, A^{-1}.

P
A square matrix of the same type and dimension as A. The matrix P contains the column permutation matrix.

P'
A square matrix of the same type and dimension as A. The matrix P' contains the rows transpositions matrix.

T
A square matrix of the same type and dimension as A., containing the matrix Z.

Z
A square matrix of the same type and dimension as A, containing the matrix R.

QTZ
A square matrix of the same type and dimension as A, containing the matrix QTZ.

This class performs a a rank-revealing complete orthogonal decomposition (COD) of the general matrix *matA* $= A$ into matrices P, Q, T, and Z such that

$$\mathbf{A\,P} = \mathbf{Q} \begin{bmatrix} \mathbf{T} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix} \mathbf{Z}$$

by using Householder transformations. Here, P is a permutation matrix, Q and Z are unitary matrices and T an upper triangular matrix of size rank-by-rank. A may be rank deficient.

solve: This method finds a solution x to the equation Ax=b, where A is the matrix of which this is the QR decomposition, if any exists.

Parameters: b the right-hand-side of the equation to solve.

Returns the exact or least-square solution if the rank is greater or equal to the number of columns of A, and an arbitrary solution otherwise. Note: The case where b is a matrix is not yet implemented. Also, this code is space inefficient.This method just tries to find as good a solution as possible. If you want to check whether a solution exists or if it is accurate, just call this function to get a result and then compute the error of this result, or use MatrixBase::isApprox() directly, for instance like this:

bool a_solution_exists = (A*result).isApprox(b, precision);

This method avoids dividing by zero, so that the non-existence of a solution doesn't by itself mean that you'll get inf or nan values. If there exists more than one solution, this method will arbitrarily choose one.

6.7.8.1 Example for a real matrix

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableRandomA6x6", ""); A.show("A")

6.8 Singular Value and Eigen (selfadjoint) decompositions

6.8.1 Singular Value Decomposition, only singular values

`ctx.mat_jacobi_svd`(*matA*, *Query*)

Returns the two-sided Jacobi SVD decomposition of a rectangular matrix.

Writing `matA.JacobiSVD(Query)` has the same effect

See also: Wikipedia [1420].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

rank
An integer. The rank of A (equal to the number of non-zero singular values)

SV
A vector of the same type`A`. The singular values A (see below).

The singular value decomposition of an $m \times n$ complex matrix $\mathbf{M}$ is a factorization of the form $\mathbf{M} = \mathbf{U\Sigma V}^*$, where $\mathbf{U}$ is an $m \times m$ complex unitary matrix, $\mathbf{\Sigma}$ is an $m \times n$ rectangular diagonal matrix with non-negative real numbers on the diagonal, and $\mathbf{V}$ is an $n \times n$ complex unitary matrix. If $\mathbf{M}$ is real, $\mathbf{U}$ and $\mathbf{V}^{\mathsf{T}} = \mathbf{V}^*$ are real orthogonal matrices.

The diagonal entries $\sigma_i = \Sigma_{ii}$ of $\mathbf{\Sigma}$ are known as the singular values of $\mathbf{M}$. The number of non-zero singular values is equal to the rank of $\mathbf{M}$. The columns of $\mathbf{U}$ and the columns of $\mathbf{V}$ are called the left-singular vectors and right-singular vectors of $\mathbf{M}$, respectively. These vectors are related by

$$\mathbf{Mv} = \sigma\mathbf{u} \text{ and } \mathbf{M}^*\mathbf{u} = \sigma\mathbf{v}.$$

The singular values are the square roots of non-negative eigenvalues of $\mathbf{M}^*\mathbf{M}$.

Matrix transpose and conjugate do not alter singular values.

$$\sigma_i(A) = \sigma_i\left(A^{\mathsf{T}}\right) = \sigma_i\left(A^*\right) = \sigma_i\left(\bar{A}\right).$$

For any unitary $U \in \mathbb{C}^{m\times m}, V \in \mathbb{C}^{n\times n}$.

$$\sigma_i(A) = \sigma_i(UAV).$$

Relation to eigenvalues:

$$\sigma_i^2(A) = \lambda_i\left(AA^*\right) = \lambda_i\left(A^*A\right).$$

The singular value decomposition is very general in the sense that it can be applied to any $m \times n$ matrix, whereas the eigenvalue decomposition can only be applied to diagonalizable matrices. Nevertheless, the two decompositions are related.

Given an SVD of M, as described above, the following two relations hold:

$$\mathbf{M}^*\mathbf{M} = \mathbf{V\Sigma}^*\mathbf{U}^*\,\mathbf{U\Sigma V}^* = \mathbf{V}(\mathbf{\Sigma}^*\mathbf{\Sigma})\mathbf{V}^*$$

$$\mathbf{MM}^* = \mathbf{U\Sigma V}^*\,\mathbf{V\Sigma}^*\mathbf{U}^* = \mathbf{U}(\mathbf{\Sigma\Sigma}^*)\mathbf{U}^*$$

The right-hand sides of these relations describe the eigenvalue decompositions of the left-hand sides. Consequently:

The columns of $\mathbf{V}$ (right-singular vectors) are eigenvectors of $\mathbf{M}^*\mathbf{M}$.

The columns of $\mathbf{U}$ (left-singular vectors) are eigenvectors of $\mathbf{M}\mathbf{M}^*$.

The non-zero elements of $\mathbf{\Sigma}$ (non-zero singular values) are the square roots of the non-zero eigenvalues of $\mathbf{M}^*\mathbf{M}$ or $\mathbf{M}\mathbf{M}^*$.

6.8.2 Singular Value Decomposition, singular values and thin singular vectors

`ctx.`**`mat_jacobi_svd_thin`**(*matA*, *Query*, *matB*)

Returns the two-sided Jacobi SVD decomposition of a rectangular matrix.

Writing `matA.JacobiSvdThin(Query, matB)` has the same effect

See also: Wikipedia [1420], Wikipedia [1418].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

matB
Optional. A general n-by-m matrix of the same type as A. You need to specify B only if you want to solve the linear equation $AX = B$

Results:

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

rank
An integer. The rank of A.

X
A general matrix of the same type and dimension as B. The solution to $AX = B$.

pseudoInverse
A square matrix of the same type and dimension as A. The pseudo-inverse of A, A^{-1}.

SV
A vector of the same type`A`. The singular values A (see below).

thinU
A square matrix of the same type and dimension as A. The thin singular vectors U (see below).

thinV
A square matrix of the same type and dimension as A. The thin singular vectors V (see below).

6.8.2.1 Example for a real matrix: the singular values, pseudoinverse and thin singular vectors

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableRandomA6x6", ""); A.show("A")

A:
  48,   43,   31,   19,   14,   24,
  46,   10,   20,  4.6,   14,   10,
  27,   39,   13,   34,   29,   37,

6.8.3 Singular Value Decomposition, singular values and full singular vectors

`ctx.mat_jacobi_svd_full`(*matA*, *Query*, *matB*)

Returns the two-sided Jacobi SVD decomposition of a rectangular matrix.

Writing `matA.JacobiSvdFull(Query, matB)` has the same effect

See also Eigen [229], Wikipedia [1420], Wikipedia [1418], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

matB
Optional. A general n-by-m matrix of the same type as A. You need to specify B only if you want to solve the linear equation $AX = B$

Results:

absdet
A scalar of a return type matching A. The absolute value of the determinant of A.

rank
An integer. The rank of A.

X
A general matrix of the same type and dimension as B. The solution to $AX = B$.

pseudoInverse
A square matrix of the same type and dimension as A. The pseudo-inverse of A, A^{-1}.

SV
A vector of the same type`A`. The singular values A (see below).

fullU
A square matrix of the same type and dimension as A. The full singular vectors U (see below).

fullV
A square matrix of the same type and dimension as A. The full singular vectors V (see below).

SVD decomposition consists in decomposing any n-by-p matrix A as a product

$A = USV*$

where U is a n-by-n unitary, V is a p-by-p unitary, and S is a n-by-p real positive matrix which is zero outside of its main diagonal; the diagonal entries of S are known as the singular values of A and the columns of U and V are known as the left and right singular vectors of A respectively. Singular values are always sorted in decreasing order.

This JacobiSVD decomposition computes only singular values by default. If you want U or V , you need to ask for them explicitly.

You can ask for only thin U or V to be computed, meaning the following. In case of a rectangular n-by-p matrix, letting m be the smaller value among n and p, there are only m singular vectors; the remaining columns of U and V do not correspond to actual singular vectors. Asking for thin U or V means asking for only their m first columns to be formed. So U is then a n-by-m matrix, and V is then a p-by-m matrix. Notice that thin U and V are all you need for (least squares) solving.

This JacobiSVD class is a two-sided Jacobi R-SVD decomposition, ensuring optimal reliability and accuracy. The downside is that it's slower than bidiagonalizing SVD algorithms for large square matrices; however its complexity is still where n is the smaller dimension and p is the greater dimension, meaning that it is still of the same order of complexity as the faster bidiagonalizing R-SVD algorithms. In particular, like any R-SVD, it takes advantage of non-squareness in that its complexity is only linear in the greater dimension.

If the input matrix has inf or nan coefficients, the result of the computation is undefined, but the computation is guaranteed to terminate in finite (and reasonable) time.

The possible values for QRPreconditioner are:

- ColPivHouseholderQRPreconditioner is the default. In practice it's very safe. It uses column-pivoting QR.
- FullPivHouseholderQRPreconditioner, is the safest and slowest. It uses full-pivoting QR. Contrary to other QRs, it doesn't allow computing thin unitaries.
- HouseholderQRPreconditioner is the fastest, and less safe and accurate than the pivoting variants. It uses non-pivoting QR. This is very similar in safety and accuracy to the bidiagonalization process used by bidiagonalizing SVD algorithms (since bidiagonalization is inherently non-pivoting). However the resulting SVD is still more reliable than bidiagonalizing SVDs because the Jacobi-based iterarive process is more reliable than the optimized bidiagonal SVD iterations.
- NoQRPreconditioner allows not to use a QR preconditioner at all. This is useful if you know that you will only be computing JacobiSVD decompositions of square matrices. Non-square matrices require a QR preconditioner. Using this option will result in faster compilation and smaller executable code. It won't significantly speed up computation, since JacobiSVD is always checking if QR preconditioning is needed before applying it anyway.

const internal::solve retval¡JacobiSVD, Rhs¿ solve (const MatrixBase¡ Rhs ¿ & b) const Returns a (least squares) solution of using the current SVD decomposition of A. Parameters: b the right-hand-side of the equation to solve.

Note: Solving requires both U and V to be computed. Thin U and V are enough, there is no need for full U or V. SVD solving is implicitly least-squares. Thus, this method serves both purposes of exact solving and least-squaressolving. In other words, the returned solution is guaranteed to minimize the Euclidean norm $||Ax - b||$.

Example for a real matrix: the singular values, pseudoinverse and full singular vectors

```
>>> from xlcalcnet import *

6.8.4 Symmetric/Hermitian Eigensystem, only eigen values

`ctx.mat_self_adjoint_eigen_values`(*matA*, *Query*)

Returns the eigendecomposition of the symmetric/hermitian matrix *matA* $= A$.

Writing `matA.SelfAdjointEigenValues(Query)` has the same effect

See also Eigen [238], Wikipedia [1405], Wikipedia [1407], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

info
Reports whether previous computation was successful.

eval
Returns the eigenvalues of given matrix.

evec
Returns the eigenvectors of given matrix.

sqrt
Returns the positive-definite square root of the matrix

inversesqrt
Returns the inverse square root of the matrix

A matrix A is selfadjoint if it equals its adjoint. For real matrices, this means that the matrix is symmetric: it equals its transpose. This class computes the eigenvalues and eigenvectors of a selfadjoint matrix. These are the scalars λ and vectors v such that $Av = \lambda v$. The eigenvalues of a selfadjoint matrix are always real. If D is a diagonal matrix with the eigenvalues on the diagonal, and V is a matrix with the eigenvectors as its columns, then $A = VDV^{-1}$ (for selfadjoint matrices, the matrix V is always invertible). This is called the eigendecomposition. The algorithm exploits the fact that the matrix is selfadjoint, making it faster and more accurate than the general purpose eigenvalue algorithms implemented in EigenSolver and ComplexEigenSolver. Only the lower triangular part of the input matrix is referenced.

Call the function compute() to compute the eigenvalues and eigenvectors of a given matrix. Alternatively, you can use the SelfAdjointEigenSolver(const MatrixType, int) constructor which computes the eigenvalues and eigenvectors at construction time. Once the eigenvalue and eigenvectors are computed, they can be retrieved with the eigenvalues() and eigenvectors() functions. The documentation for SelfAdjointEigenSolver(const MatrixType, int) contains an example of the typical use of this class.

To solve the generalized eigenvalue problem $Av = \lambda Bv$ and the likes, see the class GeneralizedSelfAdjointEigenSolver. This implementation uses a symmetric QR algorithm. The matrix is first reduced to tridiagonal form using the Tridiagonalization class. The tridiagonal matrix is then brought to diagonal form with implicit symmetric QR steps with Wilkinson shift. Details can be found in Section 8.3 of Golub & Van Loan (1996). The cost of the computation is about 9n3 if the eigenvectors are required and 4n3/3 if they are not required.

6.8.4.1 Example for a real symmetric matrix: only eigenvalues

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)

6.8.6 Generalized Selfadjoint Eigensystem, only eigenvalues

`ctx.mat_generalized_self_adjoint_eigen_values(matA, Query)`

Returns the eigendecomposition of a generalized selfadjoint eigensystem.

Writing `matA.GeneralizedSelfAdjointEigenValues(Query)` has the same effect

See also Eigen [226], Wikipedia [1437], Wikipedia [1432], Wikipedia [1406].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

eval
Returns the eigenvalues of given matrix.

evec
Returns the eigenvectors of given matrix.

The generalized eigenvalues and eigenvectors of a matrix pair A and B are scalars λ and vectors v such that $Av = \lambda Bv$. If D is a diagonal matrix with the eigenvalues on the diagonal, and V is a matrix with the eigenvectors as its columns, then $AV = BVD$. The matrix V is almost always invertible, in which case we have $A = BVDV^{-1}$. This is called the generalized eigen-decomposition.

This class solves the generalized eigenvalue problem $Av = \lambda Bv$. In this case, the matrix A should be selfadjoint and the matrix B should be positive definite. Only the lower triangular part of the input matrix is referenced.

Parameters: [in] matA Selfadjoint matrix in matrix pencil. Only the lower triangular part of the matrix is referenced. [in] matB Positive-definite matrix in matrix pencil. Only the lower triangular part of the matrix is referenced. [in] options A or-ed set of flags ComputeEigenvectors,EigenvaluesOnly - `Ax_lBx,ABx_lx,BAx_lx`. Default is ComputeEigenvectors `Ax_lBx`.

Computes the eigenvalues and (if requested) the eigenvectors of the generalized eigenproblem $Ax = \lambda Bx$ with matA the selfadjoint matrix A and matB the positive definite matrix B. Each eigenvector x satisfies the property $x^T Bx = 1$. The eigenvectors are computed if options contains ComputeEigenvectors. In addition, the two following variants can be solved via options:

`ABx_lx`: $ABx = \lambda x$

`BAx_lx`: $BAx = \lambda x$

Computes generalized eigendecomposition of given matrix pencil. Parameters [in] matA Selfadjoint matrix in matrix pencil. Only the lower triangular part of the matrix is referenced. [in] matB Positive-definite matrix in matrix pencil. Only the lower triangular part of the matrix is referenced. [in] options A or-ed set of flags

ComputeEigenvectors,EigenvaluesOnly `Ax_lBx,ABx_lx,BAx_lx`. Default is ComputeEigenvectors `Ax_lBx`. According to options, this function computes eigenvalues and (if requested) the eigenvectors of one of the following three generalized eigenproblems:

`Ax_lBx`: $Ax = \lambda Bx$

`ABx_lx`: $ABx = \lambda x$

`BAx_lx`: $BAx = \lambda x$

with matA the selfadjoint matrix A and matB the positive definite matrix B. In addition, each eigenvector satisfies the property $x * Bx = 1$.The eigenvalues() function can be used to retrieve the eigenvalues. If options contains ComputeEigenvectors, then the eigenvectors are also computed and can be retrieved by calling eigenvectors().

The implementation uses LLT to compute the Cholesky decomposition $B = LL^T$ and computes the classical eigendecomposition of the selfadjoint matrix L^{-1} A(L*)^{-1} if options contains `Ax_lBx` and of $L * AL$ otherwise. This solves the generalized eigenproblem, because any solution of the generalized eigenproblem Ax = lambda Bx corresponds to a solution $L^{-1}A(L*)^{-1}(L*x) = \lambda(L * x)$ of the eigenproblem for $L^{-1}A(L*)^{-1}$. Similar statements can be made for the two other variants.

6.8.6.1 Example for a real symmetric matrix: eigenvalues only

```

6.8.8 Tridiagonalization

`ctx.mat_tridiagonalization`(*matA*, *Query*)

Returns the tridiagonal decomposition of a selfadjoint matrix.

Writing `matA.Tridiag(Query)` has the same effect

See also Eigen [239], Wikipedia [1422], Wikipedia [1412], Wikipedia [1407], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

Q
Returns the unitary matrix Q in the decomposition.

T
Returns an expression of the tridiagonal matrix T in the decomposition..

packed
Returns the internal representation of the decomposition.

hcoeff
Returns the Householder coefficients..

diag
Returns the diagonal of the tridiagonal matrix T in the decomposition.

subdiag
Returns the subdiagonal of the tridiagonal matrix T in the decomposition.

This class performs a tridiagonal decomposition of a selfadjoint matrix A such that: $A = QTQ^*$ where Q is unitary and T a real symmetric tridiagonal matrix. A tridiagonal matrix is a matrix which has nonzero elements only on the main diagonal and the first diagonal below and above it. The Hessenberg decomposition of a selfadjoint matrix is in fact a tridiagonal decomposition. This class is used in SelfAdjointEigenSolver to compute the eigenvalues and eigenvectors of a selfadjoint matrix.

6.9 Eigen decompositions of general square matrices

6.9.1 Matrix balancing and eigenvalue/eigenvector computation

Diagonal scaling to improve eigenvalue accuracy

See also: James *et al.* [378].

Example from Matlab: https://de.mathworks.com/help/matlab/ref/balance.html

Sample code for Eigen in C++ : https://stackoverflow.com/questions/43151853/eigen-balancing-matrix-for-eigenvalue

```
void balance_matrix(const Eigen::MatrixXd &A, Eigen::MatrixXd &Aprime, Eigen::MatrixXd &D) {
    // https://arxiv.org/pdf/1401.5766.pdf (Algorithm #3)
    const int p = 2;
    double beta = 2; // Radix base (2?)
    Aprime = A;
    D = Eigen::MatrixXd::Identity(A.rows(), A.cols());
    bool converged = false;
    do {
        converged = true;
        for (Eigen::Index i = 0; i < A.rows(); ++i) {
            double c = Aprime.col(i).lpNorm<p>();
            double r = Aprime.row(i).lpNorm<p>();
            double s = pow(c, p) + pow(r, p);
            double f = 1;
            while (c < r / beta) {
                c *= beta;
                r /= beta;
                f *= beta;
            }
            while (c >= r*beta) {
                c /= beta;
                r *= beta;
                f /= beta;
            }
            if (pow(c, p) + pow(r, p) < 0.95*s) {
                converged = false;
                D(i, i) *= f;
                Aprime.col(i) *= f;
                Aprime.row(i) /= f;
            }
        }
    } while (!converged);
}
```

6.9.2 Hessenberg Decomposition

`ctx.mat_hessenberg`(*matA*, *Query*)

Reduces a square matrix to Hessenberg form by an orthogonal similarity transformation.

Writing `matA.Hessenberg(Query)` has the same effect

See also Eigen [227], Wikipedia [1411], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

H
A square matrix of the same type and dimension as A, containing the matrix H in the decomposition $A = QHQ^T$.

Q
A square matrix of the same type and dimension as A, containing the matrix Q in the decomposition $A = QHQ^T$.

packedMatrix
A square matrix of the same type and dimension as A. Returns the internal representation of the decomposition.

hcoeff
A square matrix of the same type and dimension as A. Returns the Householder coefficients of the decomposition.

Reduces a square matrix to Hessenberg form by an orthogonal similarity transformation.

In the real case, the Hessenberg decomposition consists of an orthogonal matrix Q and a Hessenberg matrix H such that $A = QHQ^T = Q^THQ$. An orthogonal matrix is a matrix whose inverse equals its transpose: $Q^{-1} = Q^T$., and $QQ^T = Q^TQ = I$

The Hessenberg decomposition of a complex matrix is $A = QHQ^*$ with Q unitary, that is, $Q^{-1} = Q^*$, and $QQ^* = Q^*Q = I$.

A Hessenberg matrix has zeros below the subdiagonal, so it is almost upper triangular.

6.9.2.1 Example for a real matrix

```

6.9.3 Schur Decomposition

`ctx.mat_schur`(*matA*, *Query*)

Performs a Schur decomposition of a square matrix.

Writing `matA.Schur(Query)` has the same effect

See also Eigen [236], Eigen [222], Wikipedia [1439], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

U
A general matrix of the same type and dimension as A, containing the matrix U in the decomposition.

T
A general matrix of the same type and dimension as A, containing the matrix T in the decomposition.

REAL:

Given a real square matrix A, this class computes the real Schur decomposition: $A = UTU^T$ where U is a real orthogonal matrix and T is a real quasi-triangular matrix. An orthogonal matrix is a matrix whose inverse is equal to its transpose, $U^{-1} = U^T$. A quasi-triangular matrix is a block-triangular matrix whose diagonal consists of 1-by-1 blocks and 2-by-2 blocks with complex eigenvalues. The eigenvalues of the blocks on the diagonal of T are the same as the eigenvalues of the matrix A, and thus the real Schur decomposition is used in EigenSolver to compute the eigendecomposition of a matrix.

COMPLEX:

Given a real or complex square matrix A, this class computes the Schur decomposition: where U is a unitary complex matrix, and T is a complex upper triangular matrix. The diagonal of the matrix T corresponds to the eigenvalues of the matrix A.

6.9.3.1 Example for a real matrix

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)

```

6.9.4 Eigensystem of a general square matrix: only eigenvalues

`ctx.mat_eigen_values`(*matA*, *Query*)

Returns the eigendecomposition of a general square matrix *matA* $= A$.

Writing `matA.EigenValues(Query)` has the same effect

See also Eigen [221], Wikipedia [1405], Wikipedia [1407], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

eval
Returns the eigenvalues of given matrix.

evec
Returns the eigenvectors of given matrix.

Computes eigenvalues and eigenvectors of general matrices. The eigenvalues and eigenvectors of a matrix A are scalars λ and vectors v such that $Av = \lambda v$. If D is a diagonal matrix with the eigenvalues on the diagonal, and V is a matrix with the eigenvectors as its columns, then $AV = VD$. The matrix V is almost always invertible, in which case we have $A = VDV^{-1}$. This is called the eigendecomposition. The eigenvalues and eigenvectors of a matrix may be complex, even when the matrix is real. However, we can choose real matrices V and D satisfying $AV = VD$, just like the eigendecomposition, if the matrix D is not required to be diagonal, but if it is allowed to have blocks of the form

$$\begin{bmatrix} \mathbf{u} & \mathbf{v} \\ -\mathbf{v} & \mathbf{u} \end{bmatrix}$$

(where u and v are real numbers) on the diagonal. These blocks correspond to complex eigenvalue pairs $u \pm iv$. We call this variant of the eigendecomposition the pseudo-eigendecomposition.

Call the function compute() to compute the eigenvalues and eigenvectors of a given matrix. Alternatively, you can use the EigenSolver(const MatrixType, bool) constructor which computes the eigenvalues and eigenvectors at construction time. Once the eigenvalue and eigenvectors are computed, they can be retrieved with the eigenvalues() and eigenvectors() functions. The pseudoEigenvalueMatrix() and pseudoEigenvectors() methods allow the construction of the pseudo-eigendecomposition.

The matrix is first reduced to real Schur form using the RealSchur (or Complex) class. The Schur decomposition is then used to compute the eigenvalues and eigenvectors. The cost of the computation is dominated by the cost of the Schur decomposition, which is very approximately 25n3 (where n is the size of the matrix) if computeEigenvectors is true, and 10n3 if computeEigenvectors is false. This method reuses of the allocated data in the EigenSolver object.

6.9.4.1 Example for a real matrix: only eigenvalues

```
>>> from xlcalcnet import *
>>> ctx = mp14.drf(); mp14.setdps(35); mp14.setshowdps(3)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableRandomA6x6", ""); A.show("A")

6.9.6 Real QZ Decomposition

`ctx.mat_real_qz`(*matA*, *Query*, *matB*)

Performs a real QZ decomposition of a pair of square matrices maA $= A$ and matB $= B$.

Writing `matA.RealQZ(Query, matB)` has the same effect

See also Eigen [235], Wikipedia [1426], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

B
Optional. A square matrix of the same type and dimensiion as A.

Results:

S
Returns matrix S in the QZ decomposition.

T
Returns matrix T in the QZ decomposition.

Q
Returns matrix Q in the QZ decomposition.

Z
Returns matrix Z in the QZ decomposition.

Given a real square matrices A and B, this class computes the real QZ decomposition: $A = QSZ, B = QTZ$ where Q and Z are real orthogonal matrixes, T is upper-triangular matrix, and S is upper quasi-triangular matrix. An orthogonal matrix is a matrix whose inverse is equal to its transpose, $U^{-1} = U^T$. A quasi-triangular matrix is a block-triangular matrix whose diagonal consists of 1-by-1 blocks and 2-by-2 blocks where further reduction is impossible due to complex eigenvalues.

The eigenvalues of the pencil $A - zB$ can be obtained from 1x1 and 2x2 blocks on the diagonals of S and T. If computeQZ==false, some time is saved by not computing matrices Q and Z.

6.9.7 PseudoEigenSystem

`ctx.mat_pseudo_eigen_system`(*matA*, *Query*)

Returns the eigenvalues of the general square matrix *matA* $= A$.

Writing `matA.PseudoEigenSystem(Query)` has the same effect

See also Eigen [233], Eigen [234].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

pseudoeval
Returns the pseudo-eigenvalues of given matrix.

pseudoevec
Returns the pseudo-eigenvectors of given matrix.

Computes eigenvalues and eigenvectors of general matrices. The eigenvalues and eigenvectors of a matrix A are scalars λ and vectors v such that $Av = \lambda v$. If D is a diagonal matrix with the eigenvalues on the diagonal, and V is a matrix with the eigenvectors as its columns, then $AV = VD$. The matrix V is almost always invertible, in which case we have $A = VDV^{-1}$. This is called the eigendecomposition. The eigenvalues and eigenvectors of a matrix may be complex, even when the matrix is real. However, we can choose real matrices V and D satisfying $AV = VD$, just like the eigendecomposition, if the matrix D is not required to be diagonal, but if it is allowed to have blocks of the form

$$\begin{bmatrix} \mathbf{u} & \mathbf{v} \\ -\mathbf{v} & \mathbf{u} \end{bmatrix}$$

(where u and v are real numbers) on the diagonal. These blocks correspond to complex eigenvalue pairs $u \pm iv$. We call this variant of the eigendecomposition the pseudo-eigendecomposition.

Call the function compute() to compute the eigenvalues and eigenvectors of a given matrix. Alternatively, you can use the EigenSolver(const MatrixType, bool) constructor which computes the eigenvalues and eigenvectors at construction time. Once the eigenvalue and eigenvectors are computed, they can be retrieved with the eigenvalues() and eigenvectors() functions. The pseudoEigenvalueMatrix() and pseudoEigenvectors() methods allow the construction of the pseudo-eigendecomposition.

The matrix is first reduced to real Schur form using the RealSchur (or Complex) class. The Schur decomposition is then used to compute the eigenvalues and eigenvectors. The cost of the computation is dominated by the cost of the Schur decomposition, which is very approximately 25n3 (where n is the size of the matrix) if computeEigenvectors is true, and 10n3 if computeEigenvectors is false. This method reuses of the allocated data in the EigenSolver object.

```

6.9.8 Real Generalized Nonsymmetric Eigenvalues

`ctx.mat_gen_eigen_values`(*matA*, *Query*, *matB*)

Returns the Generalized Nonsymmetric Eigensystem; Eigenvalues only of the general matrix *matA* $= A$.

Writing `matA.GenEigenValues(Query, matB)` has the same effect

See also Eigen [225], Wikipedia [1437], Wikipedia [1432].

Parameters:

Query
Required. A string specifying which items of the result section should be computed.

Results:

eval
Returns the eigenvalues of given matrix.

evec
Returns the eigenvectors of given matrix.

Computes the generalized eigenvalues and eigenvectors of a pair of general (nonsymmetric) matrices. Currently, only real matrices are supported.

The generalized eigenvalues and eigenvectors of a matrix pair A and B are scalars λ and vectors v such that $Av = \lambda Bv$. If D is a diagonal matrix with the eigenvalues on the diagonal, and V is a matrix with the eigenvectors as its columns, then $AV = BVD$. The matrix V is almost always invertible, in which case we have $A = BVDV^{-1}$. This is called the generalized eigen-decomposition.

The generalized eigenvalues and eigenvectors of a matrix pair may be complex, even when the matrices are real. Moreover, the generalized eigenvalue might be infinite if the matrix B is singular. To workaround this difficulty, the eigenvalues are provided as a pair of complex α and real β such that: $\lambda_i = \alpha_i/\beta_i$. If β_i is (nearly) zero, then one can consider the well defined left eigenvalue $\mu_i = \beta_i/\alpha_i$ such that: $\mu_i A v_i = B v_i$, or even $\mu_i u_i^T A v_i = u_i^T B$, where u_i is called the left eigenvector.

```

6.10 Eigen: Polynomials

6.10.1 Building a polynomial from its roots

`ctx.roots_to_monic_poly(results, matB)`

Calculates the monic polynomial from its roots.

See also: Eigen [218].

6.10.2 Polynomial evaluation

`ctx.poly_eval(roots)`

Evaluates a polynomial

See also: Eigen [218].

6.10.3 Polynomial roots

`ctx.poly_roots()`

Computes all roots (real or complex) of a given polynomial.

See also: Eigen [217].

6.11 Eigen: Fast Fourier Transform

The default implementation is based on kissfft.

The following design decisions were made concerning scaling and half-spectrum for real FFT.

The intent is to facilitate generic programming and ease migrating code from Matlab/octave. We think the default behavior of Eigen/FFT should favor correctness and generality over speed. Of course, the caller should be able to "opt-out" from this behavior and get the speed increase if they want it.

1) Scaling: Other libraries (FFTW,IMKL,KISSFFT) do not perform scaling, so there is a constant gain incurred after the forward&inverse transforms , so IFFT(FFT(x)) = Kx; this is done to avoid a vector-by-value multiply. The downside is that algorithms that worked correctly in Matlab/octave don't behave the same way once implemented in C++.

How Eigen/FFT differs: invertible scaling is performed so IFFT(FFT(x)) = x.

2) Real FFT half-spectrum Other libraries use only half the frequency spectrum (plus one extra sample for the Nyquist bin) for a real FFT, the other half is the conjugate-symmetric of the first half. This saves them a copy and some memory. The downside is the caller needs to have special logic for the number of bins in complex vs real.

How Eigen/FFT differs: The full spectrum is returned from the forward transform. This facilitates generic template programming by obviating separate specializations for real vs complex. On the inverse transform, only half the spectrum is actually used if the output type is real.

6.11.1 Forward transform

`ctx.`**`mat_fft_fwd`**`(`*matA*`)`

Calculates the Fourier transform.

Writing `matA.FFTFwd()` has the same effect

See also: Eigen [206].

6.11.2 Inverse transform

`ctx.`**`mat_fft_inv`**`(`*matA*`)`

Calculates the Fourier transform.

Writing `matA.FFTInv()` has the same effect

See also: Eigen [206].

```
Sub DemoCplxFFT()
    Console.WriteLine("Hello DemoCplxFFT!")
    Dim digits = 15
    Dim n As Int32 = 4

6.12 Eigen and Numpy (Multiprecision): Functions of matrix argument

6.12.1 Matrix Exponential

`ctx.mat_expm(matA)`

Computes the matrix exponential of a square matrix A, which is defined by the power series $\exp(A) = I + A + \frac{A^2}{2!} + \frac{A^3}{3!} + \ldots$

Writing `matA.ExpMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1433].

See also: Eigen [209], Eigen [208].

Basic examples:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> expm(zeros(3))
[1.0  0.0  0.0]
[0.0  1.0  0.0]
[0.0  0.0  1.0]
>>> expm(eye(3))
[2.71828182845905               0.0               0.0]
[             0.0  2.71828182845905               0.0]
[             0.0               0.0  2.71828182845905]
>>> expm([[1,1,0],[1,0,1],[0,1,0]])
[ 3.86814500615414  2.26812870852145  0.841130841230196]
[ 2.26812870852145  2.44114713886289   1.42699786729125]
[0.841130841230196  1.42699786729125    1.6000162976327]
>>> expm([[1,1,0],[1,0,1],[0,1,0]], method='pade')
[ 3.86814500615414  2.26812870852145  0.841130841230196]
[ 2.26812870852145  2.44114713886289   1.42699786729125]
[0.841130841230196  1.42699786729125    1.6000162976327]
>>> expm([[1+j, 0], [1+j,1]])
[(1.46869393991589 + 2.28735528717884j)                         0.0]
[  (1.03776739863568 + 3.536943175722j)  (2.71828182845905 + 0.0j)]
```

Matrices with large entries are allowed:

```
>>> expm(matrix([[1,2],[2,3]])**25)
[5.65024064048415e+2050488462815550  9.14228140091932e+2050488462815550]
[9.14228140091932e+2050488462815550  1.47925220414035e+2050488462815551]
```

The identity $\exp(A+B) = \exp(A)\exp(B)$ does not hold for noncommuting matrices:

```
>>> A = hilbert(3)
>>> B = A + eye(3)
>>> chop(mnorm(A*B - B*A))
0.0
>>> chop(mnorm(expm(A+B) - expm(A)*expm(B)))
0.0
>>> B = A + ones(3)
>>> mnorm(A*B - B*A)
1.8
>>> mnorm(expm(A+B) - expm(A)*expm(B))
42.0927851137247
```

6.12.2 Matrix Sine

`ctx.mat_sinm(matA)`

Calculates the sine function of the matrix.

Writing `matA.SinMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1441].

See also: Eigen [209], Eigen [214].

The cosine of a square matrix A is defined in analogy with the matrix exponential.

$$\cos(A) = \frac{e^{iA} + e^{-iA}}{2}$$

$$\sin(A) = \frac{e^{iA} - e^{-iA}}{2i}$$

$$\cos^2(A) + \sin^2(A) = I$$

For real A, we can write $\cos(A) = \Re(e^{iA})$ and $\sin(A) = \Im(e^{iA})$.

$$\cosh(A) = \frac{e^{A} + e^{-A}}{2}$$

$$\sinh(A) = \frac{e^{A} - e^{-A}}{2}$$

Examples:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> X = eye(3)
>>> cosm(X)
[0.54030230586814               0.0               0.0]
[            0.0  0.54030230586814               0.0]
[            0.0               0.0  0.54030230586814]
>>> X = hilbert(3)
>>> cosm(X)
[ 0.424403834569555  -0.316643413047167  -0.221474945949293]
[-0.316643413047167   0.820646708837824  -0.127183694770039]
[-0.221474945949293  -0.127183694770039   0.909236687217541]
>>> X = matrix([[1+j,-2],[0,-j]])
>>> cosm(X)
[(0.833730025131149 - 0.988897705762865j)  (1.07485840848393 - 0.17192140544213j)]
[                                     0.0               (1.54308063481524 + 0.0j)]
```

6.12.3 Matrix Cosine

`ctx.mat_cosm(`*matA*`)`

Calculates the cosine function of the matrix.

Writing `matA.CosMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1441].

See also: Eigen [209], Eigen [207].

The cosine of a square matrix A is defined in analogy with the matrix exponential.

$$\cos(A) = \frac{e^{iA} + e^{-iA}}{2}$$

$$\sin(A) = \frac{e^{iA} - e^{-iA}}{2i}$$

$$\cos^2(A) + \sin^2(A) = I$$

For real A, we can write $\cos(A) = \Re(e^{iA})$ and $\sin(A) = \Im(e^{iA})$.

$$\cosh(A) = \frac{e^{A} + e^{-A}}{2}$$

$$\sinh(A) = \frac{e^{A} - e^{-A}}{2}$$

Examples:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> X = eye(3)
>>> cosm(X)
[0.54030230586814               0.0               0.0]
[             0.0  0.54030230586814               0.0]
[             0.0               0.0  0.54030230586814]
>>> X = hilbert(3)
>>> cosm(X)
[ 0.424403834569555  -0.316643413047167  -0.221474945949293]
[-0.316643413047167   0.820646708837824  -0.127183694770039]
[-0.221474945949293  -0.127183694770039   0.909236687217541]
>>> X = matrix([[1+j,-2],[0,-j]])
>>> cosm(X)
[(0.833730025131149 - 0.988897705762865j)  (1.07485840848393 - 0.17192140544213j)]
[                                     0.0               (1.54308063481524 + 0.0j)]
```

6.12.4 Matrix Hyperbolic Sine

`ctx.mat_sinhm(matA)`

Calculates the hyperbolic sine function of the matrix.

Writing `matA.SinhMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1441].

See also: Eigen [209], Eigen [211].

The hyperbolic sine of a square matrix A is defined in analogy with the matrix exponential.

$$\sinh(A) = \frac{e^A - e^{-A}}{2}$$

$$\cosh(A) = \frac{e^A + e^{-A}}{2}$$

$$\cosh^2(A) + \sinh^2(A) = I$$

```

```

6.12.6 Matrix Square Root

`ctx.mat_sqrtm(matA)`

Computes a square root of the square matrix A, i.e. returns a matrix $B = A^{1/2}$ such that $B^2 = A$. The square root of a matrix, if it exists, is not unique.

Writing `matA.SqrtMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1440].

See also: Eigen [209], Eigen [215].

Examples

Square roots of some simple matrices:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> sqrtm([[1,0], [0,1]])
[1.0  0.0]
[0.0  1.0]
>>> sqrtm([[0,0], [0,0]])
[0.0  0.0]
[0.0  0.0]
>>> sqrtm([[2,0],[0,1]])
[1.4142135623731  0.0]
[            0.0  1.0]
>>> sqrtm([[1,1],[1,0]])
[ (0.920442065259926 - 0.21728689675164j)  (0.568864481005783 + 0.351577584254143j)]
[(0.568864481005783 + 0.351577584254143j)  (0.351577584254143 - 0.568864481005783j)]
>>> sqrtm([[1,0],[0,1]])
[1.0  0.0]
[0.0  1.0]
>>> sqrtm([[-1,0],[0,1]])
[(0.0 - 1.0j)           0.0]
[         0.0  (1.0 + 0.0j)]
>>> sqrtm([[j,0],[0,j]])
[(0.707106781186547 + 0.707106781186547j)                                      0.0]
[                                     0.0  (0.707106781186547 + 0.707106781186547j)]
```

A square root of a rotation matrix, giving the corresponding half-angle rotation matrix:

```
>>> t1 = 0.75
>>> t2 = t1 * 0.5
>>> A1 = matrix([[cos(t1), -sin(t1)], [sin(t1), cos(t1)]])
>>> A2 = matrix([[cos(t2), -sin(t2)], [sin(t2), cos(t2)]])
>>> sqrtm(A1)
[0.930507621912314  -0.366272529086048]
[0.366272529086048   0.930507621912314]
>>> A2
[0.930507621912314  -0.366272529086048]
[0.366272529086048   0.930507621912314]
```

The identity $(A^2)^{1/2} = A$ does not necessarily hold:

```
>>> A = matrix([[4,1,4],[7,8,9],[10,2,11]])
>>> sqrtm(A**2)
[ 4.0  1.0   4.0]
[ 7.0  8.0   9.0]
[10.0  2.0  11.0]
>>> sqrtm(A)**2
[ 4.0  1.0   4.0]
[ 7.0  8.0   9.0]
[10.0  2.0  11.0]
>>> A = matrix([[-4,1,4],[7,-8,9],[10,2,11]])
```

(continues on next page)

(continued from previous page)

```
>>> sqrtm(A**2)
[  7.43715112194995  -0.324127569985474   1.8481718827526]
[-0.251549715716942    9.32699765900402  2.48221180985147]
[  4.11609388833616   0.775751877098258   13.017955697342]
>>> chop(sqrtm(A)**2)
[-4.0   1.0   4.0]
[ 7.0  -8.0   9.0]
[10.0   2.0  11.0]
```

For some matrices, a square root does not exist:

```
>>> sqrtm([[0,1], [0,0]])
Traceback (most recent call last):
    ...
ZeroDivisionError: matrix is numerically singular
```

Two examples from the documentation for Matlab's `sqrtm`:

```
>>> mp.dps = 15; mp.pretty = True
>>> sqrtm([[7,10],[15,22]])
[1.56669890360128  1.74077655955698]
[2.61116483933547  4.17786374293675]
>>>
>>> X = matrix(\
...   [[5,-4,1,0,0],
...   [-4,6,-4,1,0],
...   [1,-4,6,-4,1],
...   [0,1,-4,6,-4],
...   [0,0,1,-4,5]])
>>> Y = matrix(\
...   [[2,-1,-0,-0,-0],
...   [-1,2,-1,0,-0],
...   [0,-1,2,-1,0],
...   [-0,0,-1,2,-1],
...   [-0,-0,-0,-1,2]])
>>> mnorm(sqrtm(X) - Y)
4.53155328326114e-19
```

6.12.7 Matrix Logarithm

`ctx.mat_logm(`*matA*`)`

Calculates the logarithm of the matrix.

Writing `matA.LogMat()` has the same effect

See also: Wikipedia [1423], Wikipedia [1431].

See also: Eigen [209], Eigen [212].

Computes a logarithm of the square matrix A, i.e. returns a matrix $B = \log(A)$ such that $\exp(B) = A$. The logarithm of a matrix, if it exists, is not unique.

Examples

Logarithms of some simple matrices:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> X = eye(3)
>>> logm(X)
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
>>> logm(2*X)
[0.693147180559945                0.0                0.0]
[              0.0  0.693147180559945                0.0]
[              0.0                0.0  0.693147180559945]
>>> logm(expm(X))
[1.0  0.0  0.0]
[0.0  1.0  0.0]
[0.0  0.0  1.0]
```

A logarithm of a complex matrix:

```
>>> X = matrix([[2+j, 1, 3], [1-j, 1-2*j, 1], [-4, -5, j]])
>>> B = logm(X)
>>> nprint(B)
[ (0.808757 + 0.107759j)    (2.20752 + 0.202762j)   (1.07376 - 0.773874j)]
[ (0.905709 - 0.107795j)  (0.0287395 - 0.824993j)  (0.111619 + 0.514272j)]
[(-0.930151 + 0.399512j)   (-2.06266 - 0.674397j)  (0.791552 + 0.519839j)]
>>> chop(expm(B))
[(2.0 + 1.0j)           1.0           3.0]
[(1.0 - 1.0j)  (1.0 - 2.0j)           1.0]
[        -4.0          -5.0  (0.0 + 1.0j)]
```

A matrix X close to the identity matrix, for which $\log(\exp(X)) = \exp(\log(X)) = X$ holds:

```
>>> X = eye(3) + hilbert(3)/4
>>> X
[              1.25             0.125  0.0833333333333333]
[             0.125  1.08333333333333             0.0625]
[0.0833333333333333            0.0625               1.05]
>>> logm(expm(X))
[              1.25             0.125  0.0833333333333333]
[             0.125  1.08333333333333             0.0625]
[0.0833333333333333            0.0625               1.05]
>>> expm(logm(X))
[              1.25             0.125  0.0833333333333333]
[             0.125  1.08333333333333             0.0625]
[0.0833333333333333            0.0625               1.05]
```

A logarithm of a rotation matrix, giving back the angle of the rotation:

```
>>> t = 3.7
>>> A = matrix([[cos(t),sin(t)],[-sin(t),cos(t)]])
>>> chop(logm(A))
[             0.0  -2.58318530717959]
[2.58318530717959                0.0]
>>> (2*pi-t)
2.58318530717959
```

For some matrices, a logarithm does not exist:

```
>>> logm([[1,0], [0,0]])
Traceback (most recent call last):
    ...
ZeroDivisionError: matrix is numerically singular
```

Logarithm of a matrix with large entries:

```
>>> logm(hilbert(3) * 10**20).apply(re)
[ 45.5597513593433  1.27721006042799  0.317662687717978]
[ 1.27721006042799  42.5222778973542   2.24003708791604]
[0.317662687717978  2.24003708791604    42.395212822267]
```

6.12.8 Matrix power

`ctx.mat_powm(`*matA*, *r*`)`

Computes $A^r = \exp(A \log r)$ for a matrix A and complex number r.

Writing `matA.PowMat(r)` has the same effect

See also: Wikipedia [1423], Wikipedia [1433], Wikipedia [1431].

See also: Eigen [209], Eigen [213].

Examples

Powers and inverse powers of a matrix:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = True
>>> A = matrix([[4,1,4],[7,8,9],[10,2,11]])
>>> powm(A, 2)
[ 63.0  20.0   69.0]
[174.0  89.0  199.0]
[164.0  48.0  179.0]
>>> chop(powm(powm(A, 4), 1/4.))
[ 4.0  1.0   4.0]
[ 7.0  8.0   9.0]
[10.0  2.0  11.0]

```

CHAPTER

SEVEN

NUMPY: USE WITH MULTIPRECISION DATA TYPES

7.1 Numpy array creation from shape or value

Slicing: https://stackoverflow.com/questions/509211/how-slicing-in-python-works

Note: Logic functions are not supported with multiprecision numbers as arguments

Note: input and output should use sqlite, xlread, enumerate

https://numpy.org/doc/stable/reference/generated/numpy.ufunc.html

https://numpy.org/doc/stable/reference/generated/numpy.where.html#numpy.where

https://numpy.org/doc/stable/reference/generated/numpy.choose.html#numpy.choose

https://numpy.org/doc/stable/reference/generated/numpy.select.html

Some text

https://numpy.org/doc/stable/reference/arrays.ndarray.html#array-methods

7.1.1 Conversion from integer, float or complex array

npm.t(*ctx*, *matA*)

The following code prepares the example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> np.set_printoptions(linewidth=200)
```

The following code creates a 3 x 3 array of type `int`, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> matA = npm.array([[1,2,3], [4,5,6], [7,8,9]])
>>> for ctx in ctx_all: matB = npm.t(ctx, matA); print(ctx.name + ':\n', matB)
fpm:
 [[1.0 2.0 3.0]
 [4.0 5.0 6.0]
 [7.0 8.0 9.0]]
mpm:
 [[mpf('1.0') mpf('2.0') mpf('3.0')]
```

(continues on next page)

(continued from previous page)

```
 [mpf('4.0') mpf('5.0') mpf('6.0')]
 [mpf('7.0') mpf('8.0') mpf('9.0')]]
ipm:
 [[mpi('1.0', '1.0') mpi('2.0', '2.0') mpi('3.0', '3.0')]
 [mpi('4.0', '4.0') mpi('5.0', '5.0') mpi('6.0', '6.0')]
 [mpi('7.0', '7.0') mpi('8.0', '8.0') mpi('9.0', '9.0')]]
dpm:
 [[Decimal('1') Decimal('2') Decimal('3')]
 [Decimal('4') Decimal('5') Decimal('6')]
 [Decimal('7') Decimal('8') Decimal('9')]]
qpm:
 [[Fraction(1, 1) Fraction(2, 1) Fraction(3, 1)]
 [Fraction(4, 1) Fraction(5, 1) Fraction(6, 1)]

7.1.2 Ones on the diagonal and zeros elsewhere: numpy.eye

npm.**eye**(*N*, *M=None*, *k=0*, *dtype=<class 'float'>*, *order='C'*, ***, *device=None*, *like=None*)

Return a 2-D array with ones on the diagonal and zeros elsewhere.

See https://numpy.org/doc/stable/reference/generated/numpy.eye.html#numpy.eye for details.

The following code creates a 3 x (M=4) array with ones on the first upper (k=1) diagonal and zeros elsewhere, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]

```

7.1.3 Identity array: numpy.identity

npm.**identity**(*n*, *dtype=None*, ** (Keyword-only parameters separator (PEP 3102))*, *like=None*)

Return the identity array. The identity array is a square array with ones on the main diagonal.

See https://numpy.org/doc/stable/reference/generated/numpy.identity.html#numpy.identity for details.

The following code creates a 3 x 3 identity array, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.identity(n=3, dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [[1.0 0.0 0.0]
 [0.0 1.0 0.0]

 [0 0 1.00000000000000]]
```

7.1.4 Array of ones: numpy.ones

npm.**ones**(*shape*, *dtype=None*, *order='C'*, ***, *device=None*, *like=None*)

Return a new array of given shape and type, filled with ones.

See https://numpy.org/doc/stable/reference/generated/numpy.ones.html#numpy.ones for details.

The following code creates a 1 x 3 array of ones, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.ones(shape=(3,), dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [1.0 1.0 1.0]
mpm:
 [mpf('1.0') mpf('1.0') mpf('1.0')]
ipm:
 [mpi('1.0', '1.0') mpi('1.0', '1.0') mpi('1.0', '1.0')]
dpm:
 [Decimal('1') Decimal('1') Decimal('1')]
qpm:
 [Fraction(1, 1) Fraction(1, 1) Fraction(1, 1)]
gpm:
 [mpfr('1.0') mpfr('1.0') mpfr('1.0')]
apm:
 [1.00000000000000 1.00000000000000 1.00000000000000]
```

7.1.5 Array of ones: numpy.ones_like

npm.**ones_like**(*a*, *dtype=None*, *order='K'*, *subok=True*, *shape=None*, ***, *device=None*)

Return an array of ones with the same shape and type as a given array.

See https://numpy.org/doc/stable/reference/generated/numpy.ones_like.html#numpy.ones_like for details.

The following code creates a 2 x 3 array of ones, based on another ndarray, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> x = np.arange(6); x = x.reshape((2, 3))
>>> for ctx in ctx_all: matB = npm.ones_like(x, dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
```

(continues on next page)

(continued from previous page)

```
 [[1.0 1.0 1.0]
 [1.0 1.0 1.0]]
mpm:
 [[mpf('1.0') mpf('1.0') mpf('1.0')]
 [mpf('1.0') mpf('1.0') mpf('1.0')]]
ipm:

 [mpfr('1.0') mpfr('1.0') mpfr('1.0')]]
apm:
 [[1.00000000000000 1.00000000000000 1.00000000000000]
 [1.00000000000000 1.00000000000000 1.00000000000000]]
```

7.1.6 Array of zeros: numpy.zeros

npm.**zeros**(*shape*, *dtype=None*, *order='C'*, ***, *device=None*, *like=None*)

Return a new array of given shape and type, filled with zeros.

See https://numpy.org/doc/stable/reference/generated/numpy.zeros.html#numpy.zeros for details.

The following code creates a 1 x 3 array of zeros, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.zeros(shape=(3,), dtype=ctx); print(ctx.name + ':\n', matB)

mpm:
 [mpf('1.0') mpf('1.0') mpf('1.0')]
ipm:
 [mpi('1.0', '1.0') mpi('1.0', '1.0') mpi('1.0', '1.0')]
dpm:
 [Decimal('1') Decimal('1') Decimal('1')]
qpm:
 [Fraction(1, 1) Fraction(1, 1) Fraction(1, 1)]
gpm:
 [mpfr('1.0') mpfr('1.0') mpfr('1.0')]
apm:
 [1.00000000000000 1.00000000000000 1.00000000000000]
```

7.1.7 Array of zeros: numpy.zeros_like

npm.**zeros_like**(*a*, *dtype=None*, *order='K'*, *subok=True*, *shape=None*, ***, *device=None*)

Return an array of zeros with the same shape and type as a given array.

See https://numpy.org/doc/stable/reference/generated/numpy.zeros_like.html#numpy.zeros_like for details.

The following code creates a 2 x 3 array of zeros, based on another ndarray, and then converts it into arrays of the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> x = np.arange(6); x = x.reshape((2, 3))
```

(continues on next page)

(continued from previous page)

```
>>> for ctx in ctx_all: matB = npm.zeros_like(x, dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [[0.0 0.0 0.0]
 [0.0 0.0 0.0]]
mpm:
 [[mpf('0.0') mpf('0.0') mpf('0.0')]
 [mpf('0.0') mpf('0.0') mpf('0.0')]]
ipm:
 [[mpi('0.0', '0.0') mpi('0.0', '0.0') mpi('0.0', '0.0')]

dpm:
 [[Decimal('0') Decimal('0') Decimal('0')]
 [Decimal('0') Decimal('0') Decimal('0')]]
qpm:
 [[Fraction(0, 1) Fraction(0, 1) Fraction(0, 1)]
 [Fraction(0, 1) Fraction(0, 1) Fraction(0, 1)]]
gpm:
 [[mpfr('0.0') mpfr('0.0') mpfr('0.0')]
 [mpfr('0.0') mpfr('0.0') mpfr('0.0')]]
apm:
 [[0 0 0]
 [0 0 0]]
```

7.1.8 Array of constant: numpy.full

npm.**full**(*shape*, *fill_value*, *dtype=None*, *order='C'*, ***, *device=None*, *like=None*)

Return a new array of given shape and type, filled with fill_value.

See https://numpy.org/doc/stable/reference/generated/numpy.full.html#numpy.full for details.

The following code creates a 2 x 2 array of tens, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.full(shape=(2,2), fill_value=ctx.t(10)); print(ctx.name + ':\n', matB)
fpm:
 [[10. 10.]
 [10. 10.]]
mpm:
 [[mpf('10.0') mpf('10.0')]
 [mpf('10.0') mpf('10.0')]]
ipm:
 [[mpi('10.0', '10.0') mpi('10.0', '10.0')]
 [mpi('10.0', '10.0') mpi('10.0', '10.0')]]
dpm:
 [[Decimal('10') Decimal('10')]
 [Decimal('10') Decimal('10')]]
qpm:
 [[Fraction(10, 1) Fraction(10, 1)]
 [Fraction(10, 1) Fraction(10, 1)]]
gpm:
 [[mpfr('10.0') mpfr('10.0')]
 [mpfr('10.0') mpfr('10.0')]]
apm:
 [[10.000000000000000 10.000000000000000]
 [10.000000000000000 10.000000000000000]]
```

The following code creates a 2 x 2 array of +`inf`, using the multiprecision type `ctx` in `ctx_all`. Note that `qpm` is excluded, sine it does not support `inf`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_fp = [fpm, mpm, ipm, dpm, gpm, apm]
>>> for ctx in ctx_fp: matB = npm.full(shape=(2,2), fill_value=ctx.inf); print(ctx.name + ':\n', matB)
```

(continues on next page)

(continued from previous page)

```
fpm:
 [[inf inf]
 [inf inf]]
mpm:
 [[mpf('+inf') mpf('+inf')]
 [mpf('+inf') mpf('+inf')]]
ipm:
 [[mpi('+inf', '+inf') mpi('+inf', '+inf')]
 [mpi('+inf', '+inf') mpi('+inf', '+inf')]]
dpm:
 [[Decimal('Infinity') Decimal('Infinity')]
 [Decimal('Infinity') Decimal('Infinity')]]
gpm:
 [[mpfr('inf') mpfr('inf')]
 [mpfr('inf') mpfr('inf')]]
apm:
 [[[+/- inf] [+/- inf]]
 [[+/- inf] [+/- inf]]]
```

The following code creates a 2 x 2 array of `nan`, using the multiprecision type `ctx` in `ctx_all`. Note that `qpm` is excluded, sine it does not support `nan`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_fp = [fpm, mpm, ipm, dpm, gpm, apm]
>>> for ctx in ctx_fp: matB = npm.full(shape=(2,2), fill_value=ctx.nan); print(ctx.name + ':\n', matB)
fpm:
 [[nan nan]
 [nan nan]]
mpm:
 [[mpf('nan') mpf('nan')]
 [mpf('nan') mpf('nan')]]
ipm:
 [[mpi('nan', 'nan') mpi('nan', 'nan')]
 [mpi('nan', 'nan') mpi('nan', 'nan')]]
dpm:
 [[Decimal('NaN') Decimal('NaN')]
 [Decimal('NaN') Decimal('NaN')]]
gpm:
 [[mpfr('nan') mpfr('nan')]
 [mpfr('nan') mpfr('nan')]]
apm:
 [[nan nan]
 [nan nan]]
```

7.1.9 Array of constant: numpy.full_like

npm.**full_like**(*a*, *fill_value*, *dtype=None*, *order='K'*, *subok=True*, *shape=None*, ***, *device=None*)

Return a full array with the same shape and type as a given array.

See https://numpy.org/doc/stable/reference/generated/numpy.full_like.html#numpy.full_like for details.

The following code creates a 2 x 2 array of tens, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> x = np.arange(6); x = x.reshape((2, 3))
>>> for ctx in ctx_all: matB = npm.full_like(x, fill_value=10.0, dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [[10.0 10.0 10.0]
 [10.0 10.0 10.0]]
mpm:
 [[mpf('10.0') mpf('10.0') mpf('10.0')]
 [mpf('10.0') mpf('10.0') mpf('10.0')]]
```

(continues on next page)

(continued from previous page)

```

7.1.10 Array with ones at and below the given diagonal and zeros elsewhere: numpy.tri

npm.tri(*N*, *M=None*, *k=0*, *dtype=<class 'float'>*, ***, *like=None*)

Create an array with ones at and below the given diagonal and zeros elsewhere.

See https://numpy.org/doc/stable/reference/generated/numpy.tri.html#numpy.tri for details

An array with ones at and below the given diagonal and zeros elsewhere.

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: x = npm.tri(N=3, M=5, k=-1, dtype=ctx); print(ctx.name + ':\n', x)
fpm:
 [[0.0 0.0 0.0 0.0 0.0]

 [1.00000000000000 1.00000000000000 0 0 0]]
```

7.2 Numpy array creation from existing data

7.2.1 Array from object: numpy.array

npm.**array**(*object*, *dtype=None*, ***, *copy=True*, *order='K'*, *subok=False*, *ndmin=0*, *like=None*)

Return an array from any object exposing the array interface, any object whose __array__ method returns an array, or any (nested) sequence. If object is a scalar, a 0-dimensional array containing object is returned.

The following code creates a 1-dimensional array from a 1-dimensionallist, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.array([1, 2, 3], dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [1.0 2.0 3.0]
mpm:
 [mpf('1.0') mpf('2.0') mpf('3.0')]
ipm:
 [mpi('1.0', '1.0') mpi('2.0', '2.0') mpi('3.0', '3.0')]
dpm:
 [Decimal('1') Decimal('2') Decimal('3')]
qpm:
 [Fraction(1, 1) Fraction(2, 1) Fraction(3, 1)]
gpm:
 [mpfr('1.0') mpfr('2.0') mpfr('3.0')]
apm:
 [1.00000000000000 2.00000000000000 3.00000000000000]
```

The following code creates a 2-dimensional array from a 2-dimensional list, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.array([[1, 2], [3, 4]], dtype=ctx); print(ctx.name + ':\n', matB)
fpm:
 [[1.0 2.0]
 [3.0 4.0]]
mpm:
 [[mpf('1.0') mpf('2.0')]
 [mpf('3.0') mpf('4.0')]]
ipm:
 [[mpi('1.0', '1.0') mpi('2.0', '2.0')]
 [mpi('3.0', '3.0') mpi('4.0', '4.0')]]
dpm:
 [[Decimal('1') Decimal('2')]
 [Decimal('3') Decimal('4')]]
qpm:
 [[Fraction(1, 1) Fraction(2, 1)]
 [Fraction(3, 1) Fraction(4, 1)]]
gpm:
 [[mpfr('1.0') mpfr('2.0')]
 [mpfr('3.0') mpfr('4.0')]]
apm:
 [[1.00000000000000 2.00000000000000]
 [3.00000000000000 4.00000000000000]]
```

The following code creates a 2-dimensional array from a 1-dimensional list with the keyword `ndmin`=2, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all: matB = npm.array([1, 2, 3], dtype=ctx, ndmin=2); print(ctx.name + ':\n', matB)
fpm:
 [[1.0 2.0 3.0]]
mpm:
```

(continues on next page)

(continued from previous page)

```
 [[mpf('1.0') mpf('2.0') mpf('3.0')]]
ipm:
 [[mpi('1.0', '1.0') mpi('2.0', '2.0') mpi('3.0', '3.0')]]
dpm:
 [[Decimal('1') Decimal('2') Decimal('3')]]
qpm:
 [[Fraction(1, 1) Fraction(2, 1) Fraction(3, 1)]]
gpm:
 [[mpfr('1.0') mpfr('2.0') mpfr('3.0')]]
apm:
 [[1.00000000000000 2.00000000000000 3.00000000000000]]
```

The following code creates a 1-dimensional complex array from a 1-dimensional list of integers with the keyword `dtype=complex`, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> matA = np.array([1, 2, 3], dtype=complex)
>>> for ctx in ctx_all: matB = npm.t(ctx, matA); print(ctx.name + ':\n', matB)
fpm:
 [(1+0j) (2+0j) (3+0j)]
mpm:
 [mpc(real='1.0', imag='0.0') mpc(real='2.0', imag='0.0') mpc(real='3.0', imag='0.0')]
ipm:
 [iv.mpc(mpi('1.0', '1.0'), mpi('0.0', '0.0')) iv.mpc(mpi('2.0', '2.0'), mpi('0.0', '0.0')) iv.mpc(mpi('3.0', '3.0'),␣
 ↪mpi('0.0', '0.0'))]
dpm:
 [DecCplx('1.0 + 0.0j') DecCplx('2.0 + 0.0j') DecCplx('3.0 + 0.0j')]
qpm:

gpm:
 [mpc('1.0+0.0j') mpc('2.0+0.0j') mpc('3.0+0.0j')]
apm:
 [1.00000000000000 2.00000000000000 3.00000000000000]
```

7.2.2 Array from object: numpy.asarray

`npm.asarray`(*a*, *dtype=None*, *order=None*, ***, *device=None*, *copy=None*, *like=None*)

Return an array from input data in any form that can be converted to an array. This includes lists, lists of tuples, tuples, tuples of tuples, tuples of lists and ndarrays. Existing arrays are not copied. If dtype is set, array is copied only if dtype does not match. Contrary to asanyarray, ndarray subclasses are not passed through.

See https://numpy.org/doc/stable/reference/generated/numpy.asarray.html#numpy.asarray for details.

The following code creates a 2-dimensional array from a 2-dimensional list, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> matA = npm.asarray([[1, 2], [3, 4]])
>>> for ctx in ctx_all: matB = npm.t(ctx, matA); print(ctx.name + ':\n', matB)
fpm:
 [[1.0 2.0]
 [3.0 4.0]]
mpm:
 [[mpf('1.0') mpf('2.0')]
 [mpf('3.0') mpf('4.0')]]
ipm:

 [mpfr('3.0') mpfr('4.0')]]
apm:
 [[1.00000000000000 2.00000000000000]
 [3.00000000000000 4.00000000000000]]

>>> # Existing arrays are not copied:
>>> a = npm.array([1, 2])
>>> np.asarray(a) is a
True

>>> # If dtype is set, array is copied only if dtype does not match:
>>> a = np.array([1, 2], dtype=np.float32)
>>> npm.asarray(a, dtype=np.float32) is a
True
>>> np.asarray(a, dtype=np.float64) is a
False

>>> # Contrary to asanyarray, ndarray subclasses are not passed through:
>>> issubclass(np.recarray, np.ndarray)
True
>>> a = np.array([(1.0, 2), (3.0, 4)], dtype='f4,i4').view(np.recarray)
>>> npm.asarray(a) is a
False
>>> np.asanyarray(a) is a
True
```

7.2.3 Array from object: numpy.asanyarray

npm.asanyarray(*a*, *dtype=None*, *order=None*, ***, *device=None*, *copy=None*, *like=None*)

Convert the input to an ndarray, but pass ndarray subclasses through. Return an array from input data in any form that can be converted to an array. This includes lists, lists of tuples, tuples, tuples of tuples, tuples of lists and ndarrays.

See https://numpy.org/doc/stable/reference/generated/numpy.asanyarray.html#numpy.asanyarray for details.

The following code creates a 2-dimensional array from a 2-dimensional list, using the multiprecision type `ctx` in `ctx_all`:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]

>>> # Contrary to asyarray, ndarray subclasses are passed through as-is:
>>> a = np.array([(1., 2), (3., 4)], dtype='f4,i4').view(np.recarray)
>>> np.asanyarray(a) is a
True
```

7.2.4 Array from data in a text or binary file: numpy.fromfile

npm.**fromfile**(*file*, *dtype=float*, *count=-1*, *sep=''*, *offset=0*, ***, *like=None*)

Construct an array from data in a text or binary file. A highly efficient way of reading binary data with a known data-type, as well as parsing simply formatted text files. Data written using the tofile method can be read using this function.

See https://numpy.org/doc/stable/reference/generated/numpy.fromfile.html#numpy.fromfile for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> # Construct an ndarray:
>>> dt1 = np.dtype([('time', [('min', np.int64), ('sec', np.int64)]), ('temp', float)])
>>> x = np.zeros((1,), dtype=dt1)
>>> x['time']['min'] = 10; x['temp'] = 98.25
>>> x
array([((10, 0), 98.25)], dtype=[('time', [('min', '<i8'), ('sec', '<i8')]), ('temp', '<f8')])

>>> # Save the raw data to disk:
>>> import tempfile
>>> fname = tempfile.mkstemp()[1]
>>> x.tofile(fname)

>>> # Read the raw data from disk:
>>> np.fromfile(fname, dtype=dt1)
array([((10, 0), 98.25)], dtype=[('time', [('min', '<i8'), ('sec', '<i8')]), ('temp', '<f8')])

>>> # The recommended way to store and load data:
>>> np.save(fname, x)
>>> np.load(fname + '.npy')
array([((10, 0), 98.25)], dtype=[('time', [('min', '<i8'), ('sec', '<i8')]), ('temp', '<f8')])
```

7.2.5 Array from a function: numpy.fromfunction

npm.**fromfunction**(*function*, *shape*, ***, *dtype=<class 'float'>*, *like=None*, ***kwargs*)

Construct an array by executing a function over each coordinate. The resulting array therefore has a value `fn(x, y, z)` at coordinate `(x, y, z)`.

See https://numpy.org/doc/stable/reference/generated/numpy.fromfunction.html#numpy.fromfunction for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.fromfunction(lambda i, j: i, (2, 2), dtype=float)
array([[0., 0.],
   [1., 1.]])

>>> np.fromfunction(lambda i, j: j, (2, 2), dtype=float)
array([[0., 1.],
       [0., 1.]])

>>> np.fromfunction(lambda i, j: i == j, (3, 3), dtype=int)
array([[ True, False, False],
       False,  True, False],
```

(continues on next page)

(continued from previous page)

```
       False, False,  True]])

>>> np.fromfunction(lambda i, j: i + j, (3, 3), dtype=int)
array([[0, 1, 2],
       [1, 2, 3],
       [2, 3, 4]])
```

7.2.6 Array from an iterable object: numpy.fromiter

npm.**fromiter**(*iter*, *dtype*, *count=-1*, ***, *like=None*)

Create a new 1-dimensional array from an iterable object.

See https://numpy.org/doc/stable/reference/generated/numpy.fromiter.html#numpy.fromiter for details.

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all:
...     iterable = (ctx.square(x) for x in range(5))
...     x = npm.fromiter(iterable, object)
...     print(ctx.name + ':\n', x)
fpm:
 [0.0 1.0 4.0 9.0 16.0]
mpm:
 [mpf('0.0') mpf('1.0') mpf('4.0') mpf('9.0') mpf('16.0')]
ipm:
 [mpi('0.0', '0.0') mpi('1.0', '1.0') mpi('4.0', '4.0') mpi('9.0', '9.0') mpi('16.0', '16.0')]
dpm:
 [Decimal('0') Decimal('1') Decimal('4') Decimal('9') Decimal('16')]
qpm:
 [Fraction(0, 1) Fraction(1, 1) Fraction(4, 1) Fraction(9, 1) Fraction(16, 1)]
gpm:
 [mpfr('0.0') mpfr('1.0') mpfr('4.0') mpfr('9.0') mpfr('16.0')]
apm:
 [0 1.00000000000000 4.00000000000000 9.00000000000000 16.0000000000000]
```

A carefully constructed subarray dtype will lead to higher dimensional results:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all:
...     iterable = ((ctx.t(x), ctx.square(x)) for x in range(5))
...     x = npm.fromiter(iterable, dtype=np.dtype((object, 2)))
...     print(ctx.name + ':\n', x)
fpm:
 [[0.0 0.0]
 [1.0 1.0]
 [2.0 4.0]
 [3.0 9.0]
 [4.0 16.0]]
mpm:
 [[mpf('0.0') mpf('0.0')]
 [mpf('1.0') mpf('1.0')]
 [mpf('2.0') mpf('4.0')]
 [mpf('3.0') mpf('9.0')]
 [mpf('4.0') mpf('16.0')]]
ipm:
 [[mpi('0.0', '0.0') mpi('0.0', '0.0')]
 [mpi('1.0', '1.0') mpi('1.0', '1.0')]
 [mpi('2.0', '2.0') mpi('4.0', '4.0')]
 [mpi('3.0', '3.0') mpi('9.0', '9.0')]
 [mpi('4.0', '4.0') mpi('16.0', '16.0')]]
dpm:
 [[Decimal('0') Decimal('0')]
```

(continues on next page)

(continued from previous page)

```
 [Decimal('1') Decimal('1')]
 [Decimal('2') Decimal('4')]
 [Decimal('3') Decimal('9')]
 [Decimal('4') Decimal('16')]]
qpm:
 [[Fraction(0, 1) Fraction(0, 1)]
 [Fraction(1, 1) Fraction(1, 1)]
 [Fraction(2, 1) Fraction(4, 1)]
 [Fraction(3, 1) Fraction(9, 1)]
 [Fraction(4, 1) Fraction(16, 1)]]
gpm:
 [[mpfr('0.0') mpfr('0.0')]
 [mpfr('1.0') mpfr('1.0')]
 [mpfr('2.0') mpfr('4.0')]
 [mpfr('3.0') mpfr('9.0')]
 [mpfr('4.0') mpfr('16.0')]]
apm:
 [[0 0]
 [1.00000000000000 1.00000000000000]
 [2.00000000000000 4.00000000000000]
 [3.00000000000000 9.00000000000000]
 [4.00000000000000 16.0000000000000]]
```

7.2.7 Array from text data in a string: numpy.fromstring

npm.**fromstring**(*string*, *dtype=float*, *count=-1*, ***, *sep*, *like=None*)

Create a new 1-dimensional array initialized from text data in a string.

See https://numpy.org/doc/stable/reference/generated/numpy.fromstring.html#numpy.fromstring for details.

Real numbers:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]
>>> for ctx in ctx_all:
...     x = npm.fromstring('1.1, 2.1', dtype=float, sep=',')
...     matB = npm.t(ctx, x)
...     print(ctx.name + ':\n', matB)
fpm:
 [1.1 2.1]
mpm:

 [1.00000000000000 + 3.00000000000000j 2.00000000000000 + 4.00000000000000j]
```

7.2.8 Array from text data in a formatted file: numpy.loadtxt

npm.**loadtxt**(*fname*, *dtype=<class 'float'>*, *comments='#'*, *delimiter=None*, *converters=None*, *skiprows=0*, *usecols=None*, *unpack=False*, *ndmin=0*, *encoding=None*, *max_rows=None*, ***, *quotechar=None*, *like=None*)

Load data from a text file.

See https://numpy.org/doc/stable/reference/generated/numpy.loadtxt.html#numpy.loadtxt for details.

This function aims to be a fast reader for simply formatted files. The genfromtxt function provides more sophisticated handling of, e.g., lines with missing values.

Each row in the input text file must have the same number of values to be able to read all values. If all rows do not have same number of values, a subset of up to n columns (where n is the least number of values present in all rows) can be read by specifying the columns via usecols.

```
import os
import xlcalcnet.userpaths as userpaths
for ctx in ctx_all:
    to_ctx = npm.vectorize(ctx.t, otypes=[object])

    csvpath = os.sep.join([userpaths.get_my_documents(), \
        'DataXlCalcNet', 'DataExamples', 'MainExamples', 'CSV'])
    csvfile = 'Hald.csv'
    csvname = os.sep.join([csvpath, csvfile])

    with open(csvname) as f: header = f.readline().strip('\n')
    print('Header: ', header)

    nd_data = npm.loadtxt(csvname, dtype=np.float64, delimiter=',', \
    skiprows=1, usecols=(0,1,2,3,4))
    A = to_ctx(nd_data)
    N = len(A)
    print('N:', N)
    print('A: \n', A)
    print()

7.2.9 Array from text data in a text file (can handle missing values): numpy.genfromtxt

npm.**genfromtxt**(*fname*, *dtype=<class 'float'>*, *comments='#'*, *delimiter=None*, *skip_header=0*, *skip_footer=0*, *converters=None*, *missing_values=None*, *filling_values=None*, *usecols=None*, *names=None*, *excludelist=None*, *deletechars=" !#$%&'()*+, -./:;<=>?@[\\]^{|}~"*, *replace_space='_'*, *autostrip=False*, *case_sensitive=True*, *defaultfmt='f%i'*, *unpack=None*, *usemask=False*, *loose=True*, *invalid_raise=True*, *max_rows=None*, *encoding=None*, ***, *ndmin=0*, *like=None*)

Load data from a text file, with missing values handled as specified.

Each line past the first skip_header lines is split at the delimiter character, and characters following the comments character are discarded.

See https://numpy.org/doc/stable/reference/generated/numpy.genfromtxt.html#numpy.genfromtxt for details.

When spaces are used as delimiters, or when no delimiter has been given as input, there should not be any missing data between two fields.

When variables are named (either by a flexible dtype or with a names sequence), there must not be any header in the file (else a ValueError exception is raised).

Individual values are not stripped of spaces by default. When using a custom converter, make sure the function does remove spaces.

```
import os
import xlcalcnet.userpaths as userpaths
for ctx in ctx_all:
    to_ctx = npm.vectorize(ctx.t, otypes=[object])

    csvpath = os.sep.join([userpaths.get_my_documents(), \
        'DataXlCalcNet', 'DataExamples', 'MainExamples', 'CSV'])
    csvfile = 'Hald.csv'
    csvname = os.sep.join([csvpath, csvfile])

    with open(csvname) as f: header = f.readline().strip('\n')
    print('Header: ', header)

    nd_data = npm.genfromtxt(csvname, dtype=np.float64, delimiter=',', \
    skip_header=1, usecols=(0,1,2,3,4))
    A = to_ctx(nd_data)
    N = len(A)
    print('N:', N)
    print('A: \n', A)
    print()
```

The output is the same as for the `loadtxt` example shown above and is not repeated here.

7.3 Building special arrays for numerical work

7.3.1 Evenly spaced values within a given interval: numpy.arange

npm.**arange**([*start*,]*stop*, [*step*,]*dtype=None*, *, *device=None*, *like=None*)

Return evenly spaced values within a given interval.

See https://numpy.org/doc/stable/reference/generated/numpy.arange.html#numpy.arange for details.

See also: https://numpy.org/doc/stable/user/how-to-partition.html#how-to-partition

For integer arguments the function is roughly equivalent to the Python built-in range, but returns an ndarray rather than a range instance.

When using a non-integer step, such as 0.1, it is often better to use numpy.linspace. The length of the output might not be numerically stable.

Another stability issue is due to the internal implementation of numpy.arange. The actual step value used to populate the array is dtype(start + step) - dtype(start) and not step. Precision loss can occur here, due to casting or due to using floating points when start is much larger than step. This can lead to unexpected behaviour. For example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]

```

From mpmath. See also Mpmath [688].

This is a generalized version of Python's `range()` function that accepts fractional endpoints and step sizes and returns a list of `mpf` instances.

Like `range()`, *`arange()`* can be called with 1, 2 or 3 arguments:

arange(b)
$[0, 1, 2, \ldots, x]$

arange(a, b)
$[a, a+1, a+2, \ldots, x]$

arange(a, b, h)
$[a, a+h, a+h, \ldots, x]$

where $b-1 \le x < b$ (in the third case, $b-h \le x < b$).

Like Python's `range()`, the endpoint is not included. To produce ranges where the endpoint is included, *`linspace()`* is more convenient.

Examples:

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.arange(4))
[0.0, 1.0, 2.0, 3.0]
[mpf('0.0'), mpf('1.0'), mpf('2.0'), mpf('3.0')]
[mpi('0.0', '0.0'), mpi('1.0', '1.0'), mpi('2.0', '2.0'), mpi('3.0', '3.0')]
[Decimal('0'), Decimal('1'), Decimal('2'), Decimal('3')]
[mpfr('0.0'), mpfr('1.0'), mpfr('2.0'), mpfr('3.0')]
[0, 1.00000000000000, 2.00000000000000, 3.00000000000000]

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.arange(1, 2, 0.25))
[1.0, 1.25, 1.5, 1.75]
[mpf('1.0'), mpf('1.25'), mpf('1.5'), mpf('1.75')]
[mpi('1.0', '1.0'), mpi('1.25', '1.25'), mpi('1.5', '1.5'), mpi('1.75', '1.75')]
[Decimal('1.00'), Decimal('1.25'), Decimal('1.50'), Decimal('1.75')]
[mpfr('1.0'), mpfr('1.25'), mpfr('1.5'), mpfr('1.75')]
[1.00000000000000, 1.25000000000000, 1.50000000000000, 1.75000000000000]

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.arange(1, -1, -0.75))
[1.0, 0.25, -0.5]
[mpf('1.0'), mpf('0.25'), mpf('-0.5')]
[mpi('1.0', '1.0'), mpi('0.25', '0.25'), mpi('-0.5', '-0.5')]
[Decimal('1.00'), Decimal('0.25'), Decimal('-0.50')]
[mpfr('1.0'), mpfr('0.25'), mpfr('-0.5')]
[1.00000000000000, 0.250000000000000, -0.500000000000000]
```

7.3.2 Evenly spaced values within a given interval: numpy.linspace

npm.linspace(*start*, *stop*, *num=50*, *endpoint=True*, *retstep=False*, *dtype=None*, *axis=0*, ***, *device=None*)

Return evenly spaced numbers over a specified interval.

See https://numpy.org/doc/stable/reference/generated/numpy.linspace.html#numpy.linspace for details.

Returns num evenly spaced samples, calculated over the interval [start, stop]. The endpoint of the interval can optionally be excluded.

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]

>>> # linspace with endpoint=True:
>>> for ctx in ctx_all: print(npm.linspace(start=1, stop=4, num=4, dtype=ctx))
```

[1.00000000000000 1.75000000000000 2.50000000000000 3.25000000000000]
```

From mpmath. . See also Mpmath [687].

`linspace(a, b, n)` returns a list of n evenly spaced samples from a to b.

The syntax `linspace(mpi(a,b), n)` is also valid.

This function is often more convenient than *arange()* for partitioning an interval into subintervals, since the endpoint is included:

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.linspace(1, 4, 4))
[1.0, 2.0, 3.0, 4.0]
[mpf('1.0'), mpf('2.0'), mpf('3.0'), mpf('4.0')]
[mpi('1.0', '1.0'), mpi('2.0', '2.0'), mpi('3.0', '3.0'), mpi('4.0', '4.0')]
[Decimal('1'), Decimal('2'), Decimal('3'), Decimal('4')]
[mpfr('1.0'), mpfr('2.0'), mpfr('3.0'), mpfr('4.0')]
[1.00000000000000, 2.00000000000000, 3.00000000000000, 4.00000000000000]
```

You may also provide the keyword argument `endpoint=False`:

```
>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.linspace(1, 4, 4, endpoint=False))
[1.0, 1.75, 2.5, 3.25]
[mpf('1.0'), mpf('1.75'), mpf('2.5'), mpf('3.25')]
[mpi('1.0', '1.0'), mpi('1.75', '1.75'), mpi('2.5', '2.5'), mpi('3.25', '3.25')]
[Decimal('1.00'), Decimal('1.75'), Decimal('2.50'), Decimal('3.25')]
[mpfr('1.0'), mpfr('1.75'), mpfr('2.5'), mpfr('3.25')]
[1.00000000000000, 1.75000000000000, 2.50000000000000, 3.25000000000000]
```

7.3.3 Evenly spaced values on a log scale: numpy.logspace

`npm.logspace`(*start*, *stop*, *num=50*, *endpoint=True*, *base=10.0*, *dtype=None*, *axis=0*)

Return numbers spaced evenly on a log scale. In linear space, the sequence starts at base ** start (base to the power of start) and ends with base ** stop.

See https://numpy.org/doc/stable/reference/generated/numpy.logspace.html#numpy.logspace for details.

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, qpm, gpm, apm]

>>> # linspace with endpoint=True:
```

(continues on next page)

(continued from previous page)

```
>>> for ctx in ctx_all: print(npm.logspace(start=2, stop=3, num=4, dtype=ctx))

```

7.3.4 Evenly spaced values on a log scale (a geometric progression): numpy.geomspace

npm.**geomspace**(*start*, *stop*, *num=50*, *endpoint=True*, *dtype=None*, *axis=0*)

Return numbers spaced evenly on a log scale (a geometric progression).

See https://numpy.org/doc/stable/reference/generated/numpy.geomspace.html#numpy.geomspace for details.

This is similar to logspace, but with endpoints specified directly. Each output sample is a constant multiple of the previous. If the inputs or dtype are complex, the output will follow a logarithmic spiral in the complex plane. (There are an infinite number of spirals passing through two points; the output will follow the shortest such path.)

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, gpm, apm]

>>> # geomspace with endpoint=True:
>>> for ctx in ctx_all: print(npm.geomspace(start=1, stop=1000, num=4, dtype=ctx))

```

7.3.5 Extract a diagonal or construct a diagonal array: numpy.diag

npm.**diag**(*v*, *k=0*)

Extract a diagonal or construct a diagonal array.

See https://numpy.org/doc/stable/reference/generated/numpy.diag.html#numpy.diag for details.

See the more detailed documentation for numpy.diagonal if you use this function to extract a diagonal and wish to write to the resulting array; whether it returns a copy or a view depends on what version of numpy you are using.

Array x:

```
>>> from xlcalcnet import fpm, mpm, ipm, dpm, qpm, gpm, apm, npm, np
>>> ctx_all = [fpm, mpm, ipm, dpm, gpm, apm]

>>> for ctx in ctx_all: x = npm.arange(9, dtype=ctx).reshape((3,3)); print(ctx.name +', x: \n', x)
fpm, x:
 [[0. 1. 2.]
 [3. 4. 5.]
 [6. 7. 8.]]
mpm, x:
 [[mpf('0.0') mpf('1.0') mpf('2.0')]
 [mpf('3.0') mpf('4.0') mpf('5.0')]
 [mpf('6.0') mpf('7.0') mpf('8.0')]]
ipm, x:
 [[mpi('0.0', '0.0') mpi('1.0', '1.0') mpi('2.0', '2.0')]
 [mpi('3.0', '3.0') mpi('4.0', '4.0') mpi('5.0', '5.0')]
 [mpi('6.0', '6.0') mpi('7.0', '7.0') mpi('8.0', '8.0')]]
dpm, x:
 [[Decimal('0') Decimal('1') Decimal('2')]
 [Decimal('3') Decimal('4') Decimal('5')]
 [Decimal('6') Decimal('7') Decimal('8')]]
qpm, x:
 [[Fraction(0, 1) Fraction(1, 1) Fraction(2, 1)]
 [Fraction(3, 1) Fraction(4, 1) Fraction(5, 1)]
 [Fraction(6, 1) Fraction(7, 1) Fraction(8, 1)]]
gpm, x:
 [[mpfr('0.0') mpfr('1.0') mpfr('2.0')]
 [mpfr('3.0') mpfr('4.0') mpfr('5.0')]
 [mpfr('6.0') mpfr('7.0') mpfr('8.0')]]
apm, x:
 [[0 1.00000000000000 2.00000000000000]
 [3.00000000000000 4.00000000000000 5.00000000000000]
 [6.00000000000000 7.00000000000000 8.00000000000000]]
```

Diagonal of array x:

```
>>> for ctx in ctx_all: x = npm.arange(9, dtype=ctx).reshape((3,3)); print(ctx.name +', diag(x): \n', npm.diag(x))
fpm, diag(x):
 [0. 4. 8.]
mpm, diag(x):
 [mpf('0.0') mpf('4.0') mpf('8.0')]
ipm, diag(x):
 [mpi('0.0', '0.0') mpi('4.0', '4.0') mpi('8.0', '8.0')]
dpm, diag(x):
 [Decimal('0') Decimal('4') Decimal('8')]
qpm, diag(x):
 [Fraction(0, 1) Fraction(4, 1) Fraction(8, 1)]
gpm, diag(x):
 [mpfr('0.0') mpfr('4.0') mpfr('8.0')]
apm, diag(x):
 [0 4.00000000000000 8.00000000000000]
```

Superdiagonal of array x:

```
>>> for ctx in ctx_all: x = npm.arange(9, dtype=ctx).reshape((3,3)); print(ctx.name +', diag(x, k=1): \n', npm.diag(x,␣
↪k=1))
fpm, diag(x, k=1):
 [1. 5.]
mpm, diag(x, k=1):
 [mpf('1.0') mpf('5.0')]
ipm, diag(x, k=1):
 [mpi('1.0', '1.0') mpi('5.0', '5.0')]
dpm, diag(x, k=1):
 [Decimal('1') Decimal('5')]
qpm, diag(x, k=1):
 [Fraction(1, 1) Fraction(5, 1)]
gpm, diag(x, k=1):
 [mpfr('1.0') mpfr('5.0')]
apm, diag(x, k=1):
 [1.00000000000000 5.00000000000000]
```

Subdiagonal of array x:

```
>>> for ctx in ctx_all: x = npm.arange(9, dtype=ctx).reshape((3,3)); print(ctx.name +', diag(x, k=-1): \n', npm.diag(x,
↪ k=-1))
fpm, diag(x, k=-1):
 [3. 7.]
mpm, diag(x, k=-1):
 [mpf('3.0') mpf('7.0')]
ipm, diag(x, k=-1):
 [mpi('3.0', '3.0') mpi('7.0', '7.0')]
dpm, diag(x, k=-1):
 [Decimal('3') Decimal('7')]
qpm, diag(x, k=-1):
 [Fraction(3, 1) Fraction(7, 1)]
gpm, diag(x, k=-1):
 [mpfr('3.0') mpfr('7.0')]
apm, diag(x, k=-1):
 [3.00000000000000 7.00000000000000]
```

Setting the diagonal. Note that only the diagonal values are set, the others are just 0.

```
>>> for ctx in ctx_all: x = npm.arange(9, dtype=ctx).reshape((3,3)); print(ctx.name +', npm.diag(npm.diag(x)): \n',␣
↪npm.diag(npm.diag(x)))
fpm, npm.diag(npm.diag(x)):
 [[0. 0. 0.]
 [0. 4. 0.]
 [0. 0. 8.]]
mpm, npm.diag(npm.diag(x)):
```

(continues on next page)

(continued from previous page)

```
 [[mpf('0.0') 0 0]
 [0 mpf('4.0') 0]
 [0 0 mpf('8.0')]]
ipm, npm.diag(npm.diag(x)):
 [[mpi('0.0', '0.0') 0 0]
 [0 mpi('4.0', '4.0') 0]
 [0 0 mpi('8.0', '8.0')]]
dpm, npm.diag(npm.diag(x)):
 [[Decimal('0') 0 0]
 [0 Decimal('4') 0]
 [0 0 Decimal('8')]]
qpm, npm.diag(npm.diag(x)):
 [[Fraction(0, 1) 0 0]
 [0 Fraction(4, 1) 0]
 [0 0 Fraction(8, 1)]]
gpm, npm.diag(npm.diag(x)):
 [[mpfr('0.0') 0 0]
 [0 mpfr('4.0') 0]
 [0 0 mpfr('8.0')]]
apm, npm.diag(npm.diag(x)):
 [[0 0 0]
 [0 4.00000000000000 0]
 [0 0 8.00000000000000]]
```

7.3.6 Extract specified diagonals: numpy.diagonal

npm.**diagonal**(*a*, *offset=0*, *axis1=0*, *axis2=1*)

Return specified diagonals.

See https://numpy.org/doc/stable/reference/generated/numpy.diagonal.html for details.

If a is 2-D, returns the diagonal of a with the given offset, i.e., the collection of elements of the form a[i, i+offset]. If a has more than two dimensions, then the axes specified by axis1 and axis2 are used to determine the 2-D sub-array whose diagonal is returned. The shape of the resulting array can be determined by removing axis1 and axis2 and appending an index to the right equal to the size of the resulting diagonals.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.arange(4).reshape(2,2)
>>> a
array([[0, 1],
       [2, 3]])
>>> a.diagonal()
array([0, 3])
>>> a.diagonal()
array([0, 3])
a.diagonal(1)
array([1])

>>> # A 3-D example:
>>> a = np.arange(8).reshape(2,2,2); a
array([[[0, 1],
    [2, 3]],
   [[4, 5],
    [6, 7]]])
>>> a.diagonal(0,0,1)
array([[0, 6],
   [1, 7]])

>>> # The sub-arrays whose main diagonals we just obtained; note that each corresponds
>>> # to fixing the right-most
>>> # (column) axis, and that the diagonals are "packed" in rows.
>>> a[:,:,0]  # main diagonal is [0 6]
```

(continues on next page)

(continued from previous page)

```
array([[0, 2],
   [4, 6]])
>>> a[:,:,1]  # main diagonal is [1 7]
array([[1, 3],
   [5, 7]])

>>> # The anti-diagonal can be obtained by reversing the order of elements using either
>>> # numpy.flipud or numpy.fliplr.
>>> a = np.arange(9).reshape(3, 3); a
array([[0, 1, 2],
   [3, 4, 5],
   [6, 7, 8]])
>>> np.fliplr(a).diagonal()  # Horizontal flip
array([2, 4, 6])
>>> np.flipud(a).diagonal()  # Vertical flip
array([2, 4, 6])
array([6, 4, 2])
```

7.3.7 Two-dimensional array with the flattened input as a diagonal: numpy.diagflat

npm.**diagflat**(*v*, *k=0*)

Create a two-dimensional array with the flattened input as a diagonal.

See https://numpy.org/doc/stable/reference/generated/numpy.diagflat.html#numpy.diagflat for details.

Create a two-dimensional array with the flattened input as a diagonal.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.diagflat([[1,2], [3,4]])
array([[1, 0, 0, 0],
   [0, 2, 0, 0],
   [0, 0, 3, 0],
   [0, 0, 0, 4]])

>>> np.diagflat([1,2], 1)
array([[0, 1, 0],
   [0, 0, 2],
   [0, 0, 0]])
```

7.3.8 Lower triangle of an array: numpy.tril

npm.**tril**(*m*, *k=0*)

Returns the lower triangle of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.tril.html#numpy.tril for details

Return a copy of an array with elements above the k-th diagonal zeroed. For arrays with ndim exceeding 2, tril will apply to the final two axes.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.tril([[1,2,3],[4,5,6],[7,8,9],[10,11,12]], -1)
array([[ 0,  0,  0],
   [ 4,  0,  0],
   [ 7,  8,  0],
   [10, 11, 12]])

>>> np.tril(np.arange(3*4*5).reshape(3, 4, 5))
array([[[ 0,  0,  0,  0,  0],
```

(continues on next page)

(continued from previous page)

```
    [ 5,  6,  0,  0,  0],
    [10, 11, 12,  0,  0],
    [15, 16, 17, 18,  0]],
   [[20,  0,  0,  0,  0],
    [25, 26,  0,  0,  0],
    [30, 31, 32,  0,  0],
    [35, 36, 37, 38,  0]],
   [[40,  0,  0,  0,  0],
    [45, 46,  0,  0,  0],
    [50, 51, 52,  0,  0],
    [55, 56, 57, 58,  0]]])
```

7.3.9 Upper triangle of an array: numpy.triu

npm.**triu**(*m*, *k=0*)

Returns the upper triangle of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.triu.html#numpy.triu for details

Return a copy of an array with the elements below the k-th diagonal zeroed. For arrays with ndim exceeding 2, triu will apply to the final two axes.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.triu([[1,2,3],[4,5,6],[7,8,9],[10,11,12]], -1)
array([[ 1,  2,  3],
   [ 4,  5,  6],
   [ 0,  8,  9],
   [ 0,  0, 12]])

>>> np.triu(np.arange(3*4*5).reshape(3, 4, 5))
array([[[ 0,  1,  2,  3,  4],
    [ 0,  6,  7,  8,  9],
    [ 0,  0, 12, 13, 14],
    [ 0,  0,  0, 18, 19]],
   [[20, 21, 22, 23, 24],
    [ 0, 26, 27, 28, 29],
    [ 0,  0, 32, 33, 34],
    [ 0,  0,  0, 38, 39]],
   [[40, 41, 42, 43, 44],
    [ 0, 46, 47, 48, 49],
    [ 0,  0, 52, 53, 54],
    [ 0,  0,  0, 58, 59]]])
```

7.3.10 Vandermonde matrix.: numpy.vander

npm.**vander**(*x*, *N=None*, *increasing=False*)

Generate a Vandermonde matrix.

See https://numpy.org/doc/stable/reference/generated/numpy.vander.html#numpy.vander for details

The columns of the output matrix are powers of the input vector. The order of the powers is determined by the increasing boolean argument. Specifically, when increasing is False, the i-th output column is the input vector raised element-wise to the power of N - i - 1.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([1, 2, 3, 5])
>>> N = 3
>>> np.vander(x, N)
array([[ 1,  1,  1],
```

(continues on next page)

(continued from previous page)

```
       [ 4,  2,  1],
       [ 9,  3,  1],
       [25,  5,  1]])

>>> np.column_stack([x**(N-1-i) for i in range(N)])
array([[ 1,  1,  1],
   [ 4,  2,  1],
   [ 9,  3,  1],
   [25,  5,  1]])

>>> x = np.array([1, 2, 3, 5])
>>> np.vander(x)
array([[  1,   1,   1,   1],
   [  8,   4,   2,   1],
   [ 27,   9,   3,   1],
   [125,  25,   5,   1]])
>>> np.vander(x, increasing=True)
array([[  1,   1,   1,   1],
   [  1,   2,   4,   8],
   [  1,   3,   9,  27],
   [  1,   5,  25, 125]])

>>> # The determinant of a square Vandermonde matrix is the product of the differences
>>> # between the values of the input vector:
>>> np.linalg.det(np.vander(x))
8.000000000000043 # may vary
>>> (5-3)*(5-2)*(5-1)*(3-2)*(3-1)*(2-1)
48
```

Example: Creating a Hilbert matrix as a dictionary (mpmath matrix)

Create (pseudo) hilbert matrix m x n. One given dimension will create hilbert matrix n x n.

The matrix is very ill-conditioned and symmetric, positive definite if square.

Example: Creating a random matrix as a dictionary (mpmath matrix)

Returns a random matrix as a dictionary (mpmath matrix).

Create a random m x n matrix. All values are >= min and <max. n defaults to m.

Example: Swap of rows in a mpmath matrix

Swaps rows in a mpmath matrix. Swap row i with row j.

Example: Extending a mpmath matrix by another column

Extends a mpmath matrix. Extend matrix A with column b and return result.

Example: Unit vectors

Returns the i-th n-dimensional unit vector as a mpmath matrix

7.4 Numpy indexing

https://numpy.org/doc/stable/user/basics.indexing.html

ndarrays can be indexed using the standard Python x[obj] syntax, where x is the array and obj the selection. There are different kinds of indexing available depending on obj: basic indexing, advanced indexing and field access.

Most of the following examples show the use of indexing when referencing data in an array. The examples work just as well when assigning to an array. See Assigning values to indexed arrays for specific examples and explanations on how assignments work.

Note that in Python, x[(exp1, exp2, ..., expN)] is equivalent to x[exp1, exp2, ..., expN]; the latter is just syntactic sugar for the former.

7.4.1 Single element indexing

See https://numpy.org/doc/stable/user/basics.indexing.html#basic-indexing

Single element indexing works exactly like that for other standard Python sequences. It is 0-based, and accepts negative indices for indexing from the end of the array.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> x = np.arange(10)
>>> x[2]
2
>>> x[-2]
8
```

It is not necessary to separate each dimension's index into its own set of square brackets.

```
>>> x.shape = (2, 5)  # now x is 2-dimensional
>>> x[1, 3]
8
>>> x[1, -1]
9
```

Note that if one indexes a multidimensional array with fewer indices than dimensions, one gets a subdimensional array. For example:

```
>>> x[0]
array([0, 1, 2, 3, 4])
```

That is, each index specified selects the array corresponding to the rest of the dimensions selected. In the above example, choosing 0 means that the remaining dimension of length 5 is being left unspecified, and that what is returned is an array of that dimensionality and size. It must be noted that the returned array is a view, i.e., it is not a copy of the original, but points to the same values in memory as does the original array. In this case, the 1-D array at the first position (0) is returned. So using a single index on the returned array, results in a single element being returned. That is:

```
>>> x[0][2]
2
```

7.4.2 Slicing and striding

Basic slicing extends Python's basic concept of slicing to N dimensions. Basic slicing occurs when obj is a slice object (constructed by start:stop:step notation inside of brackets), an integer, or a tuple of slice objects and integers. Ellipsis and newaxis objects can be interspersed with these as well.

The simplest case of indexing with N integers returns an array scalar representing the corresponding item. As in Python, all indices are zero-based: for the i-th index n_i, the valid range is $0 \leq n_i < d_i$, where d_i is the i-th element of the shape of the array. Negative indices are interpreted as counting from the end of the array (i.e., if $n_i < 0$, it means $n_i + d_i$).

All arrays generated by basic slicing are always views of the original array. NumPy slicing creates a view instead of a copy as in the case of built-in Python sequences such as string, tuple and list. Care must be taken when extracting a small portion from a large array

which becomes useless after the extraction, because the small portion extracted contains a reference to the large original array whose memory will not be released until all arrays derived from it are garbage-collected. In such cases an explicit copy() is recommended.

The standard rules of sequence slicing apply to basic slicing on a per-dimension basis (including using a step index). Some useful concepts to remember include:

The basic slice syntax is i:j:k where i is the starting index, j is the stopping index, and k is the step ($k \neq 0$). This selects the m elements (in the corresponding dimension) with index values $i, i+k, \ldots, i+(m-1)k$ where $m = q + (r \neq 0)$ and q and r are the quotient and remainder obtained by dividing $j - i$ by $k : j - i = qk + r$, so that $i + (m-1)k < j$. For example:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> x = np.array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
>>> x[1:7:2]
array([1, 3, 5])
```

Negative i and j are interpreted as $n + i$ and $n + j$ where n is the number of elements in the corresponding dimension. Negative k makes stepping go towards smaller indices. From the above example:

```
>>> x[-2:10]
array([8, 9])
>>> x[-3:3:-1]
array([7, 6, 5, 4])
```

Assume n is the number of elements in the dimension being sliced. Then, if i is not given it defaults to 0 for $k > 0$ and $n - 1$ for $k < 0$. If j is not given it defaults to n for $k > 0$ and $-n - 1$ for $k < 0$. If k is not given it defaults to 1. Note that `::` is the same as `:` and means select all indices along this axis. From the above example:

```
>>> x[5:]
array([5, 6, 7, 8, 9])
```

If the number of objects in the selection tuple is less than N, then `:` is assumed for any subsequent dimensions. For example:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> x = np.array([[[1],[2],[3]], [[4],[5],[6]]])
>>> x.shape
(2, 3, 1)
>>> x[1:2]
array([[[4],
    [5],
    [6]]])
```

An integer, i, returns the same values as `i:i+1` except the dimensionality of the returned object is reduced by 1. In particular, a selection tuple with the p-th element an integer (and all other entries :) returns the corresponding sub-array with dimension $N - 1$. If $N = 1$ then the returned object is an array scalar.

If the selection tuple has all entries : except the p-th entry which is a slice object `i:j:k`, then the returned array has dimension N formed by concatenating the sub-arrays returned by integer indexing of elements $i, i+k, \ldots, i+(m-1)k < j$.

Basic slicing with more than one non-`:` entry in the slicing tuple, acts like repeated application of slicing using a single non-`:` entry, where the non-`:` entries are successively taken (with all other non-`:` entries replaced by :). Thus, `x[ind1, ..., ind2,:]` acts like `x[ind1][..., ind2, :]` under basic slicing.

You may use slicing to set values in the array, but (unlike lists) you can never grow the array. The size of the value to be set in `x[obj] = value` must be (broadcastable to) the same shape as `x[obj]`.

A slicing tuple can always be constructed as *obj* and used in the `x[obj]` notation. Slice objects can be used in the construction in place of the `[start:stop:step]` notation. For example, `x[1:10:5, ::-1]` can also be implemented as `obj = (slice(1, 10, 5), slice(None, None, -1)); x[obj]`. This can be useful for constructing generic code that works on arrays of arbitrary dimensions.

7.4.3 Dimensional indexing tools

There are some tools to facilitate the easy matching of array shapes with expressions and in assignments.

Ellipsis expands to the number of : objects needed for the selection tuple to index all dimensions. In most cases, this means that the length of the expanded selection tuple is x.ndim. There may only be a single ellipsis present. From the above example:

```
>>> x[..., 0]
array([[1, 2, 3],
  [4, 5, 6]])
```

This is equivalent to:

```
>>> x[:, :, 0]
array([[1, 2, 3],
  [4, 5, 6]])
```

Each newaxis object in the selection tuple serves to expand the dimensions of the resulting selection by one unit-length dimension. The added dimension is the position of the newaxis object in the selection tuple. newaxis is an alias for None, and None can be used in place of this with the same result. From the above example:

```
>>> x[:, np.newaxis, :, :].shape
(2, 1, 3, 1)
>>> x[:, None, :, :].shape
(2, 1, 3, 1)
```

This can be handy to combine two arrays in a way that otherwise would require explicit reshaping operations. For example:

```
>>> x = np.arange(5)
>>> x[:, np.newaxis] + x[np.newaxis, :]
array([[0, 1, 2, 3, 4],
  [1, 2, 3, 4, 5],
  [2, 3, 4, 5, 6],
  [3, 4, 5, 6, 7],
  [4, 5, 6, 7, 8]])
```

7.4.4 Broadcasting Overview

https://numpy.org/doc/stable/user/basics.broadcasting.html#basics-broadcasting

The term broadcasting describes how NumPy treats arrays with different shapes during arithmetic operations. Subject to certain constraints, the smaller array is "broadcast" across the larger array so that they have compatible shapes. Broadcasting provides a means of vectorizing array operations so that looping occurs in C instead of Python. It does this without making needless copies of data and usually leads to efficient algorithm implementations. There are, however, cases where broadcasting is a bad idea because it leads to inefficient use of memory that slows computation.

NumPy operations are usually done on pairs of arrays on an element-by-element basis. In the simplest case, the two arrays must have exactly the same shape, as in the following example:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> a = np.array([1.0, 2.0, 3.0])
>>> b = np.array([2.0, 2.0, 2.0])
>>> a * b
array([2.,  4.,  6.])
```

NumPy's broadcasting rule relaxes this constraint when the arrays' shapes meet certain constraints. The simplest broadcasting example occurs when an array and a scalar value are combined in an operation:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> a = np.array([1.0, 2.0, 3.0])
>>> b = 2.0
```

(continues on next page)

(continued from previous page)

```
>>> a * b
array([2.,  4.,  6.])
```

The result is equivalent to the previous example where b was an array. We can think of the scalar b being stretched during the arithmetic operation into an array with the same shape as a. The new elements in b, as shown in Figure 1, are simply copies of the original scalar. The stretching analogy is only conceptual. NumPy is smart enough to use the original scalar value without actually making copies so that broadcasting operations are as memory and computationally efficient as possible.

FIGURE 1

The code in the second example is more efficient than that in the first because broadcasting moves less memory around during the multiplication (b is a scalar rather than an array).

7.4.5 General Broadcasting Rules

When operating on two arrays, NumPy compares their shapes element-wise. It starts with the trailing (i.e. rightmost) dimension and works its way left. Two dimensions are compatible when they are equal, or one of them is 1.

If these conditions are not met, a `ValueError: operands could not be broadcast together` exception is thrown, indicating that the arrays have incompatible shapes.

Input arrays do not need to have the same *number* of dimensions. The resulting array will have the same number of dimensions as the input array with the greatest number of dimensions, where the size of each dimension is the largest size of the corresponding dimension among the input arrays. Note that missing dimensions are assumed to have size one.

For example, if you have a 256x256x3 array of RGB values, and you want to scale each color in the image by a different value, you can multiply the image by a one-dimensional array with 3 values. Lining up the sizes of the trailing axes of these arrays according to the broadcast rules, shows that they are compatible:

```
Image  (3d array): 256 x 256 x 3
Scale  (1d array):             3
Result (3d array): 256 x 256 x 3
```

When either of the dimensions compared is one, the other is used. In other words, dimensions with size 1 are stretched or "copied" to match the other.

In the following example, both the A and B arrays have axes with length one that are expanded to a larger size during the broadcast operation:

```
A      (4d array):  8 x 1 x 6 x 1
B      (3d array):      7 x 1 x 5
Result (4d array):  8 x 7 x 6 x 5
```

7.4.6 Broadcastable arrays

A set of arrays is called "broadcastable" to the same shape if the above rules produce a valid result.

For example, if a.shape is (5,1), b.shape is (1,6), c.shape is (6,) and d.shape is () so that d is a scalar, then a, b, c, and d are all broadcastable to dimension (5,6); and

a acts like a (5,6) array where a[:,0] is broadcast to the other columns,

b acts like a (5,6) array where b[0,:] is broadcast to the other rows,

c acts like a (1,6) array and therefore like a (5,6) array where c[:] is broadcast to every row, and finally,

d acts like a (5,6) array where the single value is repeated.

Here are some more examples:

```
A      (2d array):  5 x 4
B      (1d array):      1
Result (2d array):  5 x 4

A      (2d array):  5 x 4
B      (1d array):      4
Result (2d array):  5 x 4

A      (3d array):  15 x 3 x 5
B      (3d array):  15 x 1 x 5
Result (3d array):  15 x 3 x 5

A      (3d array):  15 x 3 x 5
B      (2d array):       3 x 5
Result (3d array):  15 x 3 x 5

A      (3d array):  15 x 3 x 5
B      (2d array):       3 x 1
Result (3d array):  15 x 3 x 5
```

Here are examples of shapes that do not broadcast:

```
A      (1d array):  3
B      (1d array):  4 # trailing dimensions do not match

A      (2d array):      2 x 1
B      (3d array):  8 x 4 x 3 # second from last dimensions mismatched
```

An example of broadcasting when a 1-d array is added to a 2-d array:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[ 0.0,  0.0,  0.0], [10.0, 10.0, 10.0], [20.0, 20.0, 20.0], [30.0, 30.0, 30.0]])
>>> b = np.array([1.0, 2.0, 3.0])
>>> a + b
array([[  1.,   2.,   3.],
       [11.,  12.,  13.],
       [21.,  22.,  23.],
       [31.,  32.,  33.]])
>>> b = np.array([1.0, 2.0, 3.0, 4.0])
>>> a + b
Traceback (most recent call last):
ValueError: operands could not be broadcast together with shapes (4,3) (4,)
```

When the trailing dimensions of the arrays are unequal, broadcasting fails because it is impossible to align the values in the rows of the 1st array with the elements of the 2nd arrays for element-by-element addition.

Broadcasting provides a convenient way of taking the outer product (or any other outer operation) of two arrays. The following example shows an outer addition operation of two 1-d arrays:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([0.0, 10.0, 20.0, 30.0])
>>> b = np.array([1.0, 2.0, 3.0])
>>> a[:, np.newaxis] + b
array([[  1.,   2.,   3.],
       [11.,  12.,  13.],
       [21.,  22.,  23.],
       [31.,  32.,  33.]])
```

Here the newaxis index operator inserts a new axis into a, making it a two-dimensional 4x1 array. Combining the 4x1 array with b, which has shape (3,), yields a 4x3 array.

7.4.7 Assigning values to indexed arrays

Some text

https://numpy.org/doc/stable/user/basics.indexing.html#assigning-values-to-indexed-arrays

As mentioned, one can select a subset of an array to assign to using a single index, slices, and index and mask arrays. The value being assigned to the indexed array must be shape consistent (the same shape or broadcastable to the shape the index produces). For example, it is permitted to assign a constant to a slice:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.arange(10)
>>> x[2:7] = 1
```

or an array of the right size:

```
>>> x[2:7] = np.arange(5)
```

Note that assignments may result in changes if assigning higher types to lower types (like floats to ints) or even exceptions (assigning complex to floats or ints):

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x[1] = 1.2
>>> x[1]
1
>>> x[1] = 1.2j
Traceback (most recent call last):
  ...
TypeError: can't convert complex to int
```

Unlike some of the references (such as array and mask indices) assignments are always made to the original data in the array (indeed, nothing else would make sense!). Note though, that some actions may not work as one may naively expect. This particular example is often surprising to people:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.arange(0, 50, 10)
>>> x
array([ 0, 10, 20, 30, 40])
>>> x[np.array([1, 1, 3, 1])] += 1
>>> x
array([ 0, 11, 20, 31, 40])
```

Where people expect that the 1st location will be incremented by 3. In fact, it will only be incremented by 1. The reason is that a new array is extracted from the original (as a temporary) containing the values at 1, 1, 3, 1, then the value 1 is added to the temporary, and then the temporary is assigned back to the original array. Thus the value of the array at x[1] + 1 is assigned to x[1] three times, rather than being incremented 3 times.

7.5 Numpy basic array manipulation routines

Some text

https://numpy.org/doc/stable/reference/routines.array-manipulation.html

7.5.1 Copy values from one array to another: numpy.copyto

npm.**copyto**(*dst*, *src*, *casting='same_kind'*, *where=True*)

Copies values from one array to another, broadcasting as necessary. Raises a TypeError if the casting rule is violated, and if where is provided, it selects which elements to copy.

See https://numpy.org/doc/stable/reference/generated/numpy.copyto.html#numpy.copyto for details

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> A = np.array([4, 5, 6])
>>> B = [1, 2, 3]
>>> np.copyto(A, B)
>>> A
array([1, 2, 3])

>>> A = np.array([[1, 2, 3], [4, 5, 6]])
>>> B = [[4, 5, 6], [7, 8, 9]]
>>> np.copyto(A, B)
>>> A
array([[4, 5, 6],
       [7, 8, 9]])
```

7.5.2 Get the shape of an array: numpy.shape

npm.**shape**(*a*)

Return the shape of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.shape.html#numpy.shape for details

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.shape(np.eye(3))
(3, 3)
>>> np.shape([[1, 3]])
(1, 2)
>>> np.shape([0])
(1,)
>>> np.shape(0)
()

>>> a = np.array([(1, 2), (3, 4), (5, 6)], dtype=[('x', 'i4'), ('y', 'i4')])
>>> np.shape(a)
(3,)
>>> a.shape
(3,)
```

7.5.3 Reshape an array without changing its data: numpy.reshape

npm.**reshape**(*a*, */ (Positional-only parameter separator (PEP 570))*, *shape=None*, *order='C'*, ***, *newshape=None*, *copy=None*)

Gives a new shape to an array without changing its data.

See https://numpy.org/doc/stable/reference/generated/numpy.reshape.html#numpy.reshape for details

It is not always possible to change the shape of an array without copying the data.

The order keyword gives the index ordering both for fetching the values from a, and then placing the values into the output array. For example, let's say you have an array:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.arange(6).reshape((3, 2))
>>> a
array([[0, 1],
       [2, 3],
       [4, 5]])
```

You can think of reshaping as first raveling the array (using the given index order), then inserting the elements from the raveled array into the new array using the same kind of index ordering as was used for the raveling.

```
>>> np.reshape(a, (2, 3)) # C-like index ordering
array([[0, 1, 2],
       [3, 4, 5]])
>>> np.reshape(np.ravel(a), (2, 3)) # equivalent to C ravel then C reshape
array([[0, 1, 2],
       [3, 4, 5]])
>>> np.reshape(a, (2, 3), order='F') # Fortran-like index ordering
array([[0, 4, 3],
       [2, 1, 5]])
>>> np.reshape(np.ravel(a, order='F'), (2, 3), order='F')
array([[0, 4, 3],
       [2, 1, 5]])
```

Additional examples:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[1,2,3], [4,5,6]])
>>> np.reshape(a, 6)
array([1, 2, 3, 4, 5, 6])
>>> np.reshape(a, 6, order='F')
array([1, 4, 2, 5, 3, 6])

>>> np.reshape(a, (3,-1))       # the unspecified value is inferred to be 2
array([[1, 2],
       [3, 4],
       [5, 6]])
```

7.5.4 Get a contiguous flattened array: numpy.ravel

npm.**ravel**(*a*, *order='C'*)

Return a contiguous flattened array.

See https://numpy.org/doc/stable/reference/generated/numpy.ravel.html#numpy.ravel for details

A 1-D array, containing the elements of the input, is returned. A copy is made only if needed.

As of NumPy 1.10, the returned array will have the same type as the input array. (for example, a masked array will be returned for a masked array input)

It is equivalent to reshape(-1, order=order).

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([[1, 2, 3], [4, 5, 6]])
>>> np.ravel(x)
array([1, 2, 3, 4, 5, 6])

>>> x.reshape(-1)
```

(continues on next page)

(continued from previous page)

```
array([1, 2, 3, 4, 5, 6])

>>> np.ravel(x, order='F')
array([1, 4, 2, 5, 3, 6])
```

When order is 'A', it will preserve the array's 'C' or 'F' ordering:

```
>>> np.ravel(x.T)
array([1, 4, 2, 5, 3, 6])
>>> np.ravel(x.T, order='A')
array([1, 2, 3, 4, 5, 6])
```

When order is 'K', it will preserve orderings that are neither 'C' nor 'F', but won't reverse axes:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.arange(3)[::-1]; a
array([2, 1, 0])
>>> a.ravel(order='C')
array([2, 1, 0])
>>> a.ravel(order='K')
array([2, 1, 0])

>>> a = np.arange(12).reshape(2,3,2).swapaxes(1,2); a
array([[[ 0,  2,  4], [ 1,  3,  5]], [[ 6,  8, 10], [ 7,  9, 11]]])
>>> a.ravel(order='C')
array([ 0,  2,  4,  1,  3,  5,  6,  8, 10,  7,  9, 11])
>>> a.ravel(order='K')
array([ 0,  1,  2,  3,  4,  5,  6,  7,  8,  9, 10, 11])
```

7.5.5 1-D iterator over the array: ndarry.flat

`ndarry.flat()`

A 1-D iterator over the array.

See https://numpy.org/doc/stable/reference/generated/numpy.ndarray.flat.html#numpy.ndarray.flat for details.

This is a numpy.flatiter instance, which acts similarly to, but is not a subclass of, Python's built-in iterator object.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.arange(1, 7).reshape(2, 3)
>>> x
array([[1, 2, 3],
       [4, 5, 6]])
>>> x.flat[3]
4
>>> x.T
array([[1, 4],
       [2, 5],
       [3, 6]])
>>> x.T.flat[3]
5
>>> type(x.flat)
<class 'numpy.flatiter'>
```

An assignment example:

```
>>> x.flat = 3; x
array([[3, 3, 3],
       [3, 3, 3]])
>>> x.flat[[1,4]] = 1; x
```

(continues on next page)

(continued from previous page)

```
array([[3, 1, 3],
       [3, 1, 3]])
```

7.5.6 Get a copy of the array collapsed into one dimension: ndarry.flatten

ndarry.**flatten**(*order='C'*)

Return a copy of the array collapsed into one dimension.

See https://numpy.org/doc/stable/reference/generated/numpy.ndarray.flatten.html#numpy.ndarray.flatten for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[1,2], [3,4]])
>>> a.flatten()
array([1, 2, 3, 4])
>>> a.flatten('F')
array([1, 3, 2, 4])
```

7.6 Numpy array manipulation: Transpose-like operations

7.6.1 Move axes of an array to new positions: numpy.flatten

npm.**moveaxis**(*a*, *source*, *destination*)

Move axes of an array to new positions. Other axes remain in their original order.

See https://numpy.org/doc/stable/reference/generated/numpy.moveaxis.html#numpy.moveaxis for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.zeros((3, 4, 5))
>>> np.moveaxis(x, 0, -1).shape
(4, 5, 3)
>>> np.moveaxis(x, -1, 0).shape
(5, 3, 4)
```

These all achieve the same result:

```
>>> np.transpose(x).shape
(5, 4, 3)
>>> np.swapaxes(x, 0, -1).shape
(5, 4, 3)
>>> np.moveaxis(x, [0, 1], [-1, -2]).shape
(5, 4, 3)
>>> np.moveaxis(x, [0, 1, 2], [-1, -2, -3]).shape
(5, 4, 3)
```

7.6.2 Interchange two axes of an array: numpy.swapaxes

npm.**swapaxes**(*a*, *axis1*, *axis2*)

Interchange two axes of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.swapaxes.html#numpy.swapaxes for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([[1,2,3]])
>>> np.swapaxes(x,0,1)
array([[1],
       [2],
       [3]])

>>> x = np.array([[[0,1],[2,3]],[[4,5],[6,7]]])
>>> x
array([[[0, 1],
        [2, 3]],
       [[4, 5],
        [6, 7]]])

>>> np.swapaxes(x,0,2)
array([[[0, 4],
        [2, 6]],
       [[1, 5],
        [3, 7]]])
```

7.6.3 Get an array with axes transposed: numpy.transpose

npm.**transpose**(*a*, *axes=None*)

Returns an array with axes transposed.

See https://numpy.org/doc/stable/reference/generated/numpy.transpose.html#numpy.transpose for details.

For a 1-D array, this returns an unchanged view of the original array, as a transposed vector is simply the same vector. To convert a 1-D array into a 2-D column vector, an additional dimension must be added, e.g., np.atleast2d(a).T achieves this, as does a[:, np.newaxis]. For a 2-D array, this is the standard matrix transpose. For an n-D array, if axes are given, their order indicates how the axes are permuted (see Examples). If axes are not provided, then transpose(a).shape == a.shape[::-1].

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[1, 2], [3, 4]])
a
array([[1, 2],
       [3, 4]])
>>> np.transpose(a)
array([[1, 3],
       [2, 4]])

>>> a = np.array([1, 2, 3, 4])
>>> a
array([1, 2, 3, 4])
>>> np.transpose(a)
array([1, 2, 3, 4])

>>> a = np.ones((1, 2, 3))
>>> np.transpose(a, (1, 0, 2)).shape
(2, 1, 3)

>>> a = np.ones((2, 3, 4, 5))
>>> np.transpose(a).shape
(5, 4, 3, 2)
```

ndarray.T

https://numpy.org/doc/stable/reference/generated/numpy.ndarray.T.html#numpy.ndarray.T

View of the transposed array. Same as self.transpose().

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[1, 2], [3, 4]])
a
array([[1, 2],
       [3, 4]])
>>> a.T
array([[1, 3],
       [2, 4]])

>>> a = np.array([1, 2, 3, 4])
>>> a
array([1, 2, 3, 4])
>>> a.T
array([1, 2, 3, 4])
```

7.7 Numpy array manipulation: Changing number of dimensions

7.7.1 Convert inputs to arrays with at least one dimension: numpy.atleast_1d

npm.**atleast_1d**(**arys*)

Convert inputs to arrays with at least one dimension.

See https://numpy.org/doc/stable/reference/generated/numpy.atleast_1d.html#numpy.atleast_1d for details

Scalar inputs are converted to 1-dimensional arrays, whilst higher-dimensional inputs are preserved.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.atleast_1d(1.0)
array([1.])

>>> x = np.arange(9.0).reshape(3,3)
>>> np.atleast_1d(x)
array([[0., 1., 2.],
       [3., 4., 5.],
       [6., 7., 8.]])
>>> np.atleast_1d(x) is x
True

>>> np.atleast_1d(1, [3, 4])
[array([1]), array([3, 4])]
```

7.7.2 Convert inputs to arrays with at least two dimensions: numpy.atleast_2d

npm.**atleast_2d**(**arys*)

Convert inputs as arrays with at least two dimensions.

See https://numpy.org/doc/stable/reference/generated/numpy.atleast_2d.html#numpy.atleast_2d for details

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.atleast_2d(3.0)
array([[3.]])

>>> x = np.arange(3.0)
>>> np.atleast_2d(x)
array([[0., 1., 2.]])
>>> np.atleast_2d(x).base is x
True

>>> np.atleast_2d(1, [1, 2], [[1, 2]])
[array([[1]]), array([[1, 2]]), array([[1, 2]])]
```

7.7.3 Convert inputs to arrays with at least two dimensions: numpy.atleast_3d

npm.**atleast_3d**(**arys*)

Convert inputs as arrays with at least three dimensions.

See https://numpy.org/doc/stable/reference/generated/numpy.atleast_3d.html#numpy.atleast_3d for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> np.atleast_3d(3.0)
array([[[3.]]])

>>> x = np.arange(3.0)
```

(continues on next page)

(continued from previous page)

```
>>> np.atleast_3d(x).shape
(1, 3, 1)

>>> x = np.arange(12.0).reshape(4,3)
>>> np.atleast_3d(x).shape
(4, 3, 1)
>>> np.atleast_3d(x).base is x.base  # x is a reshape, so not base itself
True

for arr in np.atleast_3d([1, 2], [[1, 2]], [[[1, 2]]]): print(arr, arr.shape)
[[[1]
  [2]]] (1, 2, 1)
[[[1]
  [2]]] (1, 2, 1)
[[[1 2]]] (1, 1, 2)
```

7.7.4 Broadcast an array to a new shape: numpy.broadcast_to

npm.**broadcast_to**(*array*, *shape*, *subok=False*)

Broadcast an array to a new shape.

See https://numpy.org/doc/stable/reference/generated/numpy.broadcast_to.html#numpy.broadcast_to for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([1, 2, 3])
>>> np.broadcast_to(x, (3, 3))
array([[1, 2, 3],
       [1, 2, 3],
       [1, 2, 3]])
```

7.7.5 Broadcast any number of arrays against each other: numpy.broadcast_arrays

npm.**broadcast_arrays**(**args*, *subok=False*)

Broadcast any number of arrays against each other.

See https://numpy.org/doc/stable/reference/generated/numpy.broadcast_arrays.html#numpy.broadcast_arrays for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([[1,2,3]])
>>> y = np.array([[4],[5]])
>>> np.broadcast_arrays(x, y)
[array([[1, 2, 3],
       [1, 2, 3]]), array([[4, 4, 4],
       [5, 5, 5]])]
```

Here is a useful idiom for getting contiguous copies instead of non-contiguous views.

```
>>> [np.array(a) for a in np.broadcast_arrays(x, y)]
[array([[1, 2, 3],
       [1, 2, 3]]), array([[4, 4, 4],
       [5, 5, 5]])]
```

7.7.6 Expand the shape of an array: numpy.expand_dims

npm.**expand_dims**(*a*, *axis*)

Expand the shape of an array. Insert a new axis that will appear at the axis position in the expanded array shape.

See https://numpy.org/doc/stable/reference/generated/numpy.expand_dims.html#numpy.expand_dims for details.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([1, 2])
>>> x.shape
(2,)
```

The following is equivalent to `x[np.newaxis, :]` or `x[np.newaxis]`:

```
>>> y = np.expand_dims(x, axis=0)
>>> y
array([[1, 2]])
>>> y.shape
(1, 2)
```

The following is equivalent to `x[:, np.newaxis]`:

```
>>> y = np.expand_dims(x, axis=1)
>>> y
array([[1],
       [2]])
>>> y.shape
(2, 1)
```

`axis` may also be a tuple:

```
>>> y = np.expand_dims(x, axis=(0, 1))
>>> y
array([[[1, 2]]])
>>> y = np.expand_dims(x, axis=(2, 0))
>>> y
array([[[1],
        [2]]])
```

Note that some examples may use `None` instead of `np.newaxis`. These are the same objects:

```
>>> np.newaxis is None
True
```

7.7.7 Remove axes of length one from an array: numpy.squeeze

npm.**squeeze**(*a*, *axis=None*)

Remove axes of length one from a.

https://numpy.org/doc/stable/reference/generated/numpy.squeeze.html#numpy.squeeze

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> x = np.array([[[0], [1], [2]]])
>>> x.shape
(1, 3, 1)
>>> np.squeeze(x).shape
(3,)
>>> np.squeeze(x, axis=0).shape
(3, 1)
>>> np.squeeze(x, axis=1).shape
Traceback (most recent call last):
...
ValueError: cannot select an axis to squeeze out which has size not equal to one

>>> np.squeeze(x, axis=2).shape
(1, 3)
>>> x = np.array([[1234]])
```

(continues on next page)

(continued from previous page)

```
>>> x.shape
(1, 1)
>>> np.squeeze(x)
array(1234)  # 0d array
>>> np.squeeze(x).shape
()
>>> np.squeeze(x)[()]
1234
```

7.8 Numpy array manipulation: Joining arrays

7.8.1 Join a sequence of arrays along an existing axis: numpy.concatenate

npm.**concatenate**(*(a1, a2, ...)*, *axis=0*, *out=None*, *dtype=None*, *casting="same_kind"*)

Join a sequence of arrays along an existing axis.

See https://numpy.org/doc/stable/reference/generated/numpy.concatenate.html#numpy.concatenate for details.

When one or more of the arrays to be concatenated is a MaskedArray, this function will return a MaskedArray object instead of an ndarray, but the input masks are not preserved. In cases where a MaskedArray is expected as input, use the ma.concatenate function from the masked array module instead.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> a = np.array([[1, 2], [3, 4]])
>>> b = np.array([[5, 6]])
>>> np.concatenate((a, b), axis=0)
array([[1, 2],
       [3, 4],
       [5, 6]])
>>> np.concatenate((a, b.T), axis=1)
array([[1, 2, 5],
       [3, 4, 6]])
>>> np.concatenate((a, b), axis=None)
array([1, 2, 3, 4, 5, 6])
```

This function will not preserve masking of MaskedArray inputs.

```
>>> a = np.ma.arange(3)
>>> a[1] = np.ma.masked
>>> b = np.arange(2, 5)
>>> a
masked_array(data=[0, --, 2],
             mask=[False,  True, False],
       fill_value=999999)
>>> b
array([2, 3, 4])
>>> np.concatenate([a, b])
masked_array(data=[0, 1, 2, 2, 3, 4],
             mask=False,
       fill_value=999999)
>>> np.ma.concatenate([a, b])
masked_array(data=[0, --, 2, 2, 3, 4],
             mask=[False,  True, False, False, False, False],
       fill_value=999999)
```

7.8.2 Join a sequence of arrays along an existing axis: numpy.stack

npm.**stack**(*arrays*, *axis=0*, *out=None*, *, *dtype=None*, *casting='same_kind'*)

Join a sequence of arrays along a new axis.

See https://numpy.org/doc/stable/reference/generated/numpy.stack.html#numpy.stack for details.

The axis parameter specifies the index of the new axis in the dimensions of the result. For example, if axis=0 it will be the first dimension and if axis=-1 it will be the last dimension.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> arrays = [np.random.randn(3, 4) for _ in range(10)]
>>> np.stack(arrays, axis=0).shape
(10, 3, 4)
```

(continues on next page)

(continued from previous page)

```
>>> np.stack(arrays, axis=1).shape
(3, 10, 4)

>>> np.stack(arrays, axis=2).shape
(3, 4, 10)

>>> a = np.array([1, 2, 3])
>>> b = np.array([4, 5, 6])
>>> np.stack((a, b))
array([[1, 2, 3],
       [4, 5, 6]])

>>> np.stack((a, b), axis=-1)
array([[1, 4],
       [2, 5],
       [3, 6]])
```

7.8.3 Assemble an nd-array from nested lists of blocks: numpy.block

npm.block(*arrays*)

Assemble an nd-array from nested lists of blocks.

See https://numpy.org/doc/stable/reference/generated/numpy.block.html#numpy.block for details.

Blocks in the innermost lists are concatenated (see concatenate) along the last dimension (-1), then these are concatenated along the second-last dimension (-2), and so on until the outermost list is reached.

Blocks can be of any dimension, but will not be broadcasted using the normal rules. Instead, leading axes of size 1 are inserted, to make block.ndim the same for all blocks. This is primarily useful for working with scalars, and means that code like np.block([v, 1]) is valid, where v.ndim == 1.

When the nested list is two levels deep, this allows block matrices to be constructed from their components.

When called with only scalars, `np.block` is equivalent to an ndarray call. So `np.block([[1, 2], [3, 4]])` is equivalent to `np.array([[1, 2], [3, 4]])`.

This function does not enforce that the blocks lie on a fixed grid. `np.block([[a, b], [c, d]])` is not restricted to arrays of the form:

```
AAAbb
AAAbb
cccDD
```

But is also allowed to produce, for some a, b, c, d:

```
AAAbb
AAAbb
cDDDD
```

Since concatenation happens along the last axis first, block is not capable of producing the following directly:

```
AAAbb
cccbb
cccDD
```

```
>>> import numpy as np; from xlcalcnet import mpm, dpm

>>> matA = np.eye(2) * 2
>>> B = np.eye(3) * 3
>>> np.block([
```

(continues on next page)

(continued from previous page)

```
    [matA,               np.zeros((2, 3))],
    [np.ones((3, 2)), B               ]
])
array([[2., 0., 0., 0., 0.],
       [0., 2., 0., 0., 0.],
       [1., 1., 3., 0., 0.],
       [1., 1., 0., 3., 0.],
       [1., 1., 0., 0., 3.]])
```

With a list of depth 1, block can be used as hstack

```
>>> np.block([1, 2, 3])              # hstack([1, 2, 3])
array([1, 2, 3])

>>> a = np.array([1, 2, 3])
>>> b = np.array([4, 5, 6])
>>> np.block([a, b, 10])             # hstack([a, b, 10])
array([ 1,  2,  3,  4,  5,  6, 10])

>>> A = np.ones((2, 2), int)
>>> B = 2 * A
>>> np.block([A, B])                 # hstack([A, B])
array([[1, 1, 2, 2],
       [1, 1, 2, 2]])
```

With a list of depth 2, block can be used in place of vstack:

```
>>> a = np.array([1, 2, 3])
>>> b = np.array([4, 5, 6])
>>> np.block([[a], [b]])             # vstack([a, b])
array([[1, 2, 3],
       [4, 5, 6]])

>>> A = np.ones((2, 2), int)
>>> B = 2 * A
>>> np.block([[A], [B]])             # vstack([A, B])
array([[1, 1],
       [1, 1],
       [2, 2],
       [2, 2]])
```

It can also be used in places of atleast_1d and atleast_2d

```
>>> a = np.array(0)
>>> b = np.array([1])
>>> np.block([a])                    # atleast_1d(a)
array([0])
>>> np.block([b])                    # atleast_1d(b)
array([1])

>>> np.block([[a]])                  # atleast_2d(a)
array([[0]])
np.block([[b]])                   # atleast_2d(b)
array([[1]])
```

7.8.4 Stack arrays in sequence vertically (row wise): numpy.vstack

npm.**vstack**(*tup*, *, *dtype=None*, *casting='same_kind'*)

Stack arrays in sequence vertically (row wise).

See https://numpy.org/doc/stable/reference/generated/numpy.vstack.html#numpy.vstack for details.

This is equivalent to concatenation along the first axis after 1-D arrays of shape (N,) have been reshaped to (1,N). Rebuilds arrays divided by vsplit.

This function makes most sense for arrays with up to 3 dimensions. For instance, for pixel-data with a height (first axis), width (second axis), and r/g/b channels (third axis). The functions concatenate, stack and block provide more general stacking and concatenation operations.

```
>>> a = np.array([1, 2, 3])
>>> b = np.array([4, 5, 6])
>>> np.vstack((a,b))
array([[1, 2, 3],
       [4, 5, 6]])

>>> a = np.array([[1], [2], [3]])
>>> b = np.array([[4], [5], [6]])
>>> np.vstack((a,b))
array([[1],
       [2],
       [3],
       [4],
       [5],
       [6]])
```

7.8.5 Stack arrays in sequence horizontally (column wise): numpy.hstack

npm.**hstack**(*tup*, ***, *dtype=None*, *casting='same_kind'*)

Stack arrays in sequence horizontally (column wise).

See https://numpy.org/doc/stable/reference/generated/numpy.hstack.html#numpy.hstack for details.

This is equivalent to concatenation along the second axis, except for 1-D arrays where it concatenates along the first axis. Rebuilds arrays divided by hsplit.

This function makes most sense for arrays with up to 3 dimensions. For instance, for pixel-data with a height (first axis), width (second axis), and r/g/b channels (third axis). The functions concatenate, stack and block provide more general stacking and concatenation operations.

```
>>> a = np.array((1,2,3))
>>> b = np.array((4,5,6))
>>> np.hstack((a,b))
array([1, 2, 3, 4, 5, 6])

>>> a = np.array([[1],[2],[3]])
>>> b = np.array([[4],[5],[6]])
>>> np.hstack((a,b))
array([[1, 4],
       [2, 5],
       [3, 6]])
```

7.8.6 Stack arrays in sequence depth wise (along third axis): numpy.dstack

npm.**dstack**(*tup*)

Stack arrays in sequence depth wise (along third axis).

https://numpy.org/doc/stable/reference/generated/numpy.dstack.html#numpy.dstack

This is equivalent to concatenation along the third axis after 2-D arrays of shape (M,N) have been reshaped to (M,N,1) and 1-D arrays of shape (N,) have been reshaped to (1,N,1). Rebuilds arrays divided by dsplit.

This function makes most sense for arrays with up to 3 dimensions. For instance, for pixel-data with a height (first axis), width (second axis), and r/g/b channels (third axis). The functions concatenate, stack and block provide more general stacking and concatenation operations.

```
>>> a = np.array((1,2,3))
>>> b = np.array((2,3,4))
>>> np.dstack((a,b))
array([[[1, 2],
        [2, 3],
        [3, 4]]])

>>> a = np.array([[1],[2],[3]])
>>> b = np.array([[2],[3],[4]])
>>> np.dstack((a,b))
array([[[1, 2]],
       [[2, 3]],
       [[3, 4]]])
```

7.8.7 Stack 1-D arrays as columns into a 2-D array: numpy.column_stack

npm.**column_stack**(*tup*)

Stack 1-D arrays as columns into a 2-D array.

See https://numpy.org/doc/stable/reference/generated/numpy.column_stack.html#numpy.column_stack for details.

Take a sequence of 1-D arrays and stack them as columns to make a single 2-D array. 2-D arrays are stacked as-is, just like with hstack. 1-D arrays are turned into 2-D columns first.

```
>>> a = np.array((1,2,3))
>>> b = np.array((2,3,4))
>>> np.column_stack((a,b))
array([[1, 2],
        [2, 3],
        [3, 4]])
```

7.9 Numpy array manipulation: Splitting and tiling arrays

7.9.1 Split an array into multiple sub-arrays as views: numpy.split

npm.**split**(*ary*, *indices_or_sections*, *axis=0*)

Split an array into multiple sub-arrays as views.

See https://numpy.org/doc/stable/reference/generated/numpy.split.html#numpy.split for details.

```
>>> x = np.arange(9.0)
>>> np.split(x, 3)
[array([0.,  1.,  2.]), array([3.,  4.,  5.]), array([6.,  7.,  8.])]

>>> x = np.arange(8.0)
>>> np.split(x, [3, 5, 6, 10])
[array([0.,  1.,  2.]),
 array([3.,  4.]),
 array([5.]),
 array([6.,  7.]),
 array([], dtype=float64)]
```

7.9.2 Split an array into multiple sub-arrays: numpy.array_split

npm.**array_split**(*ary*, *indices_or_sections*, *axis=0*)

Split an array into multiple sub-arrays.

See https://numpy.org/doc/stable/reference/generated/numpy.array_split.html#numpy.array_split for details.

Please refer to the split documentation. The only difference between these functions is that array_split allows indices_or_sections to be an integer that does not equally divide the axis. For an array of length l that should be split into n sections, it returns l % n sub-arrays of size l//n + 1 and the rest of size l//n.

```
>>> x = np.arange(8.0)
>>> np.array_split(x, 3)
[array([0.,  1.,  2.]), array([3.,  4.,  5.]), array([6.,  7.])]

>>> x = np.arange(9)
>>> np.array_split(x, 4)
[array([0, 1, 2]), array([3, 4]), array([5, 6]), array([7, 8])]
```

7.9.3 Split array into multiple sub-arrays along the 3rd axis (depth): numpy.dsplit

npm.**dsplit**(*ary*, *indices_or_sections*)

Split array into multiple sub-arrays along the 3rd axis (depth).

See https://numpy.org/doc/stable/reference/generated/numpy.dsplit.html#numpy.dsplit for details.

Please refer to the split documentation. dsplit is equivalent to split with axis=2, the array is always split along the third axis provided the array dimension is greater than or equal to 3.

```
>>> x = np.arange(16.0).reshape(2, 2, 4)
>>> x
array([[[ 0.,   1.,   2.,   3.],
        [ 4.,   5.,   6.,   7.]],
       [[ 8.,   9.,  10.,  11.],
        [12.,  13.,  14.,  15.]]])

>>> np.dsplit(x, 2)
[array([[[ 0.,  1.],
        [ 4.,  5.]],
```

(continues on next page)

(continued from previous page)

```
       [[ 8.,  9.],
        [12., 13.]]]), array([[[ 2.,  3.],
        [ 6.,  7.]],
       [[10., 11.],
        [14., 15.]]])]

>>> np.dsplit(x, np.array([3, 6]))
[array([[[ 0.,  1.,  2.],
        [ 4.,  5.,  6.]],
       [[ 8.,  9., 10.],
        [12., 13., 14.]]]),
 array([[[ 3.],
        [ 7.]],
       [[11.],
        [15.]]]),
array([], shape=(2, 2, 0), dtype=float64)]
```

7.9.4 Split an array into multiple sub-arrays horizontally (column-wise): numpy.hsplit

npm.**hsplit**(*ary*, *indices_or_sections*)

Split an array into multiple sub-arrays horizontally (column-wise).

See https://numpy.org/doc/stable/reference/generated/numpy.hsplit.html#numpy.hsplit for details.

Please refer to the split documentation. hsplit is equivalent to split with axis=1, the array is always split along the second axis except for 1-D arrays, where it is split at axis=0.

```
>>> x = np.arange(16.0).reshape(4, 4)
>>> x
array([[ 0.,  1.,  2.,  3.],
       [ 4.,  5.,  6.,  7.],
       [ 8.,  9., 10., 11.],
       [12., 13., 14., 15.]])

>>> np.hsplit(x, 2)
[array([[ 0.,  1.],
       [ 4.,  5.],
       [ 8.,  9.],
       [12., 13.]]),
 array([[ 2.,  3.],
       [ 6.,  7.],
       [10., 11.],
       [14., 15.]])]

>>> np.hsplit(x, np.array([3, 6]))
[array([[ 0.,  1.,  2.],
       [ 4.,  5.,  6.],
       [ 8.,  9., 10.],
       [12., 13., 14.]]),
 array([[ 3.],
       [ 7.],
       [11.],
       [15.]]),
 array([], shape=(4, 0), dtype=float64)]
```

With a higher dimensional array the split is still along the second axis.

```
>>> x = np.arange(8.0).reshape(2, 2, 2)
>>> x
array([[[0.,  1.],
        [2.,  3.]],
       [[4.,  5.],
        [6.,  7.]]])
```

(continues on next page)

(continued from previous page)

```
>>> np.hsplit(x, 2)
[array([[[0.,  1.]],
       [[4.,  5.]]]),
 array([[[2.,  3.]],
       [[6.,  7.]]])]
```

With a 1-D array, the split is along axis 0.

```
>>> x = np.array([0, 1, 2, 3, 4, 5])
>>> np.hsplit(x, 2)
[array([0, 1, 2]), array([3, 4, 5])]
```

7.9.5 Split an array into multiple sub-arrays vertically (row-wise): numpy.vsplit

npm.**vsplit**(*ary*, *indices_or_sections*)

Split an array into multiple sub-arrays vertically (row-wise).

See https://numpy.org/doc/stable/reference/generated/numpy.vsplit.html#numpy.vsplit for details.

Please refer to the split documentation. vsplit is equivalent to split with axis=0 (default), the array is always split along the first axis regardless of the array dimension.

```
>>> x = np.arange(16.0).reshape(4, 4)
>>> x
array([[ 0.,   1.,   2.,   3.],
       [ 4.,   5.,   6.,   7.],
       [ 8.,   9.,  10.,  11.],
       [12.,  13.,  14.,  15.]])

>>> np.vsplit(x, 2)
[array([[0., 1., 2., 3.],
       [4., 5., 6., 7.]]), array([[ 8.,  9., 10., 11.],
       [12., 13., 14., 15.]])]

>>> np.vsplit(x, np.array([3, 6]))
[array([[ 0.,  1.,  2.,  3.],
       [ 4.,  5.,  6.,  7.],
       [ 8.,  9., 10., 11.]]), array([[12., 13., 14., 15.]]), array([], shape=(0, 4), dtype=float64)]
```

With a higher dimensional array the split is still along the first axis.

```
>>> x = np.arange(8.0).reshape(2, 2, 2)
>>> x
array([[[0.,  1.],
        [2.,  3.]],
       [[4.,  5.],
        [6.,  7.]]])

>>> np.vsplit(x, 2)
[array([[[0., 1.],
        [2., 3.]]]), array([[[4., 5.],
        [6., 7.]]])]
```

7.9.6 Construct an array by repeating a given array: numpy.tile

npm.**tile**(*A*, *reps*)

Construct an array by repeating A the number of times given by reps.

See https://numpy.org/doc/stable/reference/generated/numpy.tile.html#numpy.tile for details.

If reps has length d, the result will have dimension of max(d, A.ndim).

If A.ndim < d, A is promoted to be d-dimensional by prepending new axes. So a shape (3,) array is promoted to (1, 3) for 2-D replication, or shape (1, 1, 3) for 3-D replication. If this is not the desired behavior, promote A to d-dimensions manually before calling this function.

If A.ndim > d, reps is promoted to A.ndim by pre-pending 1's to it. Thus for an A of shape (2, 3, 4, 5), a reps of (2, 2) is treated as (1, 1, 2, 2).

Note : Although tile may be used for broadcasting, it is strongly recommended to use numpy's broadcasting operations and functions.

```
>>> a = np.array([0, 1, 2])
>>> np.tile(a, 2)
array([0, 1, 2, 0, 1, 2])
>>> np.tile(a, (2, 2))
array([[0, 1, 2, 0, 1, 2],
       [0, 1, 2, 0, 1, 2]])
>>> np.tile(a, (2, 1, 2))
array([[[0, 1, 2, 0, 1, 2]],
       [[0, 1, 2, 0, 1, 2]]])

>>> b = np.array([[1, 2], [3, 4]])
>>> np.tile(b, 2)
array([[1, 2, 1, 2],
       [3, 4, 3, 4]])
>>> np.tile(b, (2, 1))
array([[1, 2],
       [3, 4],
       [1, 2],
       [3, 4]])

>>> c = np.array([1,2,3,4])
>>> np.tile(c,(4,1))
array([[1, 2, 3, 4],
       [1, 2, 3, 4],
       [1, 2, 3, 4],
       [1, 2, 3, 4]])
```

7.9.7 Repeat each element of an array after themselves: numpy.repeat

npm.**repeat**(*a*, *repeats*, *axis=None*)

Repeat each element of an array after themselves.

See https://numpy.org/doc/stable/reference/generated/numpy.repeat.html#numpy.repeat for details.

```
>>> np.repeat(3, 4)
array([3, 3, 3, 3])

>>> x = np.array([[1,2],[3,4]])
>>> np.repeat(x, 2)
array([1, 1, 2, 2, 3, 3, 4, 4])

>>> np.repeat(x, 3, axis=1)
array([[1, 1, 1, 2, 2, 2],
       [3, 3, 3, 4, 4, 4]])

>>> np.repeat(x, [1, 2], axis=0)
array([[1, 2],
       [3, 4],
       [3, 4]])
```

7.10 Numpy array manipulation: Adding and removing elements

7.10.1 Pad an array: numpy.pad

npm.**pad**(*array*, *pad_width*, *mode='constant'*, ***kwargs*)

Pad an array.

See https://numpy.org/doc/stable/reference/generated/numpy.pad.html for details.

For an array with rank greater than 1, some of the padding of later axes is calculated from padding of previous axes. This is easiest to think about with a rank 2 array where the corners of the padded array are calculated by using padded values from the first axis.

```
>>> a = [1, 2, 3, 4, 5]
np.pad(a, (2, 3), 'constant', constant_values=(4, 6))
array([4, 4, 1, ..., 6, 6, 6])

>>> np.pad(a, (2, 3), 'edge')
array([1, 1, 1, ..., 5, 5, 5])

>>> np.pad(a, (2, 3), 'linear_ramp', end_values=(5, -4))
array([ 5,  3,  1,  2,  3,  4,  5,  2, -1, -4])

>>> np.pad(a, (2,), 'maximum')
array([5, 5, 1, 2, 3, 4, 5, 5, 5])

>>> np.pad(a, (2,), 'mean')
array([3, 3, 1, 2, 3, 4, 5, 3, 3])

>>> np.pad(a, (2,), 'median')
array([3, 3, 1, 2, 3, 4, 5, 3, 3])

>>> a = [[1, 2], [3, 4]]
>>> np.pad(a, ((3, 2), (2, 3)), 'minimum')
array([[1, 1, 1, 2, 1, 1, 1],
       [1, 1, 1, 2, 1, 1, 1],
       [1, 1, 1, 2, 1, 1, 1],
       [1, 1, 1, 2, 1, 1, 1],
       [3, 3, 3, 4, 3, 3, 3],
       [1, 1, 1, 2, 1, 1, 1],
       [1, 1, 1, 2, 1, 1, 1]])

>>> a = [1, 2, 3, 4, 5]
>>> np.pad(a, (2, 3), 'reflect')
array([3, 2, 1, 2, 3, 4, 5, 4, 3, 2])

>>> np.pad(a, (2, 3), 'reflect', reflect_type='odd')
array([-1,  0,  1,  2,  3,  4,  5,  6,  7,  8])

>>> np.pad(a, (2, 3), 'symmetric')
array([2, 1, 1, 2, 3, 4, 5, 5, 4, 3])

>>> np.pad(a, (2, 3), 'symmetric', reflect_type='odd')
array([0, 1, 1, 2, 3, 4, 5, 5, 6, 7])

>>> np.pad(a, (2, 3), 'wrap')
array([4, 5, 1, 2, 3, 4, 5, 1, 2, 3])

>>> def pad_with(vector, pad_width, iaxis, kwargs):
        pad_value = kwargs.get('padder', 10)
        vector[:pad_width[0]] = pad_value
        vector[-pad_width[1]:] = pad_value
>>> a = np.arange(6)
>>> a = a.reshape((2, 3))
>>> np.pad(a, 2, pad_with)
```

(continues on next page)

(continued from previous page)

```
array([[10, 10, 10, 10, 10, 10, 10],
       [10, 10, 10, 10, 10, 10, 10],
       [10, 10,  0,  1,  2, 10, 10],
       [10, 10,  3,  4,  5, 10, 10],
       [10, 10, 10, 10, 10, 10, 10],
       [10, 10, 10, 10, 10, 10, 10]])
>>> np.pad(a, 2, pad_with, padder=100)
array([[100, 100, 100, 100, 100, 100, 100],
       [100, 100, 100, 100, 100, 100, 100],
       [100, 100,   0,   1,   2, 100, 100],
       [100, 100,   3,   4,   5, 100, 100],
       [100, 100, 100, 100, 100, 100, 100],
       [100, 100, 100, 100, 100, 100, 100]])
```

7.10.2 Return a new array with sub-arrays along an axis deleted: numpy.delete

npm.**delete**(*arr*, *obj*, *axis=None*)

Return a new array with sub-arrays along an axis deleted. For a one dimensional array, this returns those entries not returned by arr[obj].

See https://numpy.org/doc/stable/reference/generated/numpy.delete.html#numpy.delete for details.

Often it is preferable to use a boolean mask. For example:

```
>>> arr = np.arange(12) + 1
>>> mask = np.ones(len(arr), dtype=bool)
>>> mask[[0,2,4]] = False
>>> result = arr[mask,...]
```

Is equivalent to `np.delete(arr, [0,2,4], axis=0)`, but allows further use of *mask*.

```
>>> arr = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])
>>> arr
array([[ 1,  2,  3,  4],
       [ 5,  6,  7,  8],
       [ 9, 10, 11, 12]])
>>> np.delete(arr, 1, 0)
array([[ 1,  2,  3,  4],
       [ 9, 10, 11, 12]])

>>> np.delete(arr, np.s_[::2], 1)
array([[ 2,  4],
       [ 6,  8],
       [10, 12]])
>>> np.delete(arr, [1,3,5], None)
array([ 1,  3,  5,  7,  8,  9, 10, 11, 12])
```

7.10.3 Insert values along the given axis before the given indices: numpy.insert

npm.**insert**(*arr*, *obj*, *values*, *axis=None*)

Insert values along the given axis before the given indices.

See https://numpy.org/doc/stable/reference/generated/numpy.insert.html#numpy.insert for details.

Note that for higher dimensional inserts `obj=0` behaves very different from `obj=[0]` just like `arr[:,0,:] = values` is different from `arr[:,[0],:] = values`.

```
>>> a = np.array([[1, 1], [2, 2], [3, 3]])
>>> a
array([[1, 1],
       [2, 2],
```

(continues on next page)

(continued from previous page)

```
       [3, 3]])
>>> np.insert(a, 1, 5)
array([1, 5, 1, ..., 2, 3, 3])
>>> np.insert(a, 1, 5, axis=1)
array([[1, 5, 1],
       [2, 5, 2],
       [3, 5, 3]])
```

Difference between sequence and scalars:

```
>>> np.insert(a, [1], [[1],[2],[3]], axis=1)
array([[1, 1, 1],
       [2, 2, 2],
       [3, 3, 3]])
>>> np.array_equal(np.insert(a, 1, [1, 2, 3], axis=1),
               np.insert(a, [1], [[1],[2],[3]], axis=1))
True

>>> b = a.flatten()
>>> b
array([1, 1, 2, 2, 3, 3])
>>> np.insert(b, [2, 2], [5, 6])
array([1, 1, 5, ..., 2, 3, 3])

>>> np.insert(b, slice(2, 4), [5, 6])
array([1, 1, 5, ..., 2, 3, 3])

>>> np.insert(b, [2, 2], [7.13, False]) # type casting
array([1, 1, 7, ..., 2, 3, 3])

>>> x = np.arange(8).reshape(2, 4)
>>> idx = (1, 3)
np.insert(x, idx, 999, axis=1)
array([[  0, 999,   1,   2, 999,   3],
       [  4, 999,   5,   6, 999,   7]])
```

7.10.4 Append values to the end of an array: numpy.append

npm.**append**(*arr*, *values*, *axis=None*)

Append values to the end of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.append.html#numpy.append for details.

```
>>> np.np.append([1, 2, 3], [[4, 5, 6], [7, 8, 9]])
array([1, 2, 3, ..., 7, 8, 9])
```

When axis is specified, values must have the correct shape.

```
>>> np.append([[1, 2, 3], [4, 5, 6]], [[7, 8, 9]], axis=0)
array([[1, 2, 3],
       [4, 5, 6],
       [7, 8, 9]])
>>> np.append([[1, 2, 3], [4, 5, 6]], [7, 8, 9], axis=0)
Traceback (most recent call last):
    ...
ValueError: all the input arrays must have same number of dimensions, but
the array at index 0 has 2 dimension(s) and the array at index 1 has 1
dimension(s)
```

See https://numpy.org/doc/stable/reference/generated/numpy.resize.html#numpy.resize for details.

If the new array is larger than the original array, then the new array is filled with repeated copies of a. Note that this behavior is different from a.resize(new_shape) which fills with zeros instead of repeated copies of a.

When the total size of the array does not change reshape should be used. In most other cases either indexing (to reduce the size) or padding (to increase the size) may be a more appropriate solution.

Warning: This functionality does not consider axes separately, i.e. it does not apply interpolation/extrapolation. It fills the return array with the required number of elements, iterating over a in C-order, disregarding axes (and cycling back from the start if the new shape is larger). This functionality is therefore not suitable to resize images, or data where each axis represents a separate and distinct entity.

```
>>> a=np.array([[0,1],[2,3]])
>>> np.resize(a,(2,3))
array([[0, 1, 2],
       [3, 0, 1]])

>>> np.resize(a,(1,4))
array([[0, 1, 2, 3]])

>>> np.resize(a,(2,4))
array([[0, 1, 2, 3],
       [0, 1, 2, 3]])
```

7.10.5 Trim zeros from a 1-D array: numpy.trim_zeros

npm.**trim_zeros**(*filt*, *trim='fb'*, *axis=None*)

Trim the leading and/or trailing zeros from a 1-D array or sequence.

See https://numpy.org/doc/stable/reference/generated/numpy.trim_zeros.html#numpy.trim_zeros for details.

```
>>> a = np.array((0, 0, 0, 1, 2, 3, 0, 2, 1, 0))
>>> np.trim_zeros(a)
array([1, 2, 3, 0, 2, 1])
>>> np.trim_zeros(a, 'b')
array([0, 0, 0, ..., 0, 2, 1])
```

The input data type is preserved, list/tuple in means list/tuple out.

```
>>> np.trim_zeros([0, 1, 2, 0])
[1, 2]
```

7.10.6 Find the unique elements of an array: numpy.unique

npm.**unique**(*ar*, *return_index=False*, *return_inverse=False*, *return_counts=False*, *axis=None*, *, *equal_nan=True*)

Find the unique elements of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.unique.html#numpy.unique for details.

Returns the sorted unique elements of an array. There are three optional outputs in addition to the unique elements:

- the indices of the input array that give the unique values
- the indices of the unique array that reconstruct the input array
- the number of times each unique value comes up in the input array

When an axis is specified the subarrays indexed by the axis are sorted. This is done by making the specified axis the first dimension of the array (move the axis to the first dimension to keep the order of the other axes) and then flattening the subarrays in C order. The flattened subarrays are then viewed as a structured type with each element given a label, with the effect that we end up with a 1-D array of structured types that can be treated in the same way as any other 1-D array. The result is that the flattened subarrays are sorted in lexicographic order starting with the first element.

```
>>> np.unique([1, 1, 2, 2, 3, 3])
array([1, 2, 3])
>>> a = np.array([[1, 1], [2, 3]])
>>> np.unique(a)
array([1, 2, 3])
```

Return the unique rows of a 2D array

```
>>> a = np.array([[1, 0, 0], [1, 0, 0], [2, 3, 4]])
>>> np.unique(a, axis=0)
array([[1, 0, 0], [2, 3, 4]])
```

Return the indices of the original array that give the unique values:

```
>>> a = np.array(['a', 'b', 'b', 'c', 'a'])
>>> u, indices = np.unique(a, return_index=True)
>>> u
array(['a', 'b', 'c'], dtype='<U1')
>>> indices
array([0, 1, 3])
>>> a[indices]
array(['a', 'b', 'c'], dtype='<U1')
```

Reconstruct the input array from the unique values and inverse:

```
>>> a = np.array([1, 2, 6, 4, 2, 3, 2])
>>> u, indices = np.unique(a, return_inverse=True)
>>> u
array([1, 2, 3, 4, 6])
>>> indices
array([0, 1, 4, 3, 1, 2, 1])
>>> u[indices]
array([1, 2, 6, 4, 2, 3, 2])
```

Reconstruct the input values from the unique values and counts:

```
>>> a = np.array([1, 2, 6, 4, 2, 3, 2])
>>> values, counts = np.unique(a, return_counts=True)
>>> values
array([1, 2, 3, 4, 6])
>>> counts
array([1, 3, 1, 1, 1])
>>> np.repeat(values, counts)
array([1, 2, 2, 2, 3, 4, 6])    # original order not preserved
```

7.11 Numpy array manipulation: Rearranging elements

7.11.1 Reverse the order of elements in an array along the given axis: numpy.flip

npm.**flip**(*m*, *axis=None*)

Reverse the order of elements in an array along the given axis.

See https://numpy.org/doc/stable/reference/generated/numpy.flip.html#numpy.flip for details.

The shape of the array is preserved, but the elements are reordered.

flip(m, 0) is equivalent to flipud(m).

flip(m, 1) is equivalent to fliplr(m).

flip(m, n) corresponds to `m[...,::-1,...]` with `::-1` at position n.

flip(m) corresponds to `m[::-1,::-1,...,::-1]` with `::-1` at all positions.

flip(m, (0, 1)) corresponds to `m[::-1,::-1,...]` with `::-1` at position 0 and position 1.

```
>>> A = np.arange(8).reshape((2,2,2))
>>> A
array([[[0, 1],
        [2, 3]],
       [[4, 5],
        [6, 7]]])

>>> np.flip(A, 0)
array([[[4, 5],
        [6, 7]],
       [[0, 1],
        [2, 3]]])

>>> np.flip(A, 1)
array([[[2, 3],
        [0, 1]],
       [[6, 7],
        [4, 5]]])

>>> np.flip(A)
array([[[7, 6],
        [5, 4]],
       [[3, 2],
        [1, 0]]])

>>> np.flip(A, (0, 2))
array([[[5, 4],
        [7, 6]],
       [[1, 0],
        [3, 2]]])

>>> A = np.random.randn(3,4,5)
>>> np.all(np.flip(A,2) == A[:,:,::-1,...])
True
```

7.11.2 Reverse the order of elements along axis 1 (left/right): numpy.fliplr

npm.**fliplr**(*m*)

Reverse the order of elements along axis 1 (left/right).

See https://numpy.org/doc/stable/reference/generated/numpy.fliplr.html#numpy.fliplr for details.

For a 2-D array, this flips the entries in each row in the left/right direction. Columns are preserved, but appear in a different order than before.

```
>>> A = np.diag([1.,2.,3.])
>>> A
array([[1.,  0.,  0.],
       [0.,  2.,  0.],
       [0.,  0.,  3.]])
>>> np.fliplr(A)
array([[0.,  0.,  1.],
       [0.,  2.,  0.],
       [3.,  0.,  0.]])

>>> A = np.random.randn(2,3,5)
>>> np.all(np.fliplr(A) == A[:,::-1,...])
True
```

7.11.3 Reverse the order of elements along axis 0 (up/down): numpy.flipud

npm.**flipud**(*m*)

Reverse the order of elements along axis 0 (up/down).

See https://numpy.org/doc/stable/reference/generated/numpy.flipud.html#numpy.flipud for details.

For a 2-D array, this flips the entries in each column in the up/down direction. Rows are preserved, but appear in a different order than before.

Equivalent to `m[::-1, ...]` or `np.flip(m, axis=0)`. Requires the array to be at least 1-D.

```
>>> A = np.diag([1.0, 2, 3])
>>> A
array([[1.,  0.,  0.],
       [0.,  2.,  0.],
       [0.,  0.,  3.]])
>>> np.flipud(A)
array([[0.,  0.,  3.],
       [0.,  2.,  0.],
       [1.,  0.,  0.]])

>>> A = np.random.randn(2,3,5)
>>> np.all(np.flipud(A) == A[::-1,...])
True

>>> np.flipud([1,2])
array([2, 1])
```

7.11.4 Roll array elements along a given axis: numpy.roll

npm.**roll**(*a*, *shift*, *axis=None*)

Roll array elements along a given axis.

See https://numpy.org/doc/stable/reference/generated/numpy.roll.html#numpy.roll for details.

Elements that roll beyond the last position are re-introduced at the first.

```
>>> x = np.arange(10)
>>> np.roll(x, 2)
array([8, 9, 0, 1, 2, 3, 4, 5, 6, 7])
>>> np.roll(x, -2)
array([2, 3, 4, 5, 6, 7, 8, 9, 0, 1])

>>> x2 = np.reshape(x, (2, 5))
>>> x2
array([[0, 1, 2, 3, 4],
       [5, 6, 7, 8, 9]])
```

(continues on next page)

(continued from previous page)

```
>>> np.roll(x2, 1)
array([[9, 0, 1, 2, 3],
       [4, 5, 6, 7, 8]])
>>> np.roll(x2, -1)
array([[1, 2, 3, 4, 5],
       [6, 7, 8, 9, 0]])
>>> np.roll(x2, 1, axis=0)
array([[5, 6, 7, 8, 9],
       [0, 1, 2, 3, 4]])
>>> np.roll(x2, -1, axis=0)
array([[5, 6, 7, 8, 9],
       [0, 1, 2, 3, 4]])
>>> np.roll(x2, 1, axis=1)
array([[4, 0, 1, 2, 3],
       [9, 5, 6, 7, 8]])
>>> np.roll(x2, -1, axis=1)
array([[1, 2, 3, 4, 0],
       [6, 7, 8, 9, 5]])
>>> np.roll(x2, (1, 1), axis=(1, 0))
array([[9, 5, 6, 7, 8],
       [4, 0, 1, 2, 3]])
>>> np.roll(x2, (2, 1), axis=(1, 0))
array([[8, 9, 5, 6, 7],
       [3, 4, 0, 1, 2]])
```

7.11.5 Rotate an array by 90 degrees: numpy.rot90

npm.**rot90**(*m*, *k=1*, *axes=(0, 1)*)

Rotate an array by 90 degrees in the plane specified by axes.

See https://numpy.org/doc/stable/reference/generated/numpy.rot90.html#numpy.rot90 for details.

Rotation direction is from the first towards the second axis. This means for a 2D array with the default k and axes, the rotation will be counterclockwise

`rot90(m, k=1, axes=(1,0))` is the reverse of `rot90(m, k=1, axes=(0,1))`

`rot90(m, k=1, axes=(1,0))` is equivalent to `rot90(m, k=-1, axes=(0,1))`

```
>>> m = np.array([[1,2],[3,4]], int)
>>> m
array([[1, 2],
       [3, 4]])
>>> np.rot90(m)
array([[2, 4],
       [1, 3]])
>>> np.rot90(m, 2)
array([[4, 3],
       [2, 1]])
>>> m = np.arange(8).reshape((2,2,2))
>>> np.rot90(m, 1, (1,2))
array([[[1, 3],
        [0, 2]],
       [[5, 7],
        [4, 6]]])
```

7.12 Numpy array manipulation: Sorting

7.12.1 Sorted copy of an array: numpy.sort

npm.**sort**(*a*, *axis=-1*, *kind=None*, *order=None*, ***, *stable=None*)

Return a sorted copy of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.sort.html#numpy.sort for details.

The various sorting algorithms are characterized by their average speed, worst case performance, work space size, and whether they are stable. A stable sort keeps items with the same key in the same relative order. The four algorithms implemented in NumPy have the following properties:

All the sort algorithms make temporary copies of the data when sorting along any but the last axis. Consequently, sorting along the last axis is faster and uses less space than sorting along any other axis.

The sort order for complex numbers is lexicographic. If both the real and imaginary parts are non-nan then the order is determined by the real parts except when they are equal, in which case the order is determined by the imaginary parts.

Previous to numpy 1.4.0 sorting real and complex arrays containing nan values led to undefined behaviour. In numpy versions >= 1.4.0 nan values are sorted to the end. The extended sort order is:

Real: [R, nan]

Complex: [R + Rj, R + nanj, nan + Rj, nan + nanj]

where R is a non-nan real value. Complex values with the same nan placements are sorted according to the non-nan part if it exists. Non-nan values are sorted as before.

quicksort has been changed to introsort. When sorting does not make enough progress it switches to heapsort. This implementation makes quicksort O(n*log(n)) in the worst case.

'stable' automatically chooses the best stable sorting algorithm for the data type being sorted. It, along with 'mergesort' is currently mapped to timsort or radix sort depending on the data type. API forward compatibility currently limits the ability to select the implementation and it is hardwired for the different data types.

Timsort is added for better performance on already or nearly sorted data. On random data timsort is almost identical to mergesort. It is now used for stable sort while quicksort is still the default sort if none is chosen. For timsort details, refer to CPython listsort.txt. 'mergesort' and 'stable' are mapped to radix sort for integer data types. Radix sort is an O(n) sort instead of O(n log n).

```
>>> a = np.array([[1,4],[3,1]])
>>> np.sort(a)                # sort along the last axis
array([[1, 4],
       [1, 3]])
>>> np.sort(a, axis=None)     # sort the flattened array
array([1, 1, 3, 4])
>>> np.sort(a, axis=0)        # sort along the first axis
array([[1, 1],
       [3, 4]])
```

Use the order keyword to specify a field to use when sorting a structured array:

```
>>> dtype = [('name', 'S10'), ('height', float), ('age', int)]
>>> values = [('Arthur', 1.8, 41), ('Lancelot', 1.9, 38),
          ('Galahad', 1.7, 38)]
>>> a = np.array(values, dtype=dtype)       # create a structured array
>>> np.sort(a, order='height')
array([('Galahad', 1.7, 38), ('Arthur', 1.8, 41),
       ('Lancelot', 1.8999999999999999, 38)],
      dtype=[('name', '|S10'), ('height', '<f8'), ('age', '<i4')])
Sort by age, then height if ages are equal:
```

(continues on next page)

(continued from previous page)

```
np.sort(a, order=['age', 'height'])
array([('Galahad', 1.7, 38), ('Lancelot', 1.8999999999999999, 38),
       ('Arthur', 1.8, 41)],
      dtype=[('name', '|S10'), ('height', '<f8'), ('age', '<i4')])
```

ndarray.sort

https://numpy.org/doc/stable/reference/generated/numpy.ndarray.sort.html#numpy.ndarray.sort

Sort an array in-place. Refer to numpy.sort for full documentation.

```
>>> a = np.array([[1,4], [3,1]])
>>> a.sort(axis=1)
>>> a
array([[1, 4],
       [1, 3]])
>>> a.sort(axis=0)
>>> a
array([[1, 3],
       [1, 4]])
```

Use the order keyword to specify a field to use when sorting a structured array:

```
>>> a = np.array([('a', 2), ('c', 1)], dtype=[('x', 'S1'), ('y', int)])
>>> a.sort(order='y')
>>> a
array([(b'c', 1), (b'a', 2)],
      dtype=[('x', 'S1'), ('y', '<i8')])
```

7.12.2 Indirect stable sort using a sequence of keys: numpy.lexsort

npm.**lexsort**(*keys*, *axis=-1*)

Perform an indirect stable sort using a sequence of keys.

See https://numpy.org/doc/stable/reference/generated/numpy.lexsort.html#numpy.lexsort for details.

Given multiple sorting keys, which can be interpreted as columns in a spreadsheet, lexsort returns an array of integer indices that describes the sort order by multiple columns. The last key in the sequence is used for the primary sort order, the second-to-last key for the secondary sort order, and so on. The keys argument must be a sequence of objects that can be converted to arrays of the same shape. If a 2D array is provided for the keys argument, its rows are interpreted as the sorting keys and sorting is according to the last row, second last row etc.

Sort names: first by surname, then by name.

```
>>> surnames =    ('Hertz',    'Galilei', 'Hertz')
>>> first_names = ('Heinrich', 'Galileo', 'Gustav')
>>> ind = np.lexsort((first_names, surnames))
>>> ind
array([1, 2, 0])

>>> [surnames[i] + ", " + first_names[i] for i in ind]
['Galilei, Galileo', 'Hertz, Gustav', 'Hertz, Heinrich']
```

Sort two columns of numbers:

```
>>> a = [1,5,1,4,3,4,4] # First column
>>> b = [9,4,0,4,0,2,1] # Second column
>>> ind = np.lexsort((b,a)) # Sort by a, then by b
>>> ind
array([2, 0, 4, 6, 5, 3, 1])
```

(continues on next page)

(continued from previous page)

```
>>> [(a[i],b[i]) for i in ind]
[(1, 0), (1, 9), (3, 0), (4, 1), (4, 2), (4, 4), (5, 4)]
```

Note that sorting is first according to the elements of a. Secondary sorting is according to the elements of b.

A normal argsort would have yielded:

```
>>> [(a[i],b[i]) for i in np.argsort(a)]
[(1, 9), (1, 0), (3, 0), (4, 4), (4, 2), (4, 1), (5, 4)]
```

Structured arrays are sorted lexically by argsort:

```
>>> x = np.array([(1,9), (5,4), (1,0), (4,4), (3,0), (4,2), (4,1)], dtype=np.dtype([('x', int), ('y', int)]))
>>> np.argsort(x) # or np.argsort(x, order=('x', 'y'))
array([2, 0, 4, 6, 5, 3, 1])
```

7.12.3 Indices that would sort an array: numpy.argsort

npm.**argsort**(*a*, *axis=-1*, *kind=None*, *order=None*, ***, *stable=None*)

Returns the indices that would sort an array.

See https://numpy.org/doc/stable/reference/generated/numpy.argsort.html#numpy.argsort for details.

Perform an indirect sort along the given axis using the algorithm specified by the kind keyword. It returns an array of indices of the same shape as a that index data along the given axis in sorted order.

One dimensional array:

```
>>> x = np.array([3, 1, 2])
>>> np.argsort(x)
array([1, 2, 0])
```

Two-dimensional array:

```
>>> x = np.array([[0, 3], [2, 2]])
>>> x
array([[0, 3],
       [2, 2]])

>>> ind = np.argsort(x, axis=0)  # sorts along first axis (down)
>>> ind
array([[0, 1],
       [1, 0]])
>>> np.take_along_axis(x, ind, axis=0)  # same as np.sort(x, axis=0)
array([[0, 2],
       [2, 3]])

>>> ind = np.argsort(x, axis=1)  # sorts along last axis (across)
>>> ind
array([[0, 1],
       [0, 1]])
>>> np.take_along_axis(x, ind, axis=1)  # same as np.sort(x, axis=1)
array([[0, 3],
       [2, 2]])
```

Indices of the sorted elements of a N-dimensional array:

```
>>> ind = np.unravel_index(np.argsort(x, axis=None), x.shape)
>>> ind
(array([0, 1, 1, 0]), array([0, 0, 1, 1]))
x[ind]  # same as np.sort(x, axis=None)
array([0, 2, 2, 3])
```

Sorting with keys:

```
>>> x = np.array([(1, 0), (0, 1)], dtype=[('x', '<i4'), ('y', '<i4')])
>>> x
array([(1, 0), (0, 1)],
      dtype=[('x', '<i4'), ('y', '<i4')])

>>> np.argsort(x, order=('x','y'))
array([1, 0])

>>> np.argsort(x, order=('y','x'))
array([0, 1])
```

7.12.4 Matching 1d index and data slices: numpy.take_along_axis

npm.**take_along_axis**(*arr*, *indices*, *axis=-1*)

Take values from the input array by matching 1d index and data slices.

This iterates over matching 1d slices oriented along the specified axis in the index and data arrays, and uses the former to look up values in the latter. These slices can be different lengths.

See https://numpy.org/doc/stable/reference/generated/numpy.argsort.html#numpy.argsort for details.

One dimensional array:

```
>>> a = np.array([[10, 30, 20], [60, 40, 50]])
>>> np.sort(a, axis=1)
array([[10, 20, 30],
       [40, 50, 60]])

>>> ai = np.argsort(a, axis=1)
>>> ai
array([[0, 2, 1],
       [1, 2, 0]])

>>> np.take_along_axis(a, ai, axis=1)
array([[10, 20, 30],
       [40, 50, 60]])
```

7.12.5 Sorting a complex array: numpy.sort_complex

npm.**sort_complex**(*a*, *axis=-1*, *kind=None*, *order=None*, *, *stable=None*)

Sort a complex array using the real part first, then the imaginary part.

See https://numpy.org/doc/stable/reference/generated/numpy.sort_complex.html#numpy.sort_complex for details.

```
>>> np.sort_complex([5, 3, 6, 2, 1])
array([1.+0.j, 2.+0.j, 3.+0.j, 5.+0.j, 6.+0.j])

>>> np.sort_complex([1 + 2j, 2 - 1j, 3 - 2j, 3 - 3j, 3 + 5j])
array([1.+2.j,  2.-1.j,  3.-3.j,  3.-2.j,  3.+5.j])
```

7.13 Numpy array manipulation: Searching

7.13.1 Indices of the maximum values along an axis: numpy.argmax

npm.**argmax**(*a*, *axis=None*, *out=None*, ***, *keepdims=<no value>*)

Returns the indices of the maximum values along an axis.

See https://numpy.org/doc/stable/reference/generated/numpy.argmax.html#numpy.argmax for details.

In case of multiple occurrences of the maximum values, the indices corresponding to the first occurrence are returned.

```
>>> a = np.arange(6).reshape(2,3) + 10
>>> a
array([[10, 11, 12],
       [13, 14, 15]])
>>> np.argmax(a)
5
>>> np.argmax(a, axis=0)
array([1, 1, 1])
>>> np.argmax(a, axis=1)
array([2, 2])
```

Indexes of the maximal elements of a N-dimensional array:

```
>>> ind = np.unravel_index(np.argmax(a, axis=None), a.shape)
>>> ind
(1, 2)
>>> a[ind]
15

>>> b = np.arange(6)
>>> b[1] = 5
>>> b
array([0, 5, 2, 3, 4, 5])
>>> np.argmax(b)  # Only the first occurrence is returned.
1

>>> x = np.array([[4,2,3], [1,0,3]])
>>> index_array = np.argmax(x, axis=-1)
>>> # Same as np.amax(x, axis=-1, keepdims=True)
>>> np.take_along_axis(x, np.expand_dims(index_array, axis=-1), axis=-1)
array([[4],
       [3]])
>>> # Same as np.amax(x, axis=-1)
>>> np.take_along_axis(x, np.expand_dims(index_array, axis=-1), axis=-1).squeeze(axis=-1)
array([4, 3])
```

Setting keepdims to True,

```
>>> x = np.arange(24).reshape((2, 3, 4))
>>> res = np.argmax(x, axis=1, keepdims=True)
>>> res.shape
(2, 1, 4)
```

7.13.2 Get indices of the minimum values along an axis: numpy.argmin

npm.**argmin**(*a*, *axis=None*, *out=None*, ***, *keepdims=<no value>*)

Returns the indices of the minimum values along an axis.

See https://numpy.org/doc/stable/reference/generated/numpy.argmin.html#numpy.argmin for details.

```
>>> a = np.arange(6).reshape(2,3) + 10
>>> a
array([[10, 11, 12],
       [13, 14, 15]])
>>> np.argmin(a)
0
>>> np.argmin(a, axis=0)
array([0, 0, 0])
>>> np.argmin(a, axis=1)
array([0, 0])
```

Indices of the minimum elements of a N-dimensional array:

```
>>> ind = np.unravel_index(np.argmin(a, axis=None), a.shape)
>>> ind
(0, 0)
>>> a[ind]
10

>>> b = np.arange(6) + 10
>>> b[4] = 10
b
>>> array([10, 11, 12, 13, 10, 15])
np.argmin(b)  # Only the first occurrence is returned.
0

>>> x = np.array([[4,2,3], [1,0,3]])
>>> index_array = np.argmin(x, axis=-1)
>>> # Same as np.amin(x, axis=-1, keepdims=True)
>>> np.take_along_axis(x, np.expand_dims(index_array, axis=-1), axis=-1)
array([[2],
       [0]])
>>> # Same as np.amax(x, axis=-1)
>>> np.take_along_axis(x, np.expand_dims(index_array, axis=-1), axis=-1).squeeze(axis=-1)
array([2, 0])
```

Setting keepdims to True,

```
>>> x = np.arange(24).reshape((2, 3, 4))
>>> res = np.argmin(x, axis=1, keepdims=True)
>>> res.shape
(2, 1, 4)
```

7.13.3 Find the indices of array elements that are non-zero, grouped by element: numpy.argwhere

npm.**argwhere**(*a*)

Find the indices of array elements that are non-zero, grouped by element.

See https://numpy.org/doc/stable/reference/generated/numpy.argwhere.html#numpy.argwhere for details.

np.argwhere(a) is almost the same as np.transpose(np.nonzero(a)), but produces a result of the correct shape for a 0D array.

The output of argwhere is not suitable for indexing arrays. For this purpose use nonzero(a) instead.

```
>>> x = np.arange(6).reshape(2,3)
>>> x
array([[0, 1, 2],
       [3, 4, 5]])
>>> np.argwhere(x>1)
array([[0, 2],
       [1, 0],
       [1, 1],
       [1, 2]])
```

7.13.4 Get the indices of array elements that are non-zero: numpy.nonzero

npm.**nonzero**(*a*)

Return the indices of the elements that are non-zero.

See https://numpy.org/doc/stable/reference/generated/numpy.nonzero.html#numpy.nonzero for details.

Returns a tuple of arrays, one for each dimension of a, containing the indices of the non-zero elements in that dimension. The values in a are always tested and returned in row-major, C-style order.

To group the indices by element, rather than dimension, use argwhere, which returns a row for each non-zero element.

While the nonzero values can be obtained with a[nonzero(a)], it is recommended to use x[x.astype(bool)] or x[x != 0] instead, which will correctly handle 0-d arrays.

```
>>> x = np.array([[3, 0, 0], [0, 4, 0], [5, 6, 0]])
>>> x
array([[3, 0, 0],
       [0, 4, 0],
       [5, 6, 0]])
>>> np.nonzero(x)
(array([0, 1, 2, 2]), array([0, 1, 0, 1]))

>>> x[np.nonzero(x)]
array([3, 4, 5, 6])
>>> np.transpose(np.nonzero(x))
array([[0, 0],
       [1, 1],
       [2, 0],
       [2, 1]])
```

A common use for nonzero is to find the indices of an array, where a condition is True. Given an array a, the condition a > 3 is a boolean array and since False is interpreted as 0, np.nonzero(a > 3) yields the indices of the a where the condition is true.

```
>>> a = np.array([[1, 2, 3], [4, 5, 6], [7, 8, 9]])
a > 3
array([[False, False, False],
       [ True,  True,  True],
       [ True,  True,  True]])
>>> np.nonzero(a > 3)
(array([1, 1, 1, 2, 2, 2]), array([0, 1, 2, 0, 1, 2]))
```

Using this result to index a is equivalent to using the mask directly:

```
>>> a[np.nonzero(a > 3)]
array([4, 5, 6, 7, 8, 9])
>>> a[a > 3]  # prefer this spelling
array([4, 5, 6, 7, 8, 9])
```

nonzero can also be called as a method of the array.

```
>>> (a > 3).nonzero()
(array([1, 1, 1, 2, 2, 2]), array([0, 1, 2, 0, 1, 2]))
```

7.13.5 Return elements depending on a condition: numpy.where

npm.**where**(*condition*, [*x*, *y*,]/)

Return elements chosen from x or y depending on condition.

See https://numpy.org/doc/stable/reference/generated/numpy.where.html#numpy.where for details

```
>>> a = np.arange(10)
>>> a
array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
>>> np.where(a < 5, a, 10*a)
array([ 0,  1,  2,  3,  4, 50, 60, 70, 80, 90])
```

This can be used on multidimensional arrays too:

```
>>> np.where([[True, False], [True, True]],
         [[1, 2], [3, 4]],
         [[9, 8], [7, 6]])
array([[1, 8],
       [3, 4]])
```

The shapes of x, y, and the condition are broadcast together:

```
>>> x, y = np.ogrid[:3, :4]
>>> np.where(x < y, x, 10 + y)  # both x and 10+y are broadcast
array([[10,  0,  0,  0],
       [10, 11,  1,  1],
       [10, 11, 12,  2]])

>>> a = np.array([[0, 1, 2],
               [0, 2, 4],
               [0, 3, 6]])
>>> np.where(a < 4, a, -1)  # -1 is broadcast
array([[ 0,  1,  2],
       [ 0,  2, -1],
       [ 0,  3, -1]])
```

7.13.6 Return an array drawn from elements in choicelist, depending on a condition: numpy.select

npm.**select**(*condlist*, *choicelist*, *default=0*)

Return an array drawn from elements in choicelist, depending on conditions.

See https://numpy.org/doc/stable/reference/generated/numpy.select.html for details

Beginning with an array of integers from 0 to 5 (inclusive), elements less than 3 are negated, elements greater than 3 are squared, and elements not meeting either of these conditions (exactly 3) are replaced with a default value of 42.

```
>>> a = np.arange(6)
>>> condlist = [x<3, x>3]
>>> choicelist = [-x, x**2]
>>> np.select(condlist, choicelist, 42)
array([ 0,  -1,  -2, 42, 16, 25])
```

```
>>> condlist = [x<=4, x>3]
>>> choicelist = [x, x**2]
>>> np.select(condlist, choicelist, 55)
array([ 0,  1,  2,  3,  4, 25])
```

7.14 Numpy mathematical functions: Sums, products, differences

See also: https://numpy.org/doc/stable/reference/routines.math.html

7.14.1 Product of array elements: numpy.prod

npm.**prod**(*a*, *axis=None*, *dtype=None*, *out=None*, *keepdims=<no value>*, *initial=<no value>*, *where=<no value>*)

Return the product of array elements over a given axis. The product of an empty array is the neutral element 1.

See https://numpy.org/doc/stable/reference/generated/numpy.prod.html#numpy.prod for details.

```
>>> np.prod([])
1.0
```

By default, calculate the product of all elements:

```
>>> np.prod(a, axis=1)
array([  2.,  12.])
>>> np.prod(a, axis=0)
array([3., 8.])
```

Or select specific elements to include:

```
>>> np.prod([1., np.nan, 3.], where=[True, False, True])
3.0
```

If the type of x is unsigned, then the output type is the unsigned platform integer:

```
>>> x = np.array([1, 2, 3], dtype=np.uint8)
np.prod(x).dtype == np.uint
True
```

If x is of a signed integer type, then the output type is the default platform integer:

```
>>> x = np.array([1, 2, 3], dtype=np.int8)
np.prod(x).dtype == int
True
```

You can also start the product with a value other than one:

```
>>> np.prod([1, 2], initial=5)
10
```

7.14.2 Sum of array elements: numpy.sum

npm.**sum**(*a*, *axis=None*, *dtype=None*, *out=None*, *keepdims=<no value>*, *initial=<no value>*, *where=<no value>*)

Sum of array elements over a given axis. The sum of an empty array is the neutral element 0.

See https://numpy.org/doc/stable/reference/generated/numpy.sum.html#numpy.sum for details.

```
>>> np.prod([])
1.0
```

For floating point numbers the numerical precision of sum (and np.add.reduce) is in general limited by directly adding each number individually to the result causing rounding errors in every step. However, often numpy will use a numerically better approach (partial pairwise summation) leading to improved precision in many use-cases. This improved precision is always provided when no axis is given. When axis is given, it will depend on which axis is summed. Technically, to provide the best speed possible, the improved precision is only used when the summation is along the fast axis in memory. Note that the exact precision may vary depending on other parameters. In contrast to NumPy, Python's math.fsum function uses a slower but more

precise approach to summation. Especially when summing a large number of lower precision floating point numbers, such as float32, numerical errors can become significant. In such cases it can be advisable to use dtype="float64" to use a higher precision for the output.

```
>>> np.sum([0.5, 1.5])
2.0
>>> np.sum([0.5, 0.7, 0.2, 1.5], dtype=np.int32)
1
>>> np.sum([[0, 1], [0, 5]])
6
>>> np.sum([[0, 1], [0, 5]], axis=0)
array([0, 6])
>>> np.sum([[0, 1], [0, 5]], axis=1)
array([1, 5])
>>> np.sum([[0, 1], [np.nan, 5]], where=[False, True], axis=1)
array([1., 5.])
```

If the accumulator is too small, overflow occurs:

```
>>> np.ones(128, dtype=np.int8).sum(dtype=np.int8)
-128
```

You can also start the sum with a value other than zero:

```
>>> np.sum([10], initial=5)
15
```

7.14.3 Cumulative product of array elements: numpy.cumprod

npm.**cumprod**(*a*, *axis=None*, *dtype=None*, *out=None*)

Return the cumulative product of elements along a given axis.

See https://numpy.org/doc/stable/reference/generated/numpy.cumprod.html#numpy.cumprod for details.

```
>>> a = np.array([1,2,3])
>>> np.cumprod(a) # intermediate results 1, 1*2
              # total product 1*2*3 = 6
array([1, 2, 6])
>>> a = np.array([[1, 2, 3], [4, 5, 6]])
>>> np.cumprod(a, dtype=float) # specify type of output
array([   1.,    2.,    6.,   24.,  120.,  720.])
```

The cumulative product for each column (i.e., over the rows) of a:

```
>>> np.cumprod(a, axis=0)
array([[ 1,  2,  3],
       [ 4, 10, 18]])
```

The cumulative product for each row (i.e. over the columns) of a:

```
>>> np.cumprod(a,axis=1)
array([[  1,   2,   6],
       [  4,  20, 120]])
```

7.14.4 Cumulative sum of array elements: numpy.cumsum

npm.**cumsum**(*a*, *axis=None*, *dtype=None*, *out=None*)

Return the cumulative sum of the elements along a given axis.

See https://numpy.org/doc/stable/reference/generated/numpy.cumsum.html#numpy.cumsum for details.

Arithmetic is modular when using integer types, and no error is raised on overflow.

cumsum(a)[-1] may not be equal to sum(a) for floating-point values since sum may use a pairwise summation routine, reducing the roundoff-error. See sum for more information.

The cumulative product for each row (i.e. over the columns) of a:

```
>>> a = np.array([[1,2,3], [4,5,6]])
>>> a
array([[1, 2, 3],
       [4, 5, 6]])
>>> np.cumsum(a)
array([ 1,  3,  6, 10, 15, 21])
>>> np.cumsum(a, dtype=float)     # specifies type of output value(s)
array([  1.,   3.,   6.,  10.,  15.,  21.])

>>> np.cumsum(a,axis=0)      # sum over rows for each of the 3 columns
array([[1, 2, 3],
       [5, 7, 9]])
>>> np.cumsum(a,axis=1)      # sum over columns for each of the 2 rows
array([[ 1,  3,  6],
       [ 4,  9, 15]])
```

cumsum(b)[-1] may not be equal to sum(b)

```
>>> b = np.array([1, 2e-9, 3e-9] * 1000000)
>>> b.cumsum()[-1]
1000000.0050045159
>>> b.sum()
1000000.0050000029
```

7.14.5 N-th discrete difference: numpy.diff

npm.**diff**(*a*, *n=1*, *axis=-1*, *prepend=<no value>*, *append=<no value>*)

Calculate the n-th discrete difference along the given axis.

See https://numpy.org/doc/stable/reference/generated/numpy.diff.html#numpy.diff for details.

The first difference is given by out[i] = a[i+1] - a[i] along the given axis, higher differences are calculated by using diff recursively.

```
>>> x = np.array([1, 2, 4, 7, 0])
>>> np.diff(x)
array([ 1,  2,  3, -7])
>>> np.diff(x, n=2)
array([  1,   1, -10])

>>> x = np.array([[1, 3, 6, 10], [0, 5, 6, 8]])
>>> np.diff(x)
array([[2, 3, 4],
       [5, 1, 2]])
>>> np.diff(x, axis=0)
array([[-1,  2,  0, -2]])

>>> x = np.arange('1066-10-13', '1066-10-16', dtype=np.datetime64)
>>> np.diff(x)
array([1, 1], dtype='timedelta64[D]')
```

7.14.6 Differences between consecutive elements: numpy.ediff1d

npm.**ediff1d**(*ary*, *to_end=None*, *to_begin=None*)

Calculate the differences between consecutive elements of an array.

See https://numpy.org/doc/stable/reference/generated/numpy.ediff1d.html#numpy.ediff1d for details.

The differences between consecutive elements of an array.

```
>>> x = np.array([1, 2, 4, 7, 0])
>>> np.ediff1d(x)
array([ 1,  2,  3, -7])

>>> np.ediff1d(x, to_begin=-99, to_end=np.array([88, 99]))
array([-99,   1,   2, ...,  -7,  88,  99])
```

The returned array is always 1D.

```
>>> y = [[1, 2, 4], [1, 6, 24]]
>>> np.ediff1d(y)
array([ 1,  2, -3,  5, 18])
```

7.14.7 Gradient of an N-dimensional array: numpy.gradient

npm.**gradient**(*f*, **varargs*, *axis=None*, *edge_order=1*)

Return the gradient of an N-dimensional array.

See https://numpy.org/doc/stable/reference/generated/numpy.gradient.html#numpy.gradient for details.

The gradient is computed using second order accurate central differences in the interior points and either first or second order accurate one-sides (forward or backwards) differences at the boundaries. The returned gradient hence has the same shape as the input array.

```
>>> f = np.array([1, 2, 4, 7, 11, 16], dtype=float)
>>> np.gradient(f)
array([1. , 1.5, 2.5, 3.5, 4.5, 5. ])
>>> np.gradient(f, 2)
array([0.5 ,  0.75,  1.25,  1.75,  2.25,  2.5 ])
```

Spacing can be also specified with an array that represents the coordinates of the values F along the dimensions. For instance a uniform spacing:

```
>>> x = np.arange(f.size)
>>> np.gradient(f, x)
array([1. ,  1.5,  2.5,  3.5,  4.5,  5. ])
```

Or a non uniform one:

```
>>> x = np.array([0., 1., 1.5, 3.5, 4., 6.], dtype=float)
>>> np.gradient(f, x)
array([1. ,  3. ,  3.5,  6.7,  6.9,  2.5])
```

For two dimensional arrays, the return will be two arrays ordered by axis. In this example the first array stands for the gradient in rows and the second one in columns direction:

```
>>> np.gradient(np.array([[1, 2, 6], [3, 4, 5]], dtype=float))
[array([[ 2.,  2., -1.],
       [ 2.,  2., -1.]]), array([[1. , 2.5, 4. ],
       [1. , 1. , 1. ]])]
```

In this example the spacing is also specified: uniform for axis=0 and non uniform for axis=1

```
>>> dx = 2.
>>> y = [1., 1.5, 3.5]
>>> np.gradient(np.array([[1, 2, 6], [3, 4, 5]], dtype=float), dx, y)
[array([[ 1. ,  1. , -0.5],
       [ 1. ,  1. , -0.5]]), array([[2. , 2. , 2. ],
       [2. , 1.7, 0.5]])]
```

It is possible to specify how boundaries are treated using edge_order

```
>>> x = np.array([0, 1, 2, 3, 4])
>>> f = x**2
>>> np.gradient(f, edge_order=1)
array([1.,  2.,  4.,  6.,  7.])
>>> np.gradient(f, edge_order=2)
array([0., 2., 4., 6., 8.])
```

The axis keyword can be used to specify a subset of axes of which the gradient is calculated

```
>>> np.gradient(np.array([[1, 2, 6], [3, 4, 5]], dtype=float), axis=0)
array([[ 2.,  2., -1.],
       [ 2.,  2., -1.]])
```

7.14.8 Trapezoidal rule: numpy.trapezoid

npm.**trapezoid**(*y*, *x=None*, *dx=1.0*, *axis=-1*)

Integrate along the given axis using the composite trapezoidal rule.

Note was called trapez before NumPy 2.0.

See https://numpy.org/doc/stable/reference/generated/numpy.trapezoid.html#numpy-trapezoid for details.

If x is provided, the integration happens in sequence along its elements - they are not sorted.

Use the trapezoidal rule on evenly spaced points:

```
>>> np.trapz([1, 2, 3])
4.0
```

The spacing between sample points can be selected by either the x or dx arguments:

```
>>> np.trapz([1, 2, 3], x=[4, 6, 8])
8.0
>>> np.trapz([1, 2, 3], dx=2)
8.0
```

Using a decreasing x corresponds to integrating in reverse:

```
>>> np.trapz([1, 2, 3], x=[8, 6, 4])
-8.0
```

More generally x is used to integrate along a parametric curve. We can estimate the integral using:

```
>>> x = np.linspace(0, 1, num=50)
>>> y = x**2
>>> np.trapz(y, x)
0.33340274885464394
```

Or estimate the area of a circle, noting we repeat the sample which closes the curve:

```
>>> theta = np.linspace(0, 2 * np.pi, num=1000, endpoint=True)
>>> np.trapz(np.cos(theta), x=np.sin(theta))
3.141571941375841
```

np.trapz can be applied along a specified axis to do multiple computations in one call:

```
>>> a = np.arange(6).reshape(2, 3)
>>> a
array([[0, 1, 2],
       [3, 4, 5]])
>>> np.trapz(a, axis=0)
array([1.5, 2.5, 3.5])
>>> np.trapz(a, axis=1)
array([2.,  8.])
```

7.15 Numpy mathematical functions: Extrema Finding

7.15.1 Element-wise maximum of array elements: numpy.maximum

npm.**maximum**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Element-wise maximum of array elements.

See https://numpy.org/doc/stable/reference/generated/numpy.maximum.html#numpy.maximum for details.

Compare two arrays and return a new array containing the element-wise maxima. If one of the elements being compared is a NaN, then that element is returned. If both elements are NaNs then the first is returned. The latter distinction is important for complex NaNs, which are defined as at least one of the real or imaginary parts being a NaN. The net effect is that NaNs are propagated.

```
>>> np.maximum([2, 3, 4], [1, 5, 2])
array([2, 5, 4])

>>> np.maximum(np.eye(2), [0.5, 2]) # broadcasting
array([[ 1. ,  2. ],
       [ 0.5,  2. ]])

>>> np.maximum([np.nan, 0, np.nan], [0, np.nan, np.nan])
array([nan, nan, nan])
>>> np.maximum(np.Inf, 1)
inf
```

7.15.2 Element-wise minimum of array elements: numpy.minimum

npm.**minimum**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

See https://numpy.org/doc/stable/reference/generated/numpy.minimum.html#numpy.minimum for details.

Compare two arrays and return a new array containing the element-wise minima. If one of the elements being compared is a NaN, then that element is returned. If both elements are NaNs then the first is returned. The latter distinction is important for complex NaNs, which are defined as at least one of the real or imaginary parts being a NaN. The net effect is that NaNs are propagated.

```
>>> np.minimum([2, 3, 4], [1, 5, 2])
array([1, 3, 2])

>>> np.minimum(np.eye(2), [0.5, 2]) # broadcasting
array([[ 0.5,  0. ],
       [ 0. ,  1. ]])

>>> np.minimum([np.nan, 0, np.nan],[0, np.nan, np.nan])
array([nan, nan, nan])
>>> np.minimum(-np.Inf, 1)
-inf
```

7.15.3 Maximum of an array or maximum along an axis: numpy.max

npm.**max**(*a*, *axis=None*, *out=None*, *keepdims=<no value>*, *initial=<no value>*, *where=<no value>*)

Return the maximum of an array or maximum along an axis.

See https://numpy.org/doc/stable/reference/generated/numpy.max.html#numpy.max for details

NaN values are propagated, that is if at least one item is NaN, the corresponding max value will be NaN as well. To ignore NaN values (MATLAB behavior), please use nanmax.

Don't use max for element-wise comparison of 2 arrays; when a.shape[0] is 2, maximum(a[0], a[1]) is faster than max(a, axis=0).

```
>>> a = np.arange(4).reshape((2,2))
>>> a
array([[0, 1],
       [2, 3]])
>>> np.max(a)           # Maximum of the flattened array
3
>>> np.max(a, axis=0)   # Maxima along the first axis
array([2, 3])
>>> np.max(a, axis=1)   # Maxima along the second axis
array([1, 3])
>>> np.max(a, where=[False, True], initial=-1, axis=0)
array([-1,  3])
>>> b = np.arange(5, dtype=float)
>>> b[2] = np.NaN
>>> np.max(b)
nan
>>> np.max(b, where=~np.isnan(b), initial=-1)
4.0
>>> np.nanmax(b)
4.0
```

You can use an initial value to compute the maximum of an empty slice, or to initialize it to a different value:

```
>>> np.max([[-50], [10]], axis=-1, initial=0)
array([ 0, 10])
```

Notice that the initial value is used as one of the elements for which the maximum is determined, unlike for the default argument Python's max function, which is only used for empty iterables.

```
>>> np.max([5], initial=6)
6
>>> max([5], default=6)
5
```

7.15.4 Minimum of an array or maximum along an axis: numpy.min

npm.**min**(*a*, *axis=None*, *out=None*, *keepdims=<no value>*, *initial=<no value>*, *where=<no value>*)

Return the minimum of an array or minimum along an axis.

See https://numpy.org/doc/stable/reference/generated/numpy.min.html#numpy.min for details.

NaN values are propagated, that is if at least one item is NaN, the corresponding min value will be NaN as well. To ignore NaN values (MATLAB behavior), please use nanmin.

Don't use min for element-wise comparison of 2 arrays; when a.shape[0] is 2, minimum(a[0], a[1]) is faster than min(a, axis=0).

```
>>> a = np.arange(4).reshape((2,2))
>>> a
array([[0, 1],
       [2, 3]])
>>> np.min(a)           # Minimum of the flattened array
0
>>> np.min(a, axis=0)   # Minima along the first axis
array([0, 1])
>>> np.min(a, axis=1)   # Minima along the second axis
array([0, 2])
>>> np.min(a, where=[False, True], initial=10, axis=0)
array([10,  1])

>>> b = np.arange(5, dtype=float)
>>> b[2] = np.NaN
>>> np.min(b)
nan
```

(continues on next page)

(continued from previous page)

```
>>> np.min(b, where=~np.isnan(b), initial=10)
0.0
>>> np.nanmin(b)
0.0

>>> np.min([[-50], [10]], axis=-1, initial=0)
array([-50,   0])
```

Notice that the initial value is used as one of the elements for which the minimum is determined, unlike for the default argument Python's max function, which is only used for empty iterables. Notice that this isn't the same as Python's default argument.

```
>>> np.min([6], initial=5)
5
>>> min([6], default=5)
6
```

7.16 Numpy mathematical functions: Arithmetic operations, elementwise

7.16.1 Numerical positive, element-wise: numpy.positive

npm.**positive**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Numerical positive, element-wise. Equivalent to x.copy(), but only defined for types that support arithmetic.

See https://numpy.org/doc/stable/reference/generated/numpy.positive.html for details.

```
>>> x1 = np.array(([1., -1.]))
>>> np.positive(x1)
array([ 1., -1.])
```

The unary + operator can be used as a shorthand for np.positive on ndarrays.

```
>>> x1 = np.array(([1., -1.]))
>>> +x1
array([ 1., -1.])
```

7.16.2 Numerical negative, element-wise: numpy.negative

npm.**negative**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Numerical negative, element-wise.

See https://numpy.org/doc/stable/reference/generated/numpy.negative.html for details.

```
>>> np.negative([1.,-1.])
array([-1.,  1.])
```

The unary - operator can be used as a shorthand for np.negative on ndarrays.

```
x1 = np.array(([1., -1.]))
-x1
array([-1.,  1.])
```

7.16.3 Add arguments element-wise: numpy.add

npm.**add**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Add arguments element-wise. Equivalent to x1 + x2 in terms of array broadcasting.

See https://numpy.org/doc/stable/reference/generated/numpy.add.html#numpy.add for details

```
>>> np.add(1.0, 4.0)
5.0
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> np.add(x1, x2)
array([[  0.,   2.,   4.],
       [  3.,   5.,   7.],
       [  6.,   8.,  10.]])
```

The + operator can be used as a shorthand for np.add on ndarrays.

```
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> x1 + x2
array([[ 0.,  2.,  4.],
       [ 3.,  5.,  7.],
       [ 6.,  8., 10.]])
```

7.16.4 Subtract arguments element-wise: numpy.subtract

npm.**subtract**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Subtract arguments, element-wise. Equivalent to x1 - x2 in terms of array broadcasting.

See https://numpy.org/doc/stable/reference/generated/numpy.subtract.html#numpy.subtract for details.

```
>>> np.subtract(1.0, 4.0)
-3.0
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> np.subtract(x1, x2)
array([[ 0.,  0.,  0.],
       [ 3.,  3.,  3.],
       [ 6.,  6.,  6.]])
```

The - operator can be used as a shorthand for np.subtract on ndarrays.

```
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> x1 - x2
array([[0., 0., 0.],
       [3., 3., 3.],
       [6., 6., 6.]])
```

7.16.5 Multiply arguments element-wise: numpy.multiply

npm.**multiply**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Multiply arguments element-wise. Equivalent to x1 * x2 in terms of array broadcasting.

See https://numpy.org/doc/stable/reference/generated/numpy.multiply.html for details.

```
>>> np.multiply(2.0, 4.0)
8.0
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> np.multiply(x1, x2)
array([[  0.,   1.,   4.],
       [  0.,   4.,  10.],
       [  0.,   7.,  16.]])
```

The * operator can be used as a shorthand for np.multiply on ndarrays.

```
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> x1 * x2
array([[  0.,   1.,   4.],
       [  0.,   4.,  10.],
       [  0.,   7.,  16.]])
```

7.16.6 Divide arguments element-wise: numpy.divide

npm.**divide**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Divide arguments element-wise. Equivalent to x1 / x2 in terms of array-broadcasting.

See https://numpy.org/doc/stable/reference/generated/numpy.divide.html for details.

`true_divide` is an alias.

```
>>> np.divide(2.0, 4.0)
0.5
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = np.arange(3.0)
>>> np.divide(x1, x2)
array([[nan, 1. , 1. ],
       [inf, 4. , 2.5],
       [inf, 7. , 4. ]])
```

The / operator can be used as a shorthand for np.divide on ndarrays.

```
>>> x1 = np.arange(9.0).reshape((3, 3))
>>> x2 = 2 * np.ones(3)
x>>> 1 / x2
array([[0. , 0.5, 1. ],
       [1.5, 2. , 2.5],
       [3. , 3.5, 4. ]])
```

7.16.7 Floor-divide arguments element-wise: numpy.floor_divide

npm.**floor_divide**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the largest integer smaller or equal to the division of the inputs. It is equivalent to the Python // operator and pairs with the Python % (remainder), function so that a = a % b + b * (a // b) up to roundoff.

See https://numpy.org/doc/stable/reference/generated/numpy.floor_divide.html for details.

```
>>> np.floor_divide(7,3)
2
>>> np.floor_divide([1., 2., 3., 4.], 2.5)
array([ 0.,  0.,  1.,  1.])
```

The `//` operator can be used as a shorthand for `np.floor_divide` on ndarrays.

```
>>> x1 = np.array([1., 2., 3., 4.])
>>> x1 // 2.5
array([0., 0., 1., 1.])
```

7.16.8 Element-wise remainder of division: numpy.remainder

npm.**remainder**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Returns the element-wise remainder of division.

https://numpy.org/doc/stable/reference/generated/numpy.remainder.html

Computes the remainder complementary to the `floor_divide` function. It is equivalent to the Python modulus operator `x1 % x2` and has the same sign as the divisor x2. Returns 0 when x2 is 0 and both x1 and x2 are (arrays of) integers. The function `mod` is an alias of remainder.

```
>>> np.np.remainder([4, 7], [2, 3])
array([0, 1])
>>> np.remainder(np.arange(7), 5)
array([0, 1, 2, 3, 4, 0, 1])
```

The `%` operator can be used as a shorthand for `np.remainder` on ndarrays.

```
>>> x1 = np.arange(7)
>>> x1 % 5
array([0, 1, 2, 3, 4, 0, 1])
```

7.16.9 Element-wise square: numpy.square

npm.**square**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the element-wise square of the input.

See https://numpy.org/doc/stable/reference/generated/numpy.square.html for details.

```
>>> np.square([-1j, 1])
array([-1.-0.j,  1.+0.j])
```

7.16.10 Element-wise reciprocal: numpy.reciprocal

npm.**reciprocal**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the reciprocal of the argument, element-wise.

See https://numpy.org/doc/stable/reference/generated/numpy.reciprocal.html for details.

```
>>> np.reciprocal(2.)
0.5
>>> np.reciprocal([1, 2., 3.33])
array([ 1.       ,  0.5      ,  0.3003003])
```

7.17 Numpy mathematical functions: Averages and variances

7.17.1 Median of the array elements.: numpy.median

npm.**median**(*a*, *axis=None*, *out=None*, *overwrite_input=False*, *keepdims=False*)

Returns the median of the array elements.

See https://numpy.org/doc/stable/reference/generated/numpy.median.html for details.

Computes the median along the specified axis.

Given a vector `V` of length `N`, the median of `V` is the middle value of a sorted copy of `V`, `V_sorted` - i e., `V_sorted[(N-1)/2]`, when `N` is odd, and the average of the two middle values of `V_sorted` when `N` is even.

```
>>> a = np.array([[10, 7, 4], [3, 2, 1]])
>>> a
array([[10,  7,  4],
       [ 3,  2,  1]])
>>> np.median(a)
3.5

>>> np.median(a, axis=0)
array([6.5, 4.5, 2.5])

>>> np.median(a, axis=1)
array([7.,  2.])

>>> m = np.median(a, axis=0)
out = np.zeros_like(m)
>>> np.median(a, axis=0, out=m)
array([6.5,  4.5,  2.5])
>>> m
array([6.5,  4.5,  2.5])

>>> b = a.copy()
>>> np.median(b, axis=1, overwrite_input=True)
array([7.,  2.])

>>> assert not np.all(a==b)
>>> b = a.copy()
>>> np.median(b, axis=None, overwrite_input=True)
3.5
assert not np.all(a==b)
```

7.17.2 Average of the array elements.: numpy.average

npm.**average**(*a*, *axis=None*, *weights=None*, *returned=False*, ***, *keepdims=<no value>*)

Compute the weighted average along the specified axis.

See https://numpy.org/doc/stable/reference/generated/numpy.average.html for details.

```
>>> data = np.arange(1, 5)
>>> data
array([1, 2, 3, 4])
>>> np.average(data)
2.5
>>> np.average(np.arange(1, 11), weights=np.arange(10, 0, -1))
4.0

>>> data = np.arange(6).reshape((3, 2))
>>> data
array([[0, 1],
       [2, 3],
```

(continues on next page)

(continued from previous page)

```
       [4, 5]])
>>> np.average(data, axis=1, weights=[1./4, 3./4])
array([0.75, 2.75, 4.75])
>>> np.average(data, weights=[1./4, 3./4])
Traceback (most recent call last):
    ...
TypeError: Axis must be specified when shapes of a and weights differ.

>>> a = np.ones(5, dtype=np.float128)
>>> w = np.ones(5, dtype=np.complex64)
>>> avg = np.average(a, weights=w)
>>> print(avg.dtype)
complex256
```

With keepdims=True, the following result has shape (3, 1).

```
>>> np.average(data, axis=1, keepdims=True)
array([[0.5],
       [2.5],
       [4.5]])
```

7.17.3 Arithmetic mean: numpy.mean

npm.**mean**(*a*, *axis=None*, *dtype=None*, *out=None*, *keepdims=<no value>*, ***, *where=<no value>*)

Compute the arithmetic mean along the specified axis.

See https://numpy.org/doc/stable/reference/generated/numpy.mean.html for details.

Returns the average of the array elements. The average is taken over the flattened array by default, otherwise over the specified axis. The arithmetic mean is the sum of the elements along the axis divided by the number of elements.

```
>>> a = np.array([[1, 2], [3, 4]])
>>> np.mean(a)
2.5
>>> np.mean(a, axis=0)
array([2., 3.])
>>> np.mean(a, axis=1)
array([1.5, 3.5])
```

In single precision, mean can be inaccurate:

```
>>> a = np.zeros((2, 512*512), dtype=np.float32)
>>> a[0, :] = 1.0
>>> a[1, :] = 0.1
>>> np.mean(a)
0.54999924
```

Computing the mean in float64 is more accurate:

```
>>> np.mean(a, dtype=np.float64)
0.55000000074505806 # may vary
```

Specifying a where argument:

```
>>> a = np.array([[5, 9, 13], [14, 10, 12], [11, 15, 19]])
>>> np.mean(a)
12.0
>>> np.mean(a, where=[[True], [False], [False]])
9.0
```

7.17.4 Variance: numpy.var

npm.**var**(*a*, *axis=None*, *dtype=None*, *out=None*, *ddof=0*, *keepdims=<no value>*, ***, *where=<no value>*, *mean=<no value>*, *correction=<no value>*)

Compute the variance along the specified axis.

See https://numpy.org/doc/stable/reference/generated/numpy.var.html for details.

Returns the variance of the array elements, a measure of the spread of a distribution. The variance is computed for the flattened array by default, otherwise over the specified axis.

The variance is the average of the squared deviations from the mean, i.e., var = mean(x), where x = abs(a - a.mean())**2.

The mean is typically calculated as x.sum() / N, where N = len(x). If, however, ddof is specified, the divisor N - ddof is used instead. In standard statistical practice, ddof=1 provides an unbiased estimator of the variance of a hypothetical infinite population. ddof=0 provides a maximum likelihood estimate of the variance for normally distributed variables.

Note that for complex numbers, the absolute value is taken before squaring, so that the result is always real and nonnegative.

For floating-point input, the variance is computed using the same precision the input has. Depending on the input data, this can cause the results to be inaccurate, especially for float32 (see example below). Specifying a higher-accuracy accumulator using the dtype keyword can alleviate this issue.

```
>>> a = np.array([[1, 2], [3, 4]])
>>> np.var(a)
1.25
>>> np.var(a, axis=0)
array([1.,  1.])
>>> np.var(a, axis=1)
array([0.25,  0.25])
```

In single precision, var() can be inaccurate:

```
>>> a = np.zeros((2, 512*512), dtype=np.float32)
>>> a[0, :] = 1.0
>>> a[1, :] = 0.1
>>> np.var(a)
0.20250003
```

Computing the variance in float64 is more accurate:

```
>>> np.var(a, dtype=np.float64)
0.20249999932944759 # may vary
>>> ((1-0.55)**2 + (0.1-0.55)**2)/2
0.2025
```

Specifying a where argument:

```
>>> a = np.array([[14, 8, 11, 10], [7, 9, 10, 11], [10, 15, 5, 10]])
>>> np.var(a)
6.833333333333333 # may vary
>>> np.var(a, where=[[True], [True], [False]])
4.0
```

7.18 Numpy mathematical functions: Matrix and vector products

7.18.1 Dot product: numpy.dot

npm.**dot**(*a*, *b*, *out=None*)

Compute the Dot product of two arrays. .

See https://numpy.org/doc/stable/reference/generated/numpy.dot.html#numpy.dot for details.

Dot product of two arrays. Specifically,

If both a and b are 1-D arrays, it is inner product of vectors (without complex conjugation).

If both a and b are 2-D arrays, it is matrix multiplication, but using matmul or a @ b is preferred.

If either a or b is 0-D (scalar), it is equivalent to multiply and using numpy.multiply(a, b) or a * b is preferred.

If a is an N-D array and b is a 1-D array, it is a sum product over the last axis of a and b.

If a is an N-D array and b is an M-D array (where M>=2), it is a sum product over the last axis of a and the second-to-last axis of b:

```
>>> np.dot(3, 4)
12
```

Neither argument is complex-conjugated:

```
np.dot([2j, 3j], [2j, 3j])
(-13+0j)
```

For 2-D arrays it is the matrix product:

```
a = [[1, 0], [0, 1]]
b = [[4, 1], [2, 2]]
np.dot(a, b)
array([[4, 1],
       [2, 2]])

a = np.arange(3*4*5*6).reshape((3,4,5,6))
b = np.arange(3*4*5*6)[::-1].reshape((5,4,6,3))
np.dot(a, b)[2,3,2,1,2,2]
499128
sum(a[2,3,2,:] * b[1,2,:,2])
499128
```

7.18.2 Dot product of two vectors: numpy.vdot

npm.**vdot**(*a*, *b*, */*)

Return the dot product of two vectors.

See https://numpy.org/doc/stable/reference/generated/numpy.vdot.html#numpy.vdot for details.

The vdot(a, b) function handles complex numbers differently than dot(a, b). If the first argument is complex the complex conjugate of the first argument is used for the calculation of the dot product.

Note that vdot handles multidimensional arrays differently than dot: it does not perform a matrix product, but flattens input arguments to 1-D vectors first. Consequently, it should only be used for vectors.

```
>>> a = np.array([1+2j,3+4j])
>>> b = np.array([5+6j,7+8j])
>>> np.vdot(a, b)
(70-8j)
```

(continues on next page)

(continued from previous page)

```
>>> np.vdot(b, a)
(70+8j)
```

Note that higher-dimensional arrays are flattened!

```
>>> a = np.array([[1, 4], [5, 6]])
>>> b = np.array([[4, 1], [2, 2]])
>>> np.vdot(a, b)
30
>>> np.vdot(b, a)
30
1*4 + 4*1 + 5*2 + 6*2
30
```

7.18.3 Inner product of two arrays: numpy.inner

npm.**inner**(*a*, *b*, */*)

Return the inner product of two arrays.

See https://numpy.org/doc/stable/reference/generated/numpy.inner.html#numpy.inner for details.

Ordinary inner product of vectors for 1-D arrays (without complex conjugation), in higher dimensions a sum product over the last axes.

For vectors (1-D arrays) it computes the ordinary inner-product:

```
np.inner(a, b) = sum(a[:]*b[:])
```

More generally, if ndim(a) = r > 0 and ndim(b) = s > 0:

```
np.inner(a, b) = np.tensordot(a, b, axes=(-1,-1))
```

or explicitly:

```
np.inner(a, b)[i0,...,ir-2,j0,...,js-2]
     = sum(a[i0,...,ir-2,:]*b[j0,...,js-2,:])
```

In addition a or b may be scalars, in which case:

```
np.inner(a,b) = a*b
```

Ordinary inner product for vectors:

```
>>> a = np.array([1,2,3])
>>> b = np.array([0,1,0])
>>> np.inner(a, b)
2
```

Some multidimensional examples:

```
>>> a = np.arange(24).reshape((2,3,4))
>>> b = np.arange(4)
>>> c = np.inner(a, b)
>>> c.shape
(2, 3)
>>> c
array([[ 14,  38,  62],
       [ 86, 110, 134]])

>>> a = np.arange(2).reshape((1,1,2))
```

(continues on next page)

(continued from previous page)

```
>>> b = np.arange(6).reshape((3,2))
>>> c = np.inner(a, b)
>>> c.shape
(1, 1, 3)
>>> c
array([[[1, 3, 5]]])
```

An example where b is a scalar:

```
>>> np.inner(np.eye(2), 7)
array([[7., 0.],
       [0., 7.]])
```

7.18.4 Outer product of two vectors: numpy.outer

npm.**outer**(*a*, *b*, *out=None*)

Compute the outer product of two vectors.

See https://numpy.org/doc/stable/reference/generated/numpy.outer.html#numpy.outer for details.

Given two vectors a and b of length M and N, repsectively, the outer product [1] is:

```
[[a_0*b_0  a_0*b_1 ... a_0*b_{N-1} ]
 [a_1*b_0    .
 [ ...          .
 [a_{M-1}*b_0            a_{M-1}*b_{N-1} ]]
```

Make a (very coarse) grid for computing a Mandelbrot set:

```
>>> rl = np.outer(np.ones((5,)), np.linspace(-2, 2, 5))
>>> rl
array([[-2., -1.,  0.,  1.,  2.],
       [-2., -1.,  0.,  1.,  2.],
       [-2., -1.,  0.,  1.,  2.],
       [-2., -1.,  0.,  1.,  2.],
       [-2., -1.,  0.,  1.,  2.]])
>>> im = np.outer(1j*np.linspace(2, -2, 5), np.ones((5,)))
>>> im
array([[0.+2.j, 0.+2.j, 0.+2.j, 0.+2.j, 0.+2.j],
       [0.+1.j, 0.+1.j, 0.+1.j, 0.+1.j, 0.+1.j],
       [0.+0.j, 0.+0.j, 0.+0.j, 0.+0.j, 0.+0.j],
       [0.-1.j, 0.-1.j, 0.-1.j, 0.-1.j, 0.-1.j],
       [0.-2.j, 0.-2.j, 0.-2.j, 0.-2.j, 0.-2.j]])
>>> grid = rl + im
>>> grid
array([[-2.+2.j, -1.+2.j,  0.+2.j,  1.+2.j,  2.+2.j],
       [-2.+1.j, -1.+1.j,  0.+1.j,  1.+1.j,  2.+1.j],
       [-2.+0.j, -1.+0.j,  0.+0.j,  1.+0.j,  2.+0.j],
       [-2.-1.j, -1.-1.j,  0.-1.j,  1.-1.j,  2.-1.j],
       [-2.-2.j, -1.-2.j,  0.-2.j,  1.-2.j,  2.-2.j]])
```

An example using a “vector” of letters:

```
>>> x = np.array(['a', 'b', 'c'], dtype=object)
>>> np.outer(x, [1, 2, 3])
array([['a', 'aa', 'aaa'],
       ['b', 'bb', 'bbb'],
       ['c', 'cc', 'ccc']], dtype=object)
```

7.18.5 Matrix product of two arrays: numpy.matmul

npm.**matmul**(*x1*, *x2*, */*, *out=None*, ***, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Matrix product of two arrays.

See https://numpy.org/doc/stable/reference/generated/numpy.matmul.html#numpy.matmul for details.

The behavior depends on the arguments in the following way.

- If both arguments are 2-D they are multiplied like conventional matrices.
- If either argument is N-D, N > 2, it is treated as a stack of matrices residing in the last two indexes and broadcast accordingly.
- If the first argument is 1-D, it is promoted to a matrix by prepending a 1 to its dimensions. After matrix multiplication the prepended 1 is removed.
- If the second argument is 1-D, it is promoted to a matrix by appending a 1 to its dimensions. After matrix multiplication the appended 1 is removed.

`matmul` differs from `dot` in two important ways:

- Multiplication by scalars is not allowed, use `*` instead.
- Stacks of matrices are broadcast together as if the matrices were elements, respecting the signature `(n,k),(k,m)->(n,m)`:

```
>>> a = np.ones([9, 5, 7, 4])
>>> c = np.ones([9, 5, 4, 3])
>>> np.dot(a, c).shape
(9, 5, 7, 9, 5, 3)
>>> np.matmul(a, c).shape
(9, 5, 7, 3)
>>> # n is 7, k is 4, m is 3
```

The matmul function implements the semantics of the `@` operator introduced in Python 3.5 following PEP 465.

For 2-D arrays it is the matrix product:

```
>>> a = np.array([[1, 0], [0, 1]])
>>> b = np.array([[4, 1], [2, 2]])
>>> np.matmul(a, b)
array([[4, 1],
       [2, 2]])
```

For 2-D mixed with 1-D, the result is the usual.

```
>>> a = np.array([[1, 0], [0, 1]])
>>> b = np.array([1, 2])
>>> np.matmul(a, b)
array([1, 2])
>>> np.matmul(b, a)
array([1, 2])
```

Broadcasting is conventional for stacks of arrays

```
>>> a = np.arange(2 * 2 * 4).reshape((2, 2, 4))
>>> b = np.arange(2 * 2 * 4).reshape((2, 4, 2))
>>> np.matmul(a,b).shape
(2, 2, 2)
>>> np.matmul(a, b)[0, 1, 1]
98
>>> sum(a[0, 1, :] * b[0 , :, 1])
98
```

Vector, vector returns the scalar inner product, but neither argument is complex-conjugated:

```
>>> np.matmul([2j, 3j], [2j, 3j])
(-13+0j)
```

Scalar multiplication raises an error.

```
>>> np.matmul([1,2], 3)
Traceback (most recent call last):
...
ValueError: matmul: Input operand 1 does not have enough dimensions ...
```

The `@` operator can be used as a shorthand for `np.matmul` on ndarrays.

```
>>> x1 = np.array([2j, 3j])
x2 = np.array([2j, 3j])
>>> x1 @ x2
(-13+0j)
```

7.18.6 Tensor dot product: numpy.matmul

npm.**tensordot**(*a*, *b*, *axes=2*)

Compute tensor dot product along specified axes.

See https://numpy.org/doc/stable/reference/generated/numpy.tensordot.html#numpy.tensordot for details.

Given two tensors, a and b, and an array_like object containing two array_like objects, (a_axes, b_axes), sum the products of a's and b's elements (components) over the axes specified by a_axes and b_axes. The third argument can be a single non-negative integer_like scalar, N; if it is such, then the last N dimensions of a and the first N dimensions of b are summed over.

Three common use cases are:

- `axes = 0` : tensor product $a \otimes b$
- `axes = 1` : tensor dot product $a \cdot b$
- `axes = 2` : (default) tensor double contraction $a : b$

When axes is integer_like, the sequence for evaluation will be: first the -Nth axis in a and 0th axis in b, and the -1th axis in a and Nth axis in b last.

When there is more than one axis to sum over - and they are not the last (first) axes of a (b) - the argument axes should consist of two sequences of the same length, with the first axis to sum over given first in both sequences, the second axis second, and so forth.

The shape of the result consists of the non-contracted axes of the first tensor, followed by the non-contracted axes of the second.

A "traditional" example:

```
>>> a = np.arange(60.).reshape(3,4,5)
>>> b = np.arange(24.).reshape(4,3,2)
>>> c = np.tensordot(a,b, axes=([1,0],[0,1]))
>>> c.shape
(5, 2)
>>> c
array([[4400., 4730.],
       [4532., 4874.],
       [4664., 5018.],
       [4796., 5162.],
       [4928., 5306.]])
>>> # A slower but equivalent way of computing the same...
>>> d = np.zeros((5,2))
>>> for i in range(5):
```

(continues on next page)

(continued from previous page)

```
  for j in range(2):
    for k in range(3):
      for n in range(4):
        d[i,j] += a[k,n,i] * b[n,k,j]
>>> c == d
array([[ True,  True],
       [ True,  True],
       [ True,  True],
       [ True,  True],
       [ True,  True]])
```

An extended example taking advantage of the overloading of + and * :

```
>>> a = np.array(range(1, 9))
>>> a.shape = (2, 2, 2)
>>> A = np.array(('a', 'b', 'c', 'd'), dtype=object)
A.shape = (2, 2)
>>> a; A
array([[[1, 2],
        [3, 4]],
       [[5, 6],
        [7, 8]]])
array([['a', 'b'],
       ['c', 'd']], dtype=object)

>>> np.tensordot(a, A) # third argument default is 2 for double-contraction
array(['abbcccdddd', 'aaaaabbbbbbccccccdddddddd'], dtype=object)

>>> np.tensordot(a, A, 1)
array([[['acc', 'bdd'],
        ['aaacccc', 'bbbdddd']],
       [['aaaaacccccc', 'bbbbbddddddd'],
        ['aaaaaaaccccccc', 'bbbbbbbddddddd']]], dtype=object)

>>> np.tensordot(a, A, 0) # tensor product (result too long to incl.)
array([[[[['a', 'b'],
          ['c', 'd']],
          ...
>>> np.tensordot(a, A, (0, 1))
array([[['abbbbb', 'cddddd'],
        ['aabbbbbb', 'ccdddddd']],
       [['aaabbbbbbb', 'cccddddddd'],
        ['aaaabbbbbbbb', 'ccccddddddd']]], dtype=object)

>>> np.tensordot(a, A, (2, 1))
array([[['abb', 'cdd'],
        ['aaabbbb', 'cccdddd']],
       [['aaaaabbbbbb', 'ccccddddddd'],
        ['aaaaaaabbbbbbbb', 'cccccccddddddd']]], dtype=object)

>>> np.tensordot(a, A, ((0, 1), (0, 1)))
array(['abbbcccccddddddd', 'aabbbbccccccddddddd'], dtype=object)

>>> np.tensordot(a, A, ((2, 1), (1, 0)))
array(['acccbbdddd', 'aaaaacccccccbbbbbbddddddd'], dtype=object)
```

7.18.7 Einstein summation: numpy.einsum

npm.**einsum**(*subscripts*, **operands*, *out=None*, *dtype=None*, *order='K'*, *casting='safe'*, *optimize=False*)

Evaluates the Einstein summation convention on the operands.

See https://numpy.org/doc/stable/reference/generated/numpy.einsum.html#numpy.einsum for details.

Using the Einstein summation convention, many common multi-dimensional, linear algebraic array operations can be repre-

sented in a simple fashion. In implicit mode einsum computes these values.

In explicit mode, einsum provides further flexibility to compute other array operations that might not be considered classical Einstein summation operations, by disabling, or forcing summation over specified subscript labels.

Typically a 'greedy' algorithm is applied which empirical tests have shown returns the optimal path in the majority of cases. In some cases 'optimal' will return the superlative path through a more expensive, exhaustive search. For iterative calculations it may be advisable to calculate the optimal path once and reuse that path by supplying it as an argument. An example is given below.

See numpy.einsum_path for more details.

```
>>> a = np.arange(25).reshape(5,5)
>>> b = np.arange(5)
>>> c = np.arange(6).reshape(2,3)
```

Trace of a matrix:

```
>>> np.einsum('ii', a)
60
>>> np.einsum(a, [0,0])
60
>>> np.trace(a)
60
```

Extract the diagonal (requires explicit form):

```
>>> np.einsum('ii->i', a)
array([ 0,  6, 12, 18, 24])
>>> np.einsum(a, [0,0], [0])
array([ 0,  6, 12, 18, 24])
>>> np.diag(a)
array([ 0,  6, 12, 18, 24])
```

Sum over an axis (requires explicit form):

```
>>> np.einsum('ij->i', a)
array([ 10,  35,  60,  85, 110])
>>> np.einsum(a, [0,1], [0])
array([ 10,  35,  60,  85, 110])
>>> np.sum(a, axis=1)
array([ 10,  35,  60,  85, 110])
```

For higher dimensional arrays summing a single axis can be done with ellipsis:

```
>>> np.einsum('...j->...', a)
array([ 10,  35,  60,  85, 110])
>>> np.einsum(a, [Ellipsis,1], [Ellipsis])
array([ 10,  35,  60,  85, 110])
```

7.18.8 Kronecker product: numpy.kron

npm.**kron**(a, b)

Kronecker product of two arrays.

numpy.kron

https://numpy.org/doc/stable/reference/generated/numpy.kron.html#numpy.kron

Computes the Kronecker product, a composite array made of blocks of the second array scaled by the first.

The function assumes that the number of dimensions of a and b are the same, if necessary prepending the smallest with ones. If a.shape = (r0,r1,..,rN) and b.shape = (s0,s1,...,sN), the Kronecker product has shape (r0*s0, r1*s1, ..., rN*SN). The elements are products of elements from a and b, organized explicitly by:

```
kron(a,b)[k0,k1,...,kN] = a[i0,i1,...,iN] * b[j0,j1,...,jN]
```

where:

```
kt = it * st + jt,  t = 0,...,N
```

In the common 2-D case (N=1), the block structure can be visualized:

```
[[ a[0,0]*b,   a[0,1]*b,  ... , a[0,-1]*b  ],
 [  ...                              ...   ],
 [ a[-1,0]*b,  a[-1,1]*b, ... , a[-1,-1]*b ]]
```

Further examples:

```
>>> np.kron([1,10,100], [5,6,7])
array([  5,   6,   7, ..., 500, 600, 700])
>>> np.kron([5,6,7], [1,10,100])
array([  5,  50, 500, ...,   7,  70, 700])

>>> np.kron(np.eye(2), np.ones((2,2)))
array([[1.,  1.,  0.,  0.],
       [1.,  1.,  0.,  0.],
       [0.,  0.,  1.,  1.],
       [0.,  0.,  1.,  1.]])

>>> a = np.arange(100).reshape((2,5,2,5))
>>> b = np.arange(24).reshape((2,3,4))
>>> c = np.kron(a,b)
>>> c.shape
(2, 10, 6, 20)
>>> I = (1,3,0,2)
>>> J = (0,2,1)
>>> J1 = (0,) + J             # extend to ndim=4
>>> S1 = (1,) + b.shape
>>> K = tuple(np.array(I) * np.array(S1) + np.array(J1))
c[K] == a[I]*b[J]
True
```

7.18.9 Discrete, linear convolution: numpy.convolve

npm.**convolve**(*a*, *v*, *mode='full'*)

Returns the discrete, linear convolution of two one-dimensional sequences.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.convolve.html

See also: Wikipedia, "Convolution", https://en.wikipedia.org/wiki/Convolution

Returns the discrete, linear convolution of two one-dimensional sequences.

The convolution operator is often seen in signal processing, where it models the effect of a linear time-invariant system on a signal [1]. In probability theory, the sum of two independent random variables is distributed according to the convolution of their individual distributions.

If v is longer than a, the arrays are swapped before computation.

The discrete convolution operation is defined as

$$(a * v)_n = \sum_{m=-\infty}^{\infty} a_m v_{n-m}$$

It can be shown that a convolution $x(t) * y(t)$ in time/space is equivalent to the multiplication $X(f)Y(f)$ in the Fourier domain, after appropriate padding (padding is necessary to prevent circular convolution). Since multiplication is more efficient (faster) than convolution, the function `scipy.signal.fftconvolve` exploits the FFT to calculate the convolution of large data-sets.

Note how the convolution operator flips the second array before "sliding" the two across one another:

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.convolve([1, 2, 3], [0, 1, 0.5])
array([0. , 1. , 2.5, 4. , 1.5])
```

Only return the middle values of the convolution. Contains boundary effects, where zeros are taken into account:

```
>>> np.convolve([1,2,3],[0,1,0.5], 'same')
array([1. ,  2.5,  4. ])
```

The two arrays are of the same length, so there is only one position where they completely overlap:

```
>>> np.convolve([1,2,3],[0,1,0.5], 'valid')
array([2.5])
```

7.19 Numpy logical functions: Truth value testing

7.19.1 Test whether all array elements evaluate to True.: numpy.all, ctx.all

npm.**all**(*a*, *axis=None*, *out=None*, *keepdims=<no value>*, ***, *where=<no value>*)

Test whether all array elements along a given axis evaluate to True.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.all.html#numpy.all

Not a Number (NaN), positive infinity and negative infinity evaluate to True because these are not equal to zero

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.all([[True,False],[True,True]])
False

>>> np.all([[True,False],[True,True]], axis=0)
array([ True, False])

np.all([-1, 4, 5])
True

>>> np.all([1.0, np.nan])
True

>>> np.all([[True, True], [False, True]], where=[[True], [False]])
True

>>> o=np.array(False)
>>> z=np.all([-1, 4, 5], out=o)
>>> id(z), id(o), z
(28293632, 28293632, array(True)) # may vary
```

7.19.2 Test whether any array element evaluates to True: numpy.any, ctx.any

npm.**any**(*a*, *axis=None*, *out=None*, *keepdims=<no value>*, ***, *where=<no value>*)

Test whether any array element along a given axis evaluates to True.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.any.html#numpy.any

Returns single boolean if axis is None. Not a Number (NaN), positive infinity and negative infinity evaluate to True because these are not equal to zero.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.any([[True, False], [True, True]])
True

>>> np.any([[True, False], [False, False]], axis=0)
array([ True, False])

>>> np.any([-1, 0, 5])
True

>>> np.any(np.nan)
True

>>> np.any([[True, False], [False, False]], where=[[False], [True]])
False

>>> o=np.array(False)
```

(continues on next page)

(continued from previous page)

```
>>> z=np.any([-1, 4, 5], out=o)
>>> z, o
(array(True), array(True))
>>> # Check now that z is a reference to o
>>> z is o
True
>>> id(z), id(o) # identity of z and o
(191614240, 191614240)
```

7.19.3 Logical AND: numpy.logical_and, ctx.logical_and

npm.**logical_and**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Compute the truth value of x1 AND x2 element-wise.

numpy.logical_and, **ctx.logical_and**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.logical_and.html#numpy.logical_and

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.logical_and(True, False)
False
>>> np.logical_and([True, False], [False, False])
array([False, False])

>>> x = np.arange(5)
>>> np.logical_and(x>1, x<4)
array([False, False,  True,  True, False])
```

The & operator can be used as a shorthand for np.logical_and on boolean ndarrays.

```
>>> a = np.array([True, False])
>>> b = np.array([False, False])
>>> a & b
array([False, False])
```

7.19.4 Logical OR: numpy.logical_or, ctx.logical_or

npm.**logical_or**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Compute the truth value of x1 OR x2 element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.logical_or.html#numpy.logical_or

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.logical_or(True, False)
True
>>> np.logical_or([True, False], [False, False])
array([ True, False])

>>> x = np.arange(5)
>>> np.logical_or(x < 1, x > 3)
array([ True, False, False, False,  True])
```

The | operator can be used as a shorthand for np.logical_or on boolean ndarrays.

```
>>> a = np.array([True, False])
>>> b = np.array([False, False])
```

(continues on next page)

(continued from previous page)

```
>>> a | b
array([ True, False])
```

7.19.5 Logical XOR: numpy.logical_xor, ctx.logical_xor

npm.**logical_xor**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Compute the truth value of x1 XOR x2, element-wise.

numpy.logical_xor, **ctx.logical_xor**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.logical_xor.html#numpy.logical_xor

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.logical_xor(True, False)
True
>>> np.logical_xor([True, True, False, False], [True, False, True, False])
array([False,  True,  True, False])

>>> x = np.arange(5)
>>> np.logical_xor(x < 1, x > 3)
array([ True, False, False, False,  True])
```

Simple example showing support of broadcasting

```
>>> np.logical_xor(0, np.eye(2))
array([[ True, False],
       :cite:t:`False,  True]])
```

7.19.6 Testing array equality: numpy.array_equal, ctx.array_equal

npm.**array_equal**(*a1*, *a2*, *equal_nan=False*)

True if two arrays have the same shape and elements, False otherwise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.array_equal.html#numpy.array_equal

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.array_equal([1, 2], [1, 2])
True
>>> np.array_equal(np.array([1, 2]), np.array([1, 2]))
True
>>> np.array_equal([1, 2], [1, 2, 3])
False
>>> np.array_equal([1, 2], [1, 4])
False
>>> a = np.array([1, np.nan])
>>> np.array_equal(a, a)
False
>>> np.array_equal(a, a, equal_nan=True)
True
```

When equal_nan is True, complex values with nan components are considered equal if either the real or the imaginary components are nan.

```
>>> a = np.array([1 + 1j])
>>> b = a.copy()
>>> a.real = np.nan
```

(continues on next page)

(continued from previous page)

```
>>> b.imag = np.nan
>>> np.array_equal(a, b, equal_nan=True)
True
```

7.19.7 Testing array array_equivalence: numpy.array_equiv, ctx.array_equiv

npm.**array_equiv**(*a1*, *a2*)

True if two arrays have the same shape and elements, False otherwise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.array_equiv.html#numpy.array_equiv

Returns True if input arrays are shape consistent and all elements equal. Shape consistent means they are either the same shape, or one input array can be broadcasted to create the same shape as the other one.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.array_equiv([1, 2], [1, 2])
True
>>> np.array_equiv([1, 2], [1, 3])
False
```

Showing the shape equivalence:

```
>>> np.array_equiv([1, 2], [[1, 2], [1, 2]])
True
>>> np.array_equiv([1, 2], [[1, 2, 1, 2], [1, 2, 1, 2]])
False
>>> np.array_equiv([1, 2], [[1, 2], [1, 3]])
False
```

7.19.8 Truth value of (x1 > x2) element-wise: numpy.greater, ctx.greater

npm.**greater**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 > x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.greater_equal.html#numpy.greater

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.greater_equal([4, 2, 1], [2, 2, 2])
array([ True, True, False])
```

The > operator can be used as a shorthand for `np.greater_equal` on ndarrays.

```
>>> a = np.array([4, 2, 1])
>>> b = np.array([2, 2, 2])
>>> a > b
array([ True,  True, False])
```

7.19.9 Truth value of (x1 >= x2) element-wise: numpy.greater_equal, ctx.greater_equal

npm.**greater_equal**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 >= x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.greater_equal.html#numpy.greater_equal

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.greater_equal([4, 2, 1], [2, 2, 2])
array([ True, True, False])
```

The >= operator can be used as a shorthand for `np.greater_equal` on ndarrays.

```
>>> a = np.array([4, 2, 1])
>>> b = np.array([2, 2, 2])
>>> a >= b
array([ True,  True, False])
```

7.19.10 Truth value of (x1 < x2) element-wise: numpy.less, ctx.less

npm.**less**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 < x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.less.html#numpy.less

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.less([1, 2], [2, 2])
array([ True, False])
```

The < operator can be used as a shorthand for `np.less` on ndarrays.

```
>>> a = np.array([1, 2])
>>> b = np.array([2, 2])
>>> a < b
array([ True, False])
```

7.19.11 Truth value of (x1 <= x2) element-wise: numpy.less_equal, ctx.less_equal

npm.**less_equal**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 <= x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.less_equal.html#numpy.less_equal

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.less_equal([4, 2, 1], [2, 2, 2])
array([False,  True,  True])
```

The <= operator can be used as a shorthand for `np.less_equal` on ndarrays.

```
>>> a = np.array([4, 2, 1])
>>> b = np.array([2, 2, 2])
>>> a <= b
array([False,  True,  True])
```

7.19.12 Truth value of (x1 == x2) element-wise: numpy.equal, ctx.equal

npm.**equal**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 == x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.equal.html#numpy.equal

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.equal([0, 1, 3], np.arange(3))
array([ True,  True, False])
```

What is compared are values, not types. So an `int(1)` and an array of length one can evaluate as True:

```
>>> np.equal(1, np.ones(1))
array([ True])
```

The == operator can be used as a shorthand for `np.equal` on ndarrays.

```
>>> a = np.array([2, 4, 6])
>>> b = np.array([2, 4, 2])
>>> a == b
array([ True,  True, False])
```

7.19.13 Truth value of (x1 != x2) element-wise: numpy.equal, ctx.equal

npm.**not_equal**(*x1*, *x2*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truth value of (x1 != x2) element-wise.

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.not_equal.html#numpy.not_equal

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.not_equal([1.,2.], [1., 3.])
array([False,  True])
>>> np.not_equal([1, 2], [[1, 3],[1, 4]])
array([[False,  True],
       :cite:t:`False,  True]])
```

The != operator can be used as a shorthand for `np.not_equal` on ndarrays.

```
>>> a = np.array([1., 2.])
>>> b = np.array([1., 3.])
>>> a != b
array([False,  True])
```

7.20 Numpy mathematical functions: Integer and fractional

7.20.1 Floor of the input, element-wise.: numpy.floor, ctx.floor

npm.**floor**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the floor of the input, element-wise.

https://numpy.org/doc/stable/reference/generated/numpy.floor.html

Some spreadsheet programs calculate the "floor-towards-zero", where floor(-2.5) == -2. NumPy instead uses the definition of floor where floor(-2.5) == -3. The "floor-towards-zero" function is called fix in NumPy.

```
>>> a = np.array([-1.7, -1.5, -0.2, 0.2, 1.5, 1.7, 2.0])
>>> np.floor(a)
array([-2., -2., -1.,  0.,  1.,  1.,  2.])
```

From mpmath. See also Mpmath [674].

!!! 'MPIntervalContext' object has no attribute 'floor' !!!

Computes the floor of x, $\lfloor x \rfloor$, defined as the largest integer less than or equal to x:

Example:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> x = 3.5
>>> fp.floor(x), mp.floor(x), dp.floor(x), gp.floor(x), ap.floor(x)
(3, mpf('3.0'), Decimal('3'), mpfr('3.0'), arb3_t('3.00000000000000'))
```

Note

floor(), *ceil()* and `nint()` return a floating-point number, not a Python `int`. If $\lfloor x \rfloor$ is too large to be represented exactly at the present working precision, the result will be rounded, not necessarily in the direction implied by the mathematical definition of the function.

To avoid rounding, use *prec=0*:

```
>>> mp.dps = 15
>>> print(int(floor(10**30+1)))
1000000000000000019884624838656
>>> print(int(floor(10**30+1, prec=0)))
1000000000000000000000000000001
```

The floor function is defined for complex numbers and acts on the real and imaginary parts separately:

```
>>> x = 3.25+4.75j
>>> fp.floor(x), mp.floor(x), dp.floor(x), gp.floor(x), ap.floor(x)
((3+4j),
 mpc(real='3.0', imag='4.0'),
 DecCplx('3 + 4j'),
 mpc('3.0+4.0j'),
 acb3_t('3.00000000000000 + 4.00000000000000j'))
```

7.20.2 Ceiling of the input, element-wise.: numpy.ceil, ctx.ceil

npm.**ceil**(*x*, */*, *out=None*, ***, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the ceiling of the input, element-wise.

https://numpy.org/doc/stable/reference/generated/numpy.ceil.html

```
>>> a = np.array([-1.7, -1.5, -0.2, 0.2, 1.5, 1.7, 2.0])
>>> np.ceil(a)
array([-1., -1., -0.,  1.,  2.,  2.,  2.])
```

From mpmath. See also Mpmath [668].

Computes the ceiling of x, $\lceil x \rceil$, defined as the smallest integer greater than or equal to x:

Example:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> x = 3.5
>>> fp.ceil(x), mp.ceil(x), dp.ceil(x), gp.ceil(x), ap.ceil(x)
(4, mpf('4.0'), Decimal('4'), mpfr('4.0'), arb3_t('4.00000000000000'))
```

The ceiling function is defined for complex numbers and acts on the real and imaginary parts separately:

```
>>> x = 3.25+4.75j
>>> fp.ceil(x), mp.ceil(x), dp.ceil(x), gp.ceil(x), ap.ceil(x)
((4+5j),
 mpc(real='4.0', imag='5.0'),
 DecCplx('4 + 5j'),
 mpc('4.0+5.0j'),
 acb3_t('4.00000000000000 + 5.00000000000000j'))
```

7.20.3 Truncated value of the input, element-wise.: numpy.trunc, ctx.trunc

npm.**trunc**(*x*, */*, *out=None*, *, *where=True*, *casting='same_kind'*, *order='K'*, *dtype=None*, *subok=True*)

Return the truncated value of the input, element-wise.

https://numpy.org/doc/stable/reference/generated/numpy.trunc.html

The truncated value of the scalar x is the nearest integer i which is closer to zero than x is. In short, the fractional part of the signed number x is discarded.

not working with mpm and ipm: trunc

```
>>> a = np.array([-1.7, -1.5, -0.2, 0.2, 1.5, 1.7, 2.0])
>>> np.trunc(a)
array([-1., -1., -0.,  0.,  1.,  1.,  2.])
```

7.20.4 Fix value of the input, element-wise.: numpy.fix, ctx.fix

npm.**fix**(*x*, *out=None*)

Round to nearest integer towards zero.

https://numpy.org/doc/stable/reference/generated/numpy.fix.html

Round an array of floats element-wise to nearest integer towards zero.

```
>>> np.fix(3.14)
3.0
>>> np.fix(3)
3.0
>>> np.fix([2.1, 2.9, -2.1, -2.9])
array([ 2.,  2., -2., -2.])
```

7.21 Numpy mathematical functions: Miscellaneous

7.21.1 Random Generator

Some text

https://numpy.org/doc/stable/reference/random/generator.html#accessing-the-bitgenerator-and-spawning

ctx.rand

From mpmath. See also Mpmath [691].

!!! AttributeError: 'MPIntervalContext' object has no attribute 'rand' !!

Returns an `mpf` with value chosen randomly from $[0, 1)$. The number of randomly generated bits in the mantissa is equal to the working precision.

Examples:

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> mp.dps = iv.dps = dp.dps = gp.dps = ap.dps = 45;
>>> for ctx in [fp, mp, dp, gp, ap]: print(repr(ctx.rand()))
0.6379004385592022
mpf('0.22530711244873659663745003088710468813066280856')
Decimal('0.2572014323118752')
mpfr('0.47800233849533735330794570472789928317070007324 2',153)
arb3_t('[0.90060710732460602656601622584275901317596435 5 +/- 4.69e-46]')
```

7.21.2 Vectorization of a function: numpy.vectorize

npm.vectorize(*pyfunc=np._NoValue*, *otypes=None*, *doc=None*, *excluded=None*, *cache=False*, *signature=None*)

Returns an object that acts like pyfunc, but takes arrays as input.

https://numpy.org/doc/stable/reference/generated/numpy.vectorize.html#numpy-vectorize

Define a vectorized function which takes a nested sequence of objects or numpy arrays as inputs and returns a single numpy array or a tuple of numpy arrays. The vectorized function evaluates pyfunc over successive tuples of the input arrays like the python map function, except it uses the broadcasting rules of numpy.

The data type of the output of vectorized is determined by calling the function with the first element of the input. This can be avoided by specifying the otypes argument.

```
>>> import numpy as np
>>> def myfunc(a, b):
... "Return a-b if a>b, otherwise return a+b"
... if a > b:
...     return a - b
... else:
...     return a + b

>>> vfunc = np.vectorize(myfunc)
>>> vfunc([1, 2, 3, 4], 2)
array([3, 4, 1, 2])
```

The docstring is taken from the input function to vectorize unless it is specified:

```
>>> vfunc.__doc__
'Return a-b if a>b, otherwise return a+b'
>>> vfunc = np.vectorize(myfunc, doc='Vectorized `myfunc`')
>>> vfunc.__doc__
'Vectorized `myfunc`'
```

The output type is determined by evaluating the first element of the input, unless it is specified:

```
>>> out = vfunc([1, 2, 3, 4], 2)
>>> type(out[0])
<class 'numpy.int64'>
>>> vfunc = np.vectorize(myfunc, otypes=[float])
>>> out = vfunc([1, 2, 3, 4], 2)
>>> type(out[0])
<class 'numpy.float64'>
```

The excluded argument can be used to prevent vectorizing over certain arguments. This can be useful for array-like arguments of a fixed length such as the coefficients for a polynomial as in polyval:

```
>>> def mypolyval(p, x):
...     _p = list(p)
...     res = _p.pop(0)
...     while _p:
...         res = res*x + _p.pop(0)
...     return res
```

Here, we exclude the zeroth argument from vectorization whether it is passed by position or keyword.

```
>>> vpolyval = np.vectorize(mypolyval, excluded={0, 'p'})
>>> vpolyval([1, 2, 3], x=[0, 1])
array([3, 6])
>>> vpolyval(p=[1, 2, 3], x=[0, 1])
array([3, 6])
```

7.22 Summary and examples: Numpy utility functions

7.22.1 Exact mathematical constants

ctx.zero

Returns zero.

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.zero))
0.0
mpf('0.0')
mpi('0.0', '0.0')
Decimal('0')
mpfr('0.0')
arb('0')
```

ctx.one

Returns one.

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.one))
1.0
mpf('1.0')
mpi('1.0', '1.0')
Decimal('1')
mpfr('1.0')
arb('1.00')
```

ctx.j

Returns the imaginary unit.

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.j))
1j
mpc(real='0.0', imag='1.0')
iv.mpc(mpi('0.0', '0.0'), mpi('1.0', '1.0'))
DecCplx('0 + 1j')
mpc('0.0+1.0j')
acb('0 + 1.00j')
```

ctx.inf

Returns positive infinity.

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.inf))
inf
mpf('+inf')
mpi('+inf', '+inf')
Decimal('Infinity')
mpfr('inf')
arb('+inf')
```

ctx.ninf

Returns negative infinity.

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.ninf))
-inf
mpf('-inf')
```

(continues on next page)

(continued from previous page)

```
mpi('-inf', '-inf')
Decimal('-Infinity')
mpfr('-inf')
arb('-inf')
```

ctx.nan

Returns Not-a-Number (NaN).

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(repr(ctx.nan))
nan
mpf('nan')
mpi('nan', 'nan')
Decimal('NaN')
mpfr('nan')
arb('nan')
```

7.22.2 Complex components

numpy.real, **ctx.real**, **ctx.re**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.real.html#numpy.real

Return the real part of the complex argument.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.real(1 + 1j)
1.0
>>> a = np.array([1+2j, 3+4j, 5+6j])
>>> np.real(a)
array([1.,  3.,  5.])
```

From mpmath See also Mpmath [681].

Returns the real part of x, $\Re(x)$. `re()` converts a non-mpmath number to an mpmath number:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> x = 3
>>> fp.re(x), mp.re(x), iv.re(x), dp.re(x), gp.re(x), ap.re(x)
(3.0,
 mpf('3.0'),
 mpi('3.0', '3.0'),
 Decimal('3'),
 mpfr('3.0'),
 arb3_t('3.00000000000000'))

>>> x = -1+4j
>>> fp.re(x), mp.re(x), iv.re(x), dp.re(x), gp.re(x), ap.re(x)
(-1.0,
 mpf('-1.0'),
 mpi('-1.0', '-1.0'),
 Decimal('-1'),
 mpfr('-1.0'),
 arb3_t('-1.00000000000000'))
```

numpy.imag, **ctx.imag**, **ctx.im**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.imag

Return the imaginary part of the complex argument.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.imag(1 + 1j)
1.0
>>> a = np.array([1+2j, 3+4j, 5+6j])
>>> np.imag(a)
array([2.,  4.,  6.])
```

From mpmath. See also Mpmath [675].

Returns the imaginary part of x, $\Im(x)$. `im()` converts a non-mpmath number to an mpmath number:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> x = 3
>>> fp.im(x), mp.im(x), iv.im(x), dp.im(x), gp.im(x), ap.im(x)
(0.0, mpf('0.0'), mpi('0.0', '0.0'), Decimal('0'), mpfr('0.0'), arb3_t('0'))

>>> x = -1+4j
>>> fp.im(x), mp.im(x), iv.im(x), dp.im(x), gp.im(x), ap.im(x)
(4.0,
 mpf('4.0'),
 mpi('4.0', '4.0'),
 Decimal('4.0'),
 mpfr('4.0'),
 arb3_t('4.00000000000000'))
```

numpy.absolute, **numpy.abs**, **ctx.fabs**

https://numpy.org/doc/stable/reference/generated/numpy.absolute.html

See also: https://numpy.org/doc/stable/reference/generated/numpy.fabs.html

Calculate the absolute value of x, $|x|$, element-wise.

```
>>> x = np.array([-1.2, 1.2])
>>> np.absolute(x)
array([ 1.2,  1.2])
>>> np.absolute(1.2 + 1j)
1.5620499351813308
```

The abs function can be used as a shorthand for np.absolute on ndarrays.

```
>>> x = np.array([-1.2, 1.2])
>>> abs(x)
array([1.2, 1.2])
```

From mpmath. See also Mpmath [666].

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> fp.fabs(3), mp.fabs(3), iv.fabs(3), dp.fabs(3), gp.fabs(3), ap.fabs(3)
(3.0, mpf('3.0'), mpi('3.0', '3.0'), Decimal('3'), 3, 3)
>>> fp.fabs(-3), mp.fabs(-3), iv.fabs(-3), dp.fabs(-3), gp.fabs(-3), ap.fabs(-3)
(3.0, mpf('3.0'), mpi('3.0', '3.0'), Decimal('3'), 3, 3)
>>> fp.fabs(3+4j), mp.fabs(3+4j), iv.fabs(3+4j), dp.fabs(3+4j), gp.fabs(3+4j), ap.fabs(3+4j)
(5.0, mpf('5.0'), mpi('5.0', '5.0'), Decimal('5.0'), 5.0, 5.0)
```

numpy.angle, **ctx.angle**, **ctx.arg**, **ctx.phase**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.angle.html

Return the angle of the complex argument. Although the angle of the complex number 0 is undefined, numpy.angle(0) returns the value 0.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.angle([1.0, 1.0j, 1+1j])               # in radians
array([ 0.        ,  1.57079633,  0.78539816]) # may vary
>>> np.angle(1+1j, deg=True)                  # in degrees
45.0
```

From mpmath. See also Mpmath [669].

Example:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = True
>>> x = 3
>>> fp.arg(x), mp.arg(x), iv.arg(x), dp.arg(x), gp.arg(x), ap.arg(x)
(0.0, mpf('0.0'), mpi('0.0', '0.0'), Decimal('0.0'), mpfr('0.0'), arb3_t('0'))

>>> x = 3+3j
>>> fp.arg(x), mp.arg(x), iv.arg(x), dp.arg(x), gp.arg(x), ap.arg(x)
(0.7853981633974483,
 mpf('0.78539816339744828'),
 mpi('0.78539816339744828', '0.78539816339744839'),
 Decimal('0.785398163397448'),
 mpfr('0.78539816339744828'),
 arb3_t('[0.785398163397448 +/- 3.35e-16]'))

>>> x = 3j
>>> fp.arg(x), mp.arg(x), iv.arg(x), dp.arg(x), gp.arg(x), ap.arg(x)
(1.5707963267948966,
 mpf('1.5707963267948966'),
 mpi('1.5707963267948966', '1.5707963267948968'),
 Decimal('1.5707963267949'),
 mpfr('1.5707963267948966'),
 arb3_t('[1.57079632679490 +/- 3.56e-15]'))

>>> x = -3
>>> fp.arg(x), mp.arg(x), iv.arg(x), dp.arg(x), gp.arg(x), ap.arg(x)
(3.141592653589793,
 mpf('3.1415926535897931'),
 mpi('3.1415926535897931', '3.1415926535897936'),
 Decimal('3.14159265358979'),
 mpfr('3.1415926535897931'),
 arb3_t('[3.14159265358979 +/- 3.34e-15]'))
```

The angle is defined to satisfy $-\pi < \arg(x) \leq \pi$ and with the sign convention that a nonnegative imaginary part results in a nonnegative argument.

The value returned by `arg()` is an `mpf` instance.

numpy.sign, **ctx.sign**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.sign.html

Returns an element-wise indication of the sign of a number.

The sign function returns -1 if x < 0, 0 if x==0, 1 if x > 0. nan is returned for nan inputs.

For complex inputs, the sign function returns sign(x.real) + 0j if x.real != 0 else sign(x.imag) + 0j.

complex(nan, 0) is returned for complex nan inputs.

```
>>> np.sign([-5., 4.5])
array([-1.,  1.])
>>> np.sign(0)
0
```

(continues on next page)

(continued from previous page)

```
>>> np.sign(5-2j)
(1+0j)
```

From mpmath. See also Mpmath [682].

Returns the sign of x, defined as $\text{sign}(x) = x/|x|$ (with the special case $\text{sign}(0) = 0$):

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> x = 10
>>> fp.sign(x), mp.sign(x), iv.sign(x), dp.sign(x), gp.sign(x), ap.sign(x)
(1.0,
 mpf('1.0'),
 mpi('1.0', '1.0'),
 Decimal('1'),
 1,
 arb3_t('1.00000000000000'))

>>> x = -10
>>> fp.sign(x), mp.sign(x), iv.sign(x), dp.sign(x), gp.sign(x), ap.sign(x)
(-1.0,
 mpf('-1.0'),
 mpi('-1.0', '-1.0'),
 Decimal('-1'),
 -1,
 arb3_t('-1.00000000000000'))

>>> x = 0
>>> fp.sign(x), mp.sign(x), iv.sign(x), dp.sign(x), gp.sign(x), ap.sign(x)
(0.0, mpf('0.0'), mpi('-1.0', '-1.0'), Decimal('0'), 0, arb3_t('0'))
```

Note that the sign function is also defined for complex numbers, for which it gives the projection onto the unit circle:

```
>>> mp.dps = 15; mp.pretty = True
>>> x = 1+1j
>>> fp.sign(x), mp.sign(x), iv.sign(x), dp.sign(x), gp.sign(x), ap.sign(x)
((0.7071067811865475+0.7071067811865475j),
 mpc(real='0.70710678118654746', imag='0.70710678118654746'),
 iv.mpc(mpi('0.7071067811703', '0.7071067811994'), mpi('0.7071067811703', '0.7071067811994')),
 DecCplx('0.707106781186547 + 0.707106781186547j'),
 mpc('0.70710678118654746+0.70710678118654746j'),
 acb3_t('[0.707106781186548 +/- 6.50e-16] + [0.707106781186548 +/- 6.50e-16]j'))
```

numpy.conjugate, **numpy.conj**

https://numpy.org/doc/stable/reference/generated/numpy.conj.html

Return the complex conjugate, element-wise.

The complex conjugate of a complex number is obtained by changing the sign of its imaginary part.

```
>>> np.conjugate(1+2j)
(1-2j)

>>> x = np.eye(2) + 1j * np.eye(2)
>>> np.conjugate(x)
array([[ 1.-1.j,  0.-0.j],
       [ 0.-0.j,  1.-1.j]])
```

From mpmath. See also Mpmath [670].

!!! Error in iv with complex input !!!

Returns the complex conjugate of x, $\overline{x}$. Unlike `x.conjugate()`, `im()` converts x to a mpmath number:

Example:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = True
>>> x = 3
>>> fp.conj(x), mp.conj(x), iv.conj(x), dp.conj(x), gp.conj(x), ap.conj(x)
(3.0,
 mpf('3.0'),
 mpi('3.0', '3.0'),
 Decimal('3'),
 mpfr('3.0'),
 arb3_t('3.00000000000000'))

>>> x = -1+4j
>>> fp.conj(x), mp.conj(x), dp.conj(x), gp.conj(x), ap.conj(x)
((-1-4j),
 mpc(real='-1.0', imag='-4.0'),
 DecCplx('-1 - 4.0j'),
 mpc('-1.0-4.0j'),
 acb3_t('-1.00000000000000 - 4.00000000000000j'))
```

7.22.3 Array contents

numpy.isfinite, **ctx.isfinite**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isfinite.html

Test element-wise for finiteness (not infinity and not Not a Number). The result is returned as a boolean array. Not a Number, positive infinity and negative infinity are considered to be non-finite.

NumPy uses the IEEE Standard for Binary Floating-Point for Arithmetic (IEEE 754). This means that Not a Number is not equivalent to infinity. Also that positive infinity is not equivalent to negative infinity. But infinity is equivalent to positive infinity. Errors result if the second argument is also supplied when x is a scalar input, or if first and second arguments have different shapes.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isfinite(1)
True
>>> np.isfinite(0)
True
>>> np.isfinite(np.nan)
False
>>> np.isfinite(np.inf)
False
>>> np.isfinite(np.NINF)
False
>>> np.isfinite([np.log(-1.),1.,np.log(0)])
array([False,  True, False])

>>> x = np.array([-np.inf, 0., np.inf])
>>> y = np.array([2, 2, 2])
>>> np.isfinite(x, y)
array([0, 1, 0])
>>> y
array([0, 1, 0])
```

From mpmath. See also Mpmath [693].

Return *True* if *x* is a finite number, i.e. neither an infinity or a NaN.

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.inf), end=', ')
```

(continues on next page)

(continued from previous page)

```
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.ninf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.nan), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(3), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(3+4j), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.mpc(3,ctx.nan)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.mpc(ctx.nan,3)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.mpc(3,ctx.inf)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ctx.isfinite(ctx.mpc(ctx.inf,3)), end=', ')
False, False, False, False, False, False,
```

numpy.isinf, **ctx.isinf**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isinf

Test element-wise for positive or negative infinity.

Returns a boolean array of the same shape as x, True where `x == +/-inf`, otherwise False. NumPy uses the IEEE Standard for Binary Floating-Point for Arithmetic (IEEE 754). Errors result if the second argument is supplied when the first argument is a scalar, or if the first and second arguments have different shapes.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isinf(np.inf)
True
>>> np.isinf(np.nan)
False
>>> np.isinf(np.NINF)
True
>>> np.isinf([np.inf, -np.inf, 1.0, np.nan])
array([ True,  True, False, False])

>>> x = np.array([-np.inf, 0., np.inf])
>>> y = np.array([2, 2, 2])
>>> np.isinf(x, y)
array([1, 0, 1])
>>> y
array([1, 0, 1])
```

From mpmath. See also Mpmath [694].

Return *True* if the absolute value of *x* is infinite; otherwise return *False*.

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.isinf(ctx.inf), end=', ')
True, True, True, True, True, True,
```

(continues on next page)

(continued from previous page)

```
>>> for ctx in ctxall: print(ctx.isinf(ctx.ninf), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isinf(ctx.nan), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isinf(3), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isinf(3+4j), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isinf(ctx.mpc(3,ctx.nan)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isinf(ctx.mpc(ctx.nan,3)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isinf(ctx.mpc(3,ctx.inf)), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isinf(ctx.mpc(ctx.inf,3)), end=', ')
True, True, True, True, True, True,
```

numpy.isnan, ctx.isnan

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isnan.html#numpy.isnan

Test element-wise for NaN and return result as a boolean array. NumPy uses the IEEE Standard for Binary Floating-Point for Arithmetic (IEEE 754). This means that Not a Number is not equivalent to infinity.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isnan(np.nan)
True
>>> np.isnan(np.inf)
False
>>> np.isnan([np.log(-1.),1.,np.log(0)])
array([ True, False, False])
```

From mpmath. See also Mpmath [692].

Return *True* if *x* is a NaN (not-a-number), or for a complex number, whether either the real or complex part is NaN; otherwise return *False*:

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.isnan(ctx.nan), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isnan(ctx.inf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(ctx.ninf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(3), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(3+4j), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(ctx.mpc(3,ctx.inf)), end=', ')
```

(continues on next page)

(continued from previous page)

```
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(ctx.mpc(ctx.inf,3)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnan(ctx.mpc(3,ctx.nan)), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isnan(ctx.mpc(ctx.nan,3)), end=', ')
True, True, True, True, True, True,
```

numpy.isnat, **ctx.isnat**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isnat.html#numpy.isnat

Test element-wise for NaT (not a time) and return result as a boolean array.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isnat(np.datetime64("NaT"))
True
>>> np.isnat(np.datetime64("2016-01-01"))
False
>>> np.isnat(np.array(["NaT", "2016-01-01"], dtype="datetime64[ns]"))
array([ True, False])
```

numpy.isneginf, **ctx.isneginf**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isneginf.html#numpy.isneginf

Test element-wise for negative infinity, return result as bool array. NumPy uses the IEEE Standard for Binary Floating-Point for Arithmetic (IEEE 754). Errors result if the second argument is also supplied when x is a scalar input, if first and second arguments have different shapes, or if the first argument has complex values.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isneginf(np.NINF)
True
>>> np.isneginf(np.inf)
False
>>> np.isneginf(np.PINF)
False
>>> np.isneginf([-np.inf, 0., np.inf])
array([ True, False, False])

>>> x = np.array([-np.inf, 0., np.inf])
>>> y = np.array([2, 2, 2])
>>> np.isneginf(x, y)
array([1, 0, 0])
>>> y
array([1, 0, 0])
```

numpy.isposinf, **ctx.isposinf**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isposinf.html#numpy.isposinf

Test element-wise for positive infinity, return result as bool array. NumPy uses the IEEE Standard for Binary Floating-Point for Arithmetic (IEEE 754). Errors result if the second argument is also supplied when x is a scalar input, if first and second arguments have different shapes, or if the first argument has complex values.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isposinf(np.PINF)
True
>>> np.isposinf(np.inf)
True
>>> np.isposinf(np.NINF)
False
>>> np.isposinf([-np.inf, 0., np.inf])
array([False, False,  True])

>>> x = np.array([-np.inf, 0., np.inf])
>>> y = np.array([2, 2, 2])
>>> np.isposinf(x, y)
array([0, 0, 1])
>>> y
array([0, 0, 1])
```

ctx.isint(x, gaussian=False)

From mpmath. See also Mpmath [695].

Return *True* if *x* is integer-valued; otherwise return *False*:

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.isint(ctx.inf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isint(ctx.ninf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isint(ctx.nan), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isint(3), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isint(3+0j), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isint(3+4j), end=', ')
False, False, False, False, False, False,
```

Optionally, Gaussian integers can be checked for:

```
>>> isint(3+2j, gaussian=True)
True
```

ctx.isnormal(x)

From mpmath. . See also Mpmath [696].

Determine whether *x* is "normal" in the sense of floating-point representation; that is, return *False* if *x* is zero, an infinity or NaN; otherwise return *True*.

By extension, a complex number *x* is considered "normal" if its magnitude is normal:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.isnormal(ctx.nan), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(ctx.inf), end=', ')
False, False, False, False, False, False,
```

(continues on next page)

(continued from previous page)

```
>>> for ctx in ctxall: print(ctx.isnormal(ctx.ninf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(0), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(3), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isnormal(3+4j), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.isnormal(ctx.mpc(3,ctx.inf)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(ctx.mpc(ctx.inf,3)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(ctx.mpc(3,ctx.nan)), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.isnormal(ctx.mpc(ctx.nan,3)), end=', ')
False, False, False, False, False, False,
```

7.22.4 Array type testing

numpy.iscomplex, **ctx.iscomplex**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.iscomplex.html#numpy.iscomplex

Returns a bool array, where True if input element is complex. What is tested is whether the input has a non-zero imaginary part, not if the input type is complex.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.iscomplex([1+1j, 1+0j, 4.5, 3, 2, 2j])
array([ True, False, False, False, False,  True])
```

numpy.iscomplexobj, **ctx.iscomplexobj**, **ctx.ismpc**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.iscomplexobj.html#numpy.iscomplexobj

Check for a complex type or an array of complex numbers. The type of the input is checked, not the value. Even if the input has an imaginary part equal to zero, iscomplexobj evaluates to True.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.iscomplexobj(1)
False
np.iscomplexobj(1+0j)
True
np.iscomplexobj([3, 1+0j, True])
True
```

From mpmath:

Returns *True* if *x* is an instance of `ctx.mpc`; otherwise returns *False*.

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.ismpc(ctx.inf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(ctx.ninf), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(ctx.nan), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(ctx.one), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(1.0), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(ctx.j), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ismpc(1j), end=', ')
True, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpc(ctx.mpc(3,ctx.inf)), end=', ')
True, True, True, True, True, True,
```

numpy.isreal, **ctx.isreal**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isreal.html#numpy.isreal

Returns a bool array, where True if input element is real. If element has complex type with zero complex part, the return value for that element is True. This function may behave unexpectedly for string or object arrays (see examples)

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> a = np.array([1+1j, 1+0j, 4.5, 3, 2, 2j], dtype=complex)
>>> np.isreal(a)
array([False,  True,  True,  True,  True, False])
```

The function does not work on string arrays.

```
>>> a = np.array([2j, "a"], dtype="U")
>>> np.isreal(a)  # Warns about non-elementwise comparison
False
```

Returns True for all elements in input array of dtype=object even if any of the elements is complex.

```
>>> a = np.array([1, "2", 3+4j], dtype=object)
>>> np.isreal(a)
array([ True,  True,  True])
```

`isreal` should not be used with object arrays

```
>>> a = np.array([1+2j, 2+1j], dtype=object)
>>> np.isreal(a)
array([ True,  True])
```

numpy.isrealobj, **ctx.isrealobj**, **ctx.ismpf**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isrealobj.html#numpy.isrealobj

Return True if x is a not complex type or an array of complex numbers. The type of the input is checked, not the value. So even if the input has an imaginary part equal to zero, `isrealobj` evaluates to False if the data type is complex. The function is only meant

for arrays with numerical values but it accepts all other objects. Since it assumes array input, the return value of other objects may be True.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isrealobj('A string')
True
>>> np.isrealobj(False)
True
>>> np.isrealobj(None)
True

>>> np.isrealobj(1)
True
>>> np.isrealobj(1+0j)
False
>>> np.isrealobj([3, 1+0j, True])
False
```

From mpmath:

Returns *True* if *x* is an instance of `ctx.mpf`; otherwise returns *False*.

Example:

```
>>> from xlcalcnet import fpm, mpm, ipm, dec, gmp, apm; ctxall = [fpm, mpm, ipm, dec, gmp, apm]
>>> for ctx in ctxall: print(ctx.ismpf(ctx.inf), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ismpf(ctx.ninf), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ismpf(ctx.nan), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ismpf(ctx.one), end=', ')
True, True, True, True, True, True,

>>> for ctx in ctxall: print(ctx.ismpf(1.0), end=', ')
True, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpf(ctx.j), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpf(1j), end=', ')
False, False, False, False, False, False,

>>> for ctx in ctxall: print(ctx.ismpf(ctx.mpc(3,ctx.inf)), end=', ')
False, False, False, False, False, False,
```

numpy.isscalar, **ctx.isscalar**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isscalar.html#numpy.isscalar

Returns True if the type of element is a scalar type. In most cases `np.ndim(x) == 0` should be used instead of this function, as that will also return true for 0d arrays.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isscalar(3.1)
True
>>> np.isscalar(np.array(3.1))
False
>>> np.isscalar([3.1])
False
>>> np.isscalar(False)
```

(continues on next page)

(continued from previous page)

```
True
>>> np.isscalar('numpy')
True
```

NumPy supports PEP 3141 numbers:

```
>>> from fractions import Fraction
>>> np.isscalar(Fraction(5, 17))
True
>>> from numbers import Number
>>> np.isscalar(Number())
True
```

7.22.5 Using tolerances

numpy.allclose, **ctx.allclose**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.allclose.html#numpy.allclose

Returns True if two arrays are element-wise equal within a tolerance.

The tolerance values are positive, typically very small numbers. The relative difference (rtol * abs(b)) and the absolute difference atol are added together to compare against the absolute difference between a and b.

NaNs are treated as equal if they are in the same place and if `equal_nan=True`. Infs are treated as equal if they are in the same place and of the same sign in both arrays.

If the following equation is element-wise True, then allclose returns True.

absolute(a - b) <= (atol + rtol * absolute(b))

The above equation is not symmetric in a and b, so that `allclose(a, b)` might be different from `allclose(b, a)` in some rare cases.

The comparison of a and b uses standard broadcasting, which means that a and b need not have the same shape in order for `allclose(a, b)` to evaluate to True. The same is true for equal but not array_equal.

allclose is not defined for non-numeric data types. bool is considered a numeric data-type for this purpose.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.allclose([1e10,1e-7], [1.00001e10,1e-8])
False
>>> np.allclose([1e10,1e-8], [1.00001e10,1e-9])
True
>>> np.allclose([1e10,1e-8], [1.0001e10,1e-9])
False
>>> np.allclose([1.0, np.nan], [1.0, np.nan])
False
>>> np.allclose([1.0, np.nan], [1.0, np.nan], equal_nan=True)
True
```

numpy.isclose, **ctx.isclose**, **ctx.almosteq(s, t, rel_eps=None, abs_eps=None)**

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.isclose.html#numpy.isclose

Returns a boolean array where two arrays are element-wise equal within a tolerance.

The tolerance values are positive, typically very small numbers. The relative difference (rtol * abs(b)) and the absolute difference atol are added together to compare against the absolute difference between a and b.

For finite values, isclose uses the following equation to test whether two floating point values are equivalent.

absolute(a - b) <= (atol + rtol * absolute(b))

Unlike the built-in math.isclose, the above equation is not symmetric in a and b – it assumes b is the reference value – so that isclose(a, b) might be different from isclose(b, a). Furthermore, the default value of atol is not zero, and is used to determine what small values should be considered close to zero. The default value is appropriate for expected values of order unity: if the expected values are significantly smaller than one, it can result in false positives. atol should be carefully selected for the use case at hand. A zero value for atol will result in False if either a or b is zero.

isclose is not defined for non-numeric data types. bool is considered a numeric data-type for this purpose.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.isclose([1e10,1e-7], [1.00001e10,1e-8])
array([ True, False])
>>> np.isclose([1e10,1e-8], [1.00001e10,1e-9])
array([ True, True])
>>> np.isclose([1e10,1e-8], [1.0001e10,1e-9])
array([False,  True])

>>> np.isclose([1.0, np.nan], [1.0, np.nan])
array([ True, False])
>>> np.isclose([1.0, np.nan], [1.0, np.nan], equal_nan=True)
array([ True, True])

>>> np.isclose([1e-8, 1e-7], [0.0, 0.0])
array([ True, False])
>>> np.isclose([1e-100, 1e-7], [0.0, 0.0], atol=0.0)
array([False, False])
>>> np.isclose([1e-10, 1e-10], [1e-20, 0.0])
array([ True,  True])
>>> np.isclose([1e-10, 1e-10], [1e-20, 0.999999e-10], atol=0.0)
array([False,  True])
```

From mpmath. See also Mpmath [697].

Determine whether the difference between s and t is smaller than a given epsilon, either relatively or absolutely.

Both a maximum relative difference and a maximum difference ('epsilons') may be specified. The absolute difference is defined as $|s-t|$ and the relative difference is defined as $|s-t|/\max(|s|,|t|)$.

If only one epsilon is given, both are set to the same value. If none is given, both epsilons are set to 2^{-p+m} where p is the current working precision and m is a small integer. The default setting typically allows `almosteq()` to be used to check for mathematical equality in the presence of small rounding errors.

Examples

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False
>>> s = 3.141592653589793; t = 3.141592653589790
>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.almosteq(s, t), end=', ')
True, True, True, True, True, True,

>>> s = 3.141592653589793; t = 3.141592653589700
>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.almosteq(s, t), end=', ')
False, False, False, False, False, False,

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.almosteq(s, t, 1e-10), end=', ')
True, True, True, True, True, True,

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.almosteq(1e-20, 2e-20), end=', ')
True, True, True, True, True, True,

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(ctx.almosteq(1e-20, 2e-20, rel_eps=0, abs_eps=0), end=', ')
False, False, False, False, False, False,
```

7.22.6 Clipping (limiting) the values in an array.

numpy.clip

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.clip.html

Clip (limit) the values in an array.

Given an interval, values outside the interval are clipped to the interval edges. For example, if an interval of `[0, 1]` is specified, values smaller than 0 become 0, and values larger than 1 become 1.

Equivalent to but faster than `np.minimum(a_max, np.maximum(a, a_min))`.

No check is performed to ensure `a_min < a_max`.

When a_min is greater than a_max, `clip` returns an array in which all values are equal to a_max, as shown in the second example.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> a = np.arange(10)
>>> a
array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
>>> np.clip(a, 1, 8)
array([1, 1, 2, 3, 4, 5, 6, 7, 8, 8])
>>> np.clip(a, 8, 1)
array([1, 1, 1, 1, 1, 1, 1, 1, 1, 1])
>>> np.clip(a, 3, 6, out=a)
array([3, 3, 3, 3, 4, 5, 6, 6, 6, 6])
>>> a
array([3, 3, 3, 3, 4, 5, 6, 6, 6, 6])
>>> a = np.arange(10)
>>> a
array([0, 1, 2, 3, 4, 5, 6, 7, 8, 9])
>>> np.clip(a, [3, 4, 1, 1, 1, 4, 4, 4, 4, 4], 8)
array([3, 4, 2, 3, 4, 5, 6, 7, 8, 8])
```

numpy.real_if_close

For a detailed description of parameters and return values see:

https://numpy.org/doc/stable/reference/generated/numpy.real_if_close.html

If input is complex with all imaginary parts close to zero, return real parts.

“Close to zero” is defined as tol * (machine epsilon of the type for a).

Machine epsilon varies from machine to machine and between data types but Python floats on most platforms have a machine epsilon equal to 2.2204460492503131e-16. You can use ‘np.finfo(float).eps’ to print out the machine epsilon for floats.

```
>>> import numpy as np; from xlcalcnet import mpm, dpm
>>> np.finfo(float).eps
2.22044604925031e-16 # may vary

>>> np.real_if_close([2.1 + 4e-14j, 5.2 + 3e-15j], tol=1000)
array([2.1, 5.2])
>>> np.real_if_close([2.1 + 4e-13j, 5.2 + 3e-15j], tol=1000)
array([2.1+4.e-13j, 5.2 + 3e-15j])
```

ctx.chop(x, tol=None)

See also Mpmath [685].

!!! iv context does not accept lists: NotImplementedError !!!

!!! dp, gp and ap contexts do not accept lists: return None !!!

Chops off small real or imaginary parts, or converts numbers close to zero to exact zeros. The input can be a single number or an iterable:

Example:

```
>>> from xlcalcnet import mp, iv, fp, dp, gp, ap
>>> mp.dps = 15; mp.pretty = False

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(repr(ctx.chop(1e-10, tol = 1e-11)))
1e-10
mpf('1.0e-10')
mpi('1.0e-10', '1.0e-10')
Decimal('1E-10')
mpfr('1e-10')
arb3_t('[1.00000000000000e-10 +/- 3.66e-27]')

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(repr(ctx.chop(1e-10, tol = 1e-9)))
0.0
mpf('0.0')
mpi('0.0', '0.0')
Decimal('0')
mpfr('0.0')
arb3_t('0')

>>> for ctx in [fp, mp, iv, dp, gp, ap]: print(repr(ctx.chop(5+1e-10j, tol = 1e-9)))
5.0
mpf('5.0')
mpi('5.0', '5.0')
Decimal('5')
mpfr('5.0')
arb3_t('5.00000000000000')

>>> for ctx in [mp, fp, dp, gp, ap]: print(ctx.chop([1.0, 1e-20, 3+1e-18j, -4, 2]))
[mpf('1.0'), mpf('0.0'), mpf('3.0'), mpf('-4.0'), mpf('2.0')]
[1.0, 0.0, 3.0, -4.0, 2.0]

None
None
None
```

The tolerance defaults to `100*eps`.

7.23 Arithmetic operations with scalars and iterables

7.23.1 fadd: Addition using a custom precision and rounding mode

`ctx.fadd`(*x*, *y*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [667].

!!! There is no special code for fadd except mp !!!

!!! Add special code for dp, gp, ap !!!

!!! fp and iv still missing !!!

Adds the numbers *x* and *y*, giving a floating-point result, optionally using a custom precision and rounding mode.

The default precision is the working precision of the context. You can specify a custom precision in bits by passing the *prec* keyword argument, or by providing an equivalent decimal precision with the *dps* keyword argument. If the precision is set to `+inf`, or if the flag *exact=True* is passed, an exact addition with no rounding is performed. Changing the precision has no effect for the fp context.

For the mp, dp, gp, and ap (in point mode only) contexts: when the precision is finite, the optional *rounding* keyword argument specifies the direction of rounding. Valid options are `'n'` for nearest (default), `'f'` for floor, `'c'` for ceiling, `'d'` for down, `'u'` for up.

Examples

Using *fadd()* with precision and rounding control:

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> mp.fadd(2, 1e-20)
mpf('2.0')
>>> mp.nprint(mp.fadd(2, 1e-20, prec=100), 25)
2.000000000000000000001
>>> mp.nprint(mp.fadd(2, 1e-20, dps=15), 25)
2.0
>>> mp.nprint(mp.fadd(2, 1e-20, dps=25), 25)
2.000000000000000000001
>>> mp.nprint(mp.fadd(2, 1e-20, exact=True), 25)
2.000000000000000000001

>>> gp.dps = 15; gp.pretty = False
>>> gp.fadd(2, 1e-20)
mpfr('2.0')
>>> gp.nprint(gp.fadd(2, 1e-20, prec=100), 25)
2.0000000000000000000000000E+00
>>> gp.nprint(gp.fadd(2, 1e-20, dps=15), 25)
2.0000000000000000000000000E+00
>>> gp.nprint(gp.fadd(2, 1e-20, dps=25), 25)
2.0000000000000000000000000E+00
>>> gp.nprint(gp.fadd(2, 1e-20, exact=True), 25)
2.0000000000000000000000000E+00

>>> dp.dps = 15; dp.pretty = False
>>> dp.fadd(2, 1e-20)
Decimal('2.000000000000000')
>>> dp.nprint(dp.fadd(2, 1e-20, prec=100), 25)
2.0000000000000000000000000E+0
>>> dp.dps=100
>>> dp.mpf(2) + dp.mpf('1e-20')
Decimal('2.000000000000000000001')
>>> dp.nprint(dp.fadd(2, 1e-20, dps=15), 25)
```

(continues on next page)

(continued from previous page)

```
2.00000000000000000000010000E+0
>>> dp.nprint(dp.fadd(2, 1e-20, dps=25), 25)
2.00000000000000000000010000E+0
>>> dp.nprint(dp.fadd(2, 1e-20, exact=True), 25)
2.00000000000000000000010000E+0

>>> ap.dps = 15; ap.pretty = False
>>> ap.fadd(2, 1e-20)
arb3_t('[2.00000000000000 +/- 4.45e-16]')
>>> ap.fadd(2, 1e-20, rounding='u')
 arb3_t('[2.00000000000000 +/- 4.45e-16]')
>>> ap.nprint(ap.fadd(2, 1e-20, prec=100), 25)
# nprint not properly implemented
>>> ap.dps=25
>>> ap.mpf(2) + ap.mpf('1e-20')
arb3_t('[2.000000000000000000010000 +/- 5.85e-26]')
>>> ap.nprint(ap.fadd(2, 1e-20, dps=15), 25)
# nprint not properly implemented
>>> ap.nprint(ap.fadd(2, 1e-20, dps=25), 25)
# nprint not properly implemented
>>> ap.nprint(ap.fadd(2, 1e-20, exact=True), 25)
# nprint not properly implemented
```

This is the current state of affairs in iv:

```
>>> iv.dps = 15; iv.pretty = False
>>> iv.fadd(2, 1e-20)
mpi('2.0', '2.0000000000000004')
>>> iv.nprint(iv.fadd(2, 1e-20, prec=100), 25)
[2.0, 2.00000000000000044408921]#    nprint not properly implemented
>>> iv.nprint(iv.fadd(2, 1e-20, dps=15), 25)
[2.0, 2.00000000000000044408921]#    nprint not properly implemented
>>> iv.nprint(iv.fadd(2, 1e-20, dps=25), 25)
[2.0, 2.00000000000000044408921]#    nprint not properly implemented
>>> iv.nprint(iv.fadd(2, 1e-20, exact=True), 25)
[2.0, 2.00000000000000044408921]#    nprint not properly implemented
```

TODO: Another ap example in floating point mode

See also: https://docs.python.org/3/tutorial/floatingpoint.html#tut-fp-issues.

Exact addition avoids cancellation errors, enforcing familiar laws of numbers such as $x + y - x = y$, which don't hold in floating-point arithmetic with finite precision:

```
>>> x, y = mp.mpf(2), mp.mpf('1e-1000')
>>> print(x + y - x)
0.0
>>> print(mp.fadd(x, y, prec=inf) - x)
1.0e-1000
>>> print(mp.fadd(x, y, exact=True) - x)
1.0e-1000
```

Exact addition can be inefficient and may be impossible to perform with large magnitude differences:

```
>>> fadd(1, '1e-1000000000000000000000', prec=inf)
Traceback (most recent call last):
    ...
OverflowError: the exact result does not fit in memory
```

7.23.2 fsub: Subtraction using a custom precision and rounding mode

`ctx.fsub`(*x*, *y*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [683].

Subtracts the numbers *x* and *y*, giving a floating-point result, optionally using a custom precision and rounding mode.

See the documentation of *fadd()* for a detailed description of how to specify precision and rounding.

Examples

Using *fsub()* with precision and rounding control:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> fsub(2, 1e-20)
mpf('2.0')
>>> fsub(2, 1e-20, rounding='d')
mpf('1.9999999999999998')
>>> nprint(fsub(2, 1e-20, prec=100), 25)
1.9999999999999999999
>>> nprint(fsub(2, 1e-20, dps=15), 25)
2.0
>>> nprint(fsub(2, 1e-20, dps=25), 25)
1.9999999999999999999
>>> nprint(fsub(2, 1e-20, exact=True), 25)
1.9999999999999999999
```

Exact subtraction avoids cancellation errors, enforcing familiar laws of numbers such as $x - y + y = x$, which don't hold in floating-point arithmetic with finite precision:

```
>>> x, y = mpf(2), mpf('1e1000')
>>> print(x - y + y)
0.0
>>> print(fsub(x, y, prec=inf) + y)
2.0
>>> print(fsub(x, y, exact=True) + y)
2.0
```

Exact subtraction can be inefficient and may be impossible to perform with large magnitude differences:

```
>>> fsub(1, '1e-1000000000000000000000', prec=inf)
Traceback (most recent call last):
    ...
OverflowError: the exact result does not fit in memory
```

7.23.3 fneg: Negation of a number using a custom precision and rounding mode

`ctx.fneg`(*x*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [678].

!!! NEEDS TO DESCRIBE PARAMETERS !!!!

Negates the number *x*, giving a floating-point result, optionally using a custom precision and rounding mode.

See the documentation of *fadd()* for a detailed description of how to specify precision and rounding.

Examples

An mpmath number is returned:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> fneg(2.5)
```

(continues on next page)

(continued from previous page)

```
mpf('-2.5')
>>> fneg(-5+2j)
mpc(real='5.0', imag='-2.0')
```

Precise control over rounding is possible:

```
>>> x = fadd(2, 1e-100, exact=True)
>>> fneg(x)
mpf('-2.0')
>>> fneg(x, rounding='f')
mpf('-2.0000000000000004')
```

Negating with and without roundoff:

```
>>> n = 200000000000000000000001
>>> print(int(-mpf(n)))
-200000000000000016777216
>>> print(int(fneg(n)))
-200000000000000016777216
>>> print(int(fneg(n, prec=log(n,2)+1)))
-200000000000000000000001
>>> print(int(fneg(n, dps=log(n,10)+1)))
-200000000000000000000001
>>> print(int(fneg(n, prec=inf)))
-200000000000000000000001
>>> print(int(fneg(n, dps=inf)))
-200000000000000000000001
>>> print(int(fneg(n, exact=True)))
-200000000000000000000001
```

7.23.4 fmul: Multiplication using a custom precision and rounding mode

`ctx.`**`fmul`**(*x*, *y*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [677].

Multiplies the numbers *x* and *y*, giving a floating-point result, optionally using a custom precision and rounding mode.

See the documentation of *`fadd()`* for a detailed description of how to specify precision and rounding.

Examples

The result is an mpmath number:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> fmul(2, 5.0)
mpf('10.0')
>>> fmul(0.5j, 0.5)
mpc(real='0.0', imag='0.25')
```

Avoiding roundoff:

```
>>> x, y = 10**10+1, 10**15+1
>>> print(x*y)
10000000001000010000000001
>>> print(mpf(x) * mpf(y))
1.0000000001e+25
>>> print(int(mpf(x) * mpf(y)))
10000000001000011026399232
>>> print(int(fmul(x, y)))
10000000001000011026399232
>>> print(int(fmul(x, y, dps=25)))
```

(continues on next page)

(continued from previous page)

```
10000000001000010000000001
>>> print(int(fmul(x, y, exact=True)))
10000000001000010000000001
```

Exact multiplication with complex numbers can be inefficient and may be impossible to perform with large magnitude differences between real and imaginary parts:

```
>>> x = 1+2j
>>> y = mpc(2, '1e-10000000000000000000')
>>> fmul(x, y)
mpc(real='2.0', imag='4.0')
>>> fmul(x, y, rounding='u')
mpc(real='2.0', imag='4.0000000000000009')
>>> fmul(x, y, exact=True)
Traceback (most recent call last):
    ...
OverflowError: the exact result does not fit in memory
```

7.23.5 fdiv: Division using a custom precision and rounding mode

`ctx.fdiv`(*x*, *y*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [672].

Divides the numbers *x* and *y*, giving a floating-point result, optionally using a custom precision and rounding mode.

See the documentation of *fadd()* for a detailed description of how to specify precision and rounding.

Examples

The result is an mpmath number:

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> fdiv(3, 2)
mpf('1.5')
>>> fdiv(2, 3)
mpf('0.66666666666666663')
>>> fdiv(2+4j, 0.5)
mpc(real='4.0', imag='8.0')
```

The rounding direction and precision can be controlled:

```
>>> fdiv(2, 3, dps=3)    # Should be accurate to at least 3 digits
mpf('0.6666259765625')
>>> fdiv(2, 3, rounding='d')
mpf('0.66666666666666663')
>>> fdiv(2, 3, prec=60)
mpf('0.66666666666666667')
>>> fdiv(2, 3, rounding='u')
mpf('0.66666666666666674')
```

Checking the error of a division by performing it at higher precision:

```
>>> fdiv(2, 3) - fdiv(2, 3, prec=100)
mpf('-3.7007434154172148e-17')
```

Unlike *fadd()*, *fmul()*, etc., exact division is not allowed since the quotient of two floating-point numbers generally does not have an exact floating-point representation. (In the future this might be changed to allow the case where the division is actually exact.)

```
>>> fdiv(2, 3, exact=True)
Traceback (most recent call last):
    ...
ValueError: division is not an exact operation
```

7.23.6 fsum: Sum of a finite number of terms

`ctx.`**`fsum`**(*terms*, *absolute=False*, *squared=False*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [684].

Calculates a sum containing a finite number of terms . With squared=True each term is squared, and with absolute=True the absolute value of each term is used.

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> A = [1, 2, 0.5, 7]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fsum(A)), end=', ')
10.5, mpf('10.5'), mpi('10.5', '10.5'), Decimal('10.5'), mpfr('10.5'), arb3_t('10.5'),
```

7.23.7 fprod: Product of a finite number of factors

`ctx.`**`fprod`**(*factors*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [680].

Calculates a product containing a finite number of factors (for infinite products, see *nprod()*).

The factors will be converted to mpmath numbers.

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> A = [1, 2, 0.5, 7]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fprod(A)), end=', ')
7.0, mpf('7.0'), mpi('7.0', '7.0'), Decimal('7.0'), mpfr('7.0'), arb3_t('7.0'),

>>> A = [1001, 2003, 0.5, 70005]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fprod(A)))
70180117507.5
mpf('70180117507.5')
mpi('70180117507.5', '70180117507.5')
Decimal('70180117507.5')
mpfr('70180117507.5')
arb3_t('70180117507.5')
```

7.23.8 fdot: Dot product

`ctx.`**`fdot`**(*A*, *B=None*, *conjugate=False*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`. See also Mpmath [673].

!!! conjugate not working with iv !!!

Computes the dot product of the iterables A and B,

$$\sum_{k=0} A_k B_k.$$

Alternatively, *fdot()* accepts a single iterable of pairs. In other words, `fdot(A,B)` and `fdot(zip(A,B))` are equivalent. The elements are automatically converted to mpmath numbers.

With `conjugate=True`, the elements in the second vector will be conjugated:

$$\sum_{k=0} A_k \overline{B_k}$$

Examples

```
>>> from xlcalcnet import fp, mp, iv, dp, gp, ap
>>> A = [2, 1.5, 3]; B = [1, -1, 2]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fdot(A, B)), end=', ')
6.5, mpf('6.5'), mpi('6.5', '6.5'), Decimal('6.5'), mpfr('6.5'), arb3_t('6.5'),

>>> C = list(zip(A, B)); print(C)
[(2, 1), (1.5, -1), (3, 2)]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fdot(C)), end=', ')
6.5, mpf('6.5'), mpi('6.5', '6.5'), Decimal('6.5'), mpfr('6.5'), arb3_t('6.5'),

>>> A = [2, 1.5, 3j]; B = [1+1j, 3, -1-1j]
>>> for ctx in [fp, mp, iv, dp, gp, ap]: ctx.dps = 15;  print(repr(ctx.fdot(A, B)))
(9.5-1j)
mpc(real='9.5', imag='-1.0')
iv.mpc(mpi('9.5', '9.5'), mpi('-1.0', '-1.0'))
DecCplx('9.50 - 1.0j')
mpc('9.5-1.0j')
acb3_t('9.5 - 1.0j')

>>> A = [2, 1.5, 3j]; B = [1+1j, 3, -1-1j]
>>> for ctx in [fp, mp, dp, gp, ap]:
...     ctx.dps = 15;  print(repr(ctx.fdot(A, B, conjugate=True)))
(3.5-5j)
mpc(real='3.5', imag='-5.0')
DecCplx('3.50 - 5.0j')
mpc('3.5-5.0j')
acb3_t('3.5 - 5.0j')

>>> x = ap.mpf(2); x
>>> c = 3+4j; c
>>> x + c
```

7.24 Numerical transformations and descriptive statistics

7.24.1 Centering of a matrix

mat.**centered**(*res*, *data*, *population*, *opt*)

Returns the centered version of the matrix

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf(); mp14.setdps(15)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,
21, 22, 23, 24, 25, 26,
31, 32, 33, 34, 35, 36,
41, 42, 43, 44, 45, 46,
51, 52, 53, 54, 55, 56,
61, 62, 63, 64, 65, 66,

>>> B = A.centered(); B.show("B")
B:
-25, -25, -25, -25, -25, -25,
-15, -15, -15, -15, -15, -15,
 -5,  -5,  -5,  -5,  -5,  -5,
  5,   5,   5,   5,   5,   5,
 15,  15,  15,  15,  15,  15,
 25,  25,  25,  25,  25,  25,

>>> B = A.variance(); B.show("B")
B:
350, 350, 350, 350, 350, 350,

>>> B = A.stdev(); B.show("B")
```

7.24.2 Standardization of a matrix

mat.**standardized**(*res*, *data*, *population*, *opt*)

Returns the standardized version of the matrix

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf(); mp14.setdps(5)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,
21, 22, 23, 24, 25, 26,
31, 32, 33, 34, 35, 36,
41, 42, 43, 44, 45, 46,
51, 52, 53, 54, 55, 56,
61, 62, 63, 64, 65, 66,

>>> B = A.standardized(); B.show("B")
B:
 -1.336,  -1.336,  -1.336,  -1.336,  -1.336,  -1.336,
-0.8017, -0.8017, -0.8017, -0.8017, -0.8017, -0.8017,
-0.2672, -0.2672, -0.2672, -0.2672, -0.2672, -0.2672,
 0.2672,  0.2672,  0.2672,  0.2672,  0.2672,  0.2672,
 0.8017,  0.8017,  0.8017,  0.8017,  0.8017,  0.8017,
  1.336,   1.336,   1.336,   1.336,   1.336,   1.336,

>>> C = B.variance(); C.show("C")
C:
0.9996, 0.9996, 0.9996, 0.9996, 0.9996, 0.9996,
```

See also Eigen [237].

7.24.3 Trace

`mat.trace()`

Returns the trace of the matrix. See also: Wikipedia [1395].

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf()
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,
21, 22, 23, 24, 25, 26,
31, 32, 33, 34, 35, 36,

51, 52, 53, 54, 55, 56,
61, 62, 63, 64, 65, 66,

>>> Res = A.trace(); Res.show("Res")

!!! MISSING !!!
```

7.24.4 Squared Norm

`mat.squaredNorm(`*partialmode=full*`)`

Returns the squared norm of the matrix.

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf()
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,
21, 22, 23, 24, 25, 26,
31, 32, 33, 34, 35, 36,
41, 42, 43, 44, 45, 46,
51, 52, 53, 54, 55, 56,
61, 62, 63, 64, 65, 66,

>>> Res = A.squaredNorm(); Res.show("Res")
Res:
 9526,  9964, 10414, 10876, 11350, 11836,
```

7.24.5 Euclidian Norm

mat.**Norm**(*partialmode=full*)

Returns the norm of the matrix.

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf(); mp14.setdps(6)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,
21, 22, 23, 24, 25, 26,
31, 32, 33, 34, 35, 36,
41, 42, 43, 44, 45, 46,
51, 52, 53, 54, 55, 56,
61, 62, 63, 64, 65, 66,

>>> Res = A.Norm(); Res.show("Res")
Res:
97.601, 99.820, 102.05, 104.29, 106.54, 108.79,
```

7.24.6 Covariance matrix

mat.**covariance_matrix**(*use_crossproduct=False*)

Returns the covariance matrix of the matrix. See also Wikipedia [1391], Wikipedia [1371].

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf(); mp14.setdps(15)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:

350, 350, 350, 350, 350, 350,
```

7.24.7 Correlation matrix

mat.**correlation**(*use_crossproduct=False*)

Returns the correlation matrix of matrix matA. See also Wikipedia [1369].

```
>>> from arbeigenlab import mp14
>>> ctx = mp14.drf(); mp14.setdps(6)
>>> A = ctx.read_from_sqlite(mp14.dbpath(), "DecTableA6x6", ""); A.show("A")
A:
11, 12, 13, 14, 15, 16,

```

7.24.8 Summary statistic

mat.**summary**(*summary*, *data*, *population*, *opt*)

Sets *summary* to a matrix containing summary statistics of *data*.

Constant	Meaning
ARB_STAT_COUNT	1
ARB_STAT_SUM	4 = $\sum_0^1 07^e + 11^f$
ARB_STAT_MEAN	4
ARB_STAT_MIN	13
ARB_STAT_MEDIAN	1
ARB_STAT_MAX	11
ARB_STAT_AVERAGE_DEVIATION	2
ARB_STAT_SUM_OF_SQUARES_OF_DEV	14
ARB_STAT_SUM_OF_SQUARES	8
ARB_STAT_VARIANCE	11
ARB_STAT_STANDARD_DEVIATION	6
ARB_STAT_SKEWNESS	6
ARB_STAT_KURTOSIS	8
ARB_STAT_TRIMMED_MEAN	8
ARB_STAT_HARMONIC_MEAN	9
ARB_STAT_GEOMETRIC_MEAN	9

```
>>> from arbeigenlab import mp14
>>> mpm.dps = 40;
>>> A = mp14.xrf().read_from_sqlite(mp14.dbpath(), "MpfrTableA4x4", "")
>>> B = mp14.xrf().read_from_sqlite(mp14.dbpath(), "MpfrTableB4x4", "")
```

7.24.9 Vector norm of a matrix

`ctx.norm`(*x*, *p=2*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Gives the entrywise p-norm of an iterable x, i.e. the vector norm $(\sum_k |x_k|^p)^{1/p}$, for any given $1 \le p \le \infty$.

Special cases:

If x is not iterable, this just returns `absmax(x)`.

`p=1` gives the sum of absolute values.

`p=2` is the standard Euclidean vector norm.

`p=inf` gives the magnitude of the largest element.

For x a matrix, `p=2` is the Frobenius norm. For operator matrix norms, use `mnorm()` instead.

You can use the string 'inf' as well as float('inf') or mpf('inf') to specify the infinity norm.

Examples

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> x = matrix([-10, 2, 100])
>>> norm(x, 1)
mpf('112.0')
>>> norm(x, 2)
mpf('100.5186549850325')
>>> norm(x, inf)
mpf('100.0')
```

7.24.10 Matrix norm

`ctx.mnorm(A, p=1)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Gives the matrix (operator) p-norm of A. Currently `p=1` and `p=inf` are supported:

`p=1` gives the 1-norm (maximal column sum)

`p=inf` gives the ∞-norm (maximal row sum). You can use the string 'inf' as well as float('inf') or mpf('inf')

`p=2` (not implemented) for a square matrix is the usual spectral matrix norm, i.e. the largest singular value.

`p='f'` (or 'F', 'fro', 'Frobenius, 'frobenius') gives the Frobenius norm, which is the elementwise 2-norm. The Frobenius norm is an approximation of the spectral norm and satisfies

$$\frac{1}{\sqrt{\operatorname{rank}(A)}}\|A\|_F \leq \|A\|_2 \leq \|A\|_F$$

The Frobenius norm lacks some mathematical properties that might be expected of a norm.

For general elementwise p-norms, use `norm()` instead.

Examples

```
>>> from xlcalcnet import *
>>> mp.dps = 15; mp.pretty = False
>>> A = matrix([[1, -1000], [100, 50]])
>>> mnorm(A, 1)
mpf('1050.0')
>>> mnorm(A, inf)
mpf('1001.0')
>>> mnorm(A, 'F')
mpf('1006.2310867787777')
```

7.25 Standard decompositions and linear solving

Returns the Cholesky decomposition of the symmetric matrix *matA* $= A = PLU$, without pivoting. Here *matA* is an instance of one of the above classes.

See also Eigen [231], Wikipedia [1402], Wikipedia [1432].

7.25.1 Cholesky decomposition

`ctx.cholesky`(*A*, *tol=None*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Cholesky decomposition of a symmetric positive-definite matrix A. Returns a lower triangular matrix L such that $A = L \times L^T$. More generally, for a complex Hermitian positive-definite matrix, a Cholesky decomposition satisfying $A = L \times L^H$ is returned.

The Cholesky decomposition can be used to solve linear equation systems twice as efficiently as LU decomposition, or to test whether A is positive-definite.

The optional parameter `tol` determines the tolerance for verifying positive-definiteness.

Examples

Cholesky decomposition of a positive-definite symmetric matrix:

```
>>> from xlcalcnet import *
>>> mp.dps = 25; mp.pretty = True
>>> A = eye(3) + hilbert(3)
>>> nprint(A)
[     2.0      0.5  0.333333]
[     0.5  1.33333      0.25]
[0.333333     0.25       1.2]
>>> L = cholesky(A)
>>> nprint(L)
[ 1.41421      0.0      0.0]
[0.353553  1.09924      0.0]
[0.235702  0.15162  1.05899]
>>> chop(A - L*L.T)
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

Cholesky decomposition of a Hermitian matrix:

```
>>> A = eye(3) + matrix([[0,0.25j,-0.5j],[-0.25j,0,0],[0.5j,0,0]])
>>> L = cholesky(A)
>>> nprint(L)
[          1.0                0.0                0.0]
[(0.0 - 0.25j)  (0.968246 + 0.0j)                0.0]
[ (0.0 + 0.5j)  (0.129099 + 0.0j)  (0.856349 + 0.0j)]
>>> chop(A - L*L.H)
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

Attempted Cholesky decomposition of a matrix that is not positive definite:

```
>>> A = -eye(3) + hilbert(3)
>>> L = cholesky(A)
Traceback (most recent call last):
  ...
ValueError: matrix is not positive-definite
```

References

1. Wikipedia: http://en.wikipedia.org/wiki/Cholesky_decomposition

7.25.2 Cholesky decomposition, solve

`ctx.cholesky_solve(A, b, **kwargs)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Solves a symmetric positive-definite linear equation system. This is twice as efficient as lu_solve.

Returns the LU decomposition of the general square matrix *matA* $= A = PLU$, with partial pivoting.

See also Eigen [232], Wikipedia [1414], Wikipedia [1432].

7.25.3 Matrix LU factorization

`ctx.lu(A)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

A -> P, L, U

LU factorisation of a square matrix A. L is the lower, U the upper part. P is the permutation matrix indicating the row swaps.

P*A = L*U

If you need efficiency, use the low-level method LU_decomp instead, it's much more memory efficient.

The function `lu` computes an explicit LU factorization of a matrix:

```
>>> P, L, U = lu(matrix([[0,2,3],[4,5,6],[7,8,9]]))
>>> print(P)
[0.0  0.0  1.0]
[1.0  0.0  0.0]
[0.0  1.0  0.0]
>>> print(L)
[              1.0                0.0  0.0]
[              0.0                1.0  0.0]
[0.571428571428571  0.214285714285714  1.0]
>>> print(U)
[7.0  8.0                9.0]
[0.0  2.0                3.0]
[0.0  0.0  0.214285714285714]
>>> print(P.T*L*U)
[0.0  2.0  3.0]
[4.0  5.0  6.0]
[7.0  8.0  9.0]
```

7.25.4 Determinant of a matrix, using LU decomposition

`ctx.det(A)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Calculates the determinant of a matrix, using the LU factorization.

7.25.5 Inverse of a matrix, using the LU factorization

`ctx.inverse(A, **kwargs)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Calculates the inverse of a matrix, using the LU factorization.

If you want to solve an equation system Ax = b, it's recommended to use solve(A, b) instead, it's about 3 times more efficient.

7.25.6 Linear equations: LU solve

ctx.**lu_solve**(*A*, *b*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Basic linear algebra is implemented; you can for example solve the linear equation system:

```
  x + 2*y = -10
3*x + 4*y =  10
```

using lu_solve:

```
>>> from xlcalcnet import *
>>> mp.pretty = False
>>> A = matrix([[1, 2], [3, 4]])
>>> b = matrix([-10, 10])
>>> x = lu_solve(A, b)
>>> x
matrix(
[['30.0'],
 ['-20.0']])
```

7.25.7 Linear equations: residual of LU solve

ctx.**residual**(*A*, *x*, *b*, ***kwargs*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Calculate the residual of a solution to a linear equation system.

r = A*x - b for A*x = b

If you don't trust the result, use residual to calculate the residual ||A*x-b||:

```
>>> residual(A, x, b)
matrix(
[['3.46944695195361e-18'],
 ['3.46944695195361e-18']])
>>> str(eps)
'2.22044604925031e-16'
```

As you can see, the solution is quite accurate. The error is caused by the inaccuracy of the internal floating point arithmetic. Though, it's even smaller than the current machine epsilon, which basically means you can trust the result.

lu_solve accepts overdetermined systems. It is usually not possible to solve such systems, so the residual is minimized instead. Internally this is done using Cholesky decomposition to compute a least squares approximation. This means that lu_solve will square the errors. If you can't afford this, use qr_solve instead. It is twice as slow but more accurate, and it calculates the residual automatically.

7.25.8 ??? LU improve solution

improve_solution(*ctx*, *A*, *x*, *b*, *maxsteps=1*)

Improve a solution to a linear equation system iteratively.

This re-uses the LU decomposition and is thus cheap. Usually 3 up to 4 iterations are giving the maximal improvement.

7.25.9 mpmath: LU condition number

ctx.**cond**(*A*, *norm=None*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Calculates the condition number of a matrix using a specified matrix norm.

The condition number estimates the sensitivity of a matrix to errors. Example: small input errors for ill-conditioned coefficient matrices alter the solution of the system dramatically.

For ill-conditioned matrices it's recommended to use qr_solve() instead of lu_solve(). This does not help with input errors however, it just avoids to add additional errors.

Definition: cond(A) = ||A|| * ||A**-1||

Returns the QR decomposition of the symmetric matrix *matA* $= A = QR$, without pivoting.

See also Eigen [228], Wikipedia [1436], Wikipedia [1432].

7.25.10 QR factorization

`ctx.qr`(*A*, *mode='full'*, *edps=10*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Compute a QR factorization $A = QR$ where A is an m x n matrix of real or complex numbers where m >= n

mode has following meanings: (1) mode = 'raw' returns two matrixes (A, tau) in the internal format used by LAPACK (2) mode = 'skinny' returns the leading n columns of Q and n rows of R (3) Any other value returns the leading m columns of Q and m rows of R

edps is the increase in mp precision used for calculations

Examples

```
>>> from xlcalcnet import *
>>> mp.dps = 15
>>> mp.pretty = True
>>> A = matrix([[1, 2], [3, 4], [1, 1]])
>>> Q, R = qr(A)
>>> Q
[-0.301511344577764   0.861640436855329   0.408248290463863]
[-0.904534033733291  -0.123091490979333  -0.408248290463863]

[(3.0 + 1.0j)  (4.0 + 5.0j)]
>>> chop(Q.T * Q.conjugate())
[1.0  0.0]
[0.0  1.0]
```

7.25.11 QR solve

`ctx.qr_solve`(*A*, *b*, *norm=None*, ***kwargs*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Ax = b => x, ||Ax - b||

Solve a determined or overdetermined linear equations system and calculate the norm of the residual (error). QR decomposition using Householder factorization is applied, which gives very accurate results even for ill-conditioned matrices. lu_solve is twice as efficient.

7.26 Singular Value and Eigen decompositions

See: https://math.stackexchange.com/questions/1816364/the-svd-solution-to-linear-least-squares-linear-system-of-equations

Returns the SVD decomposition of a rectangular matrix.

See also Eigen [229], Wikipedia [1420], Wikipedia [1432].

7.26.1 Real singular value decomposition of a matrix A

`ctx.svd_r`(*A*, *full_matrices=False*, *compute_uv=True*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

This routine computes the singular value decomposition of a matrix A. Given A, two orthogonal matrices U and V are calculated such that

A = U S V and U' U = 1 and V V' = 1

where S is a suitable shaped matrix whose off-diagonal elements are zero. Here ' denotes the transpose. The diagonal elements of S are the singular values of A, i.e. the positive square roots of the eigenvalues of A' A or A A'.

input:

A : a real matrix of shape (m, n)

full_matrices
: [if true, U and V are of shape (m, m) and (n, n).] if false, U and V are of shape (m, min(m, n)) and (min(m, n), n).

compute_uv : if true, U and V are calculated. if false, only S is calculated.

overwrite_a
: [if true, allows modification of A which may improve] performance. if false, A is not modified.

output:

U
: [an orthogonal matrix: U' U = 1. if full_matrices is true, U is of] shape (m, m). ortherwise it is of shape (m, min(m, n)).

S
: [an array of length min(m, n) containing the singular values of A sorted by] decreasing magnitude.

V
: [an orthogonal matrix: V V' = 1. if full_matrices is true, V is of] shape (n, n). ortherwise it is of shape (min(m, n), n).

return value:

S if compute_uv is false

(U, S, V) if compute_uv is true

overview of the matrices:

full_matrices true:

A : m*n

U : m*m U' U = 1

S as matrix : m*n

V : n*n V V' = 1

full_matrices false:

A : m*n

U : m*min(n,m) U' U = 1

S as matrix : min(m,n)*min(m,n)

V : min(m,n)*n V V' = 1

examples:

```
>>> from mpmath import mp
>>> A = mp.matrix([[2, -2, -1], [3, 4, -2], [-2, -2, 0]])
>>> S = mp.svd_r(A, compute_uv = False)
>>> print(S)
[6.0]
[3.0]
[1.0]
```

```
>>> U, S, V = mp.svd_r(A)
>>> print(mp.chop(A - U * mp.diag(S) * V))
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

see also: svd, svd_c

7.26.2 Complex singular value decomposition of a matrix A

`ctx.svd_c`(*A*, *full_matrices=False*, *compute_uv=True*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

This routine computes the singular value decomposition of a matrix A. Given A, two unitary matrices U and V are calculated such that

A = U S V and U' U = 1 and V V' = 1

where S is a suitable shaped matrix whose off-diagonal elements are zero. Here ' denotes the hermitian transpose (i.e. transposition and complex conjugation). The diagonal elements of S are the singular values of A, i.e. the positive square roots of the eigenvalues of A' A or A A'.

input:

A : a complex matrix of shape (m, n)

full_matrices : if true, U and V are of shape (m, m) and (n, n).

if false, U and V are of shape (m, min(m, n)) and (min(m, n), n).

compute_uv : if true, U and V are calculated. if false, only S is calculated.

overwrite_a
[if true, allows modification of A which may improve] performance. if false, A is not modified.

output:

U
[an unitary matrix: U' U = 1. if full_matrices is true, U is of] shape (m, m). ortherwise it is of shape (m, min(m, n)).

S
[an array of length min(m, n) containing the singular values of A sorted by] decreasing magnitude.

V
[an unitary matrix: V V' = 1. if full_matrices is true, V is of] shape (n, n). ortherwise it is of shape (min(m, n), n).

return value:

S if compute_uv is false

(U, S, V) if compute_uv is true

overview of the matrices:

full_matrices true:

A : m*n

U : m*m U' U = 1

S as matrix : m*n

V : n*n V V' = 1

full_matrices false:

A : m*n

U : m*min(n,m) U' U = 1

S as matrix : min(m,n)*min(m,n)

V : min(m,n)*n V V' = 1

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[-2j, -1-3j, -2+2j], [2-2j, -1-3j, 1], [-3+1j,-2j,0]])
>>> S = mp.svd_c(A, compute_uv = False)
>>> print(mp.chop(S - mp.matrix([mp.sqrt(34), mp.sqrt(15), mp.sqrt(6)])))
[0.0]
[0.0]
[0.0]
```

```
>>> U, S, V = mp.svd_c(A)
>>> print(mp.chop(A - U * mp.diag(S) * V))
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

see also: svd, svd_r

7.26.3 mpmath: Singular value decomposition of a matrix A (real or complex)

`ctx.svd`(*A*, *full_matrices=False*, *compute_uv=True*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

"svd" is a unified interface for "svd_r" and "svd_c". Depending on whether A is real or complex the appropriate function is called.

This routine computes the singular value decomposition of a matrix A. Given A, two orthogonal (A real) or unitary (A complex) matrices U and V are calculated such that

A = U S V and U' U = 1 and V V' = 1

where S is a suitable shaped matrix whose off-diagonal elements are zero. Here ' denotes the hermitian transpose (i.e. transposition and complex conjugation). The diagonal elements of S are the singular values of A, i.e. the squareroots of the eigenvalues of A' A or A A'.

input:

A : a real or complex matrix of shape (m, n)

full_matrices : if true, U and V are of shape (m, m) and (n, n). if false, U and V are of shape (m, min(m, n)) and (min(m, n), n).

compute_uv : if true, U and V are calculated. if false, only S is calculated.

overwrite_a : if true, allows modification of A which may improve performance. if false, A is not modified.

output:

U

[an orthogonal or unitary matrix: U' U = 1. if full_matrices is true, U is of] shape (m, m). ortherwise it is of shape (m, min(m, n)).

S

[an array of length min(m, n) containing the singular values of A sorted by] decreasing magnitude.

V

[an orthogonal or unitary matrix: V V' = 1. if full_matrices is true, V is of] shape (n, n). ortherwise it is of shape (min(m, n), n).

return value:

S if compute_uv is false

(U, S, V) if compute_uv is true

overview of the matrices:

full_matrices true: A : m*n U : m*m U' U = 1 S as matrix : m*n V : n*n V V' = 1

full_matrices false: A : m*n U : m*min(n,m) U' U = 1 S as matrix : min(m,n)*min(m,n) V : min(m,n)*n V V' = 1

examples:

```
>>> from mpmath import mp
>>> A = mp.matrix([[2, -2, -1], [3, 4, -2], [-2, -2, 0]])
>>> S = mp.svd(A, compute_uv = False)
>>> print(S)
[6.0]
[3.0]
[1.0]
```

```
>>> U, S, V = mp.svd(A)
>>> print(mp.chop(A - U * mp.diag(S) * V))
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

see also: svd_r, svd_c

7.26.4 Eigenvalue problem for a real symmetric square matrix A

`ctx.eigsy`(*d*, *e*, *z=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

Returns the eigendecomposition of the symmetric/hermitian matrix *matA* $= A$.

See also Eigen [238], Wikipedia [1405], Wikipedia [1407], Wikipedia [1432].

This routine solves the (ordinary) eigenvalue problem for a real symmetric square matrix A. Given A, an orthogonal matrix Q is calculated which diagonalizes A : $Q' A Q = \mathrm{diag}(E)$ and $Q Q^T = Q^T Q = 1$

Here diag(E) is a diagonal matrix whose diagonal is E.

The columns of Q are the eigenvectors of A and E contains the eigenvalues:

```
A * Q[:,i] = E[i] * Q[:,i]
```

input:

A: real matrix of format (n,n) which is symmetric (i.e. A=A' or A[i,j]=A[j,i])

eigvals_only: if true, calculates only the eigenvalues E. if false, calculates both eigenvectors and eigenvalues.

overwrite_a: if true, allows modification of A which may improve performance. if false, A is not modified.

output:

E: vector of format (n). contains the eigenvalues of A in ascending order.

Q: orthogonal matrix of format (n,n). contains the eigenvectors of A as columns.

return value:

E if eigvals_only is true

(E, Q) if eigvals_only is false

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, 2], [2, 0]])
>>> E = mp.eigsy(A, eigvals_only = True)
>>> print(E)
[-1.0]
[ 4.0]
```

```
>>> A = mp.matrix([[1, 2], [2, 3]])
>>> E, Q = mp.eigsy(A)
>>> print(mp.chop(A * Q[:,0] - E[0] * Q[:,0]))
[0.0]
[0.0]
```

see also: eighe, eigh, eig

7.26.5 Eigenvalue problem for a complex hermitian square matrix A

`ctx.eighe`(*A*, *eigvals_only=False*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

This routine solves the (ordinary) eigenvalue problem for a complex hermitian square matrix A. Given A, an unitary matrix Q is calculated which diagonalizes A:

Q' A Q = diag(E) and Q Q' = Q' Q = 1

Here diag(E) a is diagonal matrix whose diagonal is E. ' denotes the hermitian transpose (i.e. ordinary transposition and complex conjugation).

The columns of Q are the eigenvectors of A and E contains the eigenvalues:

A Q[:,i] = E[i] Q[:,i]

input:

A: complex matrix of format (n,n) which is hermitian
(i.e. A=A' or A[i,j]=conj(A[j,i]))

eigvals_only: if true, calculates only the eigenvalues E.
if false, calculates both eigenvectors and eigenvalues.

overwrite_a: if true, allows modification of A which may improve
performance. if false, A is not modified.

output:

E: vector of format (n). contains the eigenvalues of A in ascending order.

Q: unitary matrix of format (n,n). contains the eigenvectors
of A as columns.

return value:

E if eigvals_only is true

(E, Q) if eigvals_only is false

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[1, -3 - 1j], [-3 + 1j, -2]])
>>> E = mp.eighe(A, eigvals_only = True)
>>> print(E)
[-4.0]
[ 3.0]
```

```
>>> A = mp.matrix([[1, 2 + 5j], [2 - 5j, 3]])
>>> E, Q = mp.eighe(A)
>>> print(mp.chop(A * Q[:,0] - E[0] * Q[:,0]))
[0.0]
[0.0]
```

see also: eigsy, eigh, eig

7.26.6 mpmath: Eigenvalue problem for a selfadjoint square matrix A

`ctx.eigh`(*A*, *eigvals_only=False*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

“eigh” is a unified interface for “eigsy” and “eighe”. Depending on whether A is real or complex the appropriate function is called.

This routine solves the (ordinary) eigenvalue problem for a real symmetric or complex hermitian square matrix A. Given A, an orthogonal (A real) or unitary (A complex) matrix Q is calculated which diagonalizes A:

Q’ A Q = diag(E) and Q Q’ = Q’ Q = 1

Here diag(E) a is diagonal matrix whose diagonal is E. ‘ denotes the hermitian transpose (i.e. ordinary transposition and complex conjugation).

The columns of Q are the eigenvectors of A and E contains the eigenvalues:

A Q[:,i] = E[i] Q[:,i]

input:

A: a real or complex square matrix of format (n,n) which is symmetric
(i.e. A[i,j]=A[j,i]) or hermitian (i.e. A[i,j]=conj(A[j,i])).

eigvals_only: if true, calculates only the eigenvalues E.
if false, calculates both eigenvectors and eigenvalues.

overwrite_a: if true, allows modification of A which may improve
performance. if false, A is not modified.

output:

E: vector of format (n). contains the eigenvalues of A in ascending order.

Q: an orthogonal or unitary matrix of format (n,n). contains the
eigenvectors of A as columns.

return value:

E if eigvals_only is true

(E, Q) if eigvals_only is false

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, 2], [2, 0]])
>>> E = mp.eigh(A, eigvals_only = True)
>>> print(E)
[-1.0]
[ 4.0]
```

```
>>> A = mp.matrix([[1, 2], [2, 3]])
>>> E, Q = mp.eigh(A)
>>> print(mp.chop(A * Q[:,0] - E[0] * Q[:,0]))
[0.0]
[0.0]
```

```
>>> A = mp.matrix([[1, 2 + 5j], [2 - 5j, 3]])
>>> E, Q = mp.eigh(A)
>>> print(mp.chop(A * Q[:,0] - E[0] * Q[:,0]))
[0.0]
[0.0]
```

see also: eigsy, eighe, eig

7.26.7 mpmath: tridiag_sym

r_sy_tridiag(*ctx*, *A*, *D*, *E*, *calc_ev=True*)

This routine transforms a real symmetric matrix A to a real symmetric tridiagonal matrix S using an orthogonal similarity transformation:

$$Q^T A Q = S$$

Returns the tridiagonal decomposition of a selfadjoint matrix. See also Eigen [239], Wikipedia [1422], Wikipedia [1412], Wikipedia [1407], Wikipedia [1432].

The orthogonal matrix Q is build up from Householder reflectors.

parameters:

A: On input, A contains the real symmetric matrix of dimension (n, n). On output, if calc_ev is true, A contains the orthogonal matrix Q, otherwise A is destroyed.

D: Returns a real array of length n, containing the diagonal elements of the tridiagonal matrix.

E: Returns a real array of length n, contains the offdiagonal elements of the tridiagonal matrix in ''E[0:(n-1)]" where ''n" is the dimension of the matrix A. ''E[n-1]" is undefined.

calc_ev: If calc_ev is true, this routine explicitly calculates the orthogonal matrix Q which is then returned in A. If calc_ev is false, Q is not explicitly calculated resulting in a shorter run time.

This routine is a python translation of the fortran routine tred2.f in the software library EISPACK (see netlib.org) which itself is based on the algol procedure tred2 described in:

Num. Math. 11, p.181-195 (1968) by Martin, Reinsch and Wilkonson

Handbook for auto. comp., Vol II, Linear Algebra, p.212-226 (1971)

For a good introduction to Householder reflections, see also Stoer, Bulirsch - Introduction to Numerical Analysis.

7.26.8 mpmath tridiag_her

c_he_tridiag_0(*ctx*, *A*, *D*, *E*, *S*)

This routine transforms a complex hermitian matrix A to a real symmetric tridiagonal matrix S using an unitary similarity transformation:

$$Q^H A Q = S$$

where Q^H denotes the hermitian matrix transpose, i.e. transposition und conjugation.The unitary matrix Q is build up from Householder reflectors and an unitary diagonal matrix.

parameters:

A: (input/output) On input, A contains the complex hermitian matrix of dimension (n,n). On output, A contains the unitary matrix Q in compressed form.

D: Returns a real array of length n, contains the diagonal elements of the tridiagonal matrix.

E: Returns a real array of length n, contains the offdiagonal elements of the tridiagonal matrix in E[0:(n-1)] where is the dimension of the matrix A. E[n-1] is undefined.

S: Returns a complex array of length n, contains a unitary diagonal matrix.

This routine is a python translation (in slightly modified form) of the fortran routine htridi.f in the software library EISPACK (see netlib.org) which itself is a complex version of the algol procedure tred1 described in:

Num. Math. 11, p.181-195 (1968) by Martin, Reinsch and Wilkonson Handbook for auto. comp., Vol II, Linear Algebra, p.212-226 (1971)

For a good introduction to Householder reflections, see also Stoer, Bulirsch - Introduction to Numerical Analysis.

7.26.9 mpmath: tridiag_eigen_sym

tridiag_eigen(*ctx*, *d*, *e*, *z=False*)

This subroutine find the eigenvalues and the first components of the eigenvectors of a real symmetric tridiagonal matrix using the implicit QL method.

parameters:

d: (input/output) real array of length n. on input, d contains the diagonal elements of the input matrix. on output, d contains the eigenvalues in ascending order.

e: (input) real array of length n. on input, e contains the offdiagonal elements of the input matrix in e[0:(n-1)]. On output, e has been destroyed.

z: (input/output) If z is equal to False, no eigenvectors will be computed. Otherwise on input z should have the format z[0:m,0:n] (i.e. a real or complex matrix of dimension (m,n)). On output this matrix will be multiplied by the matrix of the eigenvectors (i.e. the columns of this matrix are the eigenvectors): z –> z*EV That means if z[i,j]={1 if j==j; 0 otherwise} on input, then on output z will contain the first m components of the eigenvectors. That means if m is equal to n, the i-th eigenvector will be z[:,i].

This routine is a python translation (in slightly modified form) of the fortran routine imtql2.f in the software library EISPACK (see netlib.org) which itself is based on the algol procudure imtql2 desribed in:

num. math. 12, p. 377-383(1968) by matrin and wilkinson modified in num. math. 15, p. 450(1970) by dubrulle handbook for auto. comp., vol. II-linear algebra, p. 241-248 (1971)

See also the routine gaussq.f in netlog.org or acm algorithm 726.

7.26.10 Eigensystem decomposition of a matrix A (real or complex)

Returns the eigendecomposition of a general square matrix *matA* $= A$. See also Eigen [221], Wikipedia [1405], Wikipedia [1407], Wikipedia [1432].

`ctx.eig`(*A*, *left=False*, *right=True*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

This routine computes the eigenvalues and optionally the left and right eigenvectors of a square matrix A. Given A, a vector E and matrices ER and EL are calculated such that

A ER[:,i] = E[i] ER[:,i]

EL[i,:] A = EL[i,:] E[i]

E contains the eigenvalues of A. The columns of ER contain the right eigenvectors of A whereas the rows of EL contain the left eigenvectors.

input:

A : a real or complex square matrix of shape (n, n) left : if true, the left eigenvectors are calulated. right : if true, the right eigenvectors are calculated. overwrite_a : if true, allows modification of A which may improve performance. if false, A is not modified.

output:

E : a list of length n containing the eigenvalues of A. ER : a matrix whose columns contain the right eigenvectors of A. EL : a matrix whose rows contain the left eigenvectors of A.

return values:

E if left and right are both false. (E, ER) if right is true and left is false. (E, EL) if left is true and right is false. (E, EL, ER) if left and right are true.

examples:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, -1, 2], [2, 5, -5], [-2, -3, 7]])
>>> E, ER = mp.eig(A)
>>> print(mp.chop(A * ER[:,0] - E[0] * ER[:,0]))
[0.0]
[0.0]
[0.0]
```

```
>>> E, EL, ER = mp.eig(A,left = True, right = True)
>>> E, EL, ER = mp.eig_sort(E, EL, ER)
>>> mp.nprint(E)
[2.0, 4.0, 9.0]
>>> print(mp.chop(A * ER[:,0] - E[0] * ER[:,0]))
[0.0]
[0.0]
[0.0]
>>> print(mp.chop( EL[0,:] * A - EL[0,:] * E[0]))
[0.0  0.0  0.0]
```

warning:

- If there are multiple eigenvalues, the eigenvectors do not necessarily span the whole vectorspace, i.e. ER and EL may have not full rank. Furthermore in that case the eigenvectors are numerical ill-conditioned.
- In the general case the eigenvalues have no natural order.

see also:

- eigh (or eigsy, eighe) for the symmetric eigenvalue problem.
- eig_sort for sorting of eigenvalues and eigenvectors

7.26.11 Sorting Eigenvalues

`ctx.`**`eig_sort`**(*E*, *EL=False*, *ER=False*, *f='real'*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

This routine sorts the eigenvalues and eigenvectors delivered by `eig`.

parameters:

E : the eigenvalues as delivered by eig

EL : the left eigenvectors as delivered by eig, or false

ER : the right eigenvectors as delivered by eig, or false

f : either a string (`real` sort by increasing real part, `imag` sort by increasing imag part, `abs` sort by absolute value) or a function mapping complexs to the reals, i.e. `f = lambda x: -mp.re(x)` would sort the eigenvalues by decreasing real part.

return values:

E if EL and ER are both false.

(E, ER) if ER is not false and left is false.

(E, EL) if EL is not false and right is false.

(E, EL, ER) if EL and ER are not false.

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, -1, 2], [2, 5, -5], [-2, -3, 7]])
>>> E, EL, ER = mp.eig(A,left = True, right = True)
>>> E, EL, ER = mp.eig_sort(E, EL, ER)
>>> mp.nprint(E)
[2.0, 4.0, 9.0]
>>> E, EL, ER = mp.eig_sort(E, EL, ER,f = lambda x: -mp.re(x))
>>> mp.nprint(E)
[9.0, 4.0, 2.0]
>>> print(mp.chop(A * ER[:,0] - E[0] * ER[:,0]))
[0.0]
[0.0]
[0.0]
>>> print(mp.chop( EL[0,:] * A - EL[0,:] * E[0]))
[0.0  0.0  0.0]
```

7.26.12 mpmath: Hessenberg decomposition of a matrix A (real or complex)

`ctx.`**`hessenberg`**(*A*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

Reduces a square matrix to Hessenberg form by an orthogonal similarity transformation. See also Eigen [227], Wikipedia [1411], Wikipedia [1432].

This routine computes the Hessenberg decomposition of a square matrix A. Given A, an unitary matrix Q is determined such that

Q' A Q = H and Q' Q = Q Q' = 1

where H is an upper right Hessenberg matrix. Here ' denotes the hermitian transpose (i.e. transposition and conjugation).

input:
A : a real or complex square matrix overwrite_a : if true, allows modification of A which may improve performance. if false, A is not modified.

output:
Q : an unitary matrix H : an upper right Hessenberg matrix

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, -1, 2], [2, 5, -5], [-2, -3, 7]])
>>> Q, H = mp.hessenberg(A)
>>> mp.nprint(H, 3)
[  3.15  2.23  4.44]
[-0.769  4.85  3.05]
[   0.0  3.61   7.0]
>>> print(mp.chop(A - Q * H * Q.transpose_conj()))
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

return value: (Q, H)

7.26.13 Schur decomposition of a matrix A (real or complex)

`ctx.schur`(*A*, *overwrite_a=False*)

where `ctx` is `dec`, `mpm`, `fpm``or ``gmp`.

Performs a Schur decomposition of a square matrix.

See also Eigen [236], Eigen [222], Wikipedia [1439], Wikipedia [1432].

This routine computes the Schur decomposition of a square matrix A. Given A, an unitary matrix Q is determined such that

Q' A Q = R and Q' Q = Q Q' = 1

where R is an upper right triangular matrix. Here ' denotes the hermitian transpose (i.e. transposition and conjugation).

input:
A : a real or complex square matrix overwrite_a : if true, allows modification of A which may improve performance. if false, A is not modified.

output:
Q : an unitary matrix R : an upper right triangular matrix

return value: (Q, R)

example:

```
>>> from mpmath import mp
>>> A = mp.matrix([[3, -1, 2], [2, 5, -5], [-2, -3, 7]])
>>> Q, R = mp.schur(A)
>>> mp.nprint(R, 3)
[2.0  0.417  -2.53]
[0.0    4.0  -4.74]
[0.0    0.0    9.0]
>>> print(mp.chop(A - Q * R * Q.transpose_conj()))
```

(continues on next page)

(continued from previous page)

```
[0.0  0.0  0.0]
[0.0  0.0  0.0]
[0.0  0.0  0.0]
```

warning: The Schur decomposition is not unique.

Special Functions

CHAPTER

EIGHT

ELLIPTIC FUNCTIONS AND RELATED

Elliptic functions historically comprise the elliptic integrals and their inverses, and originate from the problem of computing the arc length of an ellipse. From a more modern point of view, an elliptic function is defined as a doubly periodic function, i.e. a function which satisfies

$$f(z + 2\omega_1) = f(z + 2\omega_2) = f(z)$$

for some half-periods ω_1, ω_2 with $\mathrm{Im}[\omega_1/\omega_2] > 0$. The canonical elliptic functions are the Jacobi elliptic functions. More broadly, this section includes quasi-doubly periodic functions (such as the Jacobi theta functions) and other functions useful in the study of elliptic functions.

Many different conventions for the arguments of elliptic functions are in use. It is even standard to use different parameterizations for different functions in the same text or software. The usual parameters are the elliptic nome q or $\bar{q} = q^2$ (see Wikipedia [1362], MathWorld [1002]), which usually must satisfy $|q| < 1$; the elliptic parameter m (an arbitrary complex number, see MathWorld [1003]); the elliptic modulus k (an arbitrary complex number, see MathWorld [1001].); and the half-period ratio τ (see Wikipedia [1360], MathWorld [1006].), which usually must satisfy $\mathrm{Im}[\tau] > 0$.

In the context of Weierstrass elliptic functions, we also have the lattice roots e_1, e_2, e_3, which are the roots of the polynomial $4z^3 - g_2 z - g_3$, where g_2 and g_3 are the lattice invariants.

These quantities can be expressed in terms of each other using the following relations:

$$m = k^2 = \frac{e_3 - e_2}{e_1 - e_2}$$

$$\tau(m) = i\frac{K(1-m)}{K(m)}$$

$$q(\tau) = e^{i\pi\tau}$$

$$\bar{q}(\tau) = q^2(\tau) = e^{2i\pi\tau}$$

$$q(k) = \exp\left(-\pi\frac{K'(k)}{K(k)}\right)$$

$$k(q) = \frac{\theta_2^2(q)}{\theta_3^2(q)},$$

where $K(\cdot)$ denotes the complete elliptic integral of the first kind (Legendre), and $\theta_i(q)$ denote the Jacobi theta functions.

See also Wikipedia [1313], Wikipedia [1306], MathWorld [966], MathWorld [958], NIST [477].

The source code for the C# tests in Visual Studio is divided by real and complex modules:

The source code for the C# tests in Visual Studio using real modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B08a_RealEllipticFunctions.cs,

The source code for the C# tests in Visual Studio using complex modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B08b_CplxEllipticFunctions.cs,

8.1 Carlson symmetric elliptic integrals

8.1.1 Carlson symmetric elliptic integral of the first kind, $R_F(x, y, z)$

`ctx.elliptic_rf`(x, y, z)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the Carlson symmetric elliptic integral of the first kind, $R_F(x, y, z)$, which is defined for $x, y, z \notin (-\infty, 0)$, and with at most one of x, y, z being zero. See also Wikipedia [1301], NIST [172], BoostMath [136], Ehrhardt [297] (3.2.2.2), Flint [750], Mpmath [646].

$$R_F(x, y, z) = \frac{1}{2} \int_0^\infty \frac{\mathrm{d}t}{\sqrt{(t+x)(t+y)(t+z)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticRF(0.12, 0.5, 3.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticRF(0.12, 0.5, 3.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '11.0'; y = '12.0'; z = '32.0'
>>> \mathrm{d}x = dec.elliprf(x, y, z); mx = mpm.elliprf(x, y, z); gx = gmp.elliprf(x, y, z)
>>> fx = fpm.elliprf(x, y, z); ax = apm.elliprf(x, y, z)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  2.429201214189074468052339993024079155901E-1
mpm:  2.429201214189074468052339993024079155901e-1
gmp:  2.429201214189074468052339993024079155901E-01
fpm:  2.42920121418907E-01
apm:  2.429201214189074468052339993024079155901e-1 (5.907e-40%)
```

An example with complex input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; x = '11.0 + 2.0j'; y = '12.0 + 3.0j'; z = '42.0 + 3.0j'
>>> \mathrm{d}z = dec.elliprf(x, y, z); mz = mpm.elliprf(x, y, z); gz = gmp.elliprf(x, y, z)
>>> fz = fpm.elliprf(x, y, z); az = apm.elliprf(x, y, z)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az], aligned=True)
dec: 2.26781827262873246 89E-1              - 1.70116443568056467 98E-2j

gmp: 2.26781827262873246 89E-01             - 1.70116443568056467 98E-02j
fpm: 2.26781827262873E-01                   - 1.70116443568056E-02j
apm: 2.26781827262873246 89e-1 (4.669e-20%) - 1.70116443568056467 98e-2 (-1.556e-19%)j
```

8.1.2 Carlson completely symmetric elliptic integral of the second kind, $R_G(x, y, z)$

`ctx.elliptic_rg`(x, y, z)

where `ctx` is `math53` or `ctxflint`.

Returns the Carlson completely symmetric elliptic integral of the second kind, $R_G(x, y, z)$. See also Wikipedia [1301], NIST [172], BoostMath [136], Ehrhardt [297] (3.2.2.4), Flint [750], Mpmath [647].

$$R_G(x, y, z) = \frac{1}{4} \int_0^\infty \frac{t}{\sqrt{(t+x)(t+y)(t+z)}} \left(\frac{x}{t+x} + \frac{y}{t+y} + \frac{z}{t+z} \right) \mathrm{d}t.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticRG(0.12, 0.5, 3.5)
ereal('5.2359877559829887307E-1')
>>> ereal.EllipticRG(0.12, 0.5, 3.5)
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '11.0'; y = '12.0'; z = '32.0'
>>> \mathrm{d}x = dec.elliprg(x, y, z); mx = mpm.elliprg(x, y, z); gx = gmp.elliprg(x, y, z)
>>> fx = fpm.elliprg(x, y, z); ax = apm.elliprg(x, y, z)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

8.1.3 Carlson symmetric elliptic integral of the third kind, $R_J(x, y, z, p)$

`ctx.elliptic_rj`(x, y, z, p)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the Carlson symmetric elliptic integral of the third kind, $R_J(x, y, z, p)$, with $x, y, z \geq 0$, at most one may be zero and $p \neq 0$. See also Wikipedia [1301], NIST [172], BoostMath [136], Ehrhardt [297] (3.2.2.5), Flint [750], Mpmath [648].

$$R_J(x, y, z, p) = \frac{3}{2} \int_0^\infty \frac{\mathrm{d}t}{(t+p)\sqrt{(t+x)(t+y)(t+z)}}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticRJ(0.12, 0.5, 3.5, 0.4)
ereal('5.2359877559829887307E-1')
>>> ereal.EllipticRJ(0.12, 0.5, 3.5, 0.4)
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '11.0'; y = '12.0'; z = '32.0'; p = '32.0'
>>> \mathrm{d}x = dec.elliprj(x, y, z, p); mx = mpm.elliprj(x, y, z, p); gx = gmp.elliprj(x, y, z, p)
>>> fx = fpm.elliprj(x, y, z, p); ax = apm.elliprj(x, y, z, p)

```

8.1.5 Carlson degenerate symmetric elliptic integral of the first kind, $R_C(x, y)$

`ctx.elliptic_rc`(x, y)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the Carlson degenerate symmetric elliptic integral of the first kind, $R_C(x, y) = R_F(x, y, y)$, for $x \geq 0, y \neq 0$. See also Wikipedia [1301], NIST [172], BoostMath [136], Ehrhardt [297] (3.2.2.1), Flint [750], Mpmath [644].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticRC(0.12, 0.5)
ereal('5.235987755982988730 7E-1')

```

8.2 Legendre elliptic integrals (elliptic parameter m)

While the Legendre/Bulirsch/Maple style functions have the modulus k (or k', k_c) as an argument, the Mathematica style functions (prefixed with `M`) use the parameter ($m = k^2$) and therefore cover the imaginary modulus functions with $m < 0$.

8.2.1 Legendre complete elliptic integral of the first kind, $K(m)$

`ctx.m_elliptic_k(`m`)`

where `ctx` is `math53` or `ctxflint`.

Returns the complete elliptic integral of the first kind, $\mathrm{M_EllipticK}(m) = \int_0^{\pi/2} \frac{\mathrm{d}t}{\sqrt{1 - m\sin^2(t)}}$, with parameter $m \neq 1$.

See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.5.1), Flint [751].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MEllipticK(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.MEllipticK('0.51')
ereal('5.351847902755998475 4E-1')
```

Note

This function is called ellipk in mpmath.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; m = '0.7'
>>> \mathrm{d}x = dec.elliptic_k(m); mx = mpm.elliptic_k(m); gx = gmp.elliptic_k(m)
>>> fx = fpm.elliptic_k(m); ax = apm.elliptic_k(m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  2.0753631352924691438534405558824158057 38E+0

gmp:  2.0753631352924691438534405558824158057 38E+00
fpm:  2.07536313529247E+00
apm:  2.0753631352924691438534405558824158057 38e+0 (5.531e-39%)
```

An example with complex input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; m = '11.0 + 3.0j'
>>> \mathrm{d}z = dec.elliptic_k(m); mz = mpm.elliptic_k(m); gz = gmp.elliptic_k(m)
>>> fz = fpm.elliptic_k(m); az = apm.elliptic_k(m)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az], aligned=True)
dec: 5.3766585026572650659E-1              + 7.1363115405781075467E-1j
mpm: 5.3766585026572650659e-1              + 7.1363115405781075467e-1j
gmp: 5.3766585026572650659E-01             + 7.1363115405781075467E-01j
fpm: 5.37665850265727E-01                  + 7.13631154057811E-01j
apm: 5.3766585026572650659e-1 (1.575e-19%) + 7.1363115405781075467e-1 (1.187e-19%)j
```

8.2.2 Legendre complete elliptic integral of the second kind, $E(m)$

`ctx.m_elliptic_e(`m`)`

where `ctx` is `math53` or `ctxflint`.

Returns the complete elliptic integral of the second kind, $\mathrm{M_EllipticEC}(m) = \int_0^{\pi/2} \sqrt{1 - m\sin^2(t)}\,\mathrm{d}t$, with parameter $m \neq 1$.

See also Wikipedia [1304], MathWorld [955], NIST [171], BoostMath [138], Ehrhardt [297] (3.2.5.2), Flint [751].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MEllipticEC(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.MEllipticEC('0.51')
ereal('5.351847902755998475 4E-1')
```

Note

This function is called ellipe in mpmath, with ellipe taking one argument.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; m = '0.7'
>>> \mathrm{d}x = dec.elliptic_e(m); mx = mpm.elliptic_e(m); gx = gmp.elliptic_e(m)
>>> fx = fpm.elliptic_e(m); ax = apm.elliptic_e(m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

8.2.3 Legendre complete elliptic integral of the third kind, $\Pi(n, m)$

`ctx.m_elliptic_pi(`n, m`)`

where `ctx` is `math53` or `ctxflint`.

Returns the complete elliptic integral of the third kind , $\mathrm{M_EllipticPiC}(n, m) = \int_0^{\pi/2} \frac{\mathrm{d}t}{(1 - n\sin^2(t))\sqrt{1 - m\sin^2(t)}}$, with characteristic $n \neq 1$ and parameter $m \neq 1$.

See also Wikipedia [1305], MathWorld [956], NIST [171], BoostMath [139], Ehrhardt [297] (3.2.5.3), Flint [755].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MEllipticPiC(3, 0.5)
```

(continues on next page)

(continued from previous page)

```
ereal('5.235987755982988730 7E-1')
>>> ereal.MEllipticPiC(3, 0.5)
ereal('5.351847902755998475 4E-1')
```

Note

This function is called ellippi in mpmath, with ellippi taking two arguments.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '0.3'; m = '0.7'
>>> \mathrm{d}x = dec.elliptic_pi(n, m); mx = mpm.elliptic_pi(n, m); gx = gmp.elliptic_pi(n, m)
>>> fx = fpm.elliptic_pi(n, m); ax = apm.elliptic_pi(n, m)

```

8.2.4 Legendre incomplete elliptic integral of the first kind, $F(\phi, m)$

`ctx.m_elliptic_f`(*phi*, *m*)

where `ctx` is `math53` or `ctxflint`.

Returns the complete elliptic integral of the first kind, $\mathrm{M_EllipticF}(\phi, m) = \int_0^{\phi} \frac{\mathrm{d}t}{\sqrt{1 - m\sin^2(t)}}$, with parameter $m\sin^2(\phi) \leq 1$.

See also Wikipedia [1310], MathWorld [962], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.5.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MEllipticF(0.12, 0.5)
ereal('5.235987755982988730 7E-1')

```

8.2.5 Legendre incomplete elliptic integral of the second kind, $E(\phi, m)$

`ctx.m_elliptic_e_inc`(*phi*, *m*)

where `ctx` is `math53` or `ctxflint`.

Returns the complete elliptic integral of the second kind, $\mathrm{M_EllipticE}(\phi, m) = \int_0^{\phi} \sqrt{1 - m\sin^2(t)}\,\mathrm{d}t$ with parameter $m\sin^2(\phi) \le 1$.

See also Wikipedia [1311], MathWorld [963], NIST [171], BoostMath [138], Ehrhardt [297] (3.2.5.5), Flint [755].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MEllipticE(0.12, 0.5)
ereal('5.2359877559829887307E-1')

8.3 Legendre elliptic integrals (elliptic modulus k), and related functions

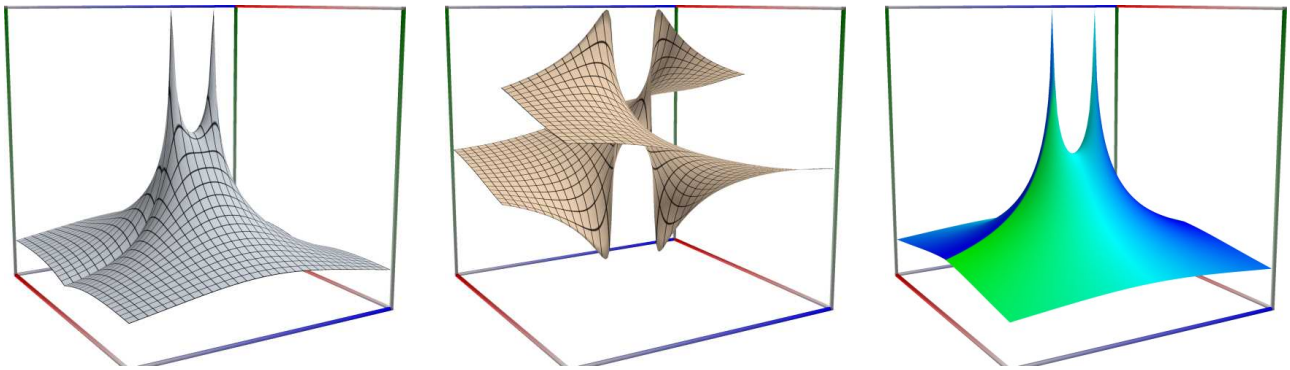
For an overview see NIST [171], BoostMath [135], Mpmath [650].

8.3.1 Legendre complete elliptic integral of the first kind, $K(k)$

`ctx.elliptic_k(k)`

where `ctx` is `math53`, `mathc53`, `ctxboost` or `ctxflint`.

Returns the Legendre complete elliptic integral of the first kind, $K(k) = \int_0^{\pi/2} \frac{\mathrm{d}t}{\sqrt{1-k^2\sin^2(t)}}$. See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.1.2), Ehrhardt [297] (4.2.30), Flint [751].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

Note: the original names are: ctx.compEllint1(k), ctxboost.Ellint_1_K(k), mathc53.Ellk(k), ctx.ellipticK(k).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CompEllint1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CompEllint1('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; m = '0.7'
>>> \mathrm{d}x = dec.elliptic_k(m); mx = mpm.elliptic_k(m); gx = gmp.elliptic_k(m)
>>> fx = fpm.elliptic_k(m); ax = apm.elliptic_k(m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

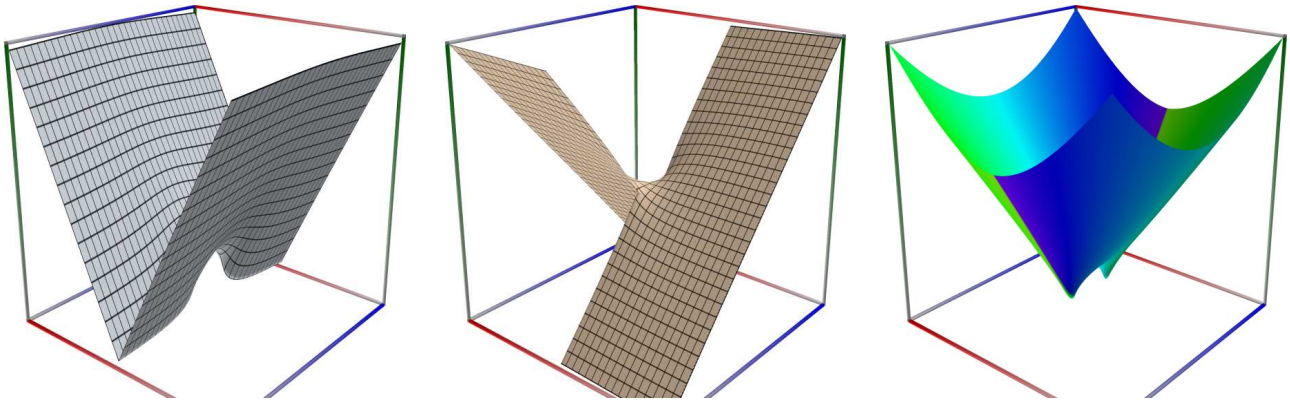
8.3.2 Legendre complete elliptic integral of the second kind, $E(k)$

`ctx.elliptic_e(`k`)`

where `ctx` is `math53`, `mathc53`, `ctxboost` or `ctxflint`.

Note: the original names are: ctx.compEllint2(k), ctxboost.Ellint_2_K(k), mathc53.Elle(k), ctx.ellipticE(k).

Returns the Legendre complete elliptic integral of the second kind, $E(k) = \int_0^{\pi/2} \sqrt{1 - k^2 \sin^2(t)}\, \mathrm{d}t$. See also Wikipedia [1304], MathWorld [955], NIST [171], BoostMath [138], Ehrhardt [297] (3.2.1.2), Ehrhardt [297] (4.2.29), Flint [751].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CompEllint2(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CompEllint2('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; m = '0.7'
>>> \mathrm{d}x = dec.elliptic_e(m); mx = mpm.elliptic_e(m); gx = gmp.elliptic_e(m)

```

8.3.3 Legendre complete elliptic integral of the third kind, $\Pi(n;k)$

`ctx.elliptic_pi`(n, k)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

The original names are: ctx.compEllint3(n, k), ctxboost.Ellint3K(n, k), ctx.ellipticPi(n, k).

Returns the Legendre complete elliptic integral of the third kind, $\Pi(n;k) = \int_0^{\pi/2} \frac{\mathrm{d}t}{(1-n\sin^2(t))\sqrt{1-k^2\sin^2(t)}}$. See also Wikipedia [1305], MathWorld [956], NIST [171], BoostMath [139], Ehrhardt [297] (3.2.1.3), Flint [751].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CompEllint3(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CompEllint3(3, 0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

8.3.4 Legendre incomplete elliptic integral of the first kind, $F(\phi, k)$

`ctx.elliptic_f`(*phi*, *k*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

The original names are: ctx.ellint1(phi, k), ctxboost.Ellint1F(phi, k), ctx.ellipticF(phi, k),

Returns the Legendre incomplete elliptic integral of the first kind, $F(\phi, k) = \int_0^{\phi} \frac{\mathrm{d}t}{\sqrt{1 - k^2 \sin^2(t)}}$. See also Wikipedia [1310], MathWorld [962], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.1.6), Flint [755], Mpmath [651].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Ellint1(0.12, 0.5)
ereal('5.235987755982988730 7E-1')

```

8.3.5 Legendre incomplete elliptic integral of the second kind, $E(\phi, k)$

`ctx.elliptic_e_inc`(*phi*, *k*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

The original names are: ctx.ellint2(phi, k), ctxboost.Ellint2E(phi, k), ctx.ellipticEInc(phi, k).

Returns the Legendre incomplete elliptic integral of the second kind, $E(\phi, k) = \int_0^{\phi} \sqrt{1 - k^2 \sin^2(t)}\, \mathrm{d}t$. See also Wikipedia [1311], MathWorld [963], NIST [171], BoostMath [138], Ehrhardt [297] (3.2.1.7), Flint [755], Mpmath [659].

An example in Python

```
>>> from xlcalcnet import ereal

8.4 Jacobi elliptic functions

For an introduction, see Wikipedia [1313], MathWorld [966], BoostMath [153], NIST [477], Mpmath [658].

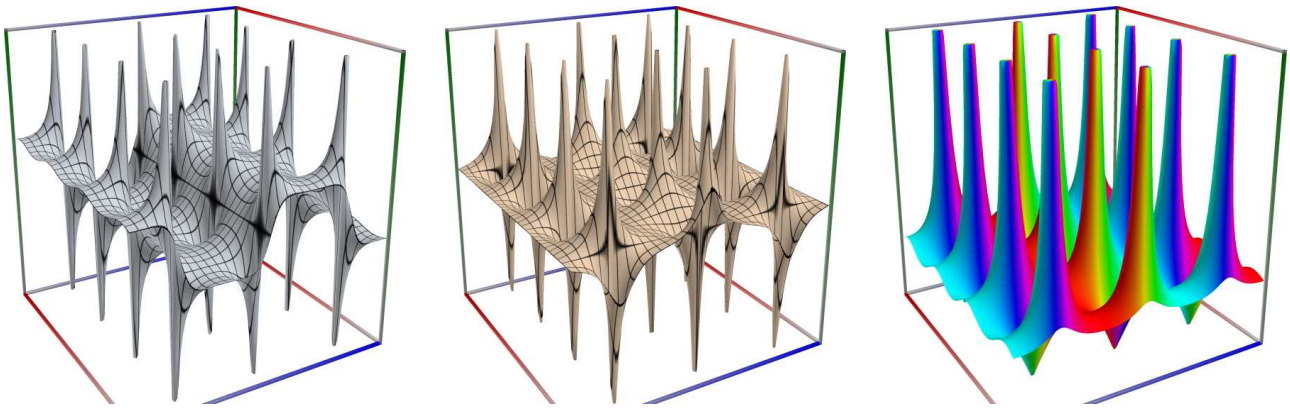
8.4.1 Jacobi elliptic function $\mathrm{sn}(x, k)$

`ctx.jacobi_sn`(x, k)

where `ctx` is `math53`, `mathc53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{sn}(x, k) = \sin(\mathrm{am}(x, k))$, where $\mathrm{am}(x, k)$ denotes the Jacobi amplitude function, and $\mathrm{sn}(x, 0) = \sin(x)$. See also BoostMath [157], Wikipedia [1313], MathWorld [277], NIST [477], Ehrhardt [297] (3.2.11.1), Ehrhardt [297] (4.2.58).

The version for `ecplx` has the restriction that k must be real.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiSN(0.8, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiSN(0.8, '0.51')
ereal('5.3518479027559984754E-1')
```

The function is defined as

$$\mathrm{sn}(u, k) = \frac{\theta_3(0, q)}{\theta_2(0, q)} \frac{\theta_1(t, q)}{\theta_4(t, q)}.$$

Here $t = u/\theta_3^2(0, q)$, $q = q(k) = \exp\left[-\pi K'(k)/K(k)\right]$ denotes the nome, $K(k)$ denotes the complete elliptic integral of the first kind and $K'(k) = K(\sqrt{1 - k^2})$ denotes the complementary complete elliptic integral of the first kind.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_sn(u, m); mx = mpm.jacobi_sn(u, m); gx = gmp.jacobi_sn(u, m)
>>> fx = fpm.jacobi_sn(u, m); ax = apm.jacobi_sn(u, m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

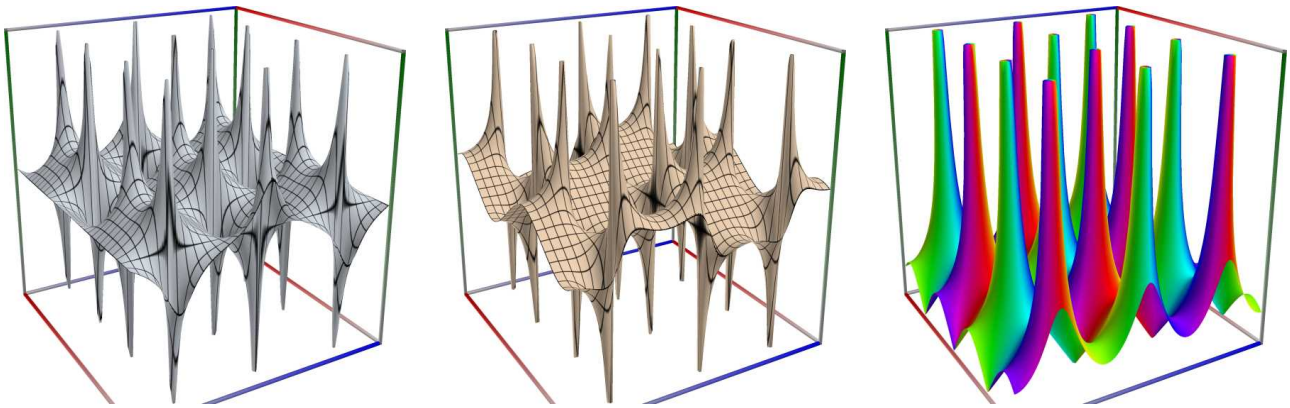
8.4.2 Jacobi elliptic function $\mathrm{cn}(x, k)$

`ctx.jacobi_cn`(x, k)

where `ctx` is `math53`, `mathc53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{cn}(x, k) = \cos(\mathrm{am}(x, k))$, where $\mathrm{am}(x, k)$ denotes the Jacobi amplitude function, and $\mathrm{cn}(x, 0) = \cos(x)$. See also BoostMath [143], Wikipedia [1313], MathWorld [267], NIST [477], Ehrhardt [297] (3.2.11.2), Ehrhardt [297] (4.2.18).

The version for `ecplx` has the restriction that k must be real.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiCN(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiCN(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

The function is defined as

$$\mathrm{cn}(u, k) = \frac{\theta_4(0, q)}{\theta_2(0, q)} \frac{\theta_2(t, q)}{\theta_4(t, q)}.$$

Here $t = u/\theta_3^2(0, q)$, and $q = q(k)$ denotes the nome.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_cn(u, m); mx = mpm.jacobi_cn(u, m); gx = gmp.jacobi_cn(u, m)
>>> fx = fpm.jacobi_cn(u, m); ax = apm.jacobi_cn(u, m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

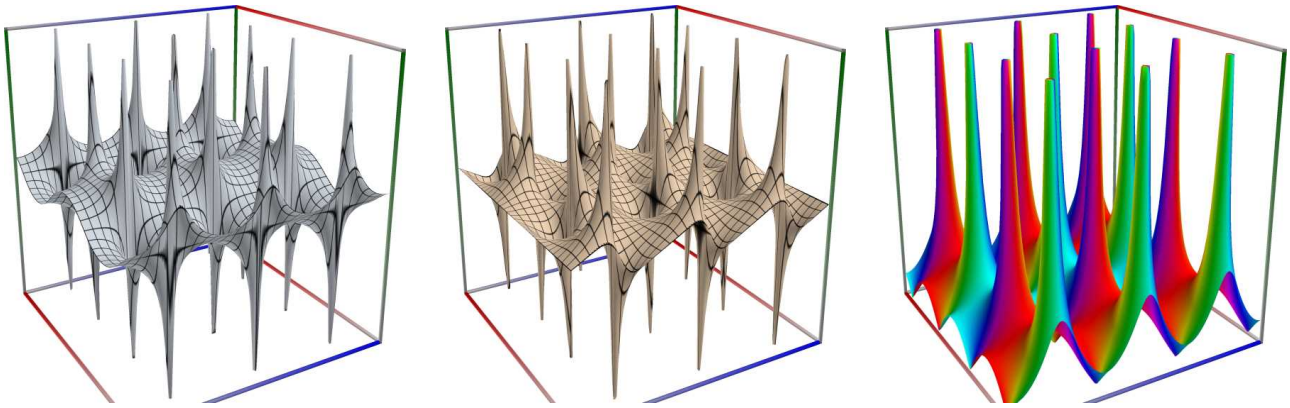
8.4.3 Jacobi elliptic function $\mathrm{dn}(x,k)$

`ctx.jacobi_dn`(x, k)

where `ctx` is `math53`, `mathc53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{dn}(x,k) = \sqrt{1-k^2\mathrm{sn}^2(x,k)}$ with $\mathrm{dn}(x,0) = 1$. See also BoostMath [146], Wikipedia [1313], MathWorld [270], NIST [477], Ehrhardt [297] (3.2.11.3), Ehrhardt [297] (4.2.26).

The version for `ecplx` has the restriction that k must be real.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x+iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiDN(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiDN(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

The function is defined as

$$\mathrm{dn}(u,k) = \frac{\theta_4(0,q)}{\theta_3(0,q)}\frac{\theta_3(t,q)}{\theta_4(t,q)}.$$

Here $t = u/\theta_3^2(0,q)$, and $q = q(k)$ denotes the nome.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_dn(u, m); mx = mpm.jacobi_dn(u, m); gx = gmp.jacobi_dn(u, m)

8.4.4 Jacobi elliptic function $\mathrm{nc}(x, k)$

`ctx.jacobi_nc`(x, k)

where `ctx` is `math53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{nc}(x, k) = 1/\mathrm{cn}(x, k)$, with $\mathrm{nc}(x, 0) = 1/\cos(x)$. See also BoostMath [148], Wikipedia [1313], MathWorld [272], NIST [477], Ehrhardt [297] (3.2.11.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiNC(0.8, 0.5)
ereal('5.235987755982988730E-1')
>>> ereal.JacobiNC(0.8, '0.51')
ereal('5.351847902755998475E-1')
```

The function is defined as

$$\mathrm{nc}(u, k) = \frac{1}{\mathrm{cn}(u, k)}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_nc(u, m); mx = mpm.jacobi_nc(u, m); gx = gmp.jacobi_nc(u, m)

8.4.5 Jacobi elliptic function $\mathrm{sc}(x, k)$

`ctx.jacobi_sc`(x, k)

where `ctx` is `math53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{sc}(x, k) = \mathrm{sn}(x, k)/\mathrm{cn}(x, k)$. See also BoostMath [151], Wikipedia [1313], MathWorld [275], NIST [477], Ehrhardt [297] (3.2.11.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiSC(0.8, 0.5)
ereal('5.2359877559829887307E-1')

8.4.7 Jacobi elliptic function $\mathrm{nd}(x, k)$

`ctx.jacobi_nd`(x, k)

where `ctx` is `math53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{nd}(x, k) = 1/\mathrm{dn}(x, k)$. See also BoostMath [149], Wikipedia [1313], MathWorld [273], NIST [477], Ehrhardt [297] (3.2.11.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiNC(0.8, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiNC(0.8, '0.51')
ereal('5.3518479027559984754E-1')
```

The function is defined as

$$\mathrm{nd}(u, k) = \frac{1}{\mathrm{dn}(u, k)}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_nd(u, m); mx = mpm.jacobi_nd(u, m); gx = gmp.jacobi_nd(u, m)
>>> fx = fpm.jacobi_nd(u, m); ax = apm.jacobi_nd(u, m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

8.4.8 Jacobi elliptic function $\mathrm{sd}(x, k)$

`ctx.jacobi_sd`(x, k)

where `ctx` is `math53` or `ctxboost`.

Returns the Jacobi elliptic function $\mathrm{sd}(x, k) = \mathrm{sn}(x, k)/\mathrm{dn}(x, k)$. See also BoostMath [156], Wikipedia [1313], MathWorld [276], NIST [477], Ehrhardt [297] (3.2.11.8).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiSD(0.8, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiSD(0.8, '0.51')
ereal('5.3518479027559984754E-1')
```

The function is defined as

$$\mathrm{sd}(u, k) = \frac{\mathrm{sn}(u, k)}{\mathrm{dn}(u, k)}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; u = '11.0'; m = '0.6'
>>> \mathrm{d}x = dec.jacobi_sd(u, m); mx = mpm.jacobi_sd(u, m); gx = gmp.jacobi_sd(u, m)
>>> fx = fpm.jacobi_sd(u, m); ax = apm.jacobi_sd(u, m)

8.5 Jacobi theta functions and related functions

The theta functions are functions of two variables:

- z is the *argument*, an arbitrary real or complex number
- q is the *nome*, which must be a real or complex number in the unit disk (i.e. $|q| < 1$). For $|q| \ll 1$, the series converge very quickly, so the Jacobi theta functions can efficiently be evaluated to high precision.

The compact notations $\theta_n(q) = \theta_n(0, q)$ and $\theta_n = \theta_n(0, q)$ are also frequently encountered. Finally, Jacobi theta functions are frequently considered as functions of the half-period ratio τ and then usually denoted by $\theta_n(z|\tau)$.

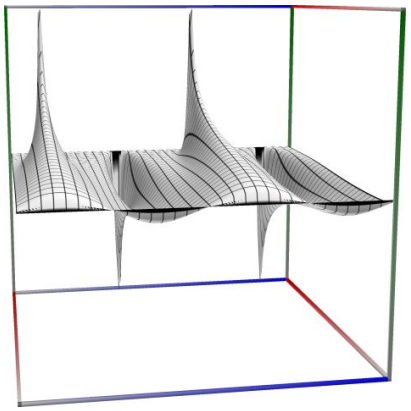
8.5.1 Jacobi theta function $\theta_1(z, q)$

ctx.jacobi_theta1(x, q)

where ctx is math53, ctxboost or ctxflint.

Returns the Jacobi theta function $\theta_1(z, q) = 2q^{1/4} \sum_{n=0}^{\infty} (-1)^n q^{n^2+n} \sin((2n+1)z)$

Note: the Amath version needs to be adapted.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

8.6 Conversions of parameters of Weierstrass $\wp$

Wikipedia [1357], Wikipedia [1358], MathWorld [994], MathWorld [992], MathWorld [284], MathWorld [283].

The Weierstrass elliptic functions may be defined on a general lattice $\Lambda = \{m2\omega_1 + n2\omega_2 : m, n \in \mathbb{Z}\}$ with half-periods $\omega_1, \omega_2 \in \mathbb{C}$.

In XlCalcNet, two interfaces are used:

The first interface (described in this section) uses $\omega = \omega_1$ and $\tau = \omega_2/\omega_1$ as parameters; these have a natural geometrical interpretation, specifying respectively the size and shape of the "fundamental parallelogram". In Flint there is a default choice of $\omega = 1$; therefore ω is omitted from the function parameters in Flint, but ω is a required parameter in XlCalcNet.

In some contexts the lattice invariants g_2 and g_3 are the natural parameters because they correspond directly with physical quantities; usually $g_2, g_3 \in \mathbb{R}$ in such cases (and also in XlCalcNet). This interface is described in the next section.

To keep these two interfaces apart with regard to mathematical notation, we write $\wp(z|\omega,\tau)$ for the first interface and $\wp_g(z; g_2, g_3)$ for the second, and likewise for the other Weierstrass functions.

To evaluate the functions on a general lattice, we can use the the following homogeneity relations (for $t \neq 0$). Note that the period ratio τ is preserved:

$$\wp'(tz|t\omega,\tau) = t^{-3}\wp'(z|\omega,\tau)$$

$$\wp(tz|t\omega,\tau) = t^{-2}\wp(z|\omega,\tau)$$

$$\zeta(tz|t\omega,\tau) = t^{-1}\zeta(z|\omega,\tau)$$

$$\sigma(tz|t\omega,\tau) = t\sigma(z|\omega,\tau)$$

$$g_2(t\omega,\tau) = t^{-4}g_2(\omega,\tau)$$

$$g_3(t\omega,\tau) = t^{-6}g_3(\omega,\tau)$$

$$e_i(t\omega,\tau) = t^{-2}e_i(\omega,\tau), \quad i = 1,2,3$$

$$\Delta(t\omega,\tau) = t^{-12}\Delta(\omega,\tau)$$

8.6.1 Elliptic lattice invariants g_2, g_3 from lattice roots e_1, e_2, e_3

`ctx.elliptic_invariants_from_roots(e1, e2)`

Computes the lattice invariants g_2, g_3. The Weierstrass elliptic function satisfies the differential equation $[\wp'(z,\tau)]^2 = 4[\wp(z,\tau)]^3 - g_2\wp(z,\tau) - g_3$. Up to constant factors, the lattice invariants are the first two Eisenstein series.

See also: MathWorld [284], MathWorld [283], Flint [772].

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2) = -4(e_2e_3 + e_3e_1 + e_1e_2),$$

$$g_3 = 4e_1e_2e_3 = \tfrac{4}{3}({e_1}^3 + {e_2}^3 + {e_3}^3).$$

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; tau = '0.0 + 0.7j'
>>> dx2, dx3 = dec.elliptic_invariants(tau); mx2, mx3 = mpm.elliptic_invariants(tau);
>>> gx2, gx3  = gmp.elliptic_invariants(tau)
>>> fx2, fx3 = fpm.elliptic_invariants(tau); ax2, ax3 = apm.elliptic_invariants(tau)
>>> print("lattice invariant g2")
>>> mpm.show([dx2, mx2, gx2, fx2, ax2], aligned=True)
>>> print("lattice invariant g3")
>>> mpm.show([dx3, mx3, gx3, fx3, ax3], aligned=True)
```

(continues on next page)

8.6.2 Elliptic lattice invariants g_2, g_3 from (ω, τ)

`ctx.g2g3_from_tau(`*omega*, *tau*`)`

Computes the lattice invariants g_2, g_3 in terms of half-period ω_1 and elliptic period ratio τ.

We have $g_2(t\omega, \tau) = t^{-4} g_2(\omega, \tau)$ and $g_3(t\omega, \tau) = t^{-6} g_3(\omega, \tau)$.

See also: MathWorld [284], MathWorld [283], Flint [772].

See also: https://en.wikipedia.org/wiki/J-invariant#Expressions_in_terms_of_theta_functions

See also: https://dlmf.nist.gov/23.3#i

We obtain the elliptic lattice invariants from the Eisenstein series $G_4(\tau)$ and $G_6(\tau)$:

$$g_2(\tau) = 60 G_4(\tau) = 60 \sum_{(m,n) \neq (0,0)} (m + n\tau)^{-4}$$

$$g_3(\tau) = 140 G_6(\tau) = 140 \sum_{(m,n) \neq (0,0)} (m + n\tau)^{-6}$$

Define $q = e^{\pi i \tau}$

Let $a = \theta_2(q)$, $b = \theta_3(q)$, $c = \theta_4(q)$, where $a^4 - b^4 + c^4 = 0$. Then

$g_2(\tau) = \frac{2}{3}\pi^4 \left(a^8 + b^8 + c^8\right)$, and

$g_3(\tau) = \frac{4}{27}\pi^6 \sqrt{\frac{(a^8+b^8+c^8)^3 - 54(abc)^8}{2}}$.

8.6.3 Elliptic lattice roots e_1, e_2, e_3 from (ω, τ)

`ctx.elliptic_roots_from_tau(`*omega*, *tau*`)`

Computes the lattice roots e_1, e_2, e_3, in terms of half-period ω_1 and elliptic period ratio τ. They are the roots of the polynomial $4z^3 - g_2 z - g_3$.

We have $e_i(t\omega, \tau) = t^{-2} e_i(\omega, \tau), \quad i = 1, 2, 3.$

See also Wikipedia [1358], Flint [772].

See also: https://dlmf.nist.gov/23.3#i

With τ as input, the roots e_1, e_2, and e_3 can be expressed in terms of the Jacobi theta functions $\theta_i(0; q)$. Let $q = e^{2i\pi\tau}$ denote the nome. Then

$$a = \theta_2(0; q); \quad b = \theta_3(0; q); \quad c = \theta_4(0; q), \quad \text{with } a^4 - b^4 + c^4 = 0, \quad \text{and}$$

$$e_1(\tau) = \tfrac{\pi^2}{3}(b^4 + c^4); \quad e_2(\tau) = \tfrac{\pi^2}{3}(-a^4 - b^4); \quad e_3(\tau) = \tfrac{\pi^2}{3}(a^4 - c^4).$$

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; tau = '0.0 + 0.7j'
>>> dx1, dx2, dx3 = dec.elliptic_roots(tau); mx1, mx2, mx3 = mpm.elliptic_roots(tau);
>>> gx1, gx2, gx3  = gmp.elliptic_roots(tau)
>>> fx1, fx2, fx3 = fpm.elliptic_roots(tau); ax1, ax2, ax3 = apm.elliptic_roots(tau)
>>> print("lattice root e1")
>>> mpm.show([dx1, mx1, gx1, fx1, ax1], aligned=True)

8.7 Weierstrass elliptic functions, in terms of elliptic period ratio τ

8.7.1 Weierstrass function $\wp(z|\tau)$

`ctx.weierstrass_p_t(`z, *tau*`)`

Computes Weierstrass's elliptic function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\wp(tz|t\omega,\tau) = t^{-2}\wp(z|\omega,\tau)$.

See also MathWorld [994], Flint [772].

See also: https://dlmf.nist.gov/23.2

$$\wp(z,\tau,\omega=1) = \frac{1}{z^2} + \sum_{n^2+m^2\neq 0}\left[\frac{1}{(z+m+n\tau)^2} - \frac{1}{(m+n\tau)^2}\right]$$

which satisfies $\wp(z,\tau,\omega=1) = \wp(z+1,\tau,\omega=1) = \wp(z+\tau,\tau,\omega=1)$. To evaluate the function efficiently, we use the formula (with with $q = e^{\pi i\tau}$)

$$\wp(z,\tau) = \pi^3\theta_2^2(0,q)\theta_3^2(0,q)\frac{\theta_4^2(\pi z,q)}{\theta_1^2(\pi z,q)} - \frac{\pi^3}{3}\left[\theta_2^4(0,q)+\theta_3^4(0,q)\right].$$

$$\wp(tz|t\omega_1,t\omega_2) = t^{-2}\wp(z|\omega_1,\omega_2)$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_p(z, tau); mx = mpm.weierstrass_p(z, tau)
>>> gx = gmp.weierstrass_p(z, tau)
>>> fx = fpm.weierstrass_p(z, tau); ax = apm.weierstrass_p(z, tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

8.7.2 Weierstrass function, first derivative: $\wp' z|\tau)$

`ctx.weierstrass_p_prime_t(`z, *tau*`)`

Computes the first derivative of Weierstrass's elliptic function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\wp'(tz|t\omega,\tau) = t^{-3}\wp'(z|\omega,\tau)$.

The Weierstrass elliptic function satisfies the differential equation $[\wp'(z,\tau)]^2 = 4[\wp(z,\tau)]^3 - g_2\wp(z,\tau) - g_3$.

$$\wp'(z,\tau) = \sqrt{4[\wp(z,\tau)]^3 - g_2\wp(z,\tau) - g_3}.$$

See also MathWorld [995], Flint [772].

See also: https://dlmf.nist.gov/23.2

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm

```

8.7.3 Inverse Weierstrass function $\wp^{-1}(z|\tau)$

`ctx.`**`weierstrass_p_inv_t`**`(`z, *tau*`)`

Computes the inverse of the Weierstrass elliptic function in terms of half-period ω_1 and elliptic period ratio τ. It which satisfies $\wp(\wp^{-1}(z,\tau),\tau) = z$. This function is given by the elliptic integral

$$\wp^{-1}(z,\tau) = \frac{1}{2}\int_z^\infty \frac{\mathrm{d}t}{\sqrt{(t-e_1)(t-e_2)(t-e_3)}} = R_F(z-e_1, z-e_2, z-e_3).$$

See also MathWorld [990], Flint [772].

See also: https://dlmf.nist.gov/23.2

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '100'; tau = '0.0 + 0.9j'

```

8.7.4 Weierstrass Zeta function $\zeta(z,\tau)$

`ctx.weierstrass_zeta_t(`*z*, *tau*`)`

Computes the Weierstrass zeta function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\zeta(tz|t\omega,\tau) = t^{-1}\zeta(z|\omega,\tau)$.

The function can be defined as

$$\zeta(z|\omega,\tau) = \frac{1}{z} + \sum_{n^2+m^2\neq 0}\left[\frac{1}{z-m-n\tau} + \frac{1}{m+n\tau} + \frac{z}{(m+n\tau)^2}\right]$$

and is quasiperiodic with $\zeta(z+1|\omega,\tau) = \zeta(z|\omega,\tau) + \zeta(1/2|\omega,\tau)$ and $\zeta(z+\tau|\omega,\tau) = \zeta(z|\omega,\tau) + \zeta(\tau/2|\omega,\tau)$.

The function is related to $\wp(z|\omega,\tau)$ by $\dfrac{d\zeta(z|\omega,\tau)}{\mathrm{d}z} = -\wp(z|\omega,\tau)$ and $\zeta(z|\omega,\tau) - z^{-1} = \displaystyle\int_0^z \left(\wp(z|\omega,\tau) - z^{-2}\right)$.

See also MathWorld [997], Flint [772].

See also: https://dlmf.nist.gov/23.2

To evaluate the function efficiently, we use the formula

$$\zeta(z|\omega,\tau) = \frac{\pi z}{3}\frac{\theta_1'''(0,q)}{\theta_1'(0,q)} + \frac{\theta_1'(\pi z,q)}{\theta_1(\pi z,q)}$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_zeta(z, tau); mx = mpm.weierstrass_zeta(z, tau)

```

8.7.5 Weierstrass Sigma function $\sigma(z|\tau)$

`ctx.weierstrass_sigma_t(`z, *omega*, *tau*`)`

Computes the Weierstrass sigma function in terms of half-period ω_1 and elliptic period ratio τ. We have $\sigma(tz|t\omega,\tau) = t\sigma(z|\omega,\tau)$.

See also MathWorld [996], Flint [772].

See also: https://dlmf.nist.gov/23.2

The function can be defined as

$$\sigma(z|\omega,\tau) = z \prod_{n^2+m^2\neq 0} \left[\left(1-\frac{z}{m+n\tau}\right)\exp\left(\frac{z}{m+n\tau}+\frac{z^2}{2(m+n\tau)^2}\right)\right]$$

and is quasiperiodic with $\sigma(z+1|\omega,\tau) = -e^{2\zeta(1/2|\omega,\tau)(z+1/2)}\sigma(z|\omega,\tau)$ and $\sigma(z+\tau|\omega,\tau) = -e^{2\zeta(\tau/2|\omega,\tau)(z+\tau/2)}\sigma(z|\omega,\tau)$.

The function is related to $\zeta(z|\omega,\tau)$ by $\frac{d}{dz}\log\sigma(z|\omega,\tau) = \zeta(z|\omega,\tau)$.

See also MathWorld [996], Flint [772].

To evaluate the function efficiently, we use the formula

$$\sigma(z,\tau) = \exp\left(-\frac{(\pi z)^2}{6}\frac{\theta_1''(0,q)}{\theta_1'(0,q)}\right)\times\frac{\theta_1(\pi z,q)}{\theta_1'(\pi z,q)}$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'

8.8 Modular forms, in terms of half-period ω_1 and elliptic period ratio τ

8.8.1 Dedekind eta function $\eta(\tau)$

ctx.**dedekind_eta**(*tau*)

Returns Dedekind η in terms of elliptic period ratio τ. . See also Flint [767], MathWorld [976], Mathworld, equation 20:

$$\eta(\tau) = \frac{\theta_2(\pi/6, \bar{q}^{1/6})}{\sqrt{3}}, \quad \text{where } \bar{q} = q^2 = e^{2i\pi\tau}.$$

See also: https://dlmf.nist.gov/23.15#ii

Returns the Dedekind eta function $\eta(ix)$ for $x \geq 0$, with $\eta(x) = q^{1/24}(q)_\infty$, and $(q)_\infty$ is is the q-Pochhammer Euler function.

See also: MathWorld [976], Ehrhardt [297] (3.2.17.10).

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; tau = '0.0 + 0.7j'
>>> \mathrm{d}x = dec.dedekind_eta(tau); mx = mpm.dedekind_eta(tau); gx = gmp.dedekind_eta(tau)
>>> fx = fpm.dedekind_eta(tau); ax = apm.dedekind_eta(tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax], aligned=True)

```

8.8.2 Elliptic modular lambda function $\lambda(\tau)$ (also DAMath)

ctx.ctx.**elliptic_modular_lambda**(*tau*)

Computes the lambda function $\lambda(\tau) = \theta_2^4(0,\tau)/\theta_3^4(0,\tau)$ in terms of elliptic period ratio τ. It is invariant under modular transformations $(a, b; c, d)$ where a, d are odd and b, c are even.

See also MathWorld [978], Flint [771].

See also: https://dlmf.nist.gov/23.15#ii

Returns the elliptic modular function $\lambda(\tau), \tau = iy, y \geq 0$, $\lambda(\tau) = \dfrac{\theta_2^4(0,q)}{\theta_e^4(0,q)}, q = e^{i\pi\tau} = e^{-\pi y}$.

See also: MathWorld [978], Ehrhardt [297] (3.2.17.11).

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; tau = '0.0 + 0.7j'
>>> \mathrm{d}x = dec.modular_lambda(tau); mx = mpm.modular_lambda(tau); gx = gmp.modular_lambda(tau)
```

(continues on next page)

```

8.8.3 Elliptic modular delta function $\Delta(\omega, \tau)$

`ctx.ctx.`**`elliptic_modular_delta`**(*omega*, *tau*)

Computes the modular discriminant $\Delta(\tau) = \eta(\tau)^{24}$ in terms of half-period ω_1 and elliptic period ratio τ. It transforms as

$$\Delta\left(\frac{a\tau+b}{c\tau+d}\right) = (c\tau+d)^{12}\Delta(\tau).$$

The modular discriminant is sometimes defined with an extra factor $(2\pi)^{12}$, which we omit in this implementation.

We have $\Delta(t\omega, \tau) = t^{-12}\Delta(\omega, \tau)$.

$$\Delta = g_2^3 - 27g_3^2 = 4096\pi^{12}\eta(\tau)^{24}$$

for Weierstrass invariants g_2, g_3, and Dedekind eta function $\eta(\tau)$.

See also Wikipedia [1357], MathWorld [992], Flint [771].

See also: https://dlmf.nist.gov/23.3#i

Computes the modular discriminant $\Delta(\tau) = \eta(\tau)^{24}$ in terms of elliptic period ratio τ. It transforms as

$$\Delta(g_2, g_3) = g_2^3 - 27g_3^2 = \Delta(e_1, e_2, e_3) = 16(e_2-e_3)^2(e_3-e_1)^2(e_1-e_2)^2.$$

See also Wikipedia [1357], MathWorld [992], Flint [771].

```

8.8.4 Klein j-invariant $j(\tau)$ (also DAMath)

`ctx.`**`klein_j`**(*tau*)

Returns the Klein j-invariant in terms of elliptic period ratio τ. See also Wikipedia [1366], MathWorld [1008], NIST [477], Flint [771], Mpmath [689].

See also: https://dlmf.nist.gov/23.15#ii

Computes Klein's j-invariant $j(\tau)$ given τ in the upper half-plane. The function is normalized so that $j(i) = 1728$. We first move τ to the fundamental domain, which does not change the value of the function. Then we use the formula

$$j(\tau) = 1728\frac{g_2^3}{g_2^3 - 27g_3^2} = 32(\theta_2^8 + \theta_3^8 + \theta_4^8)^3/(\theta_2\theta_3\theta_4)^8$$

where $\theta_i = \theta_i(0, \tau)$.

Returns the Klein j-invariant $J(\tau), \tau = iy, y \geq 0$, $J(\tau) = \dfrac{\left(\theta_2^8(q) + \theta_3^8(q) + \theta_4^8(q)\right)^3}{54(\theta_1')^8(q)}, q = e^{i\pi\tau} = e^{-\pi y}$.

See also: Wikipedia [1366], MathWorld [1008], Ehrhardt [297] (3.2.17.12).

Returns the Klein j-invariant in terms of elliptic period ratio τ. See also Wikipedia [1366], MathWorld [1008], NIST [477], Flint [771].

$$j(g_1, g_2) = 1728\frac{g_2^3}{g_2^3 - 27g_3^2}$$

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; tau = '0.0 + 0.7j'
>>> \mathrm{d}x = dec.kleinj(tau); mx = mpm.kleinj(tau); gx = gmp.kleinj(tau)

CHAPTER

NINE

LERCH'S PHI AND RELATED

The Lerch transcendent generalizes various other functions:

The polygamma function (see *polygamma()*) is given by

$$\psi^{(n)}(z) = (-1)^{n+1} n!\, \Phi(1, n+1, z).$$

The polylogarithm (see *polylog()*) is given by

$$\mathrm{Li}_s(z) = z\Phi(z, s, 1)).$$

The Legendre chi function (see *legendre_chi()*) is given by

$$\chi_n(z) = 2^{-n} z \Phi(z^2, n, 1/2).$$

The Hurwitz zeta function (see *hurwitz()*) is given by

$$\zeta(s, a) = \Phi(1, s, a).$$

The Riemann zeta function (see *zeta()*) is given by

$$\zeta(s) = \Phi(1, s, 1).$$

The Dirichlet eta function (see *dirichlet_eta()*) is given by

$$\eta(s) = \Phi(-1, s, 1).$$

Various identities include:

$$\Phi(z, s, a) = z^n \Phi(z, s, a+n) + \sum_{k=0}^{n-1} \frac{z^k}{(k+a)^s}$$

and

$$\Phi(z, s-1, a) = \left(a + z\frac{\partial}{\partial z}\right) \Phi(z, s, a)$$

and

$$\Phi(z, s+1, a) = -\frac{1}{s}\frac{\partial}{\partial a}\Phi(z, s, a).$$

The source code for the C# tests in Visual Studio is divided by real and complex modules:

The source code for the C# tests in Visual Studio using real modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B09a_RealLerchPhi.cs,

The source code for the C# tests in Visual Studio using complex modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B09b_CplxLerchPhi.cs,

9.1 Lerch's transcendent and Lerch's zeta

9.1.1 Lerch's transcendent, $\Phi(x, s, a)$

`ctx.lerch_phi(`s, z, a`)`

where `ctx` is `math53` or `ctxflint`.

Returns the Lerch transcendent $\Phi(z, s, a)$. See also Wikipedia [1361], MathWorld [1009], NIST [12], Ehrhardt [297] (3.6.10), Flint [770], Mpmath [702].

The function is defined for $|z| < 1$ and $\Re a > 0$ by

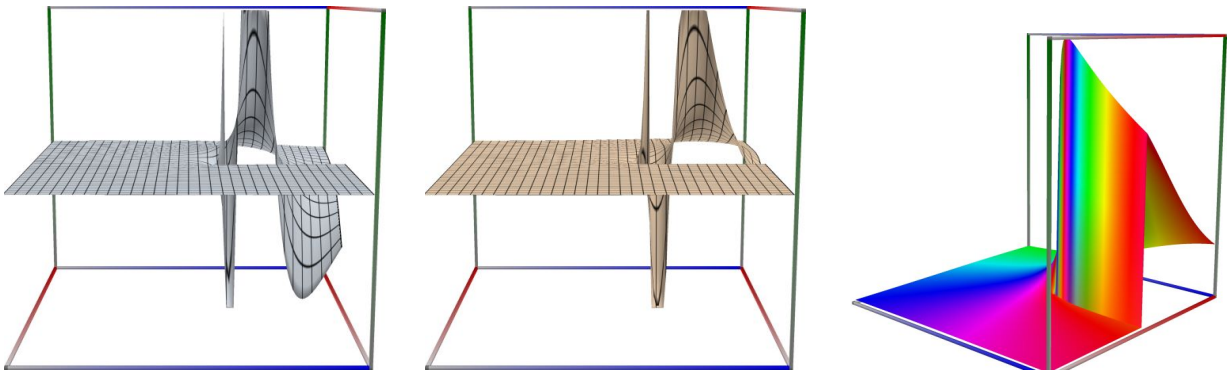
$$\Phi(z, s, a) = \sum_{k=0}^{\infty} \frac{z^k}{(a+k)^s}$$

and generally by the recurrence $\Phi(z, s, a) = z\Phi(z, s, a+1) + a^{-s}$ along with the integral representation valid for $\Re a > 0$

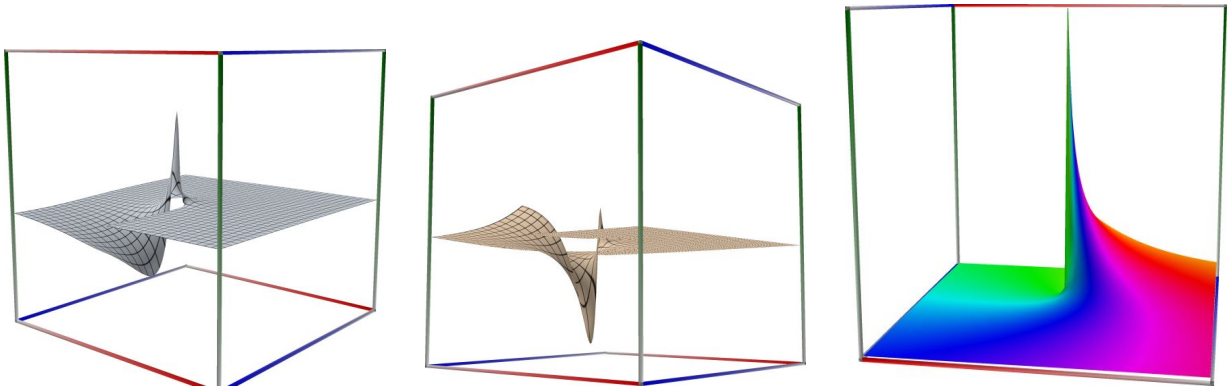
$$\Phi(z, s, a) = \frac{1}{2a^s} + \int_0^{\infty} \frac{z^t}{(a+t)^s} \mathrm{d}t - 2\int_0^{\infty} \frac{\sin(t\log z - s\arctan(t/a)}{(a^2+t^2)^{s/2}(e^{2\pi t}-1)} \mathrm{d}t.$$

The Amath implementation requires $x \le 1, s \ge -1, a \ge 0$. We have also $\Phi(x, 0, a) = 1/(1-x)$ and $\Phi(x, s, 0) = \mathrm{Li}_s(x)$.

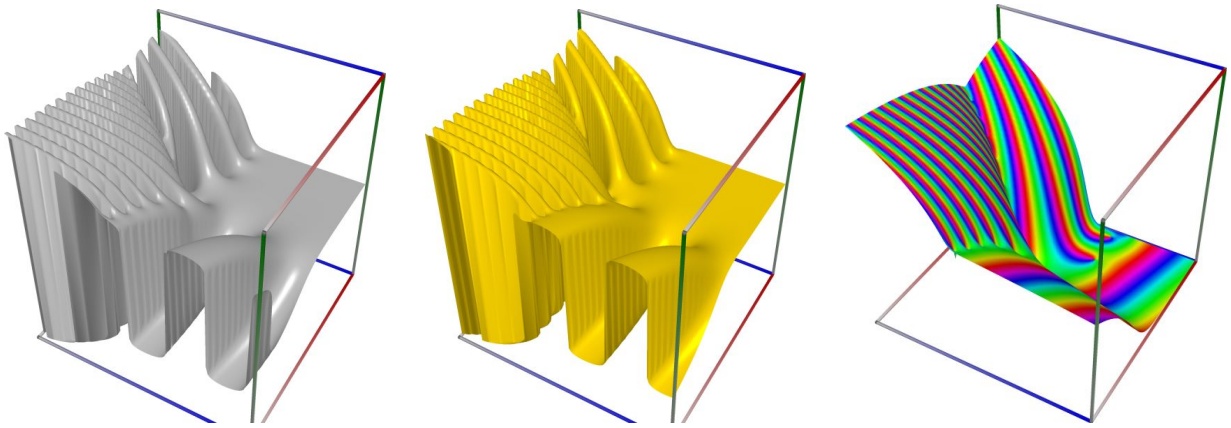
See also: https://fredrikj.net/blog/2022/02/computing-the-lerch-transcendent/



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LerchPhi(2,5, 0.5, 3)
ereal('5.2359877559829887307E-1')
>>> ereal.LerchPhi('5.1', 0.5, 3)
ereal('5.3518479027559984754E-1')
```

An example with real input, $x = 1$ (same result as Hurwitz zeta):

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '1.0'; s = '2.5'; a = '3.0'
>>> \mathrm{d}x = dec.lerchphi(x, s, a); mx = mpm.lerchphi(x, s, a); gx = gmp.lerchphi(x, s, a)
>>> fx = fpm.lerchphi(x, s, a); ax = apm.lerchphi(x, s, a)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax], aligned=True)
dec: 1.647105619542802986565586028223998768018E-1
mpm: 1.647105619542802986565586028223998768018e-1
gmp: 1.647105619542802986565586028223998768018E-01
fpm: 1.64710561954280E-01
apm: 1.647105619542802986565586028223998768018e-1 (1.742e-39%)
```

An example with real input, $x < 1, s \geq 0, a > 0$ (real result for real x, s, a):

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '-11.5'; s = '2.5'; a = '7'
>>> \mathrm{d}x = dec.lerchphi(x, s, a); mx = mpm.lerchphi(x, s, a); gx = gmp.lerchphi(x, s, a)
>>> fx = fpm.lerchphi(x, s, a); ax = apm.lerchphi(x, s, a)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax], aligned=True)
dec: 8.6837919848369498481095326076141308753 96E-4
mpm: 8.6837919848369498481095326076141308753 96e-4
gmp: 8.6837919848369498481095326076141308753 96E-04

An example with complex input for z and s, but integer a:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; z = '11.0 + 2.0j'; s = '12.0 + 3.0j'; a = '7'
>>> \mathrm{d}z = dec.lerchphi(z, s, a); mz = mpm.lerchphi(z, s, a); gz = gmp.lerchphi(z, s, a)
>>> fz = fpm.lerchphi(z, s, a); az = apm.lerchphi(z, s, a)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az], aligned=True)
dec: -1.37197530011373 08013E-10              - 4.4570178228236195866E-12j
mpm: -1.37197530011373 08013e-10              - 4.4570178228236195866e-12j
gmp: -1.37197530011373 08013E-10              - 4.4570178228236195866E-12j
fpm: -1.37197530011373E-10                    - 4.45701782282362E-12j
apm: -1.37197529647403 20417e-10 (-0.002002%) - 4.4570185825924147934e-12 (-0.06162%)j
```

Evaluation works for complex arguments for z, s, a, and $|z| \geq 1$, currently only for `mpm`:

```
>>> mpm.lerchphi(1+2j, 3-j, 4+2j)
(0.00202500995700990860053946 9 + 0.00332789753681355880743808 9j)
>>> mpm.lerchphi(-2,2,-2.5)
-12.28676272353094275265944
>>> mpm.lerchphi(10,10,10)
(-4.46213072710218570181734 9e-11 - 1.57517219898109621882348 1e-12j)
>>> mpm.lerchphi(10,10,-10.5)
(112658784011940.5605789002 - 498113185.5756221777743631j)
```

9.1.2 Lerch's zeta

`ctx.lerch_zeta`(*lambda1*, *alpha*, *s*)

Returns the lerch zeta function. See also Wikipedia [1361], Apostol [11], Ferreira and López [301].

The Lerch zeta function is given by

$$L(\lambda_1, \alpha, s) = \sum_{n=0}^{\infty} \frac{e^{2\pi i \lambda n}}{(n+\alpha)^s}.$$

The Lerch zeta function is related to the Lerch transcendent by

$$L(\lambda_1, \alpha, s) = \Phi(e^{2\pi i \lambda_1}, s, \alpha).$$

For λ_1 rational, $L(\lambda_1, \alpha, s)$ may be expressed as a finite sum over the Hurwitz zeta-function. Suppose $\lambda_1 = \frac{p}{q}$ with $p, q \in \mathbb{Z}$ and $q > 0$. Then $z = \omega = e^{2\pi i \frac{p}{q}}$ and $\omega^q = 1$.

$$L(\lambda_1, \alpha, s) = \Phi(\omega, s, \alpha) = \sum_{n=0}^{\infty} \frac{\omega^n}{(n+\alpha)^s} = \sum_{m=0}^{q-1} \omega^m q^{-s} \zeta\left(s, \frac{m+\alpha}{q}\right)$$

An example with complex input for λ_1 and s, but integer α:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; lambda1 = '1.0 + 0.5j'; s = '1.0 + 0.5j'; alpha = '1'
>>> \mathrm{d}z = dec.lerch_zeta(lambda1, alpha, s); mz = mpm.lerch_zeta(lambda1, alpha, s)
>>> gz = gmp.lerch_zeta(lambda1, alpha, s)
>>> fz = fpm.lerch_zeta(lambda1, alpha, s); az = apm.lerch_zeta(lambda1, alpha, s)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az], aligned=True)

9.2 Polygamma and related functions

9.2.1 Polygamma function, $\psi^{(n)}(x)$

`ctx.polygamma`(n, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the polygamma function $\psi^{(n)}(x), \quad x \neq 0, -1, -2, \ldots$ The function returns the Hurwitz zeta value $(-1)^{n+1} n! \zeta(n+1, x)$ if x is positive; for $x < 0$ it is calculated from $\psi^{(n)}(1-x) + (-1)^{n+1}\psi^{(n)}(x) = (-1)^n \pi \frac{\mathrm{d}^n}{\mathrm{d}x^n} \cot(\pi x)$.

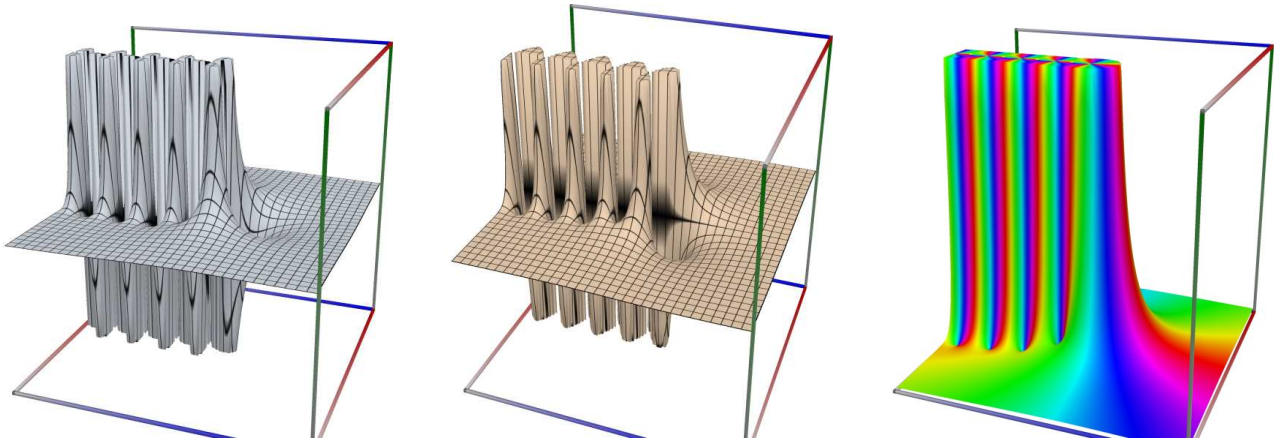
See also Wikipedia [1269], MathWorld [895], NIST [23], BoostMath [109], Ehrhardt [297] (3.5.6.6), Flint [731], Mpmath [600].

This function computes the polygamma function $\psi^{(n)}(x)$, i.e. the n^{th} derivative of the ψ function, with $n \geq 0$ and $x \neq 0, -1, -2, \ldots$. For $x > 0$ the result is calculated as

$$\psi^{(n)}(x) = (-1)^{n+1} n!\, \Phi(1, n+1, x) = (-1)^{n+1} n! \zeta(n+1, x).$$

The generalization to other values of s is due to Espinosa and Moll (see Espinosa and Moll [298]) :

$$\psi(s, z) = \frac{\zeta'(s+1, z) + (\gamma + \psi(-s))\zeta(s+1, z)}{\Gamma(-s)}$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

> **Note**
>
> This function is called `psi` in mpmath.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.PolyGamma(6, 7.1)
ereal('5.2359877559829887307E-1')
>>> ereal.PolyGamma(12, '4.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; m = '10'; x = '5.0'
>>> \mathrm{d}x = dec.polygamma(m, x); mx = mpm.polygamma(m, x); gx = gmp.polygamma(m, x)

apm: -1.3604463879878727646e-2 (-4.864e-20%) - 8.1339079821692487285e-3 (-8.136e-20%)j
```

9.2.2 TriGamma function, $\psi'(x)$

`ctx.trigamma(x)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the trigamma function $\psi'(x), \quad x \neq 0, -1, -2, \ldots$

The function returns the Hurwitz zeta value $\zeta(2, x)$ if x is positive; for $x < 0$ the polygamma reflection formula for $n = 1$ is used to compute the result

$$\psi'(x) = \left(\frac{\pi}{\sin(\pi x)}\right)^2 - \zeta(2, 1 - x).$$

See also Wikipedia [1296], MathWorld [939], NIST [23], BoostMath [131], Ehrhardt [297] (3.5.6.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.TriGamma(7)
ereal('5.235987755982988730 7E-1')
>>> ereal.TriGamma('4.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

```

9.2.3 DiGamma function $\psi(x)$

`ctx.digamma(x)`

where `ctx` is `math53`, `mathc53`, `ctxboost`, `ctxflint`.

Returns the digamma function $\psi(x) = \dfrac{\mathrm{d}(\log\Gamma(x)}{\mathrm{d}x} = \dfrac{\Gamma'(x)}{\Gamma(x)}, \quad x \neq 0, -1, -2, \ldots$.

See also Wikipedia [1277], MathWorld [919], NIST [23], BoostMath [117], Ehrhardt [297] (3.5.6.1), Ehrhardt [297] (4.2.50), Flint [741], Flint [731], Mpmath [608].

This function returns the digamma or ψ function, which is defines as

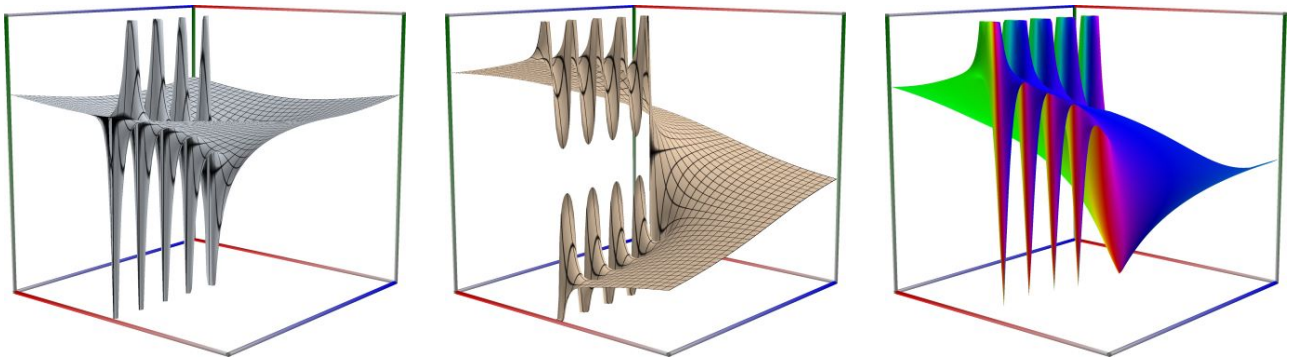
$$\psi(x) = \frac{d(\log\Gamma(x))}{\mathrm{d}x} = \frac{\Gamma'(x)}{\Gamma(x)}, \quad x \neq 0, -1, -2, \ldots$$

If $x < 0$ it is transformed to positive values with the reflection formula

$$\psi(1 - x) = \psi(x) + \pi\cot(\pi x)$$

and for $0 < x < 12$ the recurrence formula

$$\psi(x + 1) = \psi(x) + \frac{1}{x}$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Psi(7)
ereal('5.235987755982988730 7E-1')
>>> ereal.Psi('4.51')

```

`ctx.`**`psi`**`(`*x*`)`

is an alias of `ctx.digamma(x)`.

9.2.4 Harmonic number function, H_x

`ctx.harmonic(x)`

Returns the Harmonic number $H_x = \psi(x+1) + \gamma, \quad x \neq -1, -2, \ldots$.

See also: Wikipedia [1286], MathWorld [925], Ehrhardt [297] (3.6.20), Mpmath [615].

An example in Python

```

9.3 Polylogarithm and related functions

9.3.1 Polylogarithm, $\mathrm{Li}_s(z)$

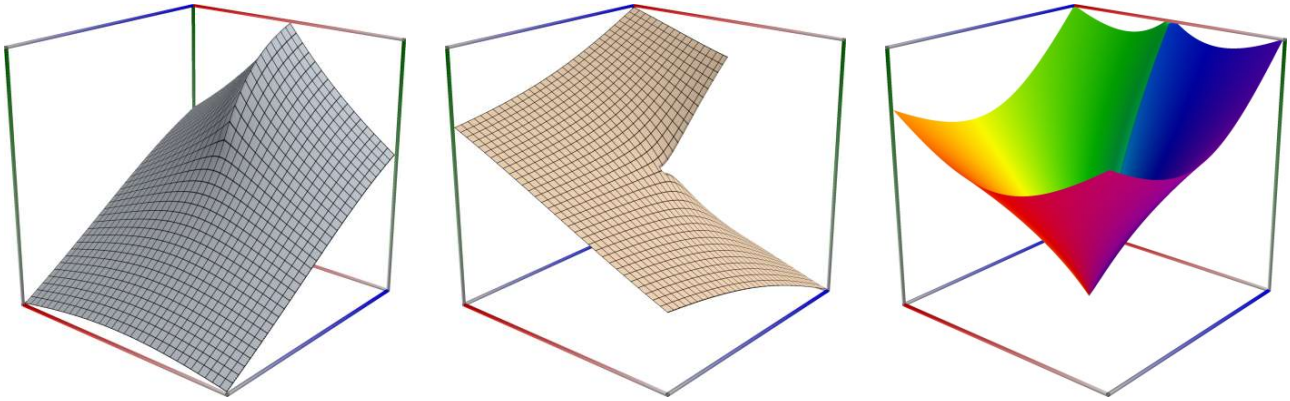
`ctx.polylog`(x, s)

where `ctx` is `math53`, `ctxflint`.

Returns the polylogarithm of real order s, $\mathrm{Li}_s(x) = \sum_{k=1}^{\infty} \frac{x^k}{k^s}$, $s \geq -1, |x| \leq 1$, or its analytic continuation. For $s \leq 1$ there is the additional arguments restriction $z \neq 1$.

See also Wikipedia [1334], MathWorld [971], NIST [18], Ehrhardt [297] (3.6.12), Flint [776], Mpmath [662].

Special cases are $\mathrm{Li}_s(0) = 0$, $\mathrm{Li}_s(1) = \zeta(s)$, $\mathrm{Li}_s(-1) = -\eta(s)$. For $x > 1$ the real part of $\mathrm{Li}_s(x)$ is returned.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.PolylogR(2, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.PolylogR(2, '0.1')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; s = '10'; x = '0.5'
>>> \mathrm{d}x = dec.polylog(s, x); mx = mpm.polylog(s, x); gx = gmp.polylog(s, x)
>>> fx = fpm.polylog(s, x); ax = apm.polylog(s, x)

9.3.2 Trilogarithm Function, $\mathrm{Li}_3(z)$

`ctx.trilog`(x)

Returns the trilogarithm $\mathrm{trilog}(x) = \Re\mathrm{Li}_3(x)$. See also Wikipedia [1338], MathWorld [957], NIST [16], Ehrhardt [297] (3.6.14), Mpmath [662].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Trilog(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Trilog('0.1')
ereal('5.351847902755998475 4E-1')
```

9.3.3 Dilogarithm Function, $\mathrm{Li}_2(z)$

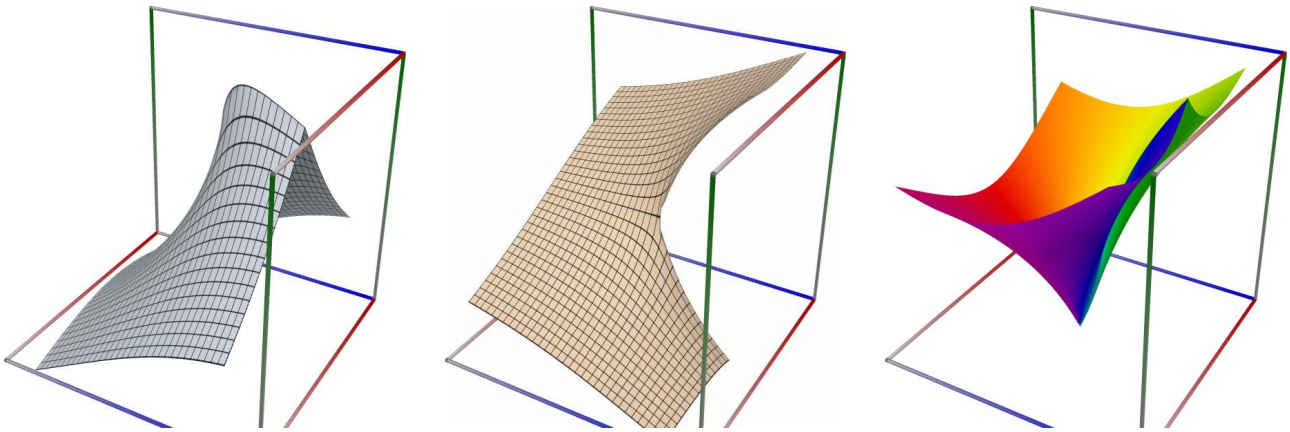
`ctx.dilog(`x`)`

where `ctx` is `math53`, `mathc53` or `ctxflint`.

Returns the dilogarithm $\mathrm{dilog}(x) = \Re\mathrm{Li}_2(x) = -\Re\int_0^x \frac{\log(1-t)}{t}\,\mathrm{d}t$.

See also Wikipedia [1338], MathWorld [957], NIST [16], Ehrhardt [297] (3.6.13), Ehrhardt [297] (4.2.25), Flint [775], Mpmath [662].

Note that there is some confusion about the naming: some authors and/or computer algebra systems use $\mathrm{dilog}(x) = \mathrm{Li}_2(1-x)$ and then call $\mathrm{Li}_2(x)$ Spence function/integral or similar.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Dilog(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Dilog('0.1')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '0.5'
>>> \mathrm{d}x = dec.dilog(x); mx = mpm.dilog(x); gx = gmp.dilog(x)

```

9.3.4 Generalized Clausen sine function

`ctx.clausen_sin`(s, z)

Returns the Clausen sine function. See also Wikipedia [1359], MathWorld [1022], Mpmath [701].

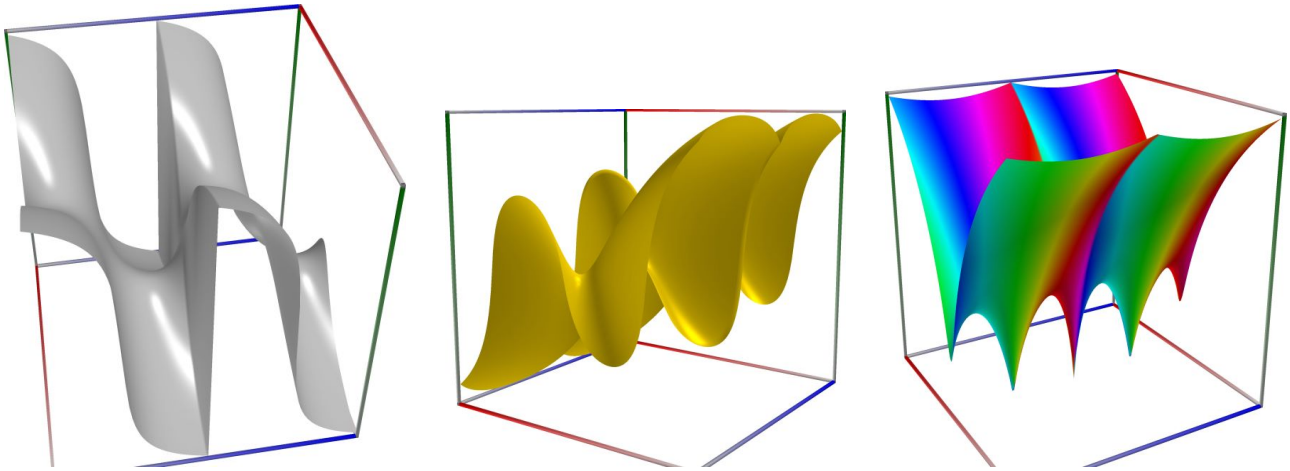
Computes the Clausen sine function, defined formally by the series

$$\mathrm{Cl}_s(z) = \sum_{k=1}^{\infty} \frac{\sin(kz)}{k^s}.$$

The special case $\mathrm{Cl}_2(z)$ (i.e. `clsin(2,z)`) is the classical "Clausen function". More generally, the Clausen function is defined for complex s and z, even when the series does not converge. The Clausen function is related to the polylogarithm (*polylog()*) as

$$\begin{aligned}\mathrm{Cl}_s(z) &= \frac{1}{2i}\left(\mathrm{Li}_s\left(e^{iz}\right) - \mathrm{Li}_s\left(e^{-iz}\right)\right) \\ &= \mathrm{Im}\left[\mathrm{Li}_s(e^{iz})\right] \quad (s, z \in \mathbb{R}),\end{aligned}$$

and this representation can be taken to provide the analytic continuation of the series. The complementary function *clcos()* gives the corresponding cosine sum.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; s = '3'; x = '4'
>>> \mathrm{d}x = dec.clsin(s, x); mx = mpm.clsin(s, x); gx = gmp.clsin(s, x)

```

9.3.5 Generalized Clausen cosine function

`ctx.clausen_cos(`s, z`)`

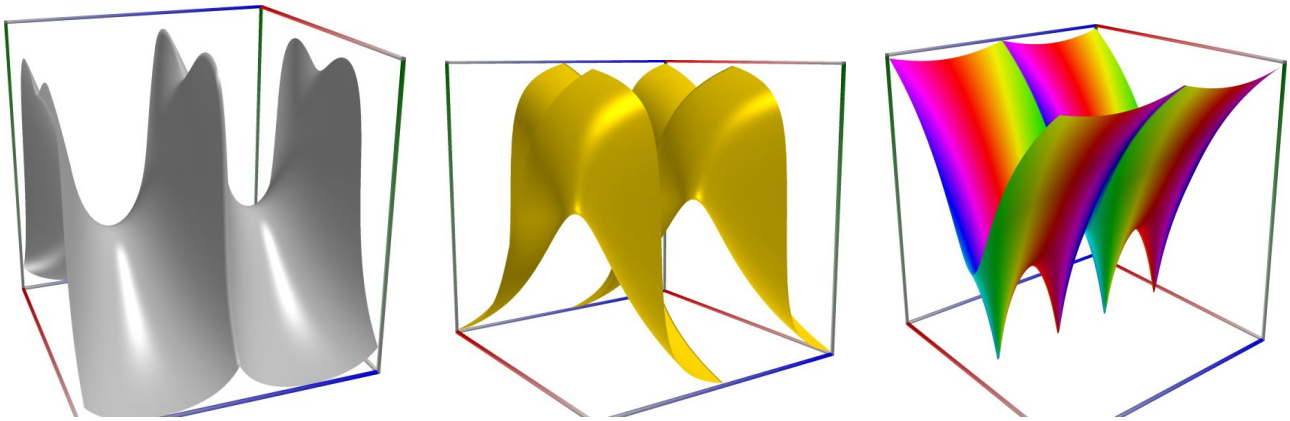
Returns the Clausen cosine function. See also Wikipedia [1359], MathWorld [1022], Mpmath [700].

Computes the Clausen cosine function, defined formally by the series

$$\widetilde{\mathrm{Cl}}_s(z) = \sum_{k=1}^{\infty} \frac{\cos(kz)}{k^s}.$$

This function is complementary to the Clausen sine function *clsin()*. In terms of the polylogarithm,

$$\begin{aligned}\widetilde{\mathrm{Cl}}_s(z) &= \frac{1}{2}\left(\mathrm{Li}_s\left(e^{iz}\right) + \mathrm{Li}_s\left(e^{-iz}\right)\right) \\ &= \mathrm{Re}\left[\mathrm{Li}_s(e^{iz})\right] \quad (s, z \in \mathbb{R}).\end{aligned}$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; s = '3'; x = '4'
>>> \mathrm{d}x = dec.clcos(s, x); mx = mpm.clcos(s, x); gx = gmp.clcos(s, x)

9.3.6 Classical Clausen function, $\mathrm{Cl}_2(x)$

`ctx.clausen2(`x`)`

Returns the Clausen function $\mathrm{Cl}_2(x) = \Im \mathrm{Li}_2(e^{ix}) = \int_0^x \log|2\sin(t/2)|\,\mathrm{d}t$.

See also: Wikipedia [1359], MathWorld [1022], Ehrhardt [297] (3.6.15), Mpmath [700].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Clausen2(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Clausen2('0.1')
ereal('5.351847902755998475 4E-1')
```

9.3.7 Bose-Einstein integrals, $G_s(x)$

`ctx.bose_einstein(s, x)`

Returns the Bose-Einstein integral of real order s, $G_s(x) = \dfrac{1}{\Gamma(s+1)} \displaystyle\int_0^\infty \frac{t^s}{e^{t-x}-1} = \mathrm{Li}_{s+1}(e^x)$. If $x > 0$ the real part of $G_s(x)$ is returned.

See also: MathWorld [953], Ehrhardt [297] (3.6.7), NIST [15].

$$G_s(x) = \frac{1}{\Gamma(s+1)} \int_0^\infty \frac{t^s}{e^{t-x}-1} \mathrm{d}t,$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BoseEinstein(2,5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BoseEinstein(2,'51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

9.3.8 Fermi-Dirac integrals, $F_s(x)$

`ctx.fermi_dirac(`s, x`)`

where `ctx` is `math53` or `ctxflint`.

Returns the Fermi-Dirac integral of order s, $F_s(x) = \dfrac{1}{\Gamma(s+1)} \displaystyle\int_0^\infty \frac{t^s}{e^{t-x}+1} = -\mathrm{Li}_{s+1}(-e^x)$.

See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDiracR(2,5)
ereal('5.235987755982988730 7E-1')

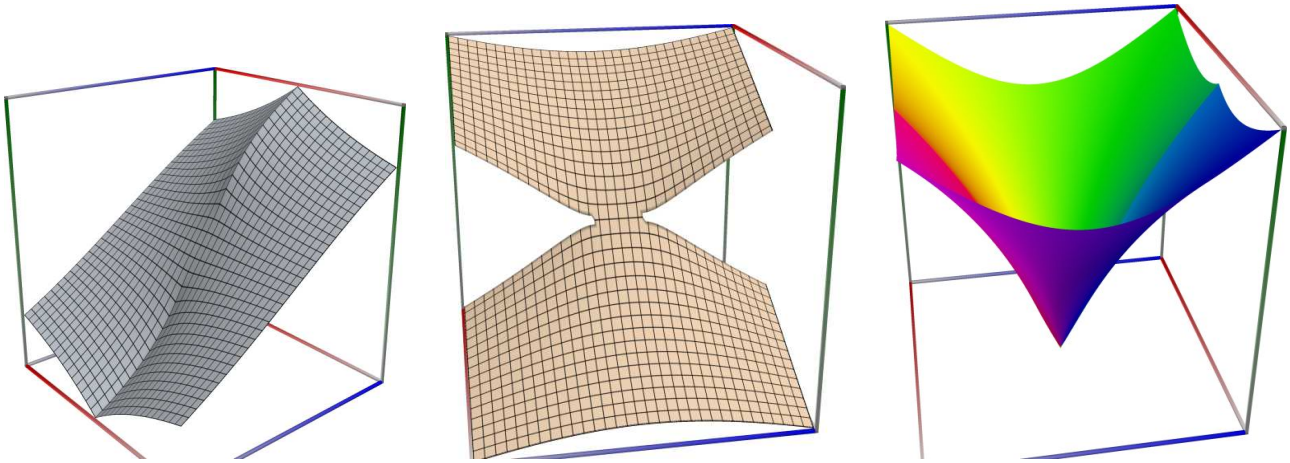
9.3.9 Legendre's Chi function, $\chi_s(x)$

`ctx.legendre_chi`(s, x)

Returns Legendre's Chi function, defined as $\chi_s(x) = \sum_{n=0}^{\infty} \frac{x^{2n+1}}{(2n+1)^s} = \frac{1}{2}\left(\mathrm{Li}_s(x) - \mathrm{Li}_s(-x)\right)$, for $s \geq 0, |x| \leq 1$.

See also: Wikipedia [1330], MathWorld [969], Ehrhardt [297] (3.6.9).



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LegendreChi(2,5, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LegendreChi('5.1', 0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

```

9.3.10 Generalized inverse tangent integral

`ctx.inverse_tan_integral`(s, z)

Returns the generalized inverse tangent integral $Ti_s(z)$, which can be expressed in terms of polylogarithms:

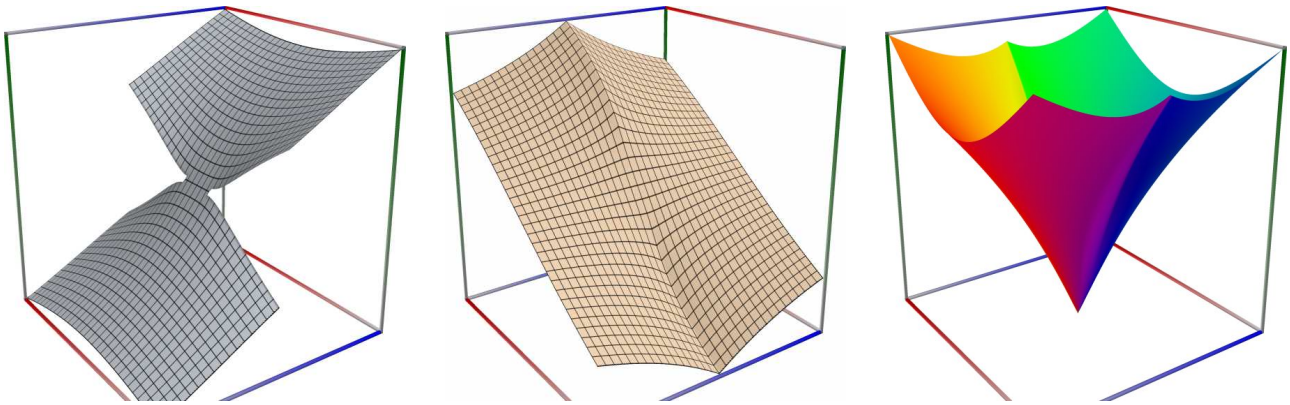
$$\mathrm{Ti}_s(z) = \frac{1}{2i}\left[\mathrm{Li}_s(iz) - \mathrm{Li}_s(-iz)\right].$$

The relation in particular implies:

$$\mathrm{Ti}_0(z) = \frac{z}{1+z^2}, \quad \mathrm{Ti}_1(z) = \arctan z, \quad \mathrm{Ti}_2(z) = \int_0^z \frac{\arctan t}{t}\mathrm{d}t, \quad \ldots \quad \mathrm{Ti}_{n+1}(z) = \int_0^z \frac{\mathrm{Ti}_n(t)}{t}\mathrm{d}t,$$

which explains the function name.

See also: Wikipedia [1335], MathWorld [965], Ehrhardt [297] (3.6.17).



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

9.4 Hurwitz zeta and related functions

9.4.1 Hurwitz zeta function, $\zeta(s, a)$

`ctx.hurwitz_zeta(`s, a`)`

where `ctx` is `math53`, `ctxflint`.

Returns the Hurwitz zeta function, defined as $\zeta(s,a) = \sum_{k=0}^{\infty} \frac{1}{(a+k)^s}$, $s > 1, a \neq 0, -1, -2, \ldots$, and by analytic continuation for $s \neq 0$. The amath implementation requires $a > 0$. If $a = 1$ then $\zeta(s)$ is returned, and if $s = 0$ the result is $\frac{1}{2} - a$.

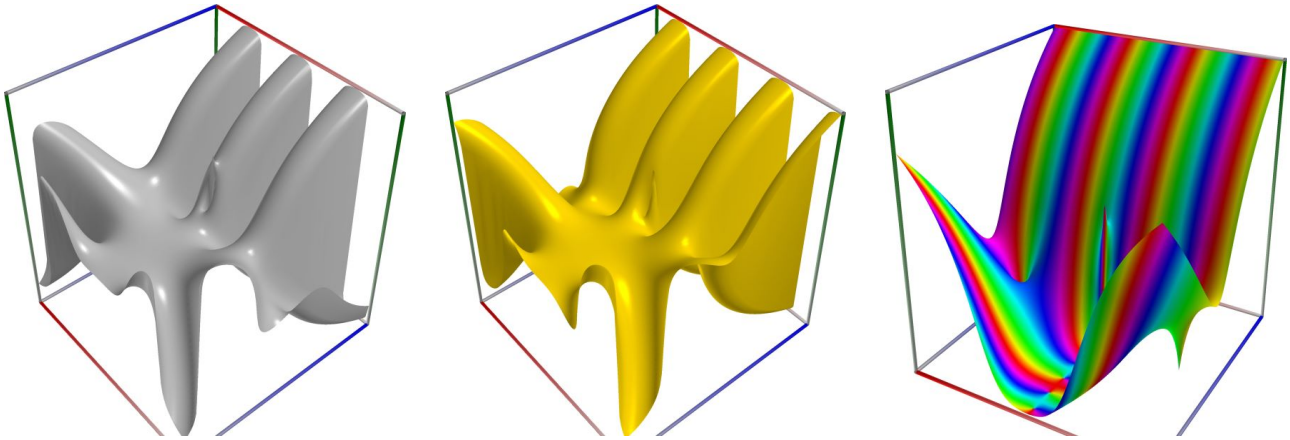
See also Wikipedia [1327], MathWorld [961], NIST [17], Ehrhardt [297] (3.6.6), Flint [763].

$$\zeta(-n, a) = -\frac{B_{n+1}(a)}{n+1}.$$

$$\zeta(s, 1) = \zeta(s).$$

$$\zeta\left(s, \tfrac{1}{2}\right) = (2^s - 1)\zeta(s).$$

$$\zeta'(0, a) = \log\Gamma(a) - \tfrac{1}{2}\log(2\pi).$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

```

9.4.2 Generalized harmonic number function, $H_x^{(r)}$

`ctx.`**`harmonic2`**(x, s)

Returns the generalized harmonic function $H_x^{(r)} = \zeta(r) - \zeta(r, x+1)$ for $r \neq 1$ and $H_x^{(r)} = H_x$ for $r = 1$.

See also: Wikipedia [1286], MathWorld [924], Ehrhardt [297] (3.6.21).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Harmonic2(5, 10.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Harmonic2(5, '10.1')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '10'; r = '1.5'
>>> \mathrm{d}x = dec.harmonic2(x, r); mx = mpm.harmonic2(x, r); gx = gmp.harmonic2(x, r)

```

9.4.3 Bernoulli numbers, B_n

`ctx.bernoulli(`n`)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note ctxboost.BernoulliB2n(n)

Returns the Bernoulli numbers B_n, which are defined by their generating function $\frac{1}{e^t - 1} \sum_{n=0}^{\infty} B_n \frac{t^n}{n!}$, $|t < 2\pi|$. If $n < 0$ or if $n > 2$ is odd, the result is 0, and $B_1 = -1/2$.

See also Wikipedia [1250], MathWorld [878], NIST [242], BoostMath [93], Ehrhardt [297] (3.10.2), Mpmath [583].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Bernoulli(8)
ereal('5.2359877559829887307E-1')
>>> ereal.Bernoulli(14)
ereal('5.3518479027559984754E-1')
```

An example:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '16'
>>> \mathrm{d}x = dec.bernoulli(n); mx = mpm.bernoulli(n); gx = gmp.bernoulli(n)

```

9.4.4 Bernoulli polynomials, $B_n(x)$

`ctx.bernpoly(n, x)`

Returns $B_n(x) = \sum_{n=0}^{\infty} \binom{n}{k} B_k x^{n-k}$, the Bernoulli polynomial of degree $n \geq 0$.

See also Wikipedia [1251], MathWorld [879], NIST [242], Ehrhardt [297] (3.10.3), Flint [728], Mpmath [584].

See the Amath documentation (p. 146) for connection formula to Hurwitz Zeta.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Bernpoly(3,4)
ereal('5.2359877559829887307E-1')
>>> ereal.Bernpoly(13,14)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '16'; x = '1.5'
>>> \mathrm{d}x = dec.bernpoly(n, x); mx = mpm.bernpoly(n, x); gx = gmp.bernpoly(n, x)

```

9.4.5 Euler numbers

`ctx.eulernum(`n`)`

where `ctx` is `math53`, `ctxflint`.

Returns the Euler numbers E_n. See also Wikipedia [1279], MathWorld [921], Flint [762], Ehrhardt [297] (3.10.8), Mpmath [610].

The Euler numbers E_n can be defined as

$$E_n = \frac{4^n \beta(n+1)}{\zeta(n)} \frac{2B_n}{\pi}$$

An example:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '16'
>>> \mathrm{d}x = dec.eulernum(n); mx = mpm.eulernum(n); gx = gmp.eulernum(n)
>>> fx = fpm.eulernum(n); ax = apm.eulernum(n)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

apm:  1.939151214500000000000000000000000000000e+10 (0.0%)
```

9.4.6 Euler polynomials, $E_n(x)$

`ctx.eulerpoly(n, x)`

Returns $E_n(x) = \dfrac{2}{n+1}\left(B_{n+1}(x) - 2^{n+1}B_{n+1}\left(\dfrac{x}{2}\right)\right)$, the Euler polynomial of degree $n \geq 0$. Special values include the Euler numbers $E_n = 2^n E_n(1/2)$.

See also Wikipedia [1280], MathWorld [922], NIST [242], Ehrhardt [297] (3.10.9), Mpmath [611].

$$E_{n-1}(x) = \frac{2}{n}\left(B_n(x) - 2^n B_n\left(\tfrac{1}{2}x\right)\right),$$

$$E_{n-1}(x) = \frac{2^n}{n}\left(B_n\left(\tfrac{1}{2}x + \tfrac{1}{2}\right) - B_n\left(\tfrac{1}{2}x\right)\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Eulerpoly(3, 4)
ereal('5.235987755982988730 7E-1')
>>> ereal.Eulerpoly(3, 12)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '16'; x = '1.5'
>>> \mathrm{d}x = dec.eulerpoly(n, x); mx = mpm.eulerpoly(n, x); gx = gmp.eulerpoly(n, x)

9.4.7 Barnes G-function

`ctx.barnes_g(z)`

Returns the Barnes G-function of z. See also Wikipedia [1299], MathWorld [916], NIST [20], Whittaker and Watson [1081], Mpmath [627].

Evaluates the Barnes G-function, which generalizes the superfactorial (*superfac()*) and by extension also the hyperfactorial (*hyperfac()*) to the complex numbers in an analogous way to how the gamma function generalizes the ordinary factorial.

The Barnes G-function may be defined in terms of a Weierstrass product:

$$G(z+1) = (2\pi)^{z/2} e^{-[z(z+1)+\gamma z^2]/2} \prod_{n=1}^{\infty} \left[\left(1+\frac{z}{n}\right)^n e^{-z+z^2/(2n)}\right]$$

For positive integers n, we have have relation to superfactorials $G(n) = \mathrm{sf}(n-2) = 0! \cdot 1! \cdots (n-2)!$.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '1.5'
>>> \mathrm{d}x = dec.barnesg(x); mx = mpm.barnesg(x); gx = gmp.barnesg(x)
>>> fx = fpm.barnesg(x); ax = apm.barnesg(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

9.4.8 Logarithm of Barnes G function

`ctx.logbarnes_g(`x`)`

where `ctx` is `math53` or `ctxflint`.

Returns $\log G(z)$, the logarithm of Barnes G function, with log G(z) = (z-1) log Gamma(z) - zeta'(-1,z) + zeta'(-1).

See also: Wikipedia [1299], MathWorld [916], MathWorld [932], NIST [20], Ehrhardt [297] (3.5.6.9).

Computes Barnes G-function or the logarithmic Barnes G-function, respectively. The logarithmic version has branch cuts on the negative real axis and is continuous elsewhere in the complex plane, in analogy with the logarithmic gamma function. The functional equation

$$\log G(z+1) = \log \Gamma(z) + \log G(z).$$

holds for all z.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogBarnesG(7.1)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogBarnesG('4.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '1.5'
>>> \mathrm{d}x = dec.Logbarnesg(x); mx = mpm.Logbarnesg(x); gx = gmp.Logbarnesg(x)
>>> fx = fpm.Logbarnesg(x); ax = apm.Logbarnesg(x)

```

9.4.9 Hyperfactorial

`ctx.hyperfactorial(z)`

Returns the hyperfactorial of z. See also Wikipedia [1287], MathWorld [927], of Integer Sequences [428], Mpmath [634].

Computes the hyperfactorial, defined for integers as the product

$$H(n) = \prod_{k=1}^{n} k^k.$$

The hyperfactorial satisfies the recurrence formula $H(z) = z^z H(z-1)$. It can be defined more generally in terms of the Barnes G-function (see *barnesg()*) and the gamma function by the formula

$$H(z) = \frac{\Gamma(z+1)^z}{G(z+1)}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '1.5'
>>> \mathrm{d}x = dec.hyperfac(x); mx = mpm.hyperfac(x); gx = gmp.hyperfac(x)

```

9.4.10 Superfactorial

`ctx.superfactorial(z)`

Returns the Superfactorial of z. See also Wikipedia [1295], MathWorld [938], of Integer Sequences [429], Mpmath [639].

Computes the superfactorial, defined as the product of consecutive factorials

$$\mathrm{sf}(n) = \prod_{k=1}^{n} k!$$

For general complex z, $\mathrm{sf}(z)$ is defined in terms of the Barnes G-function (see *barnesg()*).

$$\mathrm{sf}(z) = G(z+2)$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '1.5'
>>> \mathrm{d}x = dec.superfac(x); mx = mpm.superfac(x); gx = gmp.superfac(x)

9.5 Riemann zeta function, and related functions

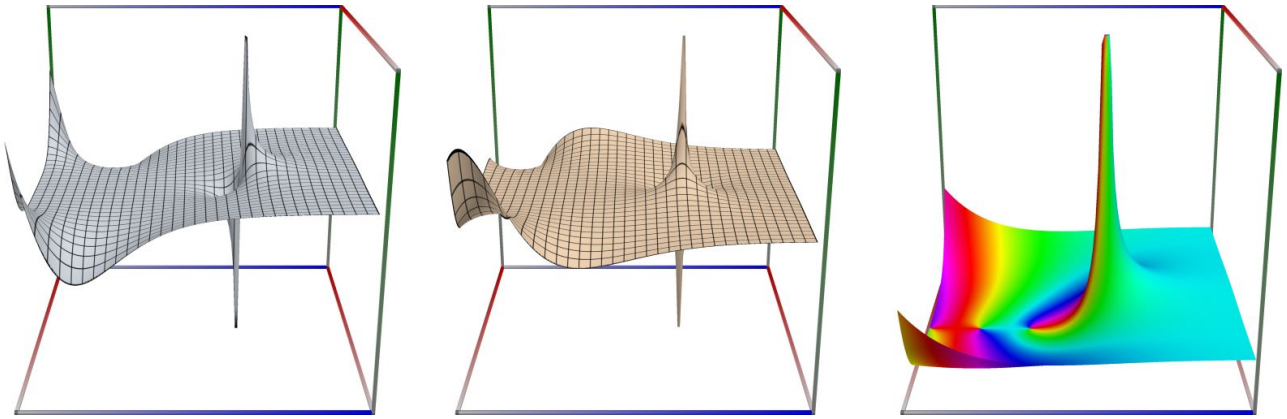
9.5.1 Riemann zeta function, $\zeta(s)$

`ctx.zeta(`s`)`

where `ctx` is `math53`, `mathc53`, `ctxboost` `ctxflint`.

Returns the Riemann zeta function, defined as $\zeta(s) = \sum_{k=1}^{\infty} \frac{1}{k^s}$ for $s > 1$, and by analytic continuation for $s \neq 1$.

See also Wikipedia [1336], MathWorld [972], NIST [19], BoostMath [158], Ehrhardt [297] (3.6.1.1), Ehrhardt [297] (4.2.63), Flint [765], Mpmath [663].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal

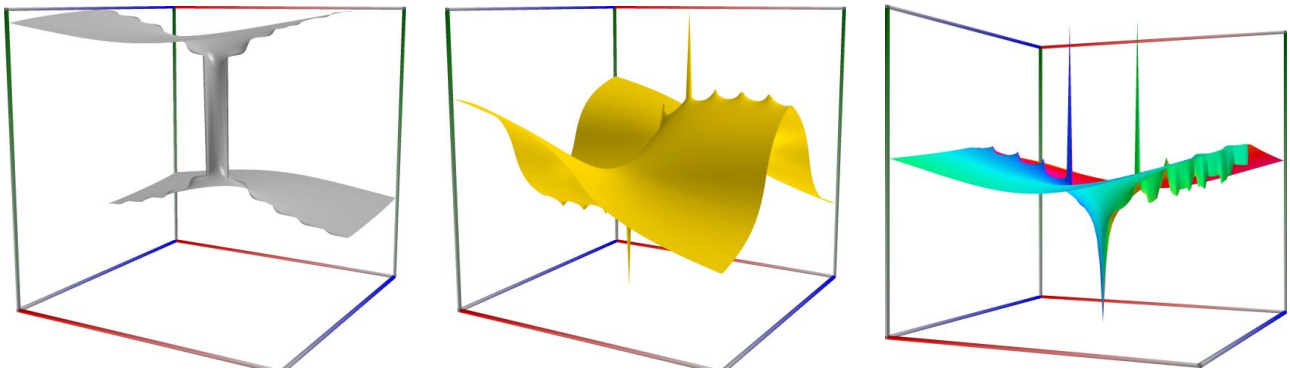
9.5.3 Hardy (or Riemann-Siegel) theta function

mathc53.**hardy_theta**(*z*)

Returns the Hardy (or Riemann-Siegel) theta function. See also Wikipedia [1365], MathWorld [1018], Ehrhardt [297] (4.2.52), Mpmath [698] Mpmath [704].

$$\theta(t) = \frac{\log\Gamma\left(\frac{1+2it}{4}\right) - \log\Gamma\left(\frac{1-2it}{4}\right)}{2i} - \frac{\log\pi}{2}t.$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.Rstheta(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.Rstheta('0.1')
ecplx('5.3518479027559984754E-1')
```

9.5.4 Hardy (or Riemann-Siegel) Z function

`mathc53.hardy_z(z)`

Returns the Hardy (or Riemann-Siegel) Z function. See also Wikipedia [1364], MathWorld [1019], NIST [13], Flint [769], Ehrhardt [297] (4.2.52), Mpmath [703].

$$Z(t) = e^{i\theta(t)}\zeta(1/2 + it)$$

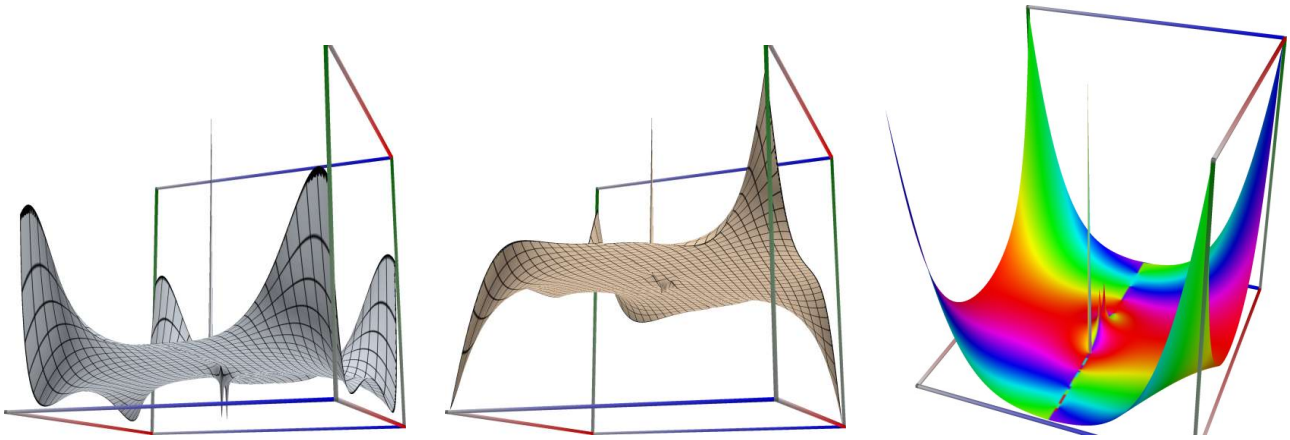
where $\zeta(s)$ is the Riemann zeta function and $\theta(t)$ denotes the Riemann-Siegel theta function.

This calls `acb_dirichlet_hardy_z`.

Computes the Z-function, also known as the Riemann-Siegel Z function,

$$Z(t) = e^{i\theta(t)}\zeta(1/2 + it)$$

where $\zeta(s)$ is the Riemann zeta function (*zeta()*) and where $\theta(t)$ denotes the Riemann-Siegel theta function (see *siegeltheta()*).



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.SiegelZ(0.5)
ecplx('5.235987755982988730 7E-1')
>>> ecplx.SiegelZ('0.1')
ecplx('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.siegelz(x); mx = mpm.siegelz(x); gx = gmp.siegelz(x)
>>> fx = fpm.siegelz(x); ax = apm.siegelz(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  -5.270127547934236224731698070416108808706E-1
mpm:  -5.270127547934236224731698070416108808706e-1

apm: -2.8270067277806269605e-1 (-2.097e-18%) - 1.6028967412508714310e-1 (-4.228e-18%)j
```

9.5.5 Riemann (Landau) function $\xi(s)$

`ctx.riemann_xi(`s`)`

Returns the Riemann (Landau) function $\xi(s)$. See also MathWorld [1016], Wikipedia [1356], Flint [764].

Landau's lower-case ξ ("xi") is defined as

$$\xi(s) = \frac{1}{2}s(s-1)\pi^{-s/2}\Gamma\left(\frac{s}{2}\right)\zeta(s)$$

for $s \in \mathbb{C}$. Here $\zeta(s)$ denotes the Riemann zeta function and $\Gamma(s)$ is the Gamma function. The functional equation (or reflection formula) for Landau's ξ is

$$\xi(1-s) = \xi(s)$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.riemann_xi(x); mx = mpm.riemann_xi(x); gx = gmp.riemann_xi(x)
>>> fx = fpm.riemann_xi(x); ax = apm.riemann_xi(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  5.502477451681679934572096474654698087218E-1

apm: 4.29157131070547904 37e-1 (1.974e-18%) + 1.29567490254131445 93e-1 (6.537e-18%)j
```

9.5.6 Dirichlet eta function, $\eta(s)$

`ctx.dirichlet_eta(x)`

Returns the Dirichlet eta function, defined as $\eta(s) = (1 - 2^{1-s})\zeta(s) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k^s}$ for $s > 0$ and by analytic continuation for $s \leq 0$.

See also: MathWorld [999], Ehrhardt [297] (3.6.3.1), Flint [764], Mpmath [699].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.DirichletEta(12)
ereal('5.235987755982988730 7E-1')
>>> ereal.DirichletEta('10.0001')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.dirichlet_eta(x); mx = mpm.dirichlet_eta(x); gx = gmp.dirichlet_eta(x)
>>> fx = fpm.dirichlet_eta(x); ax = apm.dirichlet_eta(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

9.5.7 Dirichlet $\eta(s) - 1$

`ctx.dirichlet_eta_m1(s)`

Returns the Dirichlet function $\eta(s) - 1 = (\zeta(s) - 1) - (2^{1-s}\zeta(s))$.

See also: MathWorld [999], Ehrhardt [297] (3.6.3.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.DirichletEtam1(5)
ereal('5.235987755982988730 7E-1')
>>> ereal.DirichletEtam1('51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.etam1(x); mx = mpm.etam1(x); gx = gmp.etam1(x)

```

9.5.8 Dirichlet beta function, $\beta(s)$

`ctx.dirichlet_beta(s)`

Returns the Dirichlet beta function, defined as $\beta(s) = \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)^s}$, for $s > 0$, and by analytic continuation for $s \leq 0$.

See also: Wikipedia [1343], MathWorld [977], Ehrhardt [297] (3.6.4).

Alternatively, the following definition, in terms of the Hurwitz zeta function, is valid in the whole complex s-plane:

$$\beta(s) = 4^{-s}\left(\zeta\left(s, \frac{1}{4}\right) - \zeta\left(s, \frac{3}{4}\right)\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.DirichletBeta(5)
ereal('5.2359877559829887307E-1')
>>> ereal.DirichletBeta('51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.dirichlet_beta(x); mx = mpm.dirichlet_beta(x); gx = gmp.dirichlet_beta(x)
>>> fx = fpm.dirichlet_beta(x); ax = apm.dirichlet_beta(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

apm: 1.0550279685803642739e+0 (7.226e-19%) + 3.3718823063670455625e-3 (1.828e-16%)j
```

9.5.9 Dirichlet lambda function, $\lambda(s)$

`ctx.dirichlet_lambda(`s`)`

Returns the Dirichlet lambda function, defined as $\lambda(s) = \sum_{n=0}^{\infty} (2n+1)^{-s}$, $for`s > 1$, and by analytic continuation for $s < 1$.

See also: MathWorld [1000], Ehrhardt [297] (3.6.5), Hu and Kim [376].

The function is calculated as

$$\lambda(s) = (1 - 2^{-s})\zeta(s) = -\text{exp2m1}(-s)\zeta(s)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.DirichletLambda(5)
ereal('5.2359877559829887307E-1')
>>> ereal.DirichletLambda('51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = '2.6'
>>> \mathrm{d}x = dec.dirichlet_lambda(x); mx = mpm.dirichlet_lambda(x); gx = gmp.dirichlet_lambda(x)
>>> fx = fpm.dirichlet_lambda(x); ax = apm.dirichlet_lambda(x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

9.5.10 Zeros of the Riemann zeta function

`ctx.zeta_zero(`n`)`

Returns the zeros of the Riemann zeta function. See also Wikipedia [1363], MathWorld [1017], NIST [14], Mpmath [705].

This calls `acb_dirichlet_zeta_zero`.

Computes the n-th nontrivial zero of $\zeta(s)$ on the critical line, i.e. returns an approximation of the n-th largest complex number $s = \frac{1}{2} + ti$ for which $\zeta(s) = 0$. Equivalently, the imaginary part t is a zero of the Z-function (*siegelz()*).

An example :

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; n = '20'
>>> \mathrm{d}z = dec.zetazero(n); mz = mpm.zetazero(n); gz = gmp.zetazero(n)
>>> fz = fpm.zetazero(n); az = apm.zetazero(n)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az],  aligned=True)

```

CHAPTER

TEN

HYPERGEOMETRIC FUNCTION ${}_0F_1$ AND RELATED

Text explaining this chapter

The source code for the C# tests in Visual Studio is divided by real and complex modules:

The source code for the C# tests in Visual Studio using real modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B10a_RealHypergeometric_0F1.cs,

The source code for the C# tests in Visual Studio using complex modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B10b_CplxHypergeometric_0F1.cs,

10.1 Hypergeometric Limit Function ${}_0F_1$

10.1.1 Confluent Hypergeometric Limit Function ${}_0F_1(b, x)$

`ctx.hyperg_0f1`(b, x)

Returns ${}_0F_1(b, x) = \sum_{k=0}^{\infty} \frac{1}{(b)_k} \frac{x^k}{k!}$, the confluent hypergeometric limit function, where $b \neq 0, -1, -2, \ldots$

See also Wikipedia [1256], MathWorld [903] BoostMath [104], Ehrhardt [297] (3.8.6), Flint [759], Flint [752], Mpmath [592].

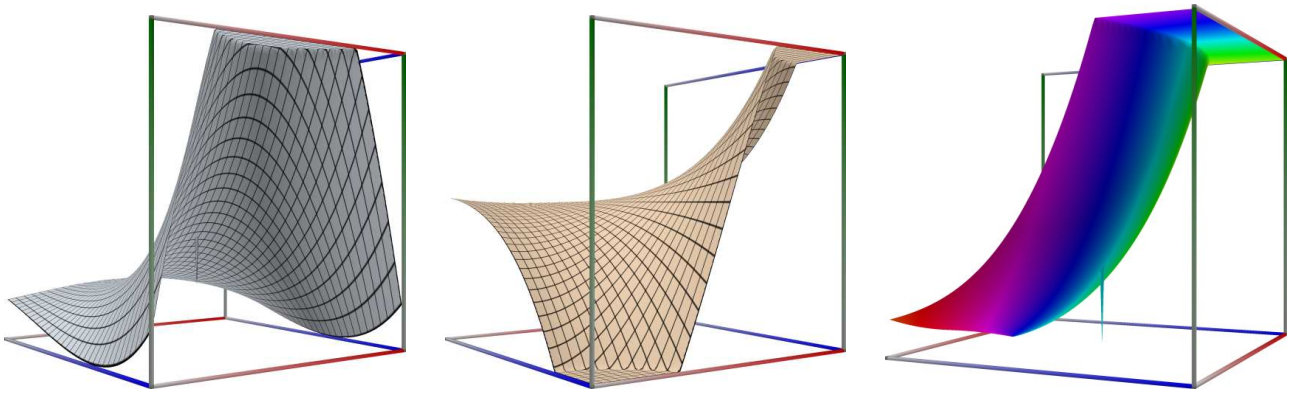
If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $b, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $b \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $b, x \in \mathbb{C}$ is accepted.

Calls `arb_hypgeom_0f1` or `acb_hypgeom_0f1`.

Returns the hypergeometric function ${}_0F_1$.

Gives the hypergeometric function ${}_0F_1$, sometimes known as the confluent limit function, defined as

$$ {}_0F_1(a, z) = \sum_{k=0}^{\infty} \frac{1}{(a)_k} \frac{z^k}{k!}. $$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hyperg0F1(5.1,0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Hyperg0F1(15.2,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.hyp0f1(a, x); mx = mpm.hyp0f1(a, x); gx = gmp.hyp0f1(a, x)
>>> fx = fpm.hyp0f1(a, x); ax = apm.hyp0f1(a, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  1.4686155009681100647083147826942249952 60E+1

```

10.1.2 Regularized Confluent Hypergeometric Limit Function ${}_0\widetilde{F}_1(b;x)$

`ctx.hyperg_0f1r`(b, x)

Returns ${}_0\widetilde{F}_1(b;x) = \dfrac{1}{\Gamma(b)}{}_0F_1(b;x)$, the regularized confluent hypergeometric limit function, for $b \neq 0, -1, -2, \cdots$, or, if $b = 0, -1, -2, \cdots = -n$, the corresponding limit ${}_0\widetilde{F}_1(b;x) = x^{n+1}{}_0\widetilde{F}_1(n+2;x) = \dfrac{x^{n+1}}{\Gamma(n+2)}{}_0F_1(n+2;x)$.

See also Wikipedia [1256], MathWorld [261] BoostMath [104], Ehrhardt [297] (3.8.7), Flint [759], Flint [752], Mpmath [592].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $b, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $b \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $b, x \in \mathbb{C}$ is accepted.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hyperg0F1r(5.1,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Hyperg0F1r(15.2,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.hyp0f1r(a, x); mx = mpm.hyp0f1r(a, x); gx = gmp.hyp0f1r(a, x)

```

10.2 Bessel functions

10.2.1 Bessel function of the 1st kind, $J_\nu(x)$

`ctx.bessel_jv`(*nu*, *x*, *scaled=False*)

Returns $J_\nu(x)$, the Bessel function of the 1st kind.

If *scaled* is *True*, then $J_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $J_\nu(x)$ is returned.

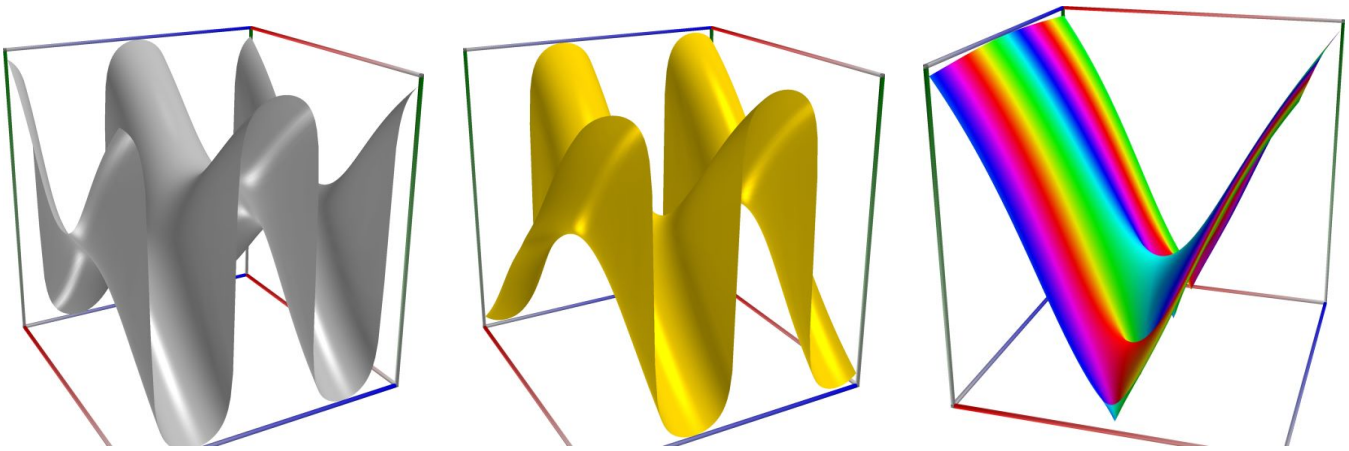
See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], Ehrhardt [297] (3.1.3.1), Flint [758], Flint [749], Mpmath [585].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

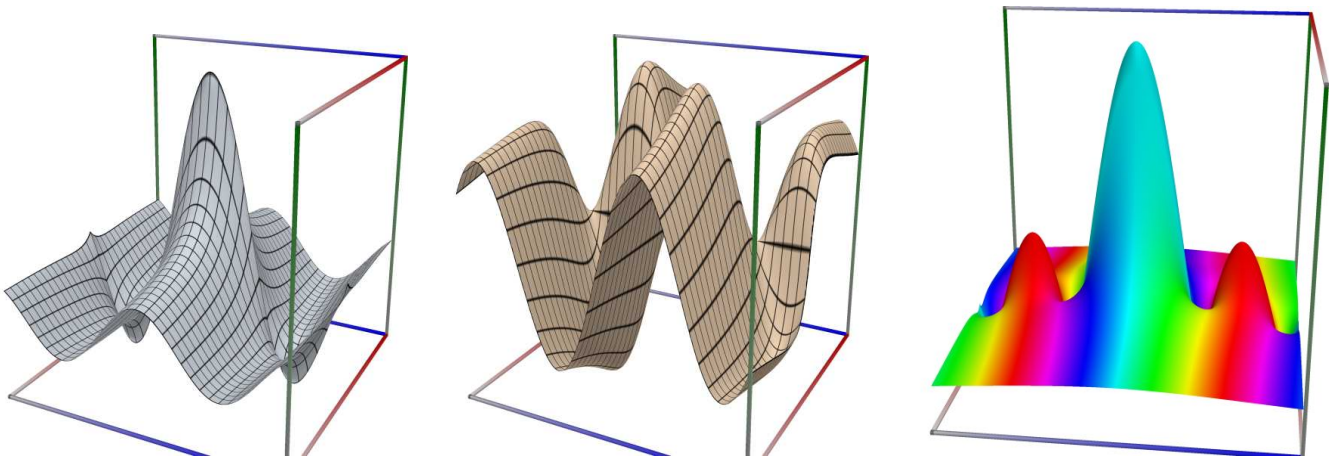
The function is defined as

$$J_\nu(x) = \left(\tfrac{1}{2}x\right)^\nu \sum_{k=0}^{\infty} (-1)^k \frac{(x^2/4)^k}{k!\Gamma(\nu+k+1)} = \frac{1}{\Gamma(\nu+1)} \left(\frac{z}{2}\right)^\nu {}_0F_1\left(\nu+1, -\frac{z^2}{4}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = J_\nu(x+iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJ(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselJ(3, '0.51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n= 10; x = 30
>>> \mathrm{d}x = dec.besselj(n, x); mx = mpm.besselj(n, x); gx = gmp.besselj(n, x)

```

10.2.2 Bessel function of the 2nd kind, $Y_\nu(x)$

`ctx.bessel_yv`(*nu*, *x*, *scaled=False*)

Returns $Y_\nu(z)$ the Bessel function of the second kind.

If *scaled* is *True*, then $Y_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $Y_\nu(x)$ is returned.

See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], Ehrhardt [297] (3.1.3.2), Flint [758], Flint [749], Mpmath [586].

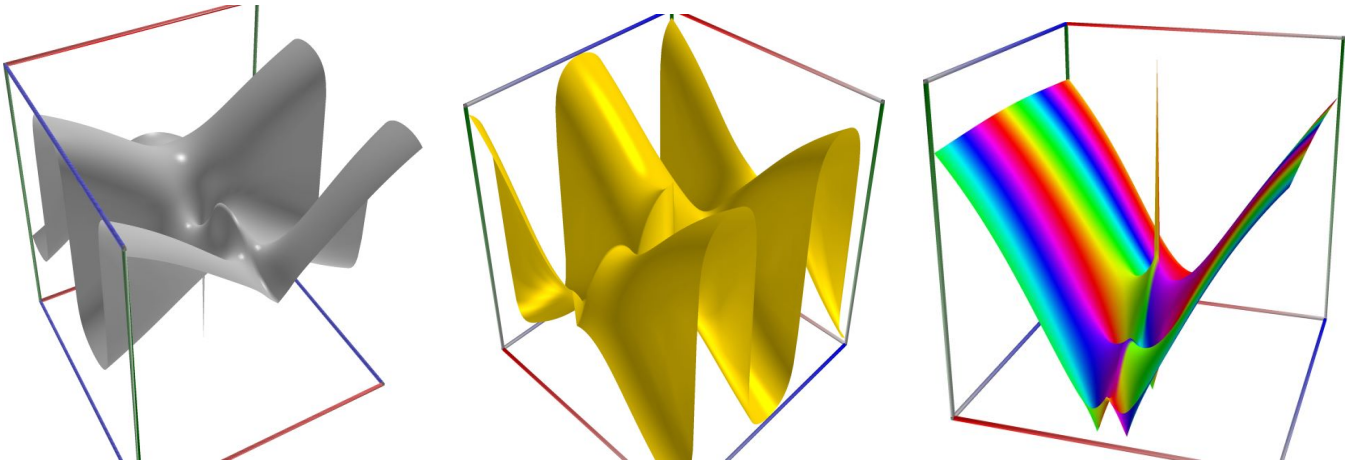
If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is computed from the formula

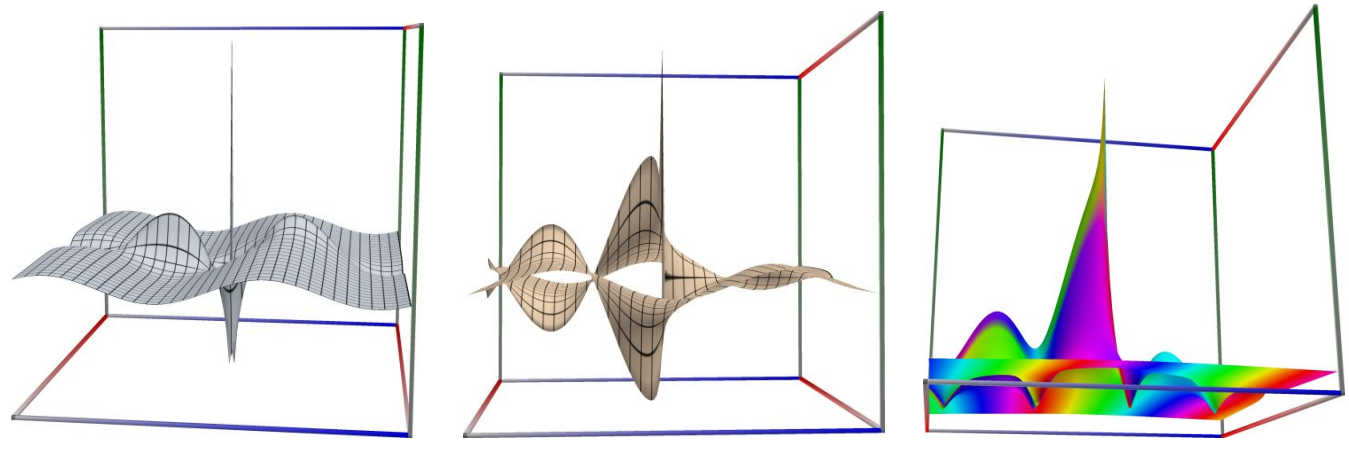
$$Y_\nu(x) = \frac{\cos(\nu\pi)J_\nu(x) - J_{-\nu}(x)}{\sin(\nu\pi)}$$

unless $\nu = n$ is an integer in which case the limit value is computed.

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = Y_\nu(x + iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselY(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselY(3, '0.51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n= 10; x = 30
>>> \mathrm{d}x = dec.bessely(n, x); mx = mpm.bessely(n, x); gx = gmp.bessely(n, x)

```

10.2.3 First derivative of the Bessel function of the first kind, $J'_\nu(x)$

`ctx.bessel_jv_prime`(*nu*, *x*, *scaled=False*)

Returns $J'_\nu(x)$, the first derivative (with respect to x) of $J_\nu(z)$, the Bessel function of the second kind.

If *scaled* is *True*, then $J'_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $J'_\nu(x)$ is returned.

See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], BoostMath [116].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is calculated as $J'_\nu(x) = \frac{1}{2}(J_{\nu-1}(x) - J_{\nu+1}(x))$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJPrime(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselJPrime(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.2.4 First derivative of the Bessel function of the second kind, $Y'_\nu(x)$

`ctx.bessel_yv_prime(nu, x, scaled=False)`

Returns $Y'_\nu(x)$, the first derivative (with respect to x) of $Y_\nu(z)$, the Bessel function of the second kind.

If *scaled* is *True*, then $Y'_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $Y'_\nu(x)$ is returned.

See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], BoostMath [116].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is calculated as $Y'_\nu(x) = \frac{1}{2}(Y_{\nu-1}(x) - Y_{\nu+1}(x))$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselYPrime(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselYPrime(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.2.5 Boost: Zeros $j_{\nu,m}$ of the Bessel function of the first kind: $J_\nu(j_{\nu,m}) = 0$

`ctx.bessel_jv_zero(nu, m)`

where `ctx` is `math53` or `ctxboost`.

For a real order $\nu \geq 0$ and a positive integer m, returns $j_{\nu,m}$, the m-th positive zero of the Bessel function of the first kind $J_\nu(x)$.

See also Wikipedia [1252], MathWorld [951], NIST [443], BoostMath [119], Mpmath [642].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJZero(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselJZero(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.2.6 Boost: Zeros $y_{\nu,m}$ of the Bessel function of the first kind: $Y_\nu(y_{\nu,m}) = 0$

`ctx.bessel_yv_zero(nu, m)`

where `ctx` is `math53` or `ctxboost`.

For a real order $\nu \geq 0$ and a positive integer m, returns $y_{\nu,m}$, the m-th positive zero of the Bessel function of the second kind $Y_\nu(x)$.

See also Wikipedia [1253], MathWorld [952], NIST [443], BoostMath [119], Mpmath [643].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJZero(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselJZero(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.3 Modified Bessel functions

10.3.1 Modified Bessel function of the 1st kind, $I_\nu(x)$

`ctx.bessel_iv`(*x*, *nu*, *scaled=False*)

Returns $I_\nu(x)$, the modified Bessel function of the first kind.

If *scaled* is *True*, then $I_\nu(x) \cdot \exp(-|\Re(x)|)$ is returned.

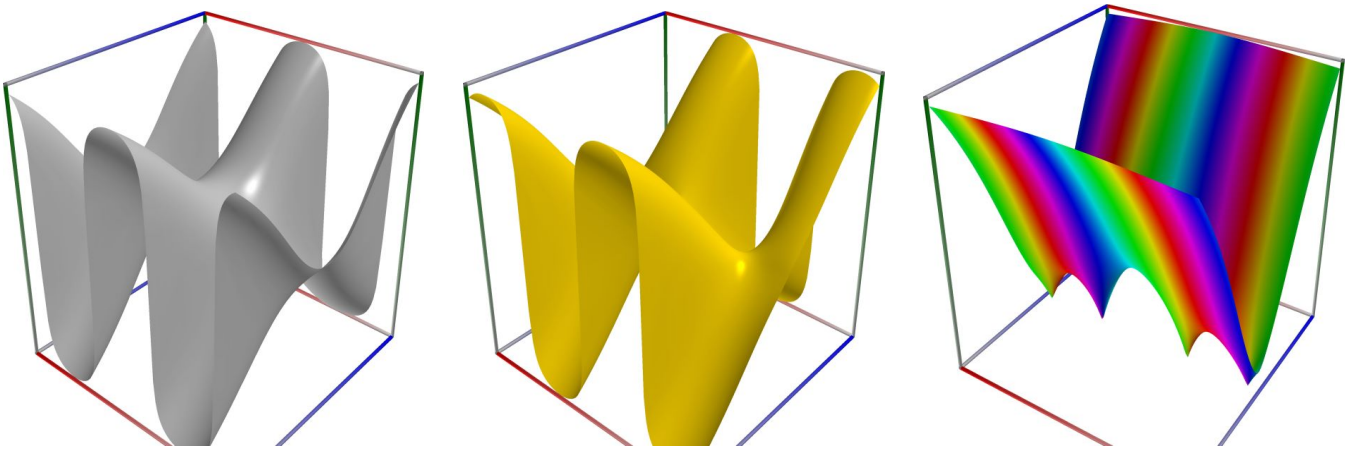
See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.4.1), Flint [758], Flint [756], Mpmath [598].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

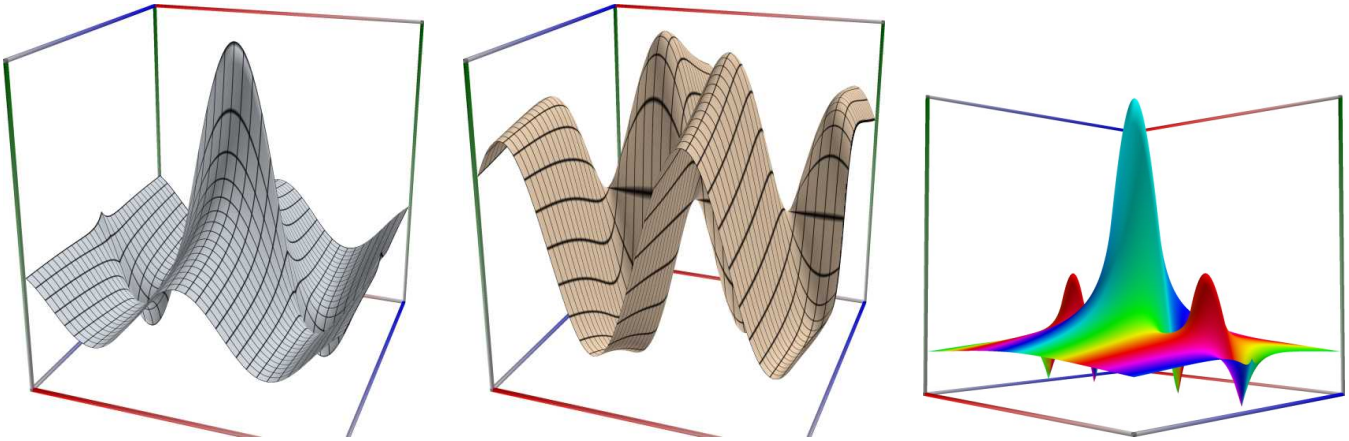
The function is defined as

$$I_\nu(z) = z^\nu (iz)^{-\nu} J_\nu(iz) = \frac{1}{\Gamma(\nu+1)} \left(\frac{z}{2}\right)^\nu {}_0F_1\left(\nu+1, \frac{z^2}{4}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = I_\nu(x+iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI(3, '0.51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n= 10; x = 30
>>> \mathrm{d}x = dec.besseli(n, x); mx = mpm.besseli(n, x); gx = gmp.besseli(n, x)

apm: -2.089047601208094054 5e-3 (-7.919e-20%) - 8.8394935038889455024e-4 (-9.358e-20%)j
```

10.3.2 Modified Bessel function of the 2nd kind, $K_\nu(x)$

`ctx.bessel_kv`(*x*, *nu*, *scaled=False*)

Returns $K_\nu(x)$, the modified Bessel function of the second kind.

If *scaled* is *True*, then $K_\nu(x) \cdot \exp(x)$ is returned.

See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.4.3), Flint [758], Flint [756], Mpmath [599].

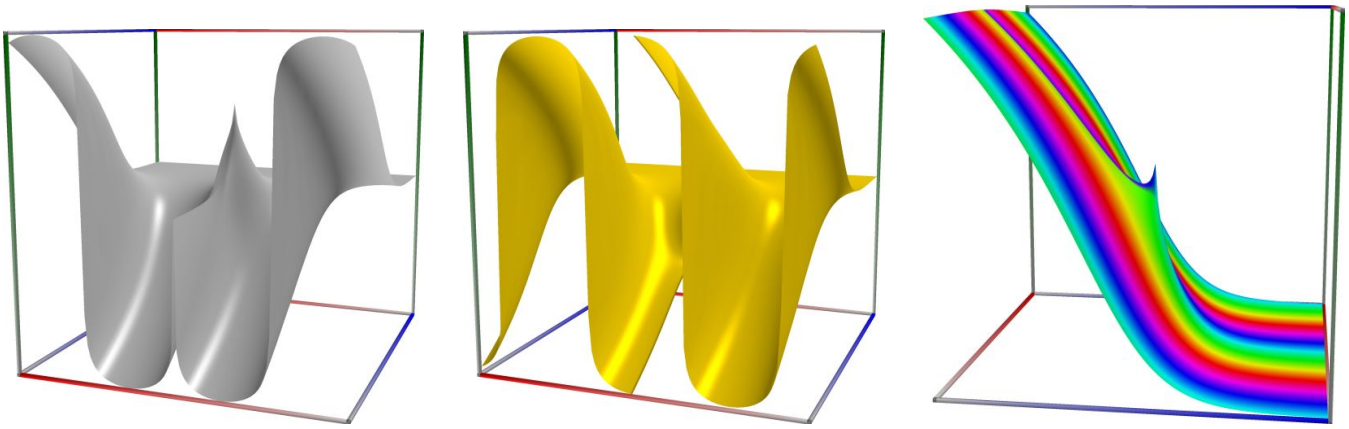
If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is defined as

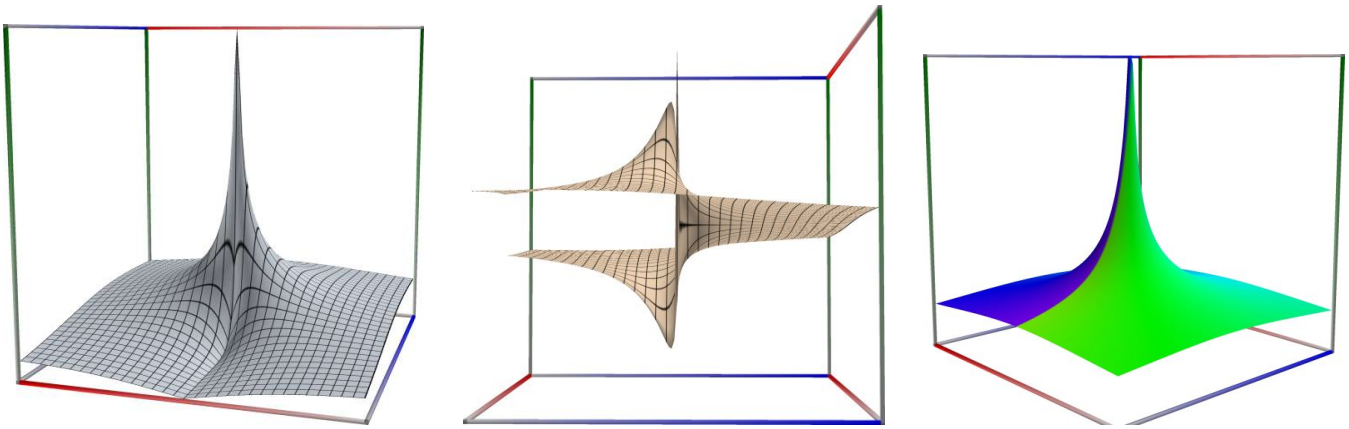
$$K_\nu(z) = \tfrac{1}{2}\pi \frac{I_{-\nu}(z) - I_\nu(z)}{\sin(\nu\pi)}.$$

if $\nu \notin \mathbb{Z}$. If $\nu \in \mathbb{Z}$, it computes the limit value.

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = K_\nu(x + iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK(3, 0.5)
```

(continues on next page)

apm: -1.9416209202983682785e+1 (-2.792e-19%) + 1.1318334583389307477e+1 (3.592e-19%)j
```

10.3.3 First derivative of the modified Bessel function of the first kind $I'_\nu(x)$

`ctx.bessel_iv_prime`(*x*, *nu*, *scaled=False*)

Returns $I'_\nu(x)$, the first derivative (with respect to x) of $I_\nu(z)$, the modified Bessel function of the first kind

If *scaled* is *True*, then $I'_\nu(x) \cdot \exp(-|\Re(x)|)$ is returned.

See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], BoostMath [116].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is calculated as $I'_\nu(x) = \frac{1}{2}(I_{\nu-1}(x) + I_{\nu+1}(x))$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselIPrime(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselIPrime(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.3.4 First derivative of the modified Bessel function of the second kind $K'_\nu(x)$

`ctx.bessel_kv_prime`(*x*, *nu*, *scaled=False*)

Returns $K'_\nu(x)$, the first derivative (with respect to x) of $K_\nu(x)$, the modified Bessel function of the second kind.

If *scaled* is *True*, then $K'_\nu(x) \cdot \exp(x)$ is returned.

See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], BoostMath [116].

If `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $\nu, x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $\nu, x \in \mathbb{C}$ is accepted.

The function is calculated as $K'_\nu(x) = -\frac{1}{2}(K_{\nu-1}(x) + K_{\nu+1}(x))$.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; n= 10; x = 30
>>> \mathrm{d}x = dec.hankel1(n, x); mx = mpm.hankel1(n, x); gx = gmp.hankel1(n, x)
>>> fx = fpm.hankel1(n, x); ax = apm.hankel1(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)

```

10.3.5 Marcum Q function, $Q_m(a,b)$ (up to octuple precision)

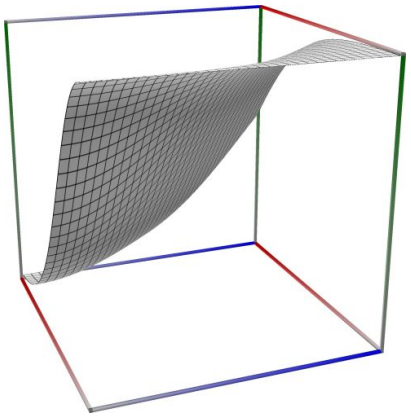
`ctx.marcum_q(`*m*, *a*, *b*`)`

Returns the Marcum Q-function $Q_m(a,b) = \frac{1}{a^{m-1}} \int_b^\infty x^m \exp\left(-\frac{x^2+a^2}{2}\right) I_{m-1}(ax)\,\mathrm{d}x$, where $m > 0$, $b \geq 0$, $a > 0$ and I_{m-1} is the modified Bessel function of first kind of order $m-1$.

See also: Short [500], Wikipedia [1354], MathWorld [1014], Ehrhardt [297] (3.3.17).

It is calculated using its relationship to the noncentral chi-squared cumulative distribution function:

If $X \sim \chi_k^2(\lambda)$ is a non-central chi-squared distribution with non-centrality parameter λ and k degrees of freedom, then its cdf is given by $F_X(x) = 1 - Q_{k/2}(\sqrt{\lambda}, \sqrt{x})$.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x+iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.MarcumQ(2, 3 ,0.5)
ereal('5.235987755982988730 7E-1')

```

10.4 Spherical Bessel functions

10.4.1 Spherical Bessel function of the first kind, $j_n(x)$

`ctx.sph_bessel_jn(`*n*, *x*, *scaled=False*`)`

Returns $j_n(x)$, the spherical Bessel function of the first kind.

If *scaled* is *True*, then $j_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $j_\nu(x)$ is returned.

See also Wikipedia [1317], MathWorld [946], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.1).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined as $j_n(x) = \sqrt{\frac{1}{2}\pi/x} J_{n+\frac{1}{2}}(x)$, where $J_n(x)$ is a Bessel function of the first kind.

In XlCalcNet, the definition $j_n(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}} J_{n+\frac{1}{2}}(x)$ is used instead, which gives identical results for $\Re(x) \geq 0$, but differs from the "traditional version" along the branch cut of the square root function. This ensures that the general definition for complex n and complex x agrees with the results from Rayleigh's formula $j_n(x) = (-x)^n \left(\frac{1}{x}\frac{d}{dx}\right)^n \frac{\sin x}{x}$ for integer $n \geq 0$ and real or complex $x \neq 0$. Given $j_0(x)$ and $j_1(x)$, Rayleigh's formula can also be computed recursively as $j_n(x) = \frac{2n-1}{x} j_{n-1}(x) - j_{n-2}(x)$ for $n \geq 2$.

We extend this to negative integer indices using $j_{-n}(x) = (-1)^n y_{n+1}(x)$ for $n > 0$, where $y_n(x)$ is the spherical Bessel function of the second kind. We also have $j_n(-x) = (-1)^n j_{n+1}(x)$ for $x > 0$.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function is real-valued. With $j_0(0) = 1$, $j_n(0) = 0$ for $n > 0$ and $n \neq 0$, $j_n(0) = -\infty$ for even $n < 0$, $j_n(0) =$ NaN for odd $n < 0$, $j_n(-\infty) = j_n(\infty) = 0$, we have the following explicit versions of Rayleigh's formula for $x \neq 0$ and $n = 0, 1, 2, 3$:

$$j_0(x) = \frac{\sin x}{x}.$$

$$j_1(x) = \frac{\sin x}{x^2} - \frac{\cos x}{x}.$$

$$j_2(x) = y_{-1}(x) = \left(\frac{3}{x^2} - 1\right)\frac{\sin x}{x} - \frac{3\cos x}{x^2}.$$

$$j_3(x) = y_{-2}(x) = \left(\frac{15}{x^3} - \frac{6}{x}\right)\frac{\sin x}{x} - \left(\frac{15}{x^2} - 1\right)\frac{\cos x}{x}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesseljn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesseljn(3, '0.51')
ereal('5.3518479027559984754E-1')
```

10.4.2 Spherical Bessel function of the second kind, $y_n(x)$

`ctx.sph_bessel_yn`(*n*, *x*, *scaled=False*)

Returns $y_n(x)$, the Spherical Bessel function of the second kind.

If *scaled* is *True*, then $y_\nu(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $y_\nu(x)$ is returned.

See also Wikipedia [1317], MathWorld [947], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.2).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined as $y_n(x) = \sqrt{\frac{1}{2}\pi/x} Y_{n+\frac{1}{2}}(x)$, where $Y_n(x)$ is a Bessel function of the second kind and, in general, n and x are complex numbers.

In XlCalcNet, the definition $y_n(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}} Y_{n+\frac{1}{2}}(x)$ is used instead, which gives identical results for $\Re(x) \geq 0$, but differs from the "traditional version" along the branch cut of the square root function. This ensures that results for real input and complex input with zero imaginary part are the same. It also ensures that the general definition for complex n and complex x agrees with the results from Rayleigh's formula $y_n(x) = -(-x)^n \left(\frac{1}{x}\frac{d}{dx}\right)^n \frac{\cos x}{x}$ for integer $n \geq 0$ and real or complex $x \neq 0$. Given $y_0(x)$ and $y_1(x)$, Rayleigh's formula can also be computed recursively as $y_n(x) = \frac{2n+1}{x} y_{n-1}(x) - y_{n-2}(x)$ for $n \geq 2$.

With $y_n(0) =$ NaN for even n, $y_n(0) = -\infty$ for odd n, $y_n(-\infty) = y_n(\infty) = 0$, we have the following explicit versions of Rayleigh's formula for $x \neq 0$ and $n = 0, 1, 2, 3$:

$$y_0(x) = -j_{-1}(x) = -\frac{\cos x}{x},$$

$$y_1(x) = j_{-2}(x) = -\frac{\cos x}{x^2} - \frac{\sin x}{x},$$

$$y_2(x) = -j_{-3}(x) = \left(-\frac{3}{x^2} + 1\right)\frac{\cos x}{x} - \frac{3\sin x}{x^2},$$

$$y_3(x) = j_{-4}(x) = \left(-\frac{15}{x^3} + \frac{6}{x}\right)\frac{\cos x}{x} - \left(\frac{15}{x^2} - 1\right)\frac{\sin x}{x}.$$

We extend this to negative integer indices using $y_{-n}(x) = (-1)^{n+1} j_{n+1}(x)$ for $n > 0$, where $j_n(x)$ is the spherical Bessel function of the first kind. We also have $y_n(-x) = (-1)^{n+1} y_n(x)$ for $x > 0$. Therefore we can calculate $y_n(x)$ for any $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ without resorting to complex functions, using the general definition with $n \geq 0, x \geq 0$, always obtaining a real result.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselyn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesselyn(3, '0.51')
ereal('5.3518479027559984754E-1')
```

10.4.3 First derivative of the spherical Bessel function of the first kind, $j_n'(x)$

`ctx.sph_bessel_jn_prime(n, x, scaled=False)`

Returns $j_n'(x)$, the first derivative (with respect to x) of $j_n(x)$, the spherical Bessel function of the first kind.

If *scaled* is *True*, then $j_\nu'(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $j_\nu'(x)$ is returned.

See also Wikipedia [1317], MathWorld [946], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.1).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

In all cases, the function is calculated as

$j_n'(x) = \dfrac{n j_{n-1}(x) - (n+1) j_{n+1}(x)}{2n+1}$ for $|2n+1| > 0.1$ and $j_n'(x) = j_{n-1}(x) - \dfrac{n+1}{x} j_n(x)$ otherwise.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function is real-valued with $j_1'(0) = 1/3$, $j_n'(0) = 0$ for $n \geq 0$ and $n \neq 1$, $j'_{-n}(0) = -\infty$ for odd $n > 0$ and $j'_{-n}(0) =$ NaN for even $n > 0$. We also have $j_n(-\infty) = 0$ and $y_n(\infty) = 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesseljn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesseljn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.4.4 First derivative of the spherical Bessel function of the second kind, $y_n'(x)$

`ctx.sph_bessel_yn_prime`(*n*, *x*, *scaled=False*)

Returns $y_n'(x)$, the first derivative (with respect to x) of $y_n(x)$, the spherical Bessel function of the second kind.

If *scaled* is *True*, then $y_\nu'(x) \cdot \exp(-|\Im(x)|)$ is returned, which means that for purely real x just $y_\nu'(x)$ is returned.

See also Wikipedia [1317], MathWorld [947], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.2).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

In all cases, the function is calculated as

$y_n'(x) = \dfrac{n y_{n-1}(x) - (n+1) y_{n+1}(x)}{2n+1}$ for $|2n+1| > 0.1$ and $y_n'(x) = y_{n-1}(x) - \dfrac{n+1}{x} y_n(x)$ otherwise.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function is real-valued with $y_{-2}'(0) = -1/3$, $y_n'(0) = 0$ for $n < 0$ and $n \neq -2$, $y_n'(0) = \infty$ for even $n \geq 0$ and $y_n'(0) =$ NaN for odd $n > 0$. We also have $y_n(-\infty) = 0$ and $y_n(\infty) = 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselyn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesselyn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.4.5 Boost: Zeros $a_{n,m}$ of the spherical Bessel function of the first kind: $j_n(a_{n,m}) = 0$

`ctx.sph_bessel_jn_zero(n, m)`

where `ctx` is `math53` or `ctxboost`.

For positive integers n and m, returns $a_{n,m}$, the m-th positive zero of the spherical Bessel function of the first kind $j_n(x)$.

See also Wikipedia [1252], MathWorld [951], NIST [443], BoostMath [119], Mpmath [642].

The function is calculated as $a_{n,m} = j_{n+\frac{1}{2},m}$, where $j_{\nu,m}$ is the m-th positive zero of the Bessel function of the first kind $J_\nu(x)$.

See: https://dlmf.nist.gov/10.58

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJZero(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselJZero(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.4.6 Boost: Zeros $b_{n,m}$ of the spherical Bessel function of the second kind: $y_n(b_{n,m}) = 0$

`ctx.sph_bessel_yn_zero(`*n*, *m*`)`

where `ctx` is `math53` or `ctxboost`.

For positive integers n and m, returns $b_{n,m}$, the m-th positive zero of the spherical Bessel function of the second kind $y_n(x)$.

Returns the zero of the spherical Bessel function of the second kind. See also Wikipedia [1253], MathWorld [952], NIST [443], BoostMath [119], Mpmath [643].

The function is calculated as $b_{n,m} = y_{n+\frac{1}{2},m}$, where $y_{\nu,m}$ is the m-th positive zero of the Bessel function of the first kind $Y_\nu(x)$.

See https://dlmf.nist.gov/10.58

An example in Python

```

ereal('5.2359877559829887307E-1')
>>> ereal.BesselJZero(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5 Modified spherical Bessel functions

10.5.1 Modified spherical Bessel function of the first kind, $i_n(x)$

`ctx.sph_bessel_in(n, x, scaled=False)`

Returns $i_n(x)$, the modified spherical Bessel function of the first kind.

If *scaled* is *True*, then $i_n(x) \cdot \exp(-|\Re(x)|)$ is returned.

See also Wikipedia [1317], MathWorld [944], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.3).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined as $i_n(x) = \sqrt{\frac{1}{2}\pi/x} I_{n+\frac{1}{2}}(x)$, where $I_n(x)$ is a modified Bessel function of the first kind.

In XlCalcNet, the definition $i_n(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}} I_{n+\frac{1}{2}}(x)$ is used instead, which gives identical results for $\Re(x) \geq 0$, but differs from the "traditional version" along the branch cut of the square root function. This ensures that results for real input and complex input with zero imaginary part are the same.

It also ensures that the general definition for complex n and complex x agrees with the results from the following two Rayleigh-type formulas:

$i_n(x) = x^n \left(\frac{1}{x}\frac{d}{dx}\right)^n \frac{\sinh(x)}{x}$ for integer $n \geq 0$ and real or complex $x \neq 0$. Given $i_0(x)$ and $i_1(x)$, this Rayleigh-type formula can also be computed recursively as $i_n(x) = \frac{2n-1}{x} i_{n-1}(x) - i_{n-2}(x)$ for $n \geq 2$.

$i_{-n-1}(x) = x^n \left(\frac{1}{x}\frac{d}{dx}\right)^n \frac{\cosh(x)}{x}$ for integer $n \geq 0$ and real or complex $x \neq 0$. Given $i_0(x)$ and $i_1(x)$, this Rayleigh-type formula can also be computed recursively as $i_n(x) = \frac{2n+3}{x} i_{n+1}(x) - i_{n+2}(x)$ for $n \leq -1$.

With $i_0(0) = 1$, $i_n(0) = \text{NaN}$ for even $n \neq 0$, $i_n(0) = -\infty$ for odd n, $i_n(-\infty) = i_n(\infty) = 0$, we have the following explicit versions of the Rayleigh-type formulas for $x \neq 0$ and $n = -3, -2, -1, 0, 1, 2$:

$$i_{-3}(x) = \frac{(3+x^2)\cosh x}{x^3} - \frac{3\sinh x}{x^2},$$

$$i_{-2}(x) = -\frac{\cosh x}{x^2} + \frac{\sinh x}{x},$$

$$i_{-1}(x) = \frac{\cosh x}{x},$$

$$i_0(x) = \frac{\sinh x}{x},$$

$$i_1(x) = -\frac{\sinh x}{x^2} + \frac{\cosh x}{x},$$

$$i_2(x) = \frac{(3+x^2)\sinh x}{x^3} - \frac{3\cosh x}{x^2}.$$

We also have $i_n(-x) = (-1)^n i_n(x)$ for $x > 0$. Therefore we can calculate $i_n(x)$ for any $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ without resorting to complex functions, using the general definition with $n \geq 0$, always obtaining a real result.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselin(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.SphBesselin(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5.2 Modified Spherical Bessel function of the second kind, $k_n(x)$

`ctx.sph_bessel_kn`(*n*, *x*, *scaled=False*)

Returns $k_n(x)$, the modified spherical Bessel function of the second kind.

If *scaled* is *True*, then $k_n(x) \cdot \exp(x)$ is returned.

See also Wikipedia [1317], MathWorld [945], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.5).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined as $k_n(x) = \sqrt{\frac{1}{2}\pi/x} K_{n+\frac{1}{2}}(x)$, where $K_n(x)$ is a modified Bessel function of the first kind.

In XlCalcNet, the definition $k_n(x) = \sqrt{\frac{1}{2}\pi} \frac{1}{\sqrt{x}} K_{n+\frac{1}{2}}(x)$ is used instead, which gives identical results for $\Re(x) \geq 0$, but differs from the "traditional version" along the branch cut of the square root function. This ensures that results for real input and complex input with zero imaginary part are the same.

It also ensures that the general definition for complex n and complex x agrees with the results from the following Rayleigh-type formula:

$k_n(x) = \frac{\pi}{2}(-x)^n \left(\frac{1}{x}\frac{d}{dx}\right)^n \frac{e^{-x}}{x}$ for integer $n \geq 0$ and real or complex $x \neq 0$. Given $k_0(x)$ and $k_1(x)$, this Rayleigh-type formula can also be computed recursively as $k_n(x) = \frac{2n-1}{x} k_{n-1}(x) - k_{n-2}(x)$ for $n \geq 2$.

With $k_n(0) = \text{NaN}$ for even n, $k_n(0) = +\infty$ for odd n, $k_n(-\infty) = -\infty$, $k_n(+\infty) = 0$, we have the following explicit versions of the Rayleigh-type formula for $x \neq 0$ and $n = 0, 1, 2$:

$$k_0(x) = \frac{\pi}{2}\frac{1}{x}e^{-x},$$

$$k_1(x) = \frac{\pi}{2}\left(\frac{1}{x^2} + \frac{1}{x}\right)e^{-x},$$

$$k_2(x) = \frac{\pi}{2}\left(\frac{3}{x^3} + \frac{3}{x^2} + \frac{1}{x}\right)e^{-x}.$$

We also have $k_{-n}(x) = k_n(x)$ for $n > 0$ and $k_n(-x) = \frac{\pi}{2}(i_n(x) - i_{-n-1}(x))$ for $x > 0$. Therefore we can calculate $k_n(x)$ for any $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ without resorting to complex functions, using the general definition with $n \geq 0$, always obtaining a real result.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselkn(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.SphBesselkn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5.3 First derivative of the modified spherical Bessel function of the first kind, $i_n'(x)$

`ctx.sph_bessel_in_prime`(*n*, *x*, *scaled=False*)

Returns $i_n'(x)$, the first derivative (with respect to x) of $i_n(x)$, the modified spherical Bessel function of the first kind.

If *scaled* is *True*, then $i_n'(x) \cdot \exp(-|\Re(x)|)$ is returned.

See also Wikipedia [1317], MathWorld [944], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.3).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

In all cases, the function is calculated as

$i_n'(x) = \dfrac{n i_{n-1}(x) - (n+1) i_{n+1}(x)}{2n+1}$ for $|2n+1| > 0.1$ and $i_n'(x) = i_{n-1}(x) - \dfrac{n+1}{x} i_n(x)$ otherwise.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function is real-valued with $i_1'(0) = 1/3$, $i_n'(0) = 0$ for $n \geq 0$ and $n \neq 1$, $i'_{-n}(0) = -\infty$ for odd $n > 0$ and $i'_{-n}(0) =$ NaN for even $n > 0$. We also have $i_n(-\infty) = 0$ and $y_n(\infty) = 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselin(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesselin(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5.4 First derivative of the modified spherical Bessel function of the second kind, $k_n'(x)$

`ctx.sph_bessel_kn_prime`(*n*, *x*, *scaled=False*)

Returns $k_n'(x)$, the first derivative (with respect to x) of $k_n(x)$, the modified spherical Bessel function of the second kind.

If *scaled* is *True*, then $K_\nu(x) \cdot \exp(x)$ is returned.

See also Wikipedia [1317], MathWorld [945], NIST [448], BoostMath [128], Ehrhardt [297] (3.1.6.5).

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

In all cases, the function is calculated as

$k_n'(x) = \dfrac{nk_{n-1}(x) - (n+1)k_{n+1}(x)}{2n+1}$ for $|2n+1| > 0.1$ and $k_n'(x) = k_{n-1}(x) - \dfrac{n+1}{x}k_n(x)$ otherwise.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function is real-valued with $k_n'(0) = -\infty$ for even $n > 0$ and odd $n < 0$ and $k_n'(0) = \text{NaN}$ for odd $n > 0$ and even $n < 0$. We also have $k_n(-\infty) = 0$ and $y_n(\infty) = 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SphBesselkn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SphBesselkn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5.5 Bessel polynomials $y_n(x)$

`ctx.besselpoly(n, x)`

Returns $y_n(x)$, the Bessel polynomial of order n.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function can be defined in terms of the modified spherical Bessel function of the second kind, $k_n(x)$:

$$y_n(x) = 2\pi^{-1}x^{-1}e^{1/x}k_n\left(x^{-1}\right), \quad n \geq 0,$$

and $y_{-n}(x) = y_{n-1}(x)$ for negative order.

The Bessel polynomial may also be defined by a recursion formula:

$$\begin{aligned} y_0(x) &= 1 \\ y_1(x) &= x + 1 \\ y_n(x) &= (2n-1)xy_{n-1}(x) + y_{n-2}(x). \end{aligned} \tag{10.1}$$

The function can be generalized to arbitrary complex n and x by expressing it in terms of Tricomi's confluent hypergeometric function, $U(a, b; x)$:

$$y_n(x) = 2^{n+1}\left(\frac{1}{x}\right)^{n+1} U\left(n+1, 2n+2; \frac{2}{x}\right), x \neq 0$$

and the limit (if it exists) for $x = 0$.

See also Ehrhardt [297] (3.7.19).

See also: https://en.wikipedia.org/wiki/Bessel_polynomials

See also: https://mathworld.wolfram.com/BesselPolynomial.html

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselPoly(4, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselPoly(4, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.5.6 Reverse Bessel polynomials $\theta_n(x)$

`ctx.besseltheta(n, x)`

Returns $\theta_n(x)$, the reverse Bessel polynomial of order n.

For $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ the function can be defined in terms of the modified spherical Bessel function of the second kind, $k_n(x)$:

$$\theta_n(x) = 2\pi^{-1}x^{n+1}e^x k_n(x), \quad n \geq 0,$$

and $\theta_{-n}(x) = x^{-n}y_{n-1}(1/x)$ for negative order, where $y_n(x)$ is the Bessel polynomial.

The reverse Bessel polynomial may also be defined by a recursion formula:

$$\begin{aligned} \theta_0(x) &= 1 \\ \theta_1(x) &= x + 1 \\ \theta_n(x) &= (2n-1)\theta_{n-1}(x) + x^2\theta_{n-2}(x). \end{aligned} \tag{10.2}$$

The function can be generalized to arbitrary complex n and x by expressing it in terms of Tricomi's confluent hypergeometric function, $U(a, b; x)$:

$$\theta_n(x) = 2^{n+1}x^{2n+1}U\left(n+1, 2n+2, 2x\right), x \neq 0$$

and the limit (if it exists) for $x = 0$.

ereal('5.2359877559829887307E-1')
>>> ereal.BesselPoly(4, '0.51')
ereal('5.351847902755998475 4E-1')
```

10.6 Hankel functions

10.6.1 Hankel function of the first kind $H_\nu^{(1)}(x)$

ctx.**hankel_h1**(*nu*, *x*, *scaled=False*)

where ctx is math53 or ctxboost.

Returns the Hankel function of the first kind, defined as $H_\nu^{(1)}(x) = J_\nu(x) + iY_\nu(x)$.

If *scaled* is *True*, then $H_\nu^{(1)e}(x) = H_\nu^{(1)}(x) \cdot \exp(-ix)$ is returned, except for a real ctx where just $H_\nu^{(1)}(x)$ is returned.

If ctx is math53, ctxboost or ctxflintreal, then $\nu, x \in \mathbb{R}$ is exspected. If ctx is cmath53, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If ctx is ctxflintcplx then $\nu, x \in \mathbb{C}$ is accepted.

See also Wikipedia [1308], MathWorld [942], NIST [444], BoostMath [115], Mpmath [631].

```
>>> from xlcalcnet import ecplx
>>> ecplx.HankelH1(10.5, 6.3)

10.6.3 Spherical Hankel function of the first kind, $h_\nu^{(1)}(x)$

`ctx.`**sph_hankel_h1**(*n*, *x*, *scaled=False*)

where `ctx` is `math53` or `ctxboost`.

Returns the spherical Hankel function of the first kind, defined as $h_n^{(1)}(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}}H_\nu^{(1)}(x) = j_\nu(x) + iy_\nu(x)$.

If *scaled* is *True*, then $h_n^{(1)e}(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}}H_\nu^{(1)e}(x)$ is returned.

See also Wikipedia [1318], MathWorld [948], NIST [449], BoostMath [129].

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

```

10.6.4 Spherical Hankel function of the second kind, $h_\nu^{(2)}(x)$

`ctx.sph_hankel_h2`(*n*, *x*, *scaled=False*)

where `ctx` is `math53` or `ctxboost`.

Returns the spherical Hankel function of the first kind, defined as $h_n^{(2)}(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}}H_\nu^{(2)}(x) = j_\nu(x) - iy_\nu(x)$.

If *scaled* is *True*, then $h_n^{(2)e}(x) = \sqrt{\frac{1}{2}\pi}\frac{1}{\sqrt{x}}H_\nu^{(2)e}(x)$ is returned.

See also Wikipedia [1318], MathWorld [948], NIST [449], BoostMath [129].

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, `ctxboost` or `ctxflintreal`, then $n \in \mathbb{Z}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflintcplx` then $n, x \in \mathbb{C}$ is accepted.

```

10.7 Airy functions

10.7.1 Airy function $\mathrm{Ai}(x)$

`ctx.airy_ai`(*x*, *scaled=False*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the Airy function $\mathrm{Ai}(x)$, with $x \in \mathbb{C}$.

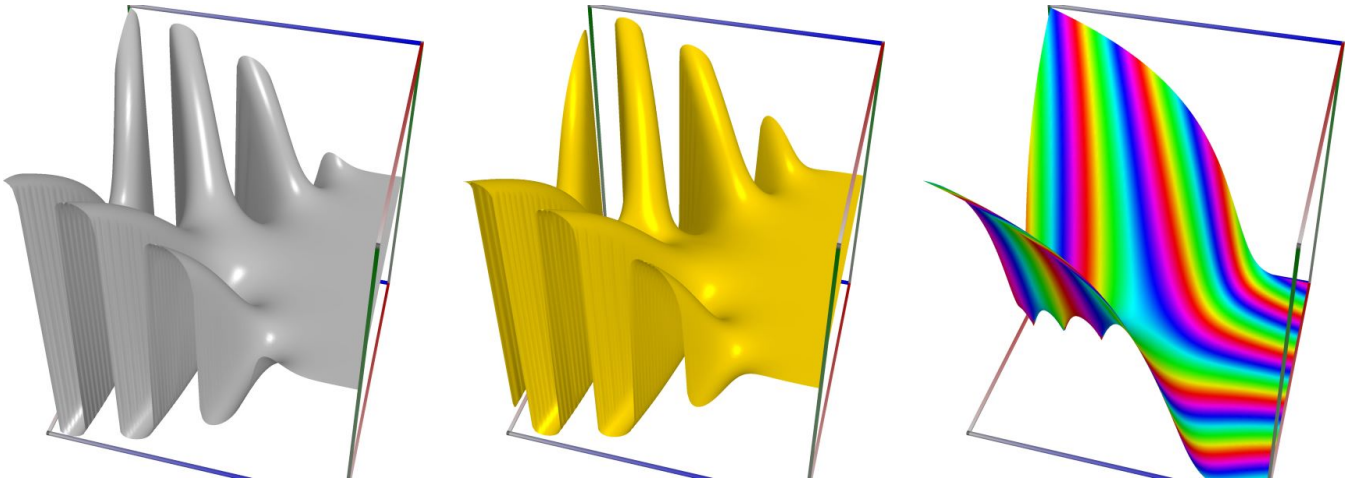
If *scaled* is *True*, then $\mathrm{Ai}(x)\exp(\sqrt{x} \cdot 2x/3)$ is returned, except for a real `ctx` with $x \le 0$ where just $\mathrm{Ai}(x)$ is returned.

See also Wikipedia [1297], MathWorld [941], MathWorld [262], NIST [434], BoostMath [112], Ehrhardt [297] (3.1.7.1), Mpmath [623].

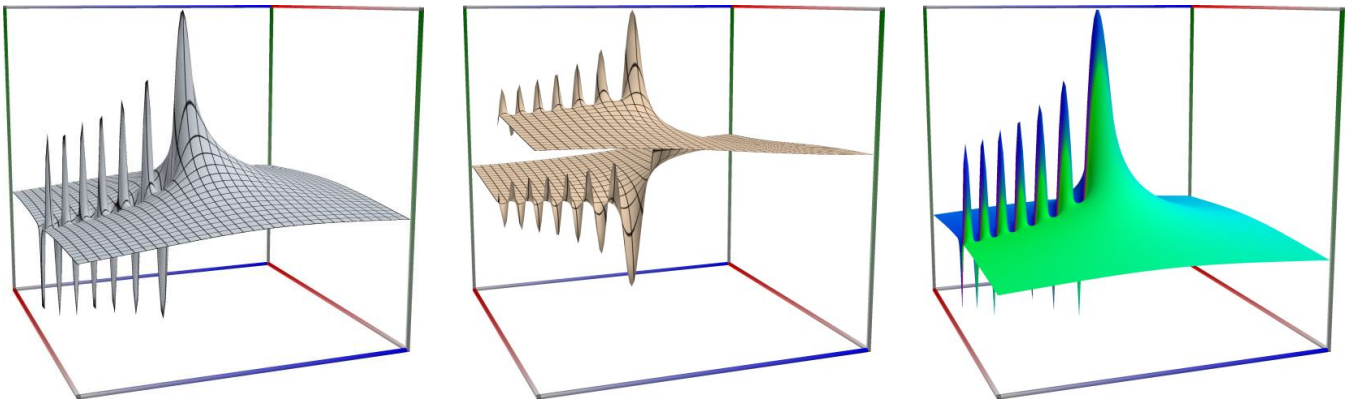
The function $\mathrm{Ai}(x)$ can be defined as

$$\mathrm{Ai}(x) = \frac{1}{3^{2/3}\Gamma(2/3)}{}_0F_1\left(\frac{2}{3}, \frac{x^3}{9}\right) - \frac{x}{3^{1/3}\Gamma(1/3)}{}_0F_1\left(\frac{4}{3}, \frac{x^3}{9}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = \mathrm{Ai}(x + iy)$ $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryAi(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryAi('0.51')
ereal('5.3518479027559984754E-1')
```

10.7.2 Airy function $\mathrm{Bi}(x)$

`ctx.airy_bi`(*x*, *scaled=False*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the Airy function $\mathrm{Bi}(x)$, with $x \in \mathbb{C}$.

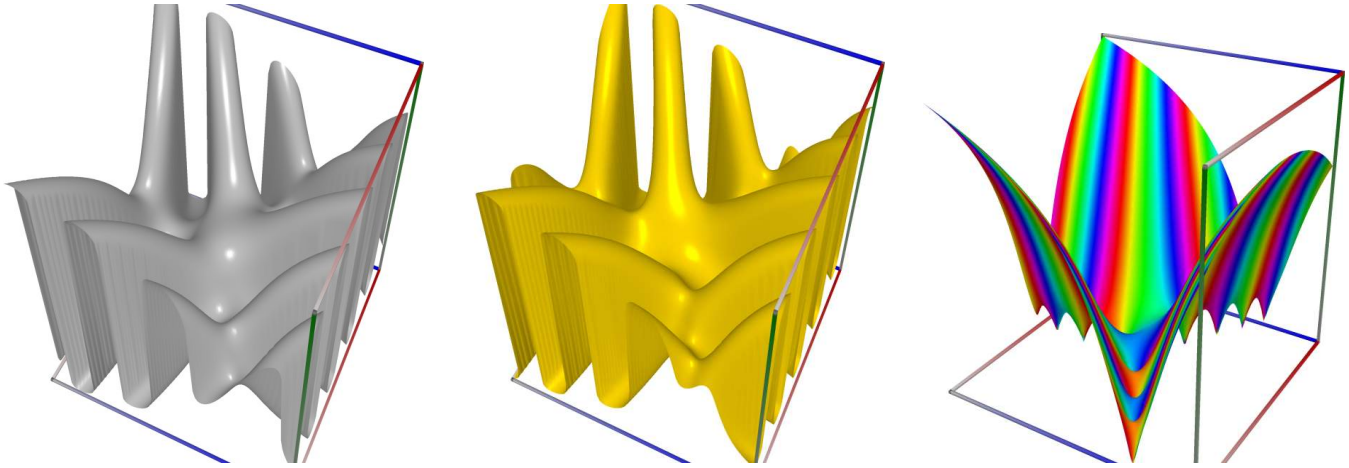
If *scaled* is *True*, then $\mathrm{Bi}(x)\exp(-|\Re(\sqrt{x}\cdot 2x/3)|)$ is returned, except for a real `ctx` with $x \le 0$ where just $\mathrm{Bi}(x)$ is returned.

See also Wikipedia [1297], MathWorld [941], MathWorld [264], NIST [434], BoostMath [113], Ehrhardt [297] (3.1.7.2), Mpmath [624].

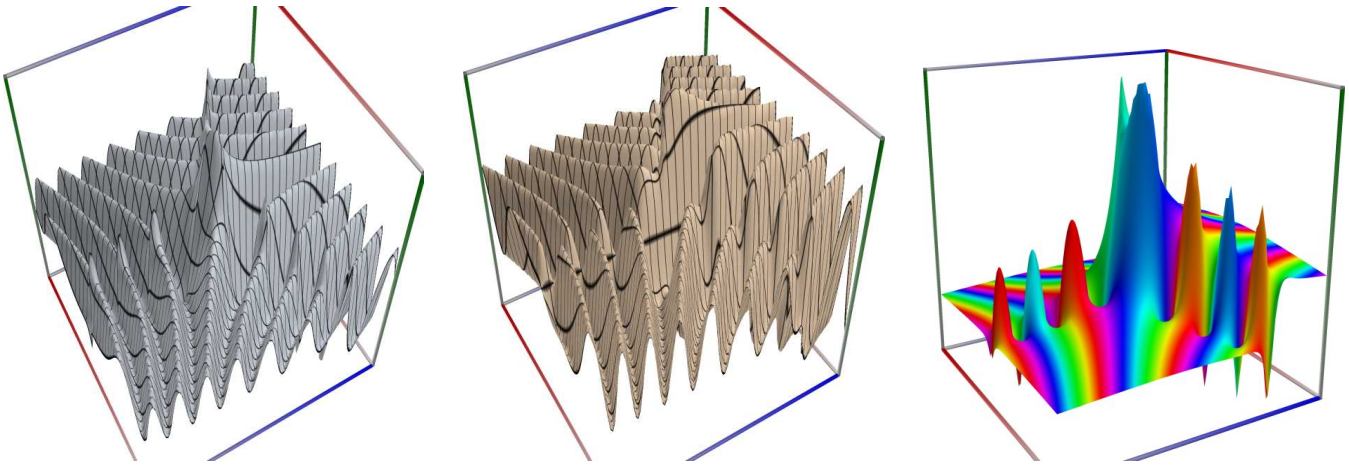
The function $\mathrm{Bi}(x)$ can be defined as

$$\mathrm{Bi}(x) = \frac{1}{3^{1/6}\Gamma(2/3)}{}_0F_1\left(\frac{2}{3}, \frac{x^3}{9}\right) + \frac{3^{1/6}x}{\Gamma(1/3)}{}_0F_1\left(\frac{4}{3}, \frac{x^3}{9}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = \mathrm{Bi}(x+iy)$ with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.



The corresponding scaled function looks like this:



An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryBi(0.5)
```

(continues on next page)

(continued from previous page)

```
ereal('5.2359877559829887307E-1')
>>> ereal.AiryBi('0.51')
ereal('5.3518479027559984754E-1')
```

10.7.3 First derivative of the Airy function Ai, $\mathrm{Ai}'(x)$

`ctx.airy_ai_prime`(*x*, *scaled=False*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $\mathrm{Ai}'(x)$, the first derivative (with respect to x) of the Airy function $\mathrm{Ai}(x)$, with $x \in \mathbb{C}$.

If *scaled* is *True*, then $\mathrm{Ai}'(x)\exp(\sqrt{x}\cdot 2x/3)$ is returned, except for a real `ctx` with $x \le 0$ where just $\mathrm{Ai}'(x)$ is returned.

See also Wikipedia [1297], MathWorld [941], MathWorld [263], NIST [434], BoostMath [132], Ehrhardt [297] (3.1.7.3).

The function $\mathrm{Ai}'(x)$ can be defined as

$$\mathrm{Ai}'(x) = \frac{x^2}{2\cdot 3^{2/3}\Gamma(2/3)}{}_0F_1\left(\frac{5}{3}, \frac{x^3}{9}\right) - \frac{1}{3^{1/3}\Gamma(1/3)}{}_0F_1\left(\frac{1}{3}, \frac{x^3}{9}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = \mathrm{Ai}'(x+iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryAiPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryAiPrime('0.51')
ereal('5.3518479027559984754E-1')
```

10.7.4 First derivative of the Airy function Bi, $\mathrm{Bi}'(x)$

`ctx.airy_bi_prime`(*x*, *scaled=False*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $\mathrm{Bi}'(x)$, the first derivative (with respect to x) of the Airy function $\mathrm{Bi}(x)$, with $x \in \mathbb{C}$.

If *scaled* is *True*, then $\mathrm{Bi}'(x)\exp(-|\Re(\sqrt{x}\cdot 2x/3)|)$ is returned, except for a real `ctx` with $x \le 0$ where just $\mathrm{Bi}'(x)$ is returned.

See also Wikipedia [1297], MathWorld [941], MathWorld [265], NIST [434], BoostMath [133], Ehrhardt [297] (3.1.7.4) and (3.1.7.6).

The function can be defined as

$$\mathrm{Bi}'(x) = \frac{x^2}{2\cdot 3^{1/6}\Gamma(2/3)}{}_0F_1\left(\frac{5}{3}, \frac{x^3}{9}\right) + \frac{3^{1/6}}{\Gamma(1/3)}{}_0F_1\left(\frac{1}{3}, \frac{x^3}{9}\right).$$

The *wpf figures* below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = \mathrm{Bi}'(x+iy)$ with $\nu = 0$ and $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryAiPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryAiPrime('0.51')
ereal('5.3518479027559984754E-1')
```

10.7.5 Real zeros a_k of the Airy function Ai, $\mathrm{Ai}(a_k) = 0$

`ctx.airy_ai_zero(`k`)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the k-th zero of the Airy Ai-function. See also MathWorld [949], NIST [434], BoostMath [113], BoostMath [133], Mpmath [640].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryAiZero(5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryAiZero(17)
ereal('5.3518479027559984754E-1')
```

10.7.6 Real zeros b_k of the Airy function Bi, $\mathrm{Bi}(b_k) = 0$

`ctx.airy_bi_zero(k)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the k-th zero of the Airy Bi-function. See also Wikipedia [1297], NIST [434], MathWorld [950], BoostMath [140], Mpmath [641].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryBiZero(5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryBiZero(17)
ereal('5.3518479027559984754E-1')
```

10.8 Kelvin functions

10.8.1 Kelvin function $\mathrm{ber}(\nu, x)$

`ctx.kelvin_ber`(*nu*, *z*, *scaled=False*)

Returns the Kelvin function $\mathrm{ber}(\nu, x)$.

If *scaled* is *True*, then $\mathrm{ber}(\nu, x) \cdot \exp(-|x|/\sqrt{2})$ is returned.

See also Wikipedia [1383], MathWorld [1024], NIST [445], Mpmath [710].

Here ν and x are, in general, complex numbers. However, if `ctx` is `math53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined for $\nu \in \mathbb{R}$ and real $x \geq 0$ as the real part of the Bessel J function of a rotated argument:

$$\mathrm{ber}(\nu, x) = \Re\Big(J_\nu\big(xe^{3\pi i/4}\big)\Big).$$

In XlCalcNet this is generalized to complex ν and x following the definition given in Maple [369] as

$$\mathrm{ber}(\nu, x) = \frac{J_\nu(x(-a+ia)) + J_\nu(x(-a-ia))}{2}, \quad \text{where } a = \tfrac{1}{2}\sqrt{2},$$

which is equivalent to the traditional definition for $\nu \in \mathbb{R}$ and real $x \geq 0$.

Note that this differs from Mpmath, which uses the conventions of Mathematica.

The Kelvin functions are all real valued for real x and positive ν.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinber(n, x); mx = mpm.kelvinber(n, x); gx = gmp.kelvinber(n, x)
>>> fx = fpm.kelvinber(n, x); ax = apm.kelvinber(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: -2.213802495986938888682464345899509922321E-1
mpm: -2.213802495986938888682464345899509922321e-1
gmp: -2.213802495986938888682464345899509922321E-01
fpm: -2.21380249598694E-01
apm: -2.213802495986938888682464345899509922332e-1 (-1.283e-37%)
```

An example with complex input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; z = '3 + 4j'
>>> \mathrm{d}z = dec.kelvinber(n, z); mz = mpm.kelvinber(n, z); gz = gmp.kelvinber(n, z)
>>> fz = fpm.kelvinber(n, z); az = apm.kelvinber(n, z)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az],  aligned=True)
dec: 1.033616210179297429 4E+1              + 7.766768913222125917 1E+0j
mpm: 1.033616210179297429 4e+1              + 7.766768913222125917 1e+0j

fpm: 1.03361621017930E+01                   + 7.76676891322213E+00j
apm: 1.033616210179297429 4e+1 (2.032e-18%) + 7.766768913222125917 1e+0 (2.225e-18%)j
```

10.8.2 Kelvin function $\mathrm{bei}(\nu, x)$

`ctx.kelvin_bei`(*nu*, *z*, *scaled=False*)

Returns the Kelvin function $\mathrm{bei}(\nu, x)$.

If *scaled* is *True*, then $\mathrm{bei}(\nu, x) \cdot \exp(-|x|/\sqrt{2})$ is returned.

See also Wikipedia [1382], MathWorld [1023], NIST [445], Mpmath [709].

Here ν and x are, in general, complex numbers. However, if `ctx` is `math53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined for $\nu \in \mathbb{R}$ and real $x \geq 0$ as the imaginary part of the Bessel J function of a rotated argument:

$$\mathrm{bei}(\nu, x) = \Im\Big(J_\nu\big(xe^{3\pi i/4}\big)\Big).$$

In XlCalcNet this is generalized to complex ν and x following the definition given in Maple [369] as

$$\mathrm{bei}(\nu, x) = \frac{J_\nu(x(-a+ia)) - J_\nu(x(-a-ia))}{2}, \quad \text{where } a = \tfrac{1}{2i}\sqrt{2},$$

which is equivalent to the traditional definition for $\nu \in \mathbb{R}$ and real $x \geq 0$.

Note that this differs from Mpmath, which uses the conventions of Mathematica.

The Kelvin functions are all real valued for real x and positive ν.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinbei(n, x); mx = mpm.kelvinbei(n, x); gx = gmp.kelvinbei(n, x)
>>> fx = fpm.kelvinbei(n, x); ax = apm.kelvinbei(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: 1.937586785266042766896808122272260201255E+0

10.8.3 Kelvin function $\ker(\nu, x)$

`ctx.kelvin_ker`(*nu*, *z*, *scaled=False*)

Returns the Kelvin function $\ker(\nu, x)$.

If *scaled* is *True*, then $\mathrm{bei}(\nu, x) \cdot \exp(|x|/\sqrt{2})$ is returned.

See also Wikipedia [1385], MathWorld [1026], NIST [445], Mpmath [712].

Here ν and x are, in general, complex numbers. However, if `ctx` is `math53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined for $\nu \in \mathbb{R}$ and real $x \geq 0$ as the real part of the Bessel K function of a rotated argument:

$$\ker(\nu, x) = \Re\left(e^{-\pi i/2} K_n\left(x e^{3\pi i/4}\right)\right).$$

In XlCalcNet this is generalized to complex ν and x following the definition given in Maple [369] as

$$\ker(\nu, x) = \frac{e^{-i\nu\pi/2} K_\nu(x(a+ia)) + e^{i\nu\pi/2} K_\nu(x(a-ia))}{2}, \quad \text{where } a = \tfrac{1}{2}\sqrt{2},$$

which is equivalent to the traditional definition for $\nu \in \mathbb{R}$ and real $x \geq 0$.

Note that this differs from Mpmath, which uses the conventions of Mathematica.

The Kelvin functions are all real valued for real x and positive ν.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinker(n, x); mx = mpm.kelvinker(n, x); gx = gmp.kelvinker(n, x)
>>> fx = fpm.kelvinker(n, x); ax = apm.kelvinker(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)

```

10.8.4 Kelvin function $\mathrm{kei}(\nu, x)$

`ctx.kelvin_kei`(*nu*, *z*, *scaled=False*)

Returns the Kelvin function $\mathrm{kei}(\nu, x)$.

If *scaled* is *True*, then $\mathrm{kei}(\nu, x) \cdot \exp(|x|/\sqrt{2})$ is returned.

See also Wikipedia [1384], MathWorld [1025], NIST [445], Mpmath [711].

Here ν and x are, in general, complex numbers. However, if `ctx` is `math53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

This function is traditionally defined for $\nu \in \mathbb{R}$ and real $x \geq 0$ as the imaginary part of the Bessel K function of a rotated argument:

$$\mathrm{kei}(\nu, x) = \Im\left(e^{-\pi i/2} K_n\left(x e^{3\pi i/4}\right)\right).$$

In XlCalcNet this is generalized to complex ν and x following the definition given in Maple [369] as

$$\mathrm{kei}(\nu, x) = \frac{e^{-i\nu\pi/2} K_\nu(x(a+ia)) - e^{i\nu\pi/2} K_\nu(x(a-ia))}{2i}, \quad \text{where } a = \tfrac{1}{2}\sqrt{2}.$$

which is equivalent to the traditional definition for $\nu \in \mathbb{R}$ and real $x \geq 0$.

Note that this differs from Mpmath, which uses the conventions of Mathematica.

The Kelvin functions are all real valued for real x and positive ν.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm

10.8.5 First derivative of the Kelvin function $\mathrm{ber}(\nu, x)$, $\mathrm{ber}'(\nu, x)$

`ctx.kelvin_ber_prime`(*nu*, *z*, *scaled=False*)

Returns $\mathrm{ber}'(\nu, x)$, the first derivative (with respect to x) of the Kelvin function $\mathrm{ber}(\nu, x)$.

If *scaled* is *True*, then $\mathrm{ber}(\nu, x) \cdot \exp(-|x|/\sqrt{2})$ is returned.

See also Wikipedia [1383], MathWorld [1024], NIST [445], Mpmath [710].

Here ν and x are, in general, complex numbers. However, if `ctx` is `math53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $\nu \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

The function is calculated as

$$\mathrm{ber}'(\nu, x) = \frac{a_1 J'_\nu(x \cdot a_1) + a_2 J'_\nu(x \cdot a_2)}{2},$$

where $a = \frac{1}{2}\sqrt{2}$, $a_1 = -a + ia$, $a_2 = -a - ia$, and $J'_\nu(x)$ is the first derivative (with respect to x) of the Bessel function $J_\nu(x)$.

The Kelvin functions are all real valued for real x and positive ν.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinber(n, x); mx = mpm.kelvinber(n, x); gx = gmp.kelvinber(n, x)

CHAPTER

ELEVEN

HYPERGEOMETRIC FUNCTION ${}_1F_1$ AND RELATED

Text explaining this chapter

The source code for the C# tests in Visual Studio is divided by real and complex modules:

The source code for the C# tests in Visual Studio using real modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B11a_RealHypergeometric_1F1.cs,

The source code for the C# tests in Visual Studio using complex modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B11b_CplxHypergeometric_1F1.cs,

11.1 Hypergeometric Functions ${}_1F_1$ (Kummer) and U (Tricomi)

11.1.1 Kummer's Confluent Hypergeometric Function ${}_1F_1(a, b; x)$

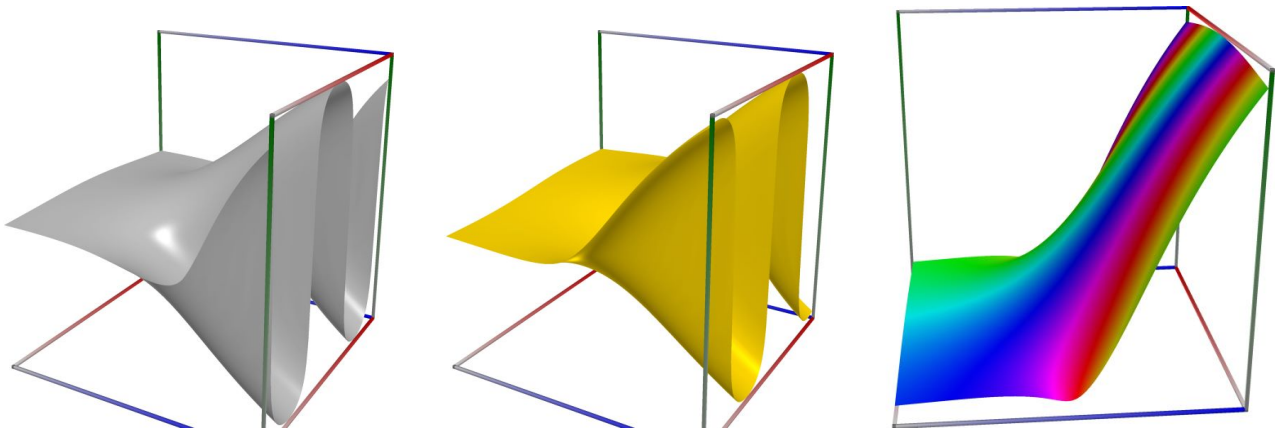
`ctx.hyperg_1f1`(a, b, x)

Returns ${}_1F_1(a, b; x)$, the confluent hypergeometric function of the first kind, where $b \neq 0, -1, -2, \ldots$.

See also Wikipedia [1257], MathWorld [901], NIST [193], BoostMath [103], Ehrhardt [297] (3.8.3), Abramowitz and Stegun. [2], Flint [759], Flint [752], Mpmath [593].

Here a, b and x are, in general, complex numbers. However, if `ctx` is `math53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $a, b, x \in \mathbb{C}$ is accepted.

The function is defined as ${}_1F_1(a, b; x) = \sum_{k=0}^{\infty} \frac{(a)_k}{(b)_k} \frac{z^k}{k!}$.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hyperg1F1(4,5,0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Hyperg1F1(14,15,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = 11.0; b = 12.0; x = 3.0
>>> \mathrm{d}x = dec.hyp1f1(a, b, x); mx = mpm.hyp1f1(a, b, x); gx = gmp.hyp1f1(a, b, x)
>>> fx = fpm.hyp1f1(a, b, x); ax = apm.hyp1f1(a, b, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  1.6016380797644591021426991674784163061 25E+1

fpm: -1.70714758928555E+01                   - 6.52507023922808E+00j
apm: -1.7071475892855456616e+1 (-1.588e-19%) - 6.5250702392280765696e+0 (-5.192e-20%)j
```

11.1.2 Regularized Kummer Confluent Hypergeometric Function, ${}_1\widetilde{F}_1(a,b;x)$

`ctx.hyperg_1f1r(`a, b, x`)`

Returns ${}_1\widetilde{F}_1(a,b;z)$, the regularized Kummer confluent hypergeometric function.

See also Wikipedia [1257], MathWorld [260], NIST [193], BoostMath [103], Ehrhardt [297] (3.8.4), Abramowitz and Stegun. [2], Flint [759], Flint [752], Mpmath [593].

Here a, b and x are, in general, complex numbers. However, if `ctx` is `math53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $a, b, x \in \mathbb{C}$ is accepted.

We have ${}_1\widetilde{F}_1(a,b;z) = \dfrac{1}{\Gamma(b)}{}_1F_1(a;b;z) = \mathbf{M}(a,b;x) = \dfrac{1}{\Gamma(b)}M(a;b;z)$, for $b \neq 0, -1, -2, \cdots$.

If $b = 0, -1, -2, \cdots = -n$, the corresponding limit ${}_1\widetilde{F}_1(a,b;x) = \dfrac{(a)_{n+1}}{(n+1)!}x^{n+1}{}_1F_1(a+n+1, n+2; x)$ is calculated.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hyperg1F1r(4,5,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Hyperg1F1r(14,15,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = 11.0; b = 12.0; x = 3.0
>>> \mathrm{d}x = dec.hyp1f1r(a, b, x); mx = mpm.hyp1f1r(a, b, x); gx = gmp.hyp1f1r(a, b, x)
>>> fx = fpm.hyp1f1r(a, b, x); ax = apm.hyp1f1r(a, b, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

11.1.3 Tricomi's Confluent Hypergeometric Function, $U(a,b;x)$

`ctx.hyperg_u`(a, b, x)

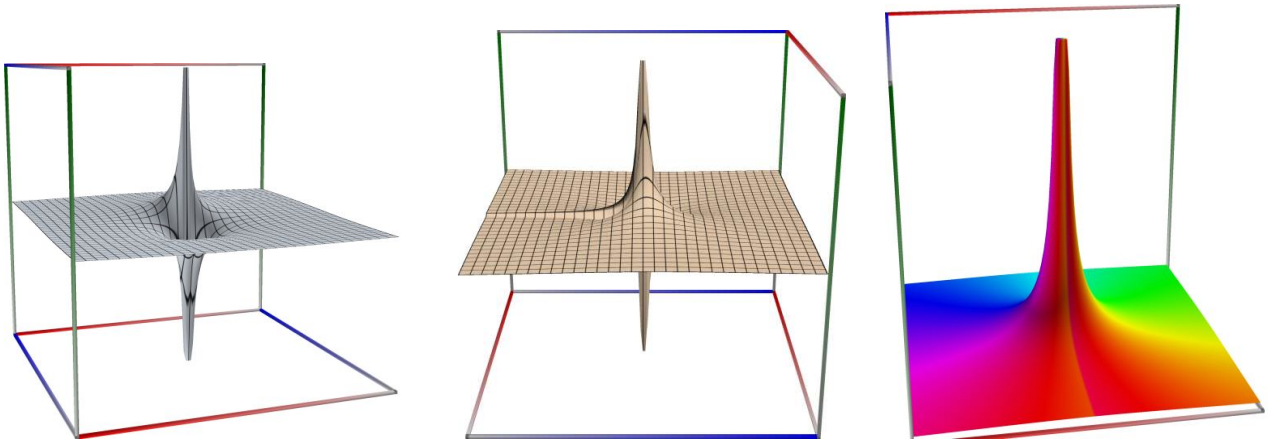
Returns Tricomi's confluent hypergeometric function of the second kind, $U(a,b;x)$.

See also Wikipedia [1257], MathWorld [902], NIST [193], Ehrhardt [297] (3.8.5), Flint [759], Flint [752], Mpmath [595].

Here a, b and x are, in general, complex numbers. However, if `ctx` is `math53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $a, b \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $a, b, x \in \mathbb{C}$ is accepted.

For all $z \neq 0$ and $b \notin \mathbb{Z}$ (but valid for all b as a limit) we have

$$U(a,b;x) = \frac{\Gamma(1-b)}{\Gamma(1+a-b)} M(a,b;c;z) + \frac{\Gamma(1-b)}{\Gamma(a)} x^{1-b} M(1+a-b, 2-b; x)$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x+iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.HypergU(4,5.1,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.HypergU(14,15.2,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = 11.0; b = 12.0; x = 3.0
>>> \mathrm{d}x = dec.hyperu(a, b, x); mx = mpm.hyperu(a, b, x); gx = gmp.hyperu(a, b, x)

```

11.1.4 Generalized Laguerre polynomials, $L_n^{(a)}(x)$

`ctx.laguerre_l`(n, a, x)

where `ctx` is `math53` or `ctxflint`.

Note: ctx.laguerre(z, n, alpha)

Returns $L_n^{(a)}(x) = \binom{n+a}{n} M(-n, a+1, x) = \frac{\Gamma(n+a+1)}{\Gamma(n+1)\Gamma(a+1)} {}_1F_1(-n, a+1, x)$, the generalized Laguerre polynomials of degree $n \geq 0$ with parameter $a; x \geq 0$ and $a > -1$ are the standard ranges.

For integer degree $n \geq 0$ and integer order $m \geq 0$, we have, as a special case, the (associated) Laguerre polynomial $L_n^m(x) = L_n^{(m)}(x)$. If $m = 0$, it is just called Laguerre polynomial: $L_n(x) = L_n^0(x) = L_n^{(0)}(x)$

These polynomials are orthogonal on the interval $(0, \infty)$, with respect to the weight function $w(x) = e^{-x}x^a$. The following standard recurrence formulas are used:

$$\begin{aligned} L_0^{(a)}(x) &= 1 \\ L_1^{(a)}(x) &= -x + 1 + a \\ nL_n^{(a)}(x) &= (2n + a - 1 - x)L_{n-1}^{(a)}(x) - (n + a - 1)L_{n-2}^{(a)}(x). \end{aligned} \tag{11.1}$$

See also Wikipedia [1315], MathWorld [929], NIST [397], BoostMath [124], Ehrhardt [297] (3.7.10) and (3.7.12), Flint [761], Flint [757], Mpmath [636].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Laguerre(2, 3, 2, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Laguerre('6, 2, 0.51')
ereal('5.351847902755998475 4E-1')
```

11.1.5 Hermite polynomial (physicist), $H_n(x)$

`ctx.hermite_h`(n, z)

Returns $H_n(z)$, the Hermite polynomial (physicist) of degree n.

See also Wikipedia [1309], MathWorld [926], NIST [397], BoostMath [121], Ehrhardt [297] (3.7.7) and (3.8.11.4), Ehrhardt [297] Flint [761], Flint [757], Mpmath [633].

Here n and x are, in general, complex numbers. However, if `ctx` is `math53`, then $n \in \mathbb{R}$ and $x \in \mathbb{R}$ is exspected. If `ctx` is `cmath53`, then $n \in \mathbb{R}$ and $x \in \mathbb{C}$ is exspected. If `ctx` is `ctxflint` then $n, x \in \mathbb{C}$ is accepted.

We have $H_n(z) = 2^n \sqrt{\pi} \left(\frac{1}{\Gamma\left(\frac{1-n}{2}\right)} {}_1F_1\left(-\frac{n}{2}, \frac{1}{2}, z^2\right) - \frac{2z}{\Gamma\left(-\frac{n}{2}\right)} {}_1F_1\left(\frac{1-n}{2}, \frac{3}{2}, z^2\right) \right)$, where $\frac{1}{\Gamma(n)}$ is evaluated calling the reciprocal gamma function.

For integer $n \geq 0$, the H_n are orthogonal on the interval $(-\infty, \infty)$, with respect to the weight function $w(x) = e^{-x^2}$. They can be computed with the standard recurrence formulas:

$$\begin{aligned} H_0(x) &= 1 \\ H_1(x) &= 2x \\ H_n(x) &= 2xH_{n-1}(x) - 2(n-1)H_{n-2}(x). \end{aligned} \tag{11.2}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.HermiteH(2, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.HermiteH(6, 0.51)
ereal('5.351847902755998475 4E-1')
```

11.1.6 Hermite polynomials (probabilist) $\mathrm{He}_n(x)$

`ctx.hermite_he(n, x)`

Returns $\mathrm{He}_n(x) = 2^{-n/2} H_n(x/\sqrt{2})$, the probabilist's Hermite polynomial of degree $n \geq 0$.

For integer n, the He_n are orthogonal on the interval $(-\infty, \infty)$, with respect to the weight function $w(x) = \exp(-x^2/2)$. They are computed with the standard recurrence formulas:

$$\begin{aligned} \mathrm{He}_0(x) &= 1 \\ \mathrm{He}_1(x) &= x \\ \mathrm{He}_n(x) &= x\,\mathrm{He}_{n-1}(x) - (n-1)\,\mathrm{He}_{n-2}(x). \end{aligned} \tag{11.3}$$

See also Wikipedia [1309], MathWorld [926], NIST [397], BoostMath [121], Ehrhardt [297] (3.7.8), Flint [761], Flint [757], Mpmath [633].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.HermiteHe(2, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.HermiteHe(6, 0.51)
ereal('5.351847902755998475 4E-1')
```

11.2 Incomplete gamma functions

11.2.1 Lower normalized incomplete gamma function, $P(a, x)$

`ctx.gamma_p`(a, x)

where `ctx` is `math53`, `ctxboost`, `ctxflint`.

Note: ctx.incGammaP(a, x)

Returns the lower normalized incomplete gamma function $P(a,x) = \frac{1}{\Gamma(a)} \int_0^x t^{a-1} e^{-t}\,\mathrm{d}t,$ for $a \geq 0$ and $x \geq 0$.

See also Wikipedia [1225], MathWorld [857], NIST [460], BoostMath [81], Ehrhardt [297] (3.5.2.1), Flint [743], Flint [733], Mpmath [551].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.IncGammaP(3.1, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.IncGammaP(3.4, '1.51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.gamma_p(a, x); mx = mpm.gamma_p(a, x); gx = gmp.gamma_p(a, x)

```

11.2.2 Upper normalized incomplete gamma functions , $Q(a, x)$

`ctx.gamma_q`(a, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaQ(a, x)

Returns the upper normalized incomplete gamma function $Q(a,x) = \dfrac{1}{\Gamma(a)} \displaystyle\int_x^\infty t^{a-1} e^{-t}\,\mathrm{d}t,$ for $a \geq 0$ and $x \geq 0$.

See also Wikipedia [1225], MathWorld [857], NIST [460], BoostMath [81], Ehrhardt [297] (3.5.2.1), Flint [743], Flint [733], Mpmath [551].

If *regularized* is 0, computes the upper incomplete gamma function $\Gamma(s,z)$.

If *regularized* is 1, computes the regularized upper incomplete gamma function $Q(s,z) = \Gamma(s,z)/\Gamma(s)$.

If *regularized* is 2, computes the generalized exponential integral $z^{-s}\Gamma(s,z) = E_{1-s}(z)$.

The different methods respectively implement the formulas

$$\Gamma(s,z) = e^{-z} U(1-s, 1-s, z)$$

$$\Gamma(s,z) = \Gamma(s) - \frac{z^s}{s} {}_1F_1(s, s+1, -z)$$

$$\Gamma(s,z) = \Gamma(s) - \frac{z^s e^{-z}}{s} {}_1F_1(1, s+1, z)$$

$$\Gamma(s,z) = \frac{(-1)^n}{n!}(\psi(n+1) - \log(z)) + \frac{(-1)^n}{(n+1)!} z\, {}_2F_2(1,1,2,2+n,-z) - z^{-n} \sum_{k=0}^{n-1} \frac{(-z)^k}{(k-n)k!}, \quad n = -s \in \mathbb{Z}_{\geq 0}$$

and an automatic algorithm choice. The automatic version also handles other special input such as $z = 0$ and $s = 1, 2, 3$. The *singular* version evaluates the finite sum directly and therefore assumes that s is not too large.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.IncGammaQ(3.1, 1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.IncGammaQ(3.4, '1.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.gamma_q(a, x); mx = mpm.gamma_q(a, x); gx = gmp.gamma_q(a, x)

11.2.3 Lower non-normalized incomplete gamma function, $\gamma(a, x)$

`ctx.gamma_lower`(a, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.incgammaL(a, x), ctxboost.TgammaLower(a, x)

Returns the real lower non-normalized incomplete gamma function $\gamma(a, x) = \int_0^x t^{a-1} e^{-t}\, \mathrm{d}t,$ for $a \geq 0$ and $x \geq 0$.

See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Ehrhardt [297] (3.5.2.2), Flint [743], Flint [733], Mpmath [551].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.IncgammaL(3.1, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.IncgammaL(3.4, '1.51')
ereal('5.3518479027559984754E-1')
```

11.2.4 Upper non-normalized incomplete gamma function, $\Gamma(a, x)$

`ctx.gamma_upper`(a, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaU(a, x)

Returns the real upper non-normalized incomplete gamma function $\Gamma(a,x) = \int_x^\infty t^{a-1}e^{-t}\,\mathrm{d}t,$ for $a \geq 0$ and $x \geq 0$.

See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Ehrhardt [297] (3.5.2.2), Flint [743], Flint [733], Mpmath [551].

An example in Python

```

```

11.2.5 Tricomi's entire incomplete gamma function: $\gamma^*(a, x)$

`ctx.gamma_tricomi(`a, z, *len*`)`

Returns Tricomi's entire incomplete gamma function $\gamma^*(a, x)$.

See also: Flint [743], Flint [733].

This routine returns Tricomi's incomplete gamma function γ^*, defined as

$$\gamma^*(a, x) = e^{-x} \frac{M(1, a+1, x)}{\Gamma(a+1)}$$

Special cases are $\gamma^*(0, x) = 1, \gamma^*(a, 0) = 1/\Gamma(a+1)$, and $\gamma^*(-n, x) = x^n$, if $-n$ is a negative integer. Otherwise there are the following relations to the other incomplete functions:

$$\gamma^*(a, x) = \frac{x^{-a}}{\Gamma(a)} \gamma(a, x) = x^{-a} P(a, x).$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.gamma_tricomi(a, x); mx = mpm.gamma_tricomi(a, x); gx = gmp.gamma_tricomi(a, x)
>>> fx = fpm.gamma_tricomi(a, x); ax = apm.gamma_tricomi(a, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

11.2.6 Derivative of the incomplete gamma function

`ctx.gamma_p_prime`(a, z)

Returns the partial derivative with respect to x of the incomplete gamma function $P(a, x)$:

The partial derivative with respect to x of the incomplete gamma function $P(a, x)$ is defined as:

$$\frac{\partial}{\partial x} P(a, x) = \frac{e^{-x} x^{a-1}}{\Gamma(a)}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a= 10; x = 30
>>> \mathrm{d}x = dec.gamma_derivative(a, x); mx = mpm.gamma_derivative(a, x); gx = gmp.gamma_derivative(a, x)

11.2.7 Inverse of the real lower normalised incomplete gamma function, $P^{-1}(a, q)$

`ctx.gamma_p_inv`(a, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaPInv(a, p)

Returns $P^{-1}(a, p)$, the functional inverse of the real lower normalized incomplete gamma function, i.e. the function calculates x with $P(a, x) = p$ where $a > 0$ and $0 < p < 1$.

See also BoostMath [80], Wikipedia [1225], MathWorld [258], NIST [460], Ehrhardt [297] (3.5.2.4).

11.2.8 Inverse of the real upper normalised incomplete gamma function, $Q^{-1}(a, q)$

`ctx.gamma_q_inv`(a, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaQInv(a, q)

Returns $Q^{-1}(a, q)$, the functional inverse of the real upper normalized incomplete gamma function, i.e. the function calculates x with $Q(a, x) = q$ where $a > 0$ and $0 < q < 1$.

See also BoostMath [80], Wikipedia [1225], MathWorld [258], NIST [460], Ehrhardt [297] (3.5.2.4).

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm

11.2.9 Inverse (on parameter a) of the real lower normalised incomplete gamma function

`ctx.gamma_p_inva`(x, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaPInva(x, p)

Returns the functional inverse (on parameter a) of the lower normalized incomplete gamma function $P(a, x)$, i.e. the function calculates a with $P(a, x) = p$ where $x > 0$ and $0 < p < 1$.

See also BoostMath [80], Wikipedia [1225], NIST [460]

```

```

11.2.10 Inverse (on parameter a) of the real upper normalised incomplete gamma function

`ctx.gamma_q_inva`(x, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: ctx.incGammaQInva(x, p)

Returns the functional inverse (on parameter a) of the upper normalized incomplete gamma function $Q(a, x)$, i.e. the function calculates a with $Q(a, x) = q$ where $x > 0$ and $0 < q < 1$.

See also BoostMath [80], Wikipedia [1225], NIST [460]

```

11.3 Coulomb, Whittaker and parabolic cylinder function

11.3.1 Regular Coulomb wave function $F_\ell(\eta, x)$

`ctx.coulomb_f`(*l*, *eta*, *x*)

where `ctx` is `math53`` or `ctxflint`.

Returns the Coulomb wave function F. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.4), Mpmath [716].

Calculates the regular Coulomb wave function

$$F_\ell(\eta, x) = \frac{1}{2i}\left(H_\ell^{(+)}(\eta, x) - H_\ell^{(-)}(\eta, x)\right),$$

where $H_\ell^{(+)}(\eta, x)$ and $H_\ell^{(-)}(\eta, x)$ are irregular Coulomb wave functions.

Coulomb wave functions are solutions of the Coulomb wave equation

$$y'' + \left(1 - \frac{2\eta}{z} - \frac{\ell(\ell+1)}{z^2}\right) y = 0$$

which is the radial Schrödinger equation for a charged particle in a Coulomb potential $1/z$, where ℓ is the orbital angular momentum and η is the Sommerfeld parameter. The standard solutions are named $F_\ell(\eta, z)$ (regular at the origin $z = 0$) and $G_\ell(\eta, z)$ (irregular at the origin). The irregular solutions $H_\ell^{\pm}(\eta, z) = G_\ell(\eta, z) \pm iF_\ell(\eta, z)$ are also used. The redundant functions $H^{\pm}$ are provided explicitly since taking the linear combination of F and G suffers from cancellation in parts of the complex plane.

Coulomb wave functions are special cases of confluent hypergeometric functions. The normalization constants and connection formulas are discussed in Dzieciol *et al.* [296], Gaspard [342], Michel [414] and chapter 33 in NIST [784]. In this implementation, we define the analytic continuations of all the functions so that the branch cut with respect to z is placed on the negative real axis.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CoulombF(3, 0.5, 2.25)
ereal('5.2359877559829887307E-1')
>>> ereal.CoulombF(3, 0.5, 8.25)
ereal('5.351847902755998475 4E-1')
```

11.3.2 Irregular Coulomb wave function $G_\ell(\eta, z)$

`ctx.coulomb_g`(L, *eta*, x)

where `ctx` is `math53`` or `ctxflint`.

Returns the irregular Coulomb wave function. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.5), Mpmath [717].

Calculates the irregular Coulomb wave function

$$G_\ell(\eta, x) = \frac{1}{2}\left(H_\ell^{(+)}(\eta, x) - H_\ell^{(-)}(\eta, x)\right),$$

where $H_\ell^{(+)}(\eta, x)$ and $H_\ell^{(-)}(\eta, x)$ are irregular Coulomb wave functions.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.coulombg(l, eta, x); mx = mpm.coulombg(l, eta, x); gx = gmp.coulombg(l, eta, x)

```

11.3.3 Irregular Coulomb wave function $H_\ell^{(+)}(\eta, x)$

`ctx.`**`coulomb_hplus`**(*L*, *eta*, *x*)

where `ctx` is `math53`` or `ctxflint`.

Returns the irregular Coulomb wave function. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.5), Mpmath [717].

Calculates the irregular Coulomb wave function

$$H_\ell^{(+)}(\eta, x) = -2i(-2)^\ell e^{\pi\eta/2} e^{+i\sigma_\ell} x^{\ell+1} e^{+ix} U(\ell + 1 + i\eta, 2l + 2, -2ix),$$

where $\sigma_\ell = \arg\Gamma(\ell + 1 + i\eta)$ is called the Coulomb phase shift.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.coulombg(l, eta, x); mx = mpm.coulombg(l, eta, x); gx = gmp.coulombg(l, eta, x)

```

11.3.4 Irregular Coulomb wave function $H_\ell^{(-)}(\eta, x)$

`ctx.coulomb_hminus`(*L*, *eta*, *x*)

where `ctx` is `math53`` or `ctxflint`.

Returns the irregular Coulomb wave function. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.5), Mpmath [717].

Calculates the irregular Coulomb wave function

$$H_\ell^{(-)}(\eta, x) = +2i(-2)^\ell e^{\pi\eta/2} e^{+i\sigma_\ell} x^{\ell+1} e^{+ix} U(\ell + 1 + i\eta, 2l + 2, -2ix),$$

where $\sigma_\ell = \arg\Gamma(\ell + 1 + i\eta)$ is called the Coulomb phase shift.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.coulombg(l, eta, x); mx = mpm.coulombg(l, eta, x); gx = gmp.coulombg(l, eta, x)
>>> fx = fpm.coulombg(l, eta, x); ax = apm.coulombg(l, eta, x)

```

11.3.5 Whittaker function $M_{\kappa,\mu}(x)$

`ctx.whittaker_m(k, m, x)`

Returns $M_{\kappa,\mu}(x) = e^{-\frac{1}{2}x} x^{\frac{1}{2}+\mu} M(\frac{1}{2}+\mu-\kappa, 1+2\mu, x)$, the Whittaker function M.

See also MathWorld [1040], Wikipedia [1397], Ehrhardt [297] (3.8.9), NIST [191], Mpmath [726].

$$M(k,m,z) = e^{-\frac{1}{2}z} z^{\frac{1}{2}+m} \, {}_1F_1(\tfrac{1}{2}+m-k, 1+2m, z)$$

Evaluates the Whittaker function $M(k,m,z)$, which gives a solution to the Whittaker differential equation

$$\frac{d^2f}{\mathrm{d}z^2} + \left(-\frac{1}{4} + \frac{k}{z} + \frac{(\frac{1}{4}-m^2)}{z^2}\right) f = 0.$$

A second solution is given by *whitw()*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.WhittakerM(5.1,0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.WhittakerM(15.2,0.5)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; k = '10'; m = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.whitm(k, m, x); mx = mpm.whitm(k, m, x); gx = gmp.whitm(k, m, x)
>>> fx = fpm.whitm(k, m, x); ax = apm.whitm(k, m, x)

```

11.3.6 Whittaker function $W_{\kappa,\mu}(x)$

`ctx.whittaker_w(`k, m, x`)`

Returns $W_{\kappa,\mu}(x) = e^{-\frac{1}{2}x} x^{\frac{1}{2}+\mu} U(\frac{1}{2}+\mu-\kappa, 1+2\mu, x)$, the Whittaker function W.

See also MathWorld [1041], Wikipedia [1397], Ehrhardt [297] (3.8.10), NIST [191], Mpmath [727].

$$W(k,m,z) = e^{-\frac{1}{2}z} z^{\frac{1}{2}+m} U(\tfrac{1}{2}+m-k, 1+2m, z).$$

Evaluates the Whittaker function $W(k,m,z)$, which gives a second solution to the Whittaker differential equation.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.WhittakerW(5.1,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.WhittakerW(15.2,0.5)
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; k = '10'; m = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.whitw(k, m, x); mx = mpm.whitw(k, m, x); gx = gmp.whitw(k, m, x)

```

11.3.7 Parabolic cylinder function $D_\nu(x)$

`ctx.cylinder_d(nu, x)`

Returns Whittaker's parabolic cylinder function $D_n(z) = U(-n - 1/2, z)$ (see *pcfu()*).

See also: MathWorld [285], Wikipedia [1390], NIST [782], Mpmath [720], Ehrhardt [297] (3.8.11.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CylinderD(5.1,0.5)
ereal('5.235987755982988730 7E-1')

11.3.8 Parabolic cylinder function $U(a,x)$

`ctx.cylinder_u(a, x)`

Returns the parabolic cylinder function $U(a,x)$.

See also: MathWorld [1037], Wikipedia [1390], Ehrhardt [297] (3.8.11.2), NIST [782], Mpmath [721].

The function is defined, for arbitrary z, as

$$U\left(a,z\right)=U\left(a,0\right)u_1(a,z)+U'\left(a,0\right)u_2(a,z),$$

$$u_1(a,z)=e^{-\frac{1}{4}z^2}\,{}_1F_1\left(\tfrac{1}{2}a+\tfrac{1}{4},\tfrac{1}{2},\tfrac{1}{2}z^2\right)=e^{\frac{1}{4}z^2}\,{}_1F_1\left(-\tfrac{1}{2}a+\tfrac{1}{4},\tfrac{1}{2},-\tfrac{1}{2}z^2\right),$$

$$u_2(a,z)=ze^{-\frac{1}{4}z^2}\,{}_1F_1\left(\tfrac{1}{2}a+\tfrac{3}{4},\tfrac{3}{2},\tfrac{1}{2}z^2\right)=ze^{\frac{1}{4}z^2}\,{}_1F_1\left(-\tfrac{1}{2}a+\tfrac{3}{4},\tfrac{3}{2},-\tfrac{1}{2}z^2\right).$$

$$U\left(a,0\right)=\frac{\sqrt{\pi}}{2^{\frac{1}{2}a+\frac{1}{4}}\Gamma\left(\frac{3}{4}+\frac{1}{2}a\right)},\quad\text{and } U'\left(a,0\right)=-\frac{\sqrt{\pi}}{2^{\frac{1}{2}a-\frac{1}{4}}\Gamma\left(\frac{1}{4}+\frac{1}{2}a\right)},$$

For $\Re(z)>0$, the function may be in terms of the confluent U-function (see *hyperu()*) by

$$U(a,z)=2^{-\frac{1}{4}-\frac{a}{2}}e^{-\frac{1}{4}z^2}U\left(\frac{a}{2}+\frac{1}{4},\frac{1}{2},\frac{1}{2}z^2\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CylinderU(5.1,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.CylinderU(15.2,0.5)

apm: 5.62444689095875E-11 (4.383e-20%) + 3.21133245467725E-11 (7.677e-20%)j
```

11.3.9 Parabolic cylinder function $V(a,x)$

`ctx.cylinder_v`(a,x)

Returns the parabolic cylinder function $V(a,x)$, which can be represented in terms of *pcfu()* as

$$V(a,z) = \frac{\Gamma(a+\frac{1}{2})(U(a,-z) - \sin(\pi a)U(a,z)}{\pi}.$$

See also: MathWorld [1037], Wikipedia [1390], Ehrhardt [297] (3.8.11.3), NIST [782], Mpmath [722].

In DAMath, this is restricted to $2a \in \mathbb{Z}$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CylinderV(5.1,0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.CylinderV(15.2,0.5)
ereal('5.3518479027559984754E-1')
>>> ereal.CylinderV(15.2,0.5)
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = '10'; x = '5.0'
>>> \mathrm{d}x = dec.pcfv(a, x); mx = mpm.pcfv(a, x); gx = gmp.pcfv(a, x)

```

11.3.10 Parabolic cylinder function $W(a,x)$

`ctx.cylinder_w(a, z)`

Returns the parabolic cylinder function $W(a,z)$. See also Wikipedia [1390], MathWorld [1037], NIST [782], Mpmath [723].

The function is defined as

$$W\left(a,x\right)=W\left(a,0\right)w_1(a,x)+W'\left(a,0\right)w_2(a,x).$$

$$W\left(a,0\right)=2^{-\frac{3}{4}}\left|\frac{\Gamma\left(\frac{1}{4}+\frac{1}{2}ia\right)}{\Gamma\left(\frac{3}{4}+\frac{1}{2}ia\right)}\right|^{\frac{1}{2}},\quad W'\left(a,0\right)=-2^{-\frac{1}{4}}\left|\frac{\Gamma\left(\frac{3}{4}+\frac{1}{2}ia\right)}{\Gamma\left(\frac{1}{4}+\frac{1}{2}ia\right)}\right|^{\frac{1}{2}}.$$

$$w_1(a,x)=e^{-\frac{1}{4}ix^2}\,{}_1F_1\left(\tfrac{1}{4}-\tfrac{1}{2}ia,\tfrac{1}{2},\tfrac{1}{2}ix^2\right),\quad w_2(a,x)=xe^{-\frac{1}{4}ix^2}\,{}_1F_1\left(\tfrac{3}{4}-\tfrac{1}{2}ia,\tfrac{3}{2},\tfrac{1}{2}ix^2\right).$$

The function can also be represented as

$$W\left(a,x\right)=\sqrt{k/2}\,e^{\frac{1}{4}\pi a}\left[e^{i\rho}U\left(ia,xe^{-\pi i/4}\right)+e^{-i\rho}U\left(-ia,xe^{\pi i/4}\right)\right].$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = '10'; x = '5.0'
>>> \mathrm{d}x = dec.pcfw(a, x); mx = mpm.pcfw(a, x); gx = gmp.pcfw(a, x)
>>> fx = fpm.pcfw(a, x); ax = apm.pcfw(a, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

11.4 Error function and related functions

11.4.1 Error function, $\mathrm{erf}(x)$

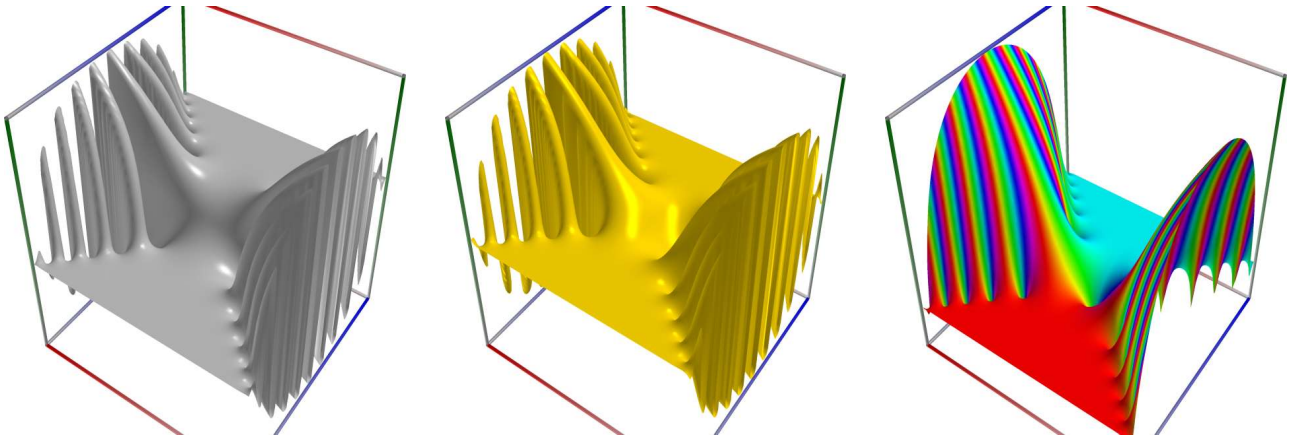
`ctx.erf(x)`

where `ctx` is `math53`, `mathc53`, `ctxboost`, `ctxflint`.

Returns the error function $\mathrm{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x \exp(-t^2) dt$. See also BoostMath [94], BoostMath [74], Wikipedia [1236], MathWorld [845], NIST [777], Ehrhardt [297] (4.2.32), Flint [739], Flint [729], Mpmath [546].

This function returns the value of the error function defined by

$$\mathrm{erf}(z) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-z^2} \mathrm{d}t = \frac{2z}{\sqrt{\pi}} {}_1F_1\left(\tfrac{1}{2}, \tfrac{3}{2}, -z^2\right).$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Dawson(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Dawson('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = 3.0
>>> \mathrm{d}x = dec.erf(x); mx = mpm.erf(x); gx = gmp.erf(x)
>>> fx = fpm.erf(x); ax = apm.erf(x)

```

11.4.2 Complementary error function, $\operatorname{erfc}(x)$

`ctx.erfc(x)`

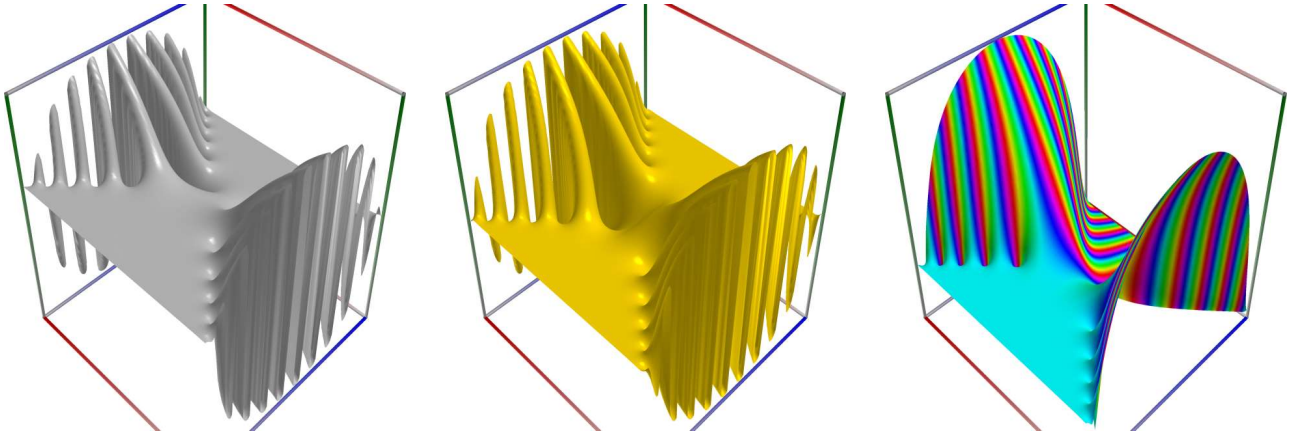
where `ctx` is `math53`, `mathc53`, `ctxboost`, `ctxflint`.

Returns the complementary error function $\operatorname{erfc}(x) = 1 - \operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int_x^\infty \exp(-t^2)\,\mathrm{d}t$.

See also BoostMath [74], Wikipedia [1233], MathWorld [846], NIST [777], MathWorld [979], Ehrhardt [297] (3.3.5), Ehrhardt [297] (4.2.33), Mpmath [545].

Returns the value of the complementary error function defined by

$$\operatorname{erfc}(x) = 1 - \operatorname{erfc}(x) = \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-x^2}\,\mathrm{d}t,$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

```

11.4.3 Inverse of the real error function, $\mathrm{erf}^{-1}(x)$

`ctx.erf_inv(`q`)`

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the real error function, satisfying $\mathrm{erf}(\mathrm{erfinv}(x)) = \mathrm{erfinv}(\mathrm{erf}(x)) = x$. See also BoostMath [73], Wikipedia [1236], MathWorld [851], NIST [777], Flint [739], Mpmath [552].

This function is defined only for $-1 \le x \le 1$.

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; q = '0.007'
>>> \mathrm{d}x = dec.erfinv(q); mx = mpm.erfinv(q); ix = ipm.erfinv(q)

11.4.4 Inverse of the real complementory error function, $\mathrm{erfc}^{-1}(x)$

`ctx.`**`erfc_inv`**`(`q`)`

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the real complementory error function, satisfying $\mathrm{erfc}(\mathrm{erfcinv}(x)) = \mathrm{erfcinv}(\mathrm{erfc}(x)) = x$. See also BoostMath [73], Wikipedia [1233], MathWorld [852], NIST [777], Flint [739].

This function is defined only for $-1 \le x \le 1$.

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; q = '0.007'
>>> \mathrm{d}x = dec.erfcinv(q); mx = mpm.erfcinv(q); ix = ipm.erfcinv(q)
>>> fx = fpm.erfcinv(q); gx = gmp.erfcinv(q); ax = apm.erfcinv(q)
>>> mpm.show([gx, fx, ax])

```

11.4.5 Standard normal density function $\phi(x)$

`ctx.ndens`(x)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: also ctx.erfZ(x), ctx.ndens(x), mathc53.Ndens(x)

Returns the Gaussian density function $\phi(z) = \frac{1}{\sqrt{2\pi}} \exp(-z^2)$. See also: Ehrhardt [297] (3.3.12.3) and (3.9.28).

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '1.2'; mu = '0'; sd = '1';
>>> \mathrm{d}x = dec.normal_pdf(x, mu, sd); mx = mpm.normal_pdf(x, mu, sd)
>>> ix = ipm.normal_pdf(x, mu, sd); fx = fpm.normal_pdf(x, mu, sd)
>>> gx = gmp.normal_pdf(x, mu, sd); ax = apm.normal_pdf(x, mu, sd)
>>> mpm.show([\mathrm{d}x, mx, ix, fx, gx, ax])

ipm:  1.941860549832129404120911390335162607571e-1 (5.173e-39%)
```

11.4.6 Standard normal cumulative distribution function $\Phi(x)$

`ctx.ndis(x)`

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Note: also ctx.erfP(x), ctx.ndis(x), mathc53.Ndis(x)

Returns the integral $\Phi(z) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{z} \exp(-t^2)\,\mathrm{d}t = \frac{1}{2}\mathrm{erfc}\left(-\frac{z}{\sqrt{2}}\right)$.

See also BoostMath [74], Wikipedia [1233], MathWorld [846], NIST [777], MathWorld [979], Ehrhardt [297] (3.3.12.1) and (3.9.28).

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '1.2'; mu = '0'; sd = '1';
>>> \mathrm{d}x = dec.normal_cdf(x, mu, sd); mx = mpm.normal_cdf(x, mu, sd)
>>> ix = ipm.normal_cdf(x, mu, sd); fx = fpm.normal_cdf(x, mu, sd)
>>> gx = gmp.normal_cdf(x, mu, sd); ax = apm.normal_cdf(x, mu, sd)
>>> mpm.show([\mathrm{d}x, mx, ix, fx, gx, ax])

ipm:  8.84930329778291731977779793043364851324 6e-1 (1.297e-39%)
```

11.4.7 Standard normal quantile function $\Phi^{-1}(q)$

`math53.ndisx(q)`

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the standard normal quantile function $\Phi^{-1}(q)$, defined as $\Phi^{-1}(q) = -\sqrt{2}\,\mathrm{erfc_inv}(2q)$.

See also BoostMath [74], Wikipedia [1233], MathWorld [846], NIST [777], MathWorld [979], Ehrhardt [297] (3.3.12.1) and (3.9.28).

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; q = '0.2'; mu = '0'; sd = '1';
>>> \mathrm{d}x = dec.normal_qtf(q, mu, sd); mx = mpm.normal_qtf(q, mu, sd)
>>> ix = ipm.normal_qtf(q, mu, sd); fx = fpm.normal_qtf(q, mu, sd)
>>> gx = gmp.normal_qtf(q, mu, sd); ax = apm.normal_qtf(q, mu, sd)
>>> mpm.show([\mathrm{d}x, mx, ix, fx, gx, ax])

ipm:  -8.41621233572914205178706121363248100626 3e-1 (-2.728e-39%)
```

11.4.8 Imaginary error function, $\operatorname{erfi}(x)$

`ctx.erfi`(x)

where `ctx` is `math53`, `mathc53`, `ctxflint`.

Returns the imaginary error function $\operatorname{erfi}(x) = \frac{2}{\sqrt{\pi}} \int_0^x \exp(t^2)\,dt = \frac{1}{i}\operatorname{erf}(ix) = \frac{2}{\sqrt{\pi}} e^{x^2} \operatorname{dawson}(x)$.

See also Wikipedia [1241], MathWorld [847], Ehrhardt [297] (3.3.8), Flint [739], Flint [729], Mpmath [547].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Erfi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Erfi('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = 3.0
>>> \mathrm{d}x = dec.erfi(x); mx = mpm.erfi(x); gx = gmp.erfi(x)
>>> fx = fpm.erfi(x); ax = apm.erfi(x)

```

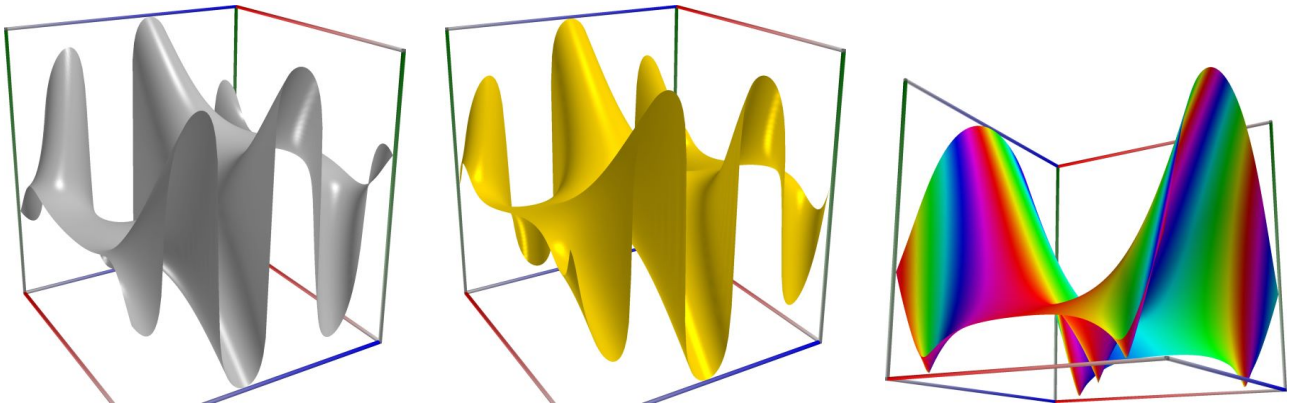
11.4.9 Dawson integral, $F(x)$

`ctx.dawson(x)`

Returns the Dawson integral $F(z) = e^{-z^2} \int_0^z e^{t^2}\,\mathrm{d}t = \frac{\sqrt{\pi}}{2} e^{-z^2}\,\mathrm{erfi}(z) = \frac{i\sqrt{\pi}}{2}\left[e^{-z^2} - w(z)\right]$.

See also Wikipedia [1341], MathWorld [975], Ehrhardt [297] (3.3.1), NIST [435].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```

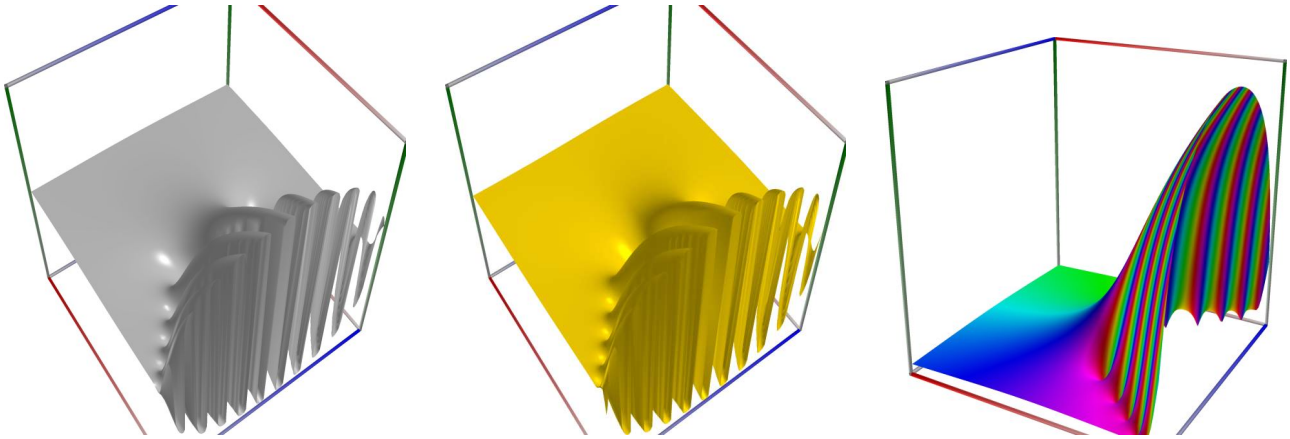
11.4.10 Faddeeva function, $w(z)$

`ctx.faddeeva(z)`

Returns the Faddeeva function function $w(z) := e^{-z^2}\operatorname{erfc}(-iz) = \operatorname{erfcx}(-iz) = e^{-z^2}\left(1 + \frac{2i}{\sqrt{\pi}}\int_0^z e^{t^2}\,\mathrm{d}t\right)$.

See also Wikipedia [1324], NIST [436].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ecplx

```

11.4.11 Fresnel sine integral, $S(x)$

`ctx.fresnel_s(z)`

where `ctx` is `math53`, `mathc53`, `ctxflint`.

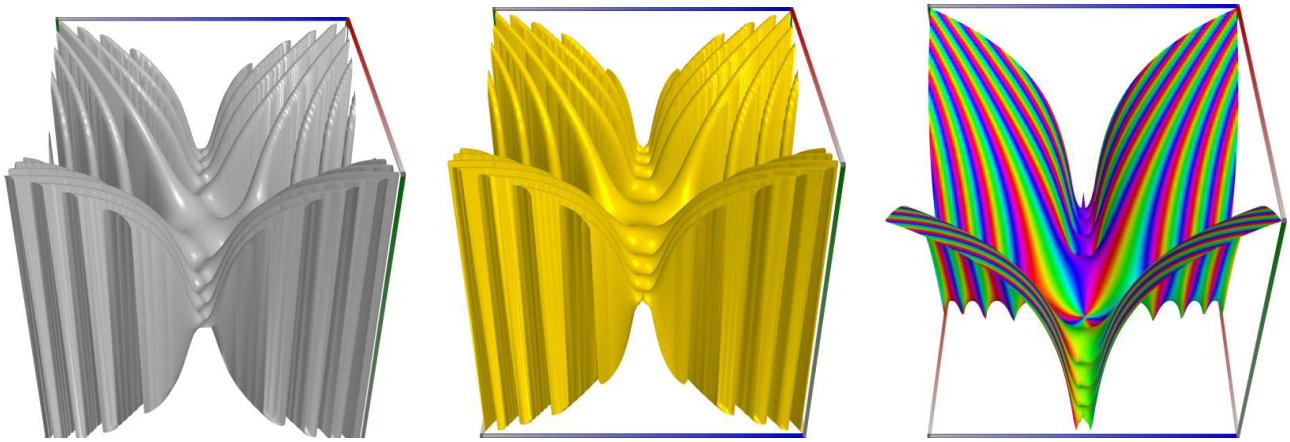
Returns the Fresnel sine integral $S(x) = \int_0^x \sin\left(\frac{\pi t^2}{2}\right) \mathrm{d}t$.

See also Wikipedia [1325], MathWorld [983], NIST [779],, Ehrhardt [297] (3.3.14), Flint [739], Flint [729], Mpmath [657].

The complex Fresnel sine integral can be expressed using the error function as follows:

$$S(z) = \sqrt{\frac{\pi}{2}} \frac{1+i}{4} \left[\operatorname{erf}\left(\frac{1+i}{\sqrt{2}} z\right) - i \operatorname{erf}\left(\frac{1-i}{\sqrt{2}} z\right) \right].$$

See also: https://docs.scipy.org/doc/scipy/reference/generated/scipy.special.fresnel.html#scipy.special.fresnel



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

```

11.4.12 Fresnel cosine integral, $C(x)$

`ctx.fresnel_c(z)`

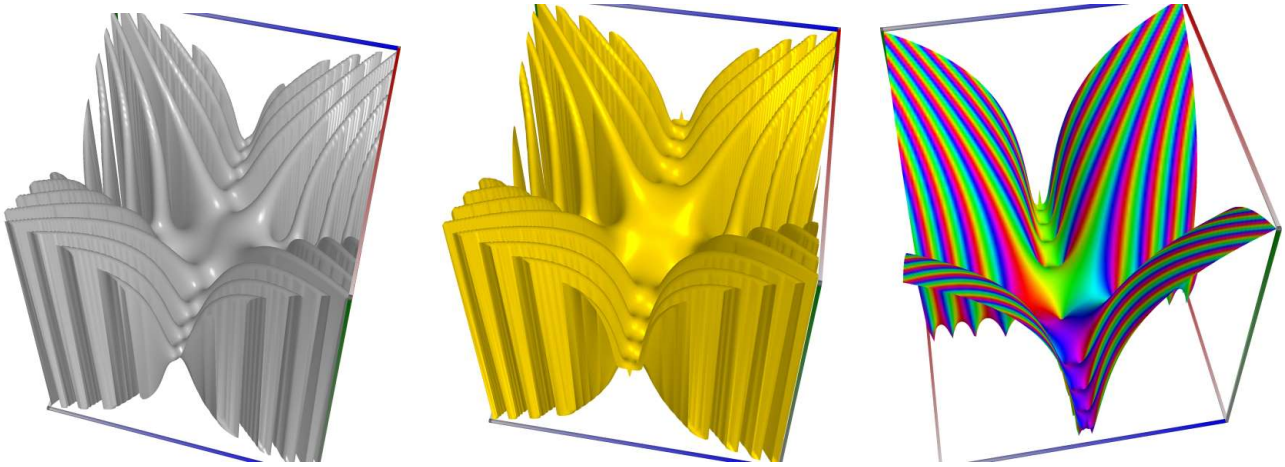
where `ctx` is `math53`, `mathc53`, `ctxflint`.

Returns the Fresnel cosine integral $C(x) = \int_0^x \cos\left(\frac{\pi t^2}{2}\right) \mathrm{d}t$.

See also Wikipedia [1325], MathWorld [982], NIST [779], Ehrhardt [297] (3.3.14), Flint [739], Flint [729], Mpmath [656].

The complex Fresnel cosine integral can be expressed using the error function as follows:

$$C(z) = \sqrt{\frac{\pi}{2}} \frac{1-i}{4} \left[\operatorname{erf}\left(\frac{1+i}{\sqrt{2}} z\right) + i \operatorname{erf}\left(\frac{1-i}{\sqrt{2}} z\right) \right].$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FresnelC(0.5)

```

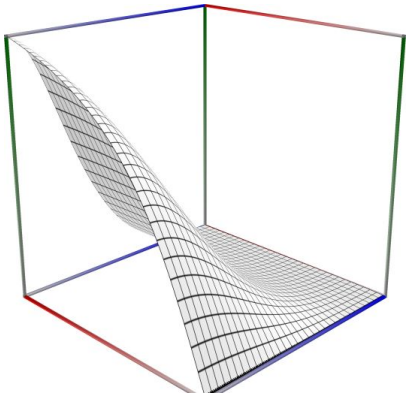
11.4.13 Owen's T function, $T(h, a)$

`ctx.owen_t`(h, a)

where `ctx` is `math53` or `ctxflint`.

Returns Owen's T function $T(h,a) = \dfrac{1}{2\pi}\displaystyle\int_0^a f(x)\mathrm{d}x = \dfrac{a}{4\pi}\int_{-1}^1 f(ax)\mathrm{d}x, \quad f(x) = \dfrac{e^{-\frac{1}{2}h^2(1+x^2)}}{1+x^2}, \quad (-\infty < h, a < +\infty).$

See also Owen [454], and Patefield and Tand [464], Wikipedia [1355], MathWorld [1015], Ehrhardt [297] (3.3.17).



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.OwenT(2.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.OwenT(2.5, '0.51')
ereal('5.3518479027559984754E-1')
```

11.5 Exponential integrals, and related functions

11.5.1 Exponential integral $E_1(x)$

`ctx.exp_integral_e1(`x`)`

where `ctx` is `math53` or `ctxflint`.

Returns the exponential integral $E_1(x) = \int_1^\infty \frac{e^{-xt}}{t}\,\mathrm{d}t, = e^{-z}U(1,1,z), \quad x \neq 0.$

For real $x < 0$ the integral can be calculated as $E_1(x) = -\mathrm{Ei}(-x)$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.5), Ehrhardt [297] (4.2.27), Flint [774], Flint [768], Mpmath [653].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.E1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.E1('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = 3.0
>>> \mathrm{d}x = dec.e1(x); mx = mpm.e1(x); gx = gmp.e1(x)

```

11.5.2 Exponential integral $\mathrm{Ei}(x)$

`ctx.exp_integral_ei(x)`

where `ctx` is `math53`, `mathc53`, `ctxboost` or `ctxflint`.

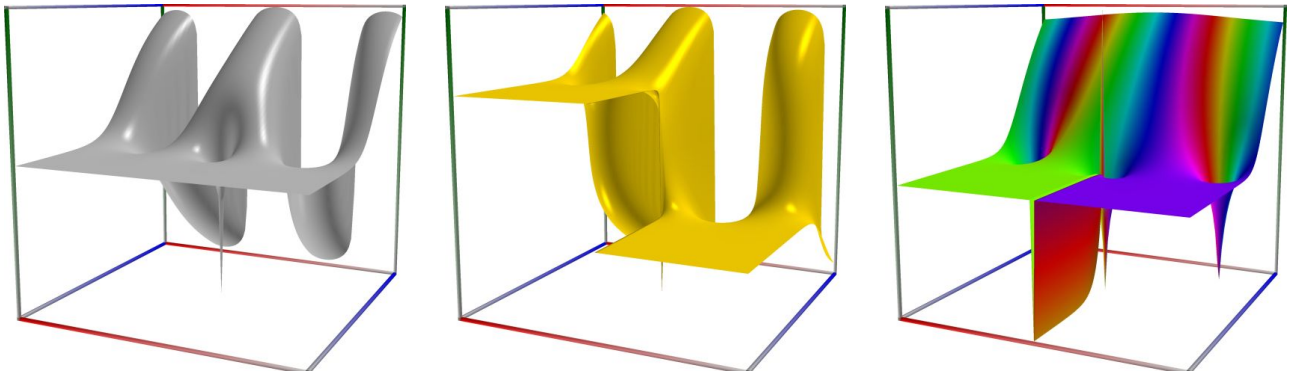
Returns the exponential integral $\mathrm{Ei}(x) = -PV\int_{-x}^{\infty} \frac{e^{-t}}{t}\,\mathrm{d}t = PV\int_{-\infty}^{x} \frac{e^{t}}{t}\,\mathrm{d}t$.

For real $x < 0$ we have $\mathrm{Ei}(x) = -E_1(-x)$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.7), Ehrhardt [297] (4.2.27), Flint [774], Flint [768], Mpmath [654].

The exponential integral $\mathrm{Ei}(z)$ can also be calculated as using

$$\mathrm{Ei}(z) = -e^z U(1,1,-z) - \log(-z) + \frac{1}{2}\left(\log(z) - \log\left(\frac{1}{z}\right)\right)$$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```

```

11.5.3 Logarithmic integral $\mathrm{li}(x)$

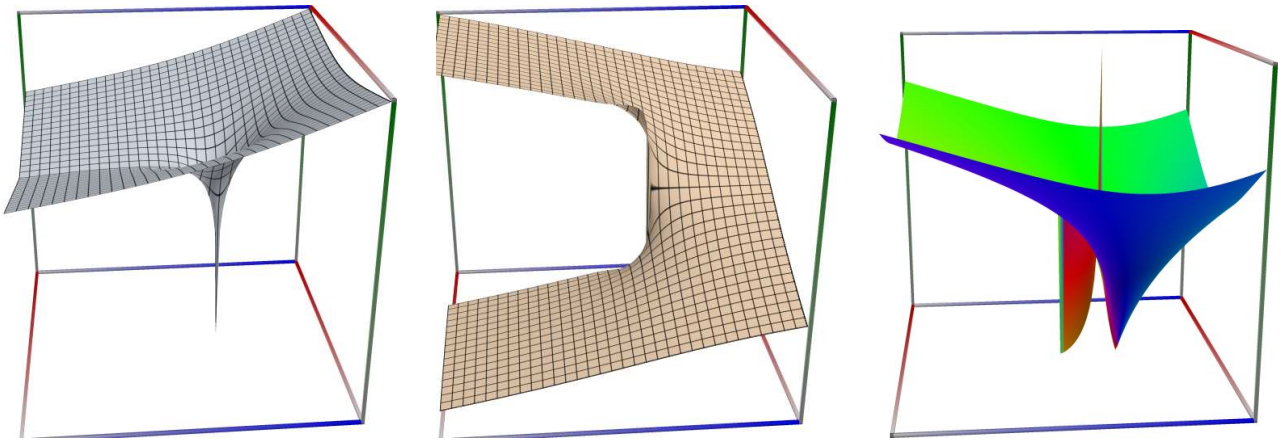
`ctx.log_integral(z)`

where `ctx` is `math53`, `mathc53` or `ctxflint`.

Returns the logarithmic integral $\mathrm{li}(x) = PV \int_0^x \frac{1}{\log(t)}\,\mathrm{d}t, \quad (x \geq 0, x \neq 1)$.

For $x \neq 0$ the integral is calculated as $\mathrm{li}(x) = \mathrm{Ei}(\log(x))$.

See also Wikipedia [1332], MathWorld [991], NIST [781], Ehrhardt [297] (3.4.15), Ehrhardt [297] (4.2.40), Flint [774], Flint [768], Mpmath [661].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

An example in Python

```

```

11.5.4 Hyperbolic sine integral $\mathrm{Shi}(x)$

`ctx.sinh_integral(x)`

where `ctx` is `math53`, `ctxflint`.

Returns the hyperbolic sine integral $\mathrm{Shi}(x) = \int_0^x \frac{\sinh(t)}{t}\,\mathrm{d}t$.

See also Wikipedia [1329], MathWorld [987], NIST [780], Ehrhardt [297] (3.4.17), Flint [774], Flint [768], Mpmath [664].

For real x the integral is calculated using the relations $\mathrm{Shi}(x) = \frac{1}{2}\left(\mathrm{Ei}(x) + \mathrm{E}_1(x)\right)$ for $x > 0$ and $\mathrm{Shi}(x) = -\mathrm{Shi}(-x)$ for $x < 0$.

For complex x the integral is calculated using the relation $\mathrm{Shi}(x) = -i\mathrm{Si}(ix)$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Shi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Shi('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = 3.0
>>> \mathrm{d}x = dec.shi(x); mx = mpm.shi(x); gx = gmp.shi(x)

```

11.5.5 Hyperbolic cosine integral $\mathrm{Chi}(x)$

`ctx.cosh_integral(`x`)`

where `ctx` is `math53`, `ctxflint`.

Note: Also ctx.chi(z), ctx.coshIntegral(z)

Returns the hyperbolic cosine integral $\mathrm{Chi}(x) = -\int_x^\infty \frac{\cosh(t)}{t}\,\mathrm{d}t = \gamma + \log(x) + \int_0^x \frac{\cosh(t)-1}{t}\,\mathrm{d}t$.

See also Wikipedia [1328], MathWorld [986], NIST [780], Ehrhardt [297] (3.4.1), Flint [774], Flint [768], Mpmath [649].

For real x the integral is calculated using the relations $\mathrm{Chi}(x) = \frac{1}{2}\left(\mathrm{Ei}(x) - \mathrm{E}_1(x)\right)$ for $x > 0$ and $\mathrm{Chi}(x) = \mathrm{Chi}(-x)$ for $x < 0$.

For complex x the integral is calculated using the relation $\mathrm{Chi}(x) = \mathrm{Ci}(ix) - \log(ix) + \log(x)$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Chi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Chi('0.51')

```

11.5.6 Generalized exponential integral $E_n(x)$

`ctx.exp_integral_en(`n, z`)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the generalized exponential integral of integer order $E_n(x) = \int_1^\infty \frac{e^{-xt}}{t^n}\,\mathrm{d}t, \quad (n \geq 0)$.

See also Wikipedia [1323], MathWorld [981], NIST [463], BoostMath [155], Ehrhardt [297] (3.4.12), Mpmath [655].

The function can be generalized for complex s and complex z using

$$\mathrm{E}_{1-s}(z) = z^{-s}\Gamma(s, z).$$

An example in Python

```
>>> from xlcalcnet import ereal

```

11.5.7 Sine integral $\mathrm{Si}(x)$

`ctx.sin_integral(z)`

where `ctx` is `math53`, `ctxflint`.

Returns the sine integral $\mathrm{Si}(x) = \int_0^x \frac{\sin(t)}{t}\,\mathrm{d}t$, and $\mathrm{Si}(x) = -\mathrm{Si}(-x)$ for $x < 0$.

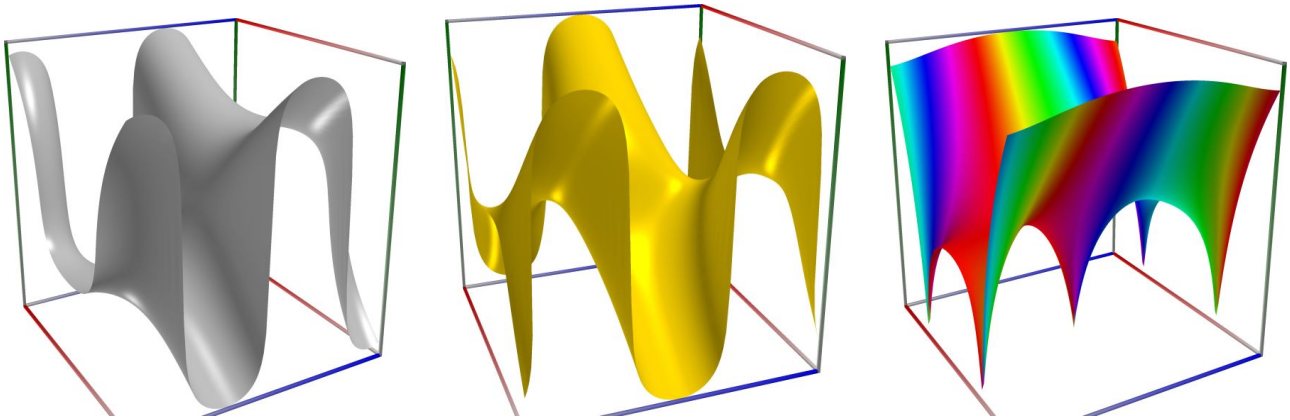
See also Wikipedia [1337], MathWorld [993], NIST [783], Ehrhardt [297] (3.4.18), Flint [774], Flint [768], Mpmath [665].

For complex z, the sine integral $\mathrm{Si}(z)$ can be computed using

$$\mathrm{Si}(z) = \frac{i}{2}\left[e^{iz}U(1,1,-iz) - e^{-iz}U(1,1,iz) + \log(-iz) - \log(iz)\right]$$

$$\mathrm{Si}(z) = z\,{}_1F_2(\tfrac{1}{2}; \tfrac{3}{2}, \tfrac{3}{2}; -\tfrac{z^2}{4})$$

and an automatic algorithm choice.



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

apm: 6.74799508140403209 27e+0 (1.004e-19%) - 3.49866372113190947 06e+0 (-4.842e-20%)j
```

11.5.8 Cosine integral $\mathrm{Ci}(x)$

`ctx.cos_integral(z)`

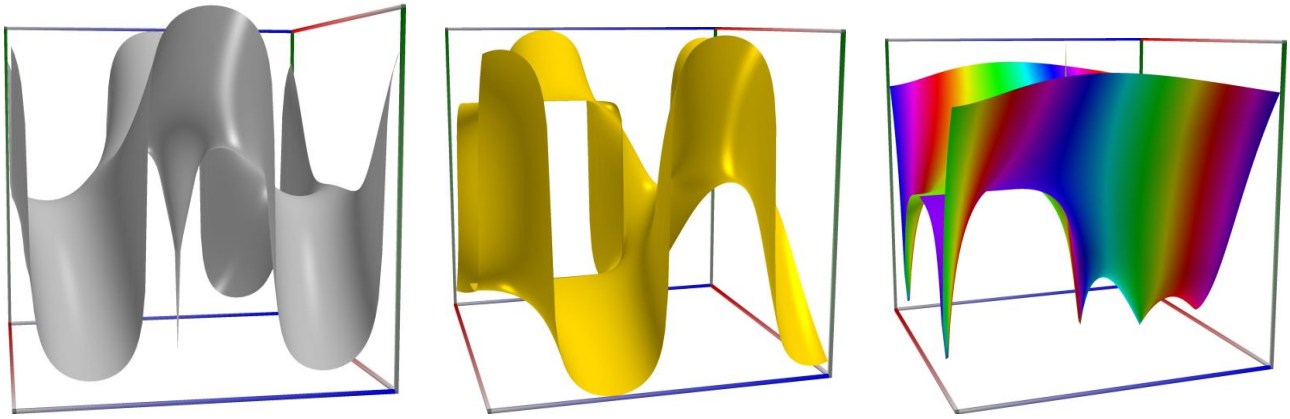
where `ctx` is `math53` or `ctxflint`.

Returns the cosine integral $\mathrm{Ci}(x) = -\int_x^\infty \frac{\cos(t)}{t}\,\mathrm{d}t = \gamma + \log(x) + \int_0^x \frac{\cos(t)-1}{t}\,\mathrm{d}t$, and $\mathrm{Ci}(x) = \mathrm{Ci}(-x)$ for $x < 0$.

For complex z, the cosine integral $\mathrm{Ci}(z)$, can be computed using

$$\mathrm{Ci}(z) = \log(z) - \frac{1}{2}\left[e^{iz}U(1,1,-iz) + e^{-iz}U(1,1,iz) + \log(-iz) + \log(iz)\right]$$

See also Wikipedia [1322], MathWorld [974], NIST [783], Ehrhardt [297] (3.4.2), Flint [774], Flint [768], Mpmath [652].



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \le x \le 6$ (blue axis), $-6 \le y \le 6$ (red axis), $-10 \le z \le 10$ (green axis). Function values are *loglog-transformed*.

CHAPTER

TWELVE

HYPERGEOMETRIC FUNCTIONS ${}_2F_1$ AND ${}_1F_2$ (AND RELATED FUNCTIONS)

The source code for the C# tests in Visual Studio is divided by real and complex modules:

The source code for the C# tests in Visual Studio using real modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B12a_RealHypergeometric_pFq.cs,

The source code for the C# tests in Visual Studio using complex modules can be found online in the `XlCalcNet` repository or in the corresponding local `XlCalcNet` folder in the file B12b_CplxHypergeometric_pFq.cs,

12.1 Gauss Hypergeometric Function ${}_2F_1$

12.1.1 Gauss Hypergeometric Function, ${}_2F_1(a, b; c; x)$

`ctx.hyperg_2f1`(a, b, c, x)

where `ctx` is `math53` or `ctxflint`.

Note: ctx.hyperg2F1(a, b, c, x)

Returns ${}_2F_1(a, b, c, x) = \sum_{k=0}^{\infty} \frac{(a)_k (b)_k}{(c)_k} \frac{x^k}{k!}$, the Gauss hypergeometric function, defined for $|x| < 1$.

See also Wikipedia [1261], MathWorld [898], NIST [192], Ehrhardt [297] (3.8.1), BoostMath [105], Flint [760], Flint [753], Mpmath [594].

Except for special cases it is required that $-c \neq \mathbb{N}$. For $x > 1$ the function is generally complex and not implemented in AMath; but if a or b is a non-positive integer, then ${}_2F_1(a, b, c, x)$ becomes a polynomial in x and there is no restriction on x.

Special values are ${}_2F_1(0, b, c, x) = {}_2F_1(a, 0, c, x) = {}_2F_1(a, b, c, 0) = 1$ and, if $c - a - b > 0$, ${}_2F_1(a, b, c, 1) = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}$.

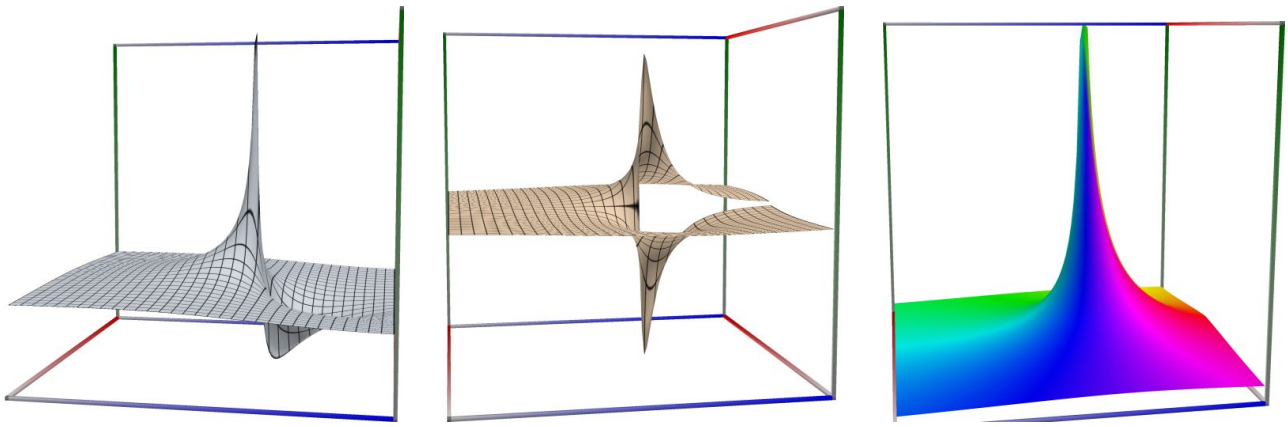
In AMath the analytic continuation is done using one or two linear transformations: For all $x < 1$ Abramowitz and Stegun. [4] equations (15.3.3-5) are used, and for $0 < x < 1$ if c and $c - a - b$ are no integers Abramowitz and Stegun. [4] equation (15.3.6). For $c = a + b \pm m, (m = 0, 1, \ldots)$ the (complicated) formulas from Abramowitz and Stegun. [4] (15.3.10-12) are implemented. If $a = -m$ is a negative integer (or b with a and b swapped, or both and $a \geq b$) the limiting cases for the (polynomial) transformations are implemented as in Abramowitz and Stegun. [4] equations (15.8.6/7).

This calls `arb_hypgeom_2f1` or `acb_hypgeom_2f1`

Returns the Gauss hypergeometric function ${}_2F_1(a, b; c; z)$.

The Gauss hypergeometric function ${}_2F_1$ is defined for $|z| < 1$ by the series

$$ {}_2F_1(a, b; c; z) = \sum_{k=0}^{\infty} \frac{(a)_k (b)_k}{(c)_k} \cdot \frac{z^k}{k!} $$



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

```

12.1.2 Regularized Hypergeometric Function, ${}_2\widetilde{F}_1(a,b;c;x)$

`ctx.hyperg_2f1r`(a, b, c, x)

where `ctx` is `math53` or `ctxflint`.

Note: ctx.hyperg2F1r(a, b, c, x)

Returns ${}_2\widetilde{F}_1(a,b;c;x) = \dfrac{1}{\Gamma(c)}{}_2F_1(a,b;c;x)$, the regularized Gauss hypergeometric function, for $c \neq 0, -1, -2, \cdots$, or, if $c = 0, -1, -2, \cdots = -m$, the corresponding limit ${}_2\widetilde{F}_1(a,b;-m;x) = \dfrac{(a)_{m+1}(b)_{m+1}}{(m+1)!}x^{m+1}{}_2F_1(a+m+1, b+m+1; m+2; x)$.

See also Wikipedia [1261], MathWorld [259], NIST [192], Ehrhardt [297] (3.8.2), BoostMath [105], Flint [760], Flint [753], Mpmath [594].

This calls `arb_hypgeom_2f1` or `acb_hypgeom_2f1` with regularized set.

Returns the regularized Gauss hypergeometric function ${}_2\widetilde{F}_1(a,b;c;z)$.

The regularized Gauss hypergeometric function ${}_2\widetilde{F}_1(a,b;c;z)$ for unrestricted c, is defined by

$$ {}_2\widetilde{F}_1(a,b;c;z) = \frac{1}{\Gamma(c)}{}_2F_1(a,b;c;z) = \boldsymbol{F}(a,b;c;z), \qquad (c \neq 0, -1, -2, \cdots) $$

and by the corresponding limit if $c = 0, -1, -2, \cdots, = -n$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hyperg2F1r(3,4,5,0.5)
ereal('5.235987755982988730 7E-1')

```

12.2 Chebyshev, Gegenbauer and Jacobi polynomials

12.2.1 Chebyshev polynomial (or function) of the first kind, $T_n(x)$

`ctx.chebyshev_t(`n, x`)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $T_n(z) = {}_2F_1\left(-n, n, \frac{1}{2}, \frac{1-z}{2}\right)$, the Chebyshev polynomial of the first kind. The $T_n(x)$ are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1-x^2)^{-1/2}$.

For integer n, the following recursion can be used, with $T_n(x) = T_{-n}(x)$:

$$\begin{aligned} T_0(x) &= 1 \\ T_1(x) &= x \\ T_{n+1}(x) &= 2xT_n(x) - T_{n-1}(x). \end{aligned} \tag{12.1}$$

See also Wikipedia [1302], MathWorld [917], NIST [397], BoostMath [114], Ehrhardt [297] (3.7.1), Flint [761], Flint [757], Mpmath [628], Ehrhardt [297] (3.7.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ChebyshevT(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.ChebyshevT('6, 0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

```

12.2.2 Chebyshev polynomial of the second kind, $U_n(x)$

`ctx.chebyshev_u(n, x)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $U_n(z) = (n+1)_2F_1\left(-n, n+2, \frac{3}{2}, \frac{1-z}{2}\right)$, the Chebyshev polynomial of the second kind. The $U_n(x)$ are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1-x^2)^{1/2}$.

For integer n, the following recursion can be used, with $U_{-1}(x) = 0$ and $U_n(x) = -U_{-n-2}(x)$:

$$\begin{aligned} U_0(x) &= 1 \\ U_1(x) &= 2x \\ U_{n+1}(x) &= 2xU_n(x) - U_{n-1}(x). \end{aligned} \tag{12.2}$$

```

12.2.3 Chebyshev polynomials of the third kind, $V_n(x)$

`ctx.chebyshev_v(n, x)`

Returns $V_n(x)$, the Chebyshev polynomial of the first kind. The $V_n(x)$ are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1+x^2)^{1/2}(1-x)^{-1/2}$.

The function can also be calculated as $V_n(x) = (-1)^n(2n+1)_2F_1\left(-n, n+1, \frac{3}{2}, \frac{1+x}{2}\right)$, which allows for complex n and x.

We also have $V_n(x) = \sqrt{\frac{2}{1+x}}T_{2n+1}\left(\sqrt{\frac{x+1}{2}}\right)$ for $x \geq 0$, and $V_n(x) = (-1)^n W_n(-x)$ for $x < 0$.

For integer n and real x, the following recursion can be used, with $V_{-n-1}(x) = V_n(x)$:

$$\begin{aligned} V_0(x) &= 1 \\ V_1(x) &= 2x - 1 \\ V_{n+1}(x) &= 2xV_n(x) - V_{n-1}(x). \end{aligned} \tag{12.3}$$

See also Wikipedia [1302], MathWorld [917], NIST [397], Ehrhardt [297] (3.7.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ChebyshevV(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.ChebyshevV('6, 0.51')
ereal('5.351847902755998475 4E-1')
```

12.2.4 Chebyshev polynomials of the fourth kind, $W_n(x)$

`ctx.chebyshev_w(n, x)`

Returns $W_k(z)$, the Chebyshev polynomial of the fourth kind of degree $n \geq 0$. The $W_n(x)$ are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1-x)^{1/2}(1+x^2)^{-1/2}$.

The function can also be calculated as $W_n(z) = (-1)^n {}_2F_1\left(-n, n+1, \frac{1}{2}, \frac{1+x}{2}\right)$, which allows for complex n and x.

We also have $W_n(x) = U_{2n}\left(\sqrt{\frac{x+1}{2}}\right)$ for $x \geq 0$, and $W_n(x) = (-1)^n V_n(-x)$ for $x < 0$.

For integer n, the following recursion can be used, with $W_{-n-1}(x) = -W_n(x)$:

$$\begin{aligned} W_0(x) &= 1 \\ W_1(x) &= 2x + 1 \\ W_{n+1}(x) &= 2xW_n(x) - W_{n-1}(x). \end{aligned} \tag{12.4}$$

See also Wikipedia [1302], MathWorld [917], NIST [397], Ehrhardt [297] (3.7.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ChebyshevW(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.ChebyshevW('6, 0.51')
ereal('5.351847902755998475 4E-1')
```

12.2.5 Gegenbauer (ultraspherical) polynomial, $C_n^{\alpha}(x)$

`ctx.gegenbauer_c`(*n*, *alpha*, *x*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $C_n^{(a)}(z)$, the Gegenbauer polynomial of degree n with parameter a. The Gegenbauer polynomials are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1 - x^2)^{a-1/2}$.

If $a \neq 0$ the function uses the recurrence formulas

$$\begin{aligned} C_0^{(a)}(x) &= 1 \\ C_1^{(a)}(x) &= 2ax \\ nC_n^{(a)}(x) &= 2(n + a - 1)xC_{n-1}^{(a)}(x) - (n + 2a - 2)C_{n-2}^{(a)}(x). \end{aligned} \tag{12.5}$$

For $a = 0$ the result can be expressed in Chebyshev polynomials: $C_0^{(0)}(x) = 1, \quad C_n^{(0)}(x) = 2/nT_n(x)$.

See also Wikipedia [1307], MathWorld [923], NIST [397], BoostMath [120], Ehrhardt [297] (3.7.6), Flint [761], Flint [757], Mpmath [630].

The function can also be expressed as

$$C_n^a(z) = \frac{(2a)_n}{\Gamma(n+1)} {}_2F_1\left(-n, 2a + n, a + \frac{1}{2}, \frac{1-z}{2}\right).$$

For nonnegative integer *n*, this is a polynomial in *a* and *z*, even when the parameters are such that the hypergeometric series is undefined. In such cases, the polynomial is evaluated using direct methods.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.GegenbauerC(3, 2, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.GegenbauerC('6, 2, 0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '10' ; a = '7.0'; x = '5.0'
>>> \mathrm{d}x = dec.gegenbauer(n, a, x); mx = mpm.gegenbauer(n, a, x); gx = gmp.gegenbauer(n, a, x)

```

12.2.6 Jacobi polynomials, $P_n^{(a,b)}(x)$

`ctx.jacobi_p`(*n*, *a*, *b*, *x*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $P_n^{(a,b)}(x)$, the Jacobi polynomial of degree $n \geq 0$ with parameters (a, b), where a, b should be greater than -1, and $a+b$ must not be an integer less than -1. Jacobi polynomials are orthogonal on the interval $(-1, 1)$, with respect to the weight function $w(x) = (1-x)^a(1+x)^b$, if a, b are greater than -1.

The cases $n \leq 1$ are computed with the explicit formulas

$$P_0^{(a,b)} = 1, \quad 2P_1^{(a,b)} = (a-b) + (a+b+2)x,$$

and for $n > 1$ there are the somewhat complicated recurrence relations

$$\begin{aligned} P_{n+1}^{(a,b)} &= (A_n x + B_n)P_n^{(a,b)} - C_n P_{n-1}^{(a,b)} \\ A_n &= \frac{(2n+a+b+1)(2n+a+b+2)}{2(n+1)(n+a+b+1)} \\ B_n &= \frac{(a^2-b^2)(2n+a+b+1)}{2(n+1)(n+a+b+1)(2n+a+b)} \\ C_n &= \frac{(n+a)(n+b)(2n+a+b+2)}{(n+1)(n+a+b+1)(2n+a+b)}. \end{aligned} \tag{12.6}$$

See also Wikipedia [1314], MathWorld [928], NIST [397], BoostMath [123], Ehrhardt [297] (3.7.9), Mpmath [635].

The function can also be expressed as

$$P_n^{(a,b)}(x) = \frac{(a+1)_n}{\Gamma(n+1)} {}_2F_1\left(-n, n+a+b+1, a+1, \frac{1-x}{2}\right).$$

For nonnegative integer *n*, this is a polynomial in *a*, *b* and *z*, even when the parameters are such that the hypergeometric series is undefined. In such cases, the polynomial is evaluated using direct methods.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiP(2, 3, 2, 0.5)
ereal('5.2359877559829887307E-1')

```

12.2.7 Zernike radial polynomials $R_n^m(r)$

`ctx.zernike_r(n, m, r)`

Returns the Zernike radial polynomial $R_n^m(r)$, with $r \geq 0$, and $n \geq m \geq 0$, $n - m$ even, zero otherwise. The orthogonality relation is

$$\int_0^1 R_n^m(r) R_{n'}^m(r) r \, \mathrm{d}r = \frac{1}{2(n+1)} \delta_{nn'}.$$

$$R_n^m(r) = (-1)^{(n-m)/2} r^m P_{(n-m)/2}^{(m,0)}(1 - 2r^2) = r^m P_{(n-m)/2}^{(0,m)}(2r^2 - 1).$$

See also: http://mathworld.wolfram.com/ZernikePolynomial.html

See also https://en.wikipedia.org/wiki/Zernike_polynomials

See also Ehrhardt [297] (3.7.20).

An example in Python

```
>>> from xlcalcnet import ereal

ereal('5.351847902755998475 4E-1')
```

12.3 Legendre polynomials and related

12.3.1 Legendre polynomial (or function) of the first kind, $P_n(x)$

`ctx.legendre_p(n, x)`

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $P_n(x) = {}_2F_1\left(-n, n+1, 1, \frac{1-x}{2}\right)$, the Legendre polynomial of degree n. The Legendre polynomials are orthogonal on the interval $(-1, 1)$ with $w(x) = 1$. If $n \geq 0$ the function uses the following recurrence relation, with $P_n(x) = P_{-n-1}(x)$:

$$\begin{aligned} P_0(x) &= 1 \\ P_1(x) &= x \\ (n+1)P_{n+1}(x) &= (2n+1)P_n(x) - nP_{n-1}(x). \end{aligned} \tag{12.7}$$

See also Wikipedia [1316], MathWorld [931], NIST [293], BoostMath [125], Ehrhardt [297] (3.7.13), Flint [761], Flint [757], Mpmath [637].

```

12.3.2 Associated Legendre function of the first kind, $P_l^m(x)$

`ctx.legendre_plm`(l, m, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns $\frac{1}{\Gamma(1-m)} \frac{(1+z)^{m/2}}{(1-z)^{m/2}} {}_2F_1\left(-n, n+1, 1-m, \frac{1-z}{2}\right)$., the (associated) Legendre function of the first kind of degree n and order m. Taking $m = 0$ gives the ordinary Legendre function of the first kind, $P_n(z)$.

See also Wikipedia [1298], MathWorld [930], NIST [293], BoostMath [125], Ehrhardt [297] (3.7.14), Flint [761], Flint [757], Mpmath [625].

Many different branch cut conventions appear in the literature. If *type* is 0, the version

$$P_n^m(z) = \frac{(1+z)^{m/2}}{(1-z)^{m/2}} \mathbf{F}\left(-n, n+1, 1-m, \frac{1-z}{2}\right)$$

is computed, and if *type* is 1, the alternative version

$$\mathcal{P}_n^m(z) = \frac{(z+1)^{m/2}}{(z-1)^{m/2}} \mathbf{F}\left(-n, n+1, 1-m, \frac{1-z}{2}\right).$$

is computed. Type 0 and type 1 respectively correspond to type 2 and type 3 in *Mathematica* and *mpmath*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LegendrePlm(2, 3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LegendrePlm(2, 6, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '10'; m = '7'; x = '0.5'
>>> \mathrm{d}x = dec.legenp(n, m, x); mx = mpm.legenp(n, m, x); gx = gmp.legenp(n, m, x)
>>> fx = fpm.legenp(n, m, x); ax = apm.legenp(n, m, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

apm: 5.167624372257488933e+14 (2.768e-19%) - 9.909518668029852477 8e+14 (-1.925e-19%)j
```

12.3.3 Legendre function of the second kind, $Q_l(x)$

`ctx.legendre_q`(l, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

See also: https://en.wikipedia.org/wiki/Legendre_polynomials

Returns $Q_n(x) = {}_2F_1\left(\frac{l+1}{2}, \frac{l+2}{2}; l+\frac{3}{2}; \frac{1}{x^2}\right)$, the Legendre function of the second kind of degree l. For integer $l \geq 0$ and $x \neq 1$, the following recurrence relations hold:

$$\begin{aligned} Q_0(x) &= \frac{1}{2}\log\left(\frac{1+x}{1-x}\right) \\ Q_1(x) &= \frac{x}{2}\log\left(\frac{1+x}{1-x}\right) - 1 \\ (k+1)Q_{k+1}(x) &= (2k+1)Q_k(x) - kQ_{k-1}(x). \end{aligned} \tag{12.8}$$

See also Wikipedia [1316], MathWorld [931], NIST [293], BoostMath [125], Ehrhardt [297] (3.7.15), Flint [761], Flint [757], Mpmath [626].

This function returns $Q_l^m(x)$, the associated Legendre functions of the second kind with $l \geq 0$, $l+m \geq 0$ and $x \neq 1$, defined as

$$Q_l^m(x) = (-1)^m(1-x^2)^{m/2}\frac{d^m}{\mathrm{d}x^m}Q_l(x), \quad |x| < 1,$$

$$Q_l^m(x) = (x^2-1)^{m/2}\frac{d^m}{\mathrm{d}x^m}Q_l(x), \quad |x| > 1.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LegendreQ(3, 0.5)
ereal('5.23598775598298873077E-1')
>>> ereal.LegendreQ(6, '0.51')
ereal('5.35184790275599847544E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '10'; m = '7'; x = '0.5'
>>> \mathrm{d}x = dec.legenq(n, m, x); mx = mpm.legenq(n, m, x); gx = gmp.legenq(n, m, x)
>>> fx = fpm.legenq(n, m, x); ax = apm.legenq(n, m, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

12.3.4 Associated Legendre function of the second kind, $Q_l^m(x)$

`ctx.legendre_qlm`(l, m, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

For generalization to hypergeometric functions, see https://en.wikipedia.org/wiki/Legendre_function#Solutions_of_the_differential_equation

and https://en.wikipedia.org/wiki/Associated_Legendre_polynomials#Generalization_via_hypergeometric_functions

Returns $Q_l^m(z) = \frac{\pi}{2\sin(\pi m)}\left(\cos(\pi m)P_l^m(z) - \frac{\Gamma(1+m+l)}{\Gamma(1-m+l)}P_l^{-m}(z)\right)$, the (associated) Legendre function of the second kind of degree l and order m.

Here $P_l^m(z)$ is the Legendre function of the first kind of degree l and order m. The formula above should be understood as limit when m is an integer. Taking $m = 0$ gives the ordinary Legendre function of the second kind, $Q_n(z)$.

A different formula from Wikipedia:

$$Q_\lambda^\mu(z) = \frac{\sqrt{\pi}\,\Gamma(\lambda+\mu+1)}{2^{\lambda+1}\Gamma(\lambda+3/2)}\frac{1}{z^{\lambda+\mu+1}}(1-z^2)^{\mu/2}\,{}_2F_1\left(\frac{\lambda+\mu+1}{2}, \frac{\lambda+\mu+2}{2}; \lambda+\frac{3}{2}; \frac{1}{z^2}\right)$$

For integer m, $l \geq 0$, $l + m \geq 0$ and $x \neq 1$, the function can be defined by

$$Q_l^m(x) = (-1)^m(1-x^2)^{m/2}\frac{d^m}{\mathrm{d}x^m}Q_l(x),$$

$$Q_l^{-m}(x) = (x^2-1)^{m/2}\frac{(l-m)!}{(l+m)!}Q_l^m(x).$$

The factor $(-1)^m$ is omitted if $|x| > 1$, see NIST [293] (14.9.14).

See also Wikipedia [1316], MathWorld [931], NIST [293], BoostMath [125], Ehrhardt [297] (3.7.16), Mpmath [626].

Sets *res* to the associated Legendre function of the second kind evaluated for degree *n*, order *m*, and argument *z*. When *m* is zero, this reduces to the Legendre function $Q_n(z)$.

Many different branch cut conventions appear in the literature. If *type* is 0, the version

$$Q_n^m(z) = \frac{\pi}{2\sin(\pi m)}\left(\cos(\pi m)P_n^m(z) - \frac{\Gamma(1+m+n)}{\Gamma(1-m+n)}P_n^{-m}(z)\right)$$

is computed, and if *type* is 1, the alternative version

$$\mathcal{Q}_n^m(z) = \frac{\pi}{2\sin(\pi m)}e^{\pi i m}\left(\mathcal{P}_n^m(z) - \frac{\Gamma(1+m+n)}{\Gamma(1-m+n)}\mathcal{P}_n^{-m}(z)\right)$$

is computed. Type 0 and type 1 respectively correspond to type 2 and type 3 in *Mathematica* and *mpmath*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LegendrePlm(2, 3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LegendrePlm(2, 6, '0.51')
ereal('5.351847902755998475 4E-1')
```

12.3.5 Spherical harmonics, $Y_n^m(\theta, \phi)$

`ctx.spherical_harmonic`(*theta*, *phi*, *n*, *m*)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.spherHarm(theta, phi, n, m), ctxboost.SphericalHarmonicR(theta, phi, n, m), ctxboost.SphericalHarmonicI(theta, phi, n, m)

!!! n and m need to be integer !!!

Returns $Y_l^m(\theta, \phi) = \sqrt{\frac{2l+1}{4\pi}\frac{(l-m)!}{(l+m)!}} P_l^m(\cos\theta) e^{im\phi}$ the spherical harmonic, where $P_l^m(z)$ is the Legendre function of the first kind of degree l and order m, $\theta \in [0, \pi]$ denotes the polar coordinate (ranging from the north pole to the south pole) and $\phi \in [0, 2\pi]$ denotes the azimuthal coordinate on a sphere. Care should be used since many different conventions for spherical coordinate variables are used.

See also Wikipedia [1319], MathWorld [937], NIST [294], BoostMath [130], Ehrhardt [297] (3.7.17), Flint [757], Mpmath [638].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SpherHarm(2, 3, 5, 4)
ereal('5.235987755982988730 7E-1')
>>> ereal.SpherHarm(2.1, 3.1, 5.1, 4.1)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; l = '10'; m = '7'; theta = '0.1'; phi = '0.2'
>>> \mathrm{d}x = dec.spherharm(l, m, theta, phi); mx = mpm.spherharm(l, m, theta, phi);
>>> gx = gmp.spherharm(l, m, theta, phi)

```

12.3.6 Toroidal harmonics $P^m_{l-1/2}(x)$

`ctx.toroidal_plm`(*l*, *m*, *x*)

Returns the toroidal harmonic $P^m_{l-1/2}(x)$, which is an associated Legendre function $P_l^m(x)$ of the first kind with half-integer degree. The current implementation is based on Amath and is restricted to $l, m = 0, 1; x > 1$, using Legendre elliptic integrals or Bulirsch elliptic integrals for numerical evaluation.

See also: https://mathworld.wolfram.com/ToroidalFunction.html

See also: https://dlmf.nist.gov/14.19

See also: Ehrhardt [297] (3.7.18).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ToroidalPlm(0, 0, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ToroidalPlm(0, 1, 1.5)
ereal('5.3518479027559984754E-1')
>>> ereal.ToroidalPlm(1, 0, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ToroidalPlm(1, 1, 1.5)
ereal('5.3518479027559984754E-1')
```

12.3.7 Toroidal harmonics $Q^m_{l-1/2}(x)$

`ctx.toroidal_qlm`(*l*, *m*, *x*)

Returns the toroidal harmonic $Q^m_{l-1/2}(x)$, which is an associated Legendre function $Q^m_l(x)$ of the second kind with half-integer degree. The current implementation is based on Amath and is restricted to $l, m = 0, 1; x > 1$, using Legendre elliptic integrals or Bulirsch elliptic integrals for numerical evaluation.

See also: Majic (2019), https://mathworld.wolfram.com/ToroidalFunction.html

See also: Ehrhardt [297] (3.7.18).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ToroidalQlm(0, 0, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ToroidalQlm(0, 1, 1.5)
ereal('5.3518479027559984754E-1')
>>> ereal.ToroidalQlm(1, 0, 1.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ToroidalQlm(1, 1, 1.5)
ereal('5.3518479027559984754E-1')
```

12.4 Incomplete beta functions

12.4.1 Non-normalized lower incomplete beta function, $B_{\text{lower}}(a, b; x)$

`ctx.beta_lower`(a, b, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.beta3(a, b, x), ctxboost.IBetaNonNormalized(a, b, x)

Returns the non-normalized incomplete beta function $B_x(a, b) = B_{\text{lower}}(a, b; x) = \int_0^x t^{a-1}(1-t)^{b-1}\,\mathrm{d}t$, for $a > 0$, $b > 0$, and $0 \le x \le 1$.

We also have $B_{\text{lower}}(a, b; x) = \frac{x^a}{a}{}_2F_1(a, 1-b, a+1, x)$

The function is undefined for nonpositive integer a.

See also Wikipedia [1224], MathWorld [849], NIST [459], BoostMath [79], BoostMath [87], Ehrhardt [297] (3.5.3.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Beta3(3.1, 0.5, 0.3)
ereal('5.2359877559829887307E-1')
>>> ereal.Beta3(3.4, '0.51', 0.3)
ereal('5.3518479027559984754E-1')
```

12.4.2 Normalized incomplete beta function, $I_x(a, b)$

`ctx.ibeta`(a, b, x)

where `ctx` is `math53`, `ctxboost`, `ctxflint`.

Returns the normalized incomplete beta function $I_x(a,b) = \dfrac{1}{B(a,b)} \displaystyle\int_0^x t^{a-1}(1-t)^{b-1}\,\mathrm{d}t,$ for $a > 0$, $b > 0$, and $0 \le x \le 1$.

See also Wikipedia [1224], MathWorld [856], NIST [459], BoostMath [79], BoostMath [87], Ehrhardt [297] (3.5.3.3), Flint [743], Flint [733].

Returns the normalised incomplete beta function $I_x(a,b)$ for $a > 0$, $b > 0$, and $0 \le x \le 1$.

$$I_x(a,b) = \frac{B_x(a,b)}{B(a,b)}, \quad B_x(a,b) = \int_0^x t^{a-1}(1-t)^{b-1}\mathrm{d}t.$$

There are some special cases

$$I_0(a,b) = 0, \quad I_1(a,b) = 1, \quad I_x(a,1) = x^a,$$

and the symmetry relation $I_x(a,b) = 1 - I_{1-x}(b,a)$, which is used for $x > a/(a+b)$.

Computes the (lower) incomplete beta function, defined by $B(a,b;z) = \int_0^z t^{a-1}(1-t)^{b-1}$, optionally the regularized incomplete beta function $I(a,b;z) = B(a,b;z)/B(a,b;1)$.

In general, the integral must be interpreted using analytic continuation. The precise definitions for all parameter values are

$$B(a,b;z) = \frac{z^a}{a} {}_2F_1(a, 1-b, a+1, z)$$

$$I(a,b;z) = \frac{\Gamma(a+b)}{\Gamma(b)} z^a {}_2\widetilde{F}_1(a, 1-b, a+1, z).$$

Note that both functions with this definition are undefined for nonpositive integer a, and I is undefined for nonpositive integer $a+b$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.IBeta(3.1, 0.5, 0.3)
ereal('5.2359877559829887307E-1')
>>> ereal.IBeta(3.4, '0.51', 0.3)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = '10'; b = '7'; x = '0.1'
>>> \mathrm{d}x = dec.ibeta(a, b, x); mx = mpm.ibeta(a, b, x); gx = gmp.ibeta(a, b, x)
>>> fx = fpm.ibeta(a, b, x); ax = apm.ibeta(a, b, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax], aligned=True)

12.4.3 Derivative of the incomplete beta function

`ctx.`**`ibeta_prime`**(a, b, x)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the partial derivative with respect to x of the incomplete beta function $I_x(a, b)$. See also BoostMath [72]. The function is defined as:

$$\frac{\partial}{\partial x} I_x(a, b) = \frac{x^{a-1}(1-x)^{b-1}}{B(a, b)}.$$

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; a = '8.3'; b = '10.4'; x = '0.7'
>>> \mathrm{d}x = dec.beta_derivative(a, b, x); mx = mpm.beta_derivative(a, b, x)
>>> ix = ipm.beta_derivative(a, b, x); fx = fpm.beta_derivative(a, b, x)

```

12.4.4 Real non-normalized upper incomplete beta function, $B_{\text{upper}}(a, b; x)$

`ctx.beta_upper`(a, b, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Note: ctx.betac(a, b, x), ctxboost.IBetacNonNormalized(a, b, x)

Returns the non-normalized incomplete beta function $B_{1-x}(a, b) = B_{\text{upper}}(a, b; x) = \int_x^1 t^{a-1}(1-t)^{b-1}\,\mathrm{d}t$, for $a > 0$, $b > 0$, and $0 \leq x \leq 1$.

This can be generalized to complex a, b and x as $B_{\text{upper}}(a, b; x) = B(a, b) - B_x(a, b)$.

See also Wikipedia [1224], MathWorld [849], NIST [459], BoostMath [79], BoostMath [87].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Betac(3.1, 0.5, 0.3)
ereal('5.2359877559829887307E-1')
>>> ereal.Betac(3.4, '0.51', 0.3)
ereal('5.351847902755998475 4E-1')
```

12.4.5 Real normalized complementory incomplete beta function, $I_{1-x}(a, b)$

`ctx.ibetac`(a, b, x)

where `ctx` is `math53`, `ctxboost` or `ctxflint`.

Returns the complement of the normalized incomplete beta function $1 - I_x(a, b) = \dfrac{1}{B(a, b)} \displaystyle\int_x^1 t^{a-1}(1-t)^{b-1}\,\mathrm{d}t$, for $a > 0$, $b > 0$, and $0 \le x \le 1$.

See also Wikipedia [1224], MathWorld [856], NIST [459], BoostMath [79], BoostMath [87], Flint [743], Flint [733].

Returns the non-normalised incomplete beta function $I_x(a, b)$ for $a > 0$, $b > 0$, and $0 \le x \le 1$:

$$I_x(a, b) = \frac{B_x(a, b)}{B(a, b)}, \quad B_x(a, b) = \int_0^x t^{a-1}(1-t)^{b-1}\mathrm{d}t.$$

$$B_x(a, b) = \int_0^x t^{a-1}(1-t)^{b-1}\mathrm{d}t.$$

There are some special cases

$$B_0(a, b) = 0, \quad B_1(a, b) = B(a, b), \quad B_x(a, 1) = \frac{x^a}{a}, \quad B_x(1, b) = \frac{1-(1-x)^b}{b},$$

and the relation $B_{1-x}(a, b) = B(a, b) - B_x(b, a)$, which is used if $x > a/(a + b)$. When $a \le 0$ or $b \le 0$, the Gauss hypergeometric function ${}_2F_2(\cdot)$ is applied: If $a \ne 0$ is not a negative integer, the result is

$$B_x(a, b) = \frac{x^a}{a}{}_2F_2(a, 1-b, a+1, x), \quad -a \notin \mathbb{N}$$

else if $b \ne 0$ is not a negative integer, the result is

$$B_x(a, b) = B(a, b) - \frac{(1-x)^b x^a}{b}{}_2F_2(1, a+b, b+1, 1-x), \quad -b \notin \mathbb{N}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Ibetac(3.1, 0.5, 0.3)
ereal('5.235987755982988730 7E-1')
>>> ereal.Ibetac(3.4, '0.51', 0.3)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; a = '10'; b = '7'; x = '0.1'
>>> \mathrm{d}x = dec.beta3(a, b, x); mx = mpm.beta3(a, b, x); gx = gmp.beta3(a, b, x)

12.4.6 Inverse of the real normalised incomplete beta function

`ctx.`**`ibeta_inv`**(a, b, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the normalised incomplete beta function. Calculates x with $Q(a, x) = p$. The input parameters are $a > 0, b > 0, p \geq 0$.

See also Wikipedia [1224], MathWorld [856], NIST [459], BoostMath [79], BoostMath [87], Ehrhardt [297] (3.5.3.5).

```

12.4.7 Inverse of the real normalised complementary incomplete beta function

`ctx.ibetac_inv`(a, b, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the functional inverse of the complement of the upper normalized incomplete beta function. Calculates x with $I_{1-x}(a, b) = p$. The input parameters are $a > 0$, $b > 0$, $p \geq 0, \leq 1$.

See also BoostMath [87], Wikipedia [1224], MathWorld [257], NIST [459].

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; a = '8.3'; b = '10.4'; prob = '0.7'

12.4.8 Inverse (on parameter a) of the real normalised incomplete beta function

`ctx.`**`ibeta_inva`**(b, x, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the normalized incomplete beta function with regard to parameter a, i.e. calculates a with $I_x(a, b) = p$. The input parameters are $x > 0$, $b > 0$, $p \geq 0, \leq 1$.

See also BoostMath [87], Wikipedia [1224], MathWorld [257], NIST [459].

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.3'; b = '10.4'; prob = '0.7'

12.4.9 Inverse (on parameter a) of the real normalised complementary incomplete beta function

`ctx.`**`ibetac_inva`**(b, x, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the complement of the normalized incomplete beta function with regard to parameter a, i.e. calculates a with $I_{1-x}(a, b) = p$. The input parameters are $x > 0$, $b > 0$, $p \geq 0, \leq 1$.

See also BoostMath [87], Wikipedia [1224], MathWorld [257], NIST [459].

```

12.4.10 Inverse (on parameter b) of the real normalised incomplete beta function

`ctx.`**`ibeta_invb`**(a, x, q)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the inverse of the normalised incomplete beta function with regard to parameter b, i.e. calculates a with $Q(a, x) = p$. The input parameters are $a > 0$, $b > 0$, $p \geq 0$.

See also BoostMath [87], Wikipedia [1224], MathWorld [257], NIST [459].

```

12.5 Hypergeometric function ${}_1F_2$

12.5.1 Non-regularized hypergeometric function ${}_1F_2$

`ctx.`**`hyperg_1f2`**$(a, b1, b2, z)$

Returns the generalized hypergeometric function ${}_1F_2$.

Returns ${}_1F_2(a_1;b_1,b_2;x) = \sum_{k=0}^{\infty} \frac{(a_1)_k}{(b_1)_k(b_2)_k} \frac{x^k}{k!}$

We also have ${}_1F_2(a_1;b_1,b_2;x) = \frac{\Gamma(b_2)}{\Gamma(a_1)\Gamma(b_2-a_1)} \int_0^1 (1-t)^{b_2-a_1-1} t^{a_1-1} {}_0F_1(b_1,tx)\,\mathrm{d}t$, where $\Re(b_2) > \Re(a_1) > 0$.

12.6 Scorer functions

12.6.1 Scorer function $\mathrm{Gi}(x)$

ctx.scorer_gi(x)

Returns the Scorer function Gi, which gives a particular solution to the inhomogeneous Airy differential equation $f''(x) - xf(x) = 1/\pi$.

See also: MathWorld [1038], Wikipedia [1392], Ehrhardt [297] (3.1.7.7), NIST [439], Mpmath [724].

The Scorer function Gi is defined as

$$\mathrm{Gi}(x) = \frac{1}{\pi}\int_0^\infty \sin\left(xt - \frac{1}{3}t^3\right)\,\mathrm{d}t.$$

Another particular solution is given by the Scorer Hi-function. The two functions are related as $\mathrm{Gi}(z) + \mathrm{Hi}(z) = \mathrm{Bi}(z)$.

We also have

$$\mathrm{Gi}(z) = \tfrac{1}{3}\mathrm{Bi}(z) - \frac{z^2}{2\pi}\,{}_1F_2\left(1; \tfrac{4}{3}, \tfrac{5}{3}; \tfrac{1}{9}z^3\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryGi(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AiryGi('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = -3
>>> \mathrm{d}x = dec.scorergi(x); mx = mpm.scorergi(x); gx = gmp.scorergi(x)
>>> fx = fpm.scorergi(x); ax = apm.scorergi(x)

```

12.6.2 Scorer function $\mathrm{Hi}(x)$

ctx.scorer_hi(x)

Returns the Scorer function Hi, which gives a particular solution to the inhomogeneous Airy differential equation $f''(x) - xf(x) = 1/\pi$.

See also: MathWorld [1039], Wikipedia [1392], Ehrhardt [297] (3.1.7.8), Mpmath [725].

Returns the Scorer function Hi, defined as

$$\mathrm{Hi}(x) = \frac{1}{\pi}\int_0^\infty \exp\left(xt - \frac{1}{3}t^3\right) \mathrm{d}t$$

We also have

$$\mathrm{Hi}(z) = \tfrac{2}{3}\mathrm{Bi}(z) + \frac{z^2}{2\pi}\,{}_1F_2\left(1; \tfrac{4}{3}, \tfrac{5}{3}; \tfrac{1}{9}z^3\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryHi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.AiryHi('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; x = -3
>>> \mathrm{d}x = dec.scorerhi(x); mx = mpm.scorerhi(x); gx = gmp.scorerhi(x)

```

12.6.3 First derivative of the Scorer function $\mathrm{Gi}(x)$, $\mathrm{Gi}'(x)$

`ctx.scorer_gi_prime(x)`

Returns $\mathrm{Gi}'(x)$, the first derivative of the Airy (Scorer) function $\mathrm{Gi}(x)$.

See also: MathWorld [1038], Wikipedia [1392], Ehrhardt [297] (3.1.7.7), NIST [439], Mpmath [724].

The function is calculated as

$$\mathrm{Gi}'(z) = \tfrac{1}{3}\mathrm{Bi}'(z) - \frac{1}{40\pi}\left[40z \cdot {}_1F_2\left(1; \tfrac{4}{3}, \tfrac{5}{3}; \tfrac{1}{9}z^3\right) + 3z^4 \cdot {}_1F_2\left(2; \tfrac{7}{3}, \tfrac{8}{3}; \tfrac{1}{9}z^3\right)\right]$$

We also have $\mathrm{Gi}'(x) = \mathrm{Bi}'(x) - \mathrm{Hi}'(x)$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryGi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.AiryGi('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```

12.6.4 First derivative of the Scorer function $\mathrm{Hi}(x)$, $\mathrm{Hi}'(x)$

`ctx.scorer_hi_prime(x)`

Returns $\mathrm{Hi}'(x)$, the first derivative of the Airy (Scorer) function $\mathrm{Hi}(x)$.

See also: MathWorld [1039], Wikipedia [1392], Ehrhardt [297] (3.1.7.8), Mpmath [725].

The function is calculated as

$$\mathrm{Hi}'(z) = \tfrac{2}{3}\mathrm{Bi}'(z) + \frac{1}{40\pi}\left[40z \cdot {}_1F_2\left(1; \tfrac{4}{3}, \tfrac{5}{3}; \tfrac{1}{9}z^3\right) + 3z^4 \cdot {}_1F_2\left(2; \tfrac{7}{3}, \tfrac{8}{3}; \tfrac{1}{9}z^3\right)\right]$$

It can also be represented as an integral:

$$\mathrm{Hi}'(x) = \frac{1}{\pi}\int_0^\infty t \exp\left(xt - \tfrac{1}{3}t^3\right) \mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AiryHi(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.AiryHi('0.51')

12.7 Struve functions

12.7.1 Struve function $\mathrm{H}_n(x)$

`ctx.struve_h(nu, x)`

Returns the Struve function $H_\nu(x)$. See also Wikipedia [1393], MathWorld [1028], NIST [462], Ehrhardt [297] (3.1.9.3), Mpmath [714].

$$\mathbf{H}_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{\Gamma(k+\frac{3}{2})\Gamma(k+n+\frac{3}{2})} \left(\frac{z}{2}\right)^{2k+n+1}$$

which is a solution to the Struve differential equation

$$z^2 f''(z) + z f'(z) + (z^2 - n^2) f(z) = \frac{2z^{n+1}}{\pi(2n-1)!!}.$$

We also have

$$\mathbf{H}_\nu(x) = \left(\frac{z}{2}\right)^{\nu+1} {}_1\widetilde{F}_2\left(1; \frac{3}{2}, \nu+\frac{3}{2}; -\frac{z^2}{4}\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveH(3, 0.5)
ereal('5.235987755982988730E-1')
>>> ereal.StruveH(3, '0.51')
ereal('5.351847902755998475E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 10; x = -3
>>> \mathrm{d}x = dec.struveh(n, x); mx = mpm.struveh(n, x); gx = gmp.struveh(n, x)
>>> fx = fpm.struveh(n, x); ax = apm.struveh(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: -7.2058762694527534388921007769900586494 03E-6

fpm: -4.83451307880925E-04                    + 8.74040703910620E-04j
apm: -4.8345130788092493588e-4 (-2.994e-19%) + 8.7404070391062002932e-4 (2.366e-19%)j
```

12.7.2 Struve function $\mathrm{L}_\nu(x)$

`ctx.struve_l(nu, x)`

Returns the Struve function L. See also Wikipedia [1393], MathWorld [1027], NIST [462], Ehrhardt [297] (3.1.9.4), Mpmath [715].

Returns the Struve function $\mathbf{L}_\nu(x)$, defined as

$$\mathbf{L}_\nu(x) = \left(\tfrac{1}{2}x\right)^{\nu+1} \sum_{k=0}^{\infty} \frac{\left(\frac{1}{2}x\right)^{2k}}{\Gamma\left(k+\frac{3}{2}\right)\Gamma\left(k+\nu+\frac{3}{2}\right)}.$$

which solves to the modified Struve differential equation

$$z^2 f''(z) + z f'(z) - (z^2+n^2) f(z) = \frac{2z^{n+1}}{\pi(2n-1)!!}.$$

We also have

$$\mathbf{L}_n(z) = -ie^{-n\pi i/2}\mathbf{H}_n(iz)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveL(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.StruveL(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 10; x = -3
>>> \mathrm{d}x = dec.struvel(n, x); mx = mpm.struvel(n, x); gx = gmp.struvel(n, x)

```

12.7.3 Struve function $\mathrm{K}_\nu(x)$

`ctx.struve_k`(*nu*, *z*)

Returns the Struve function K(nu, z) = H(nu,z) - Y(n, z). See also Wikipedia [1393], MathWorld [1027], NIST [462].

$$\mathbf{K}_\nu\left(z\right) = \mathbf{H}_\nu\left(z\right) - Y_\nu\left(z\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveK(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.StruveK(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 10; x = 3
>>> \mathrm{d}x = dec.struvek(n, x); mx = mpm.struvek(n, x); gx = gmp.struvek(n, x)

12.7.4 Struve function $\mathrm{M}_\nu(x)$

`ctx.struve_m`(*nu*, *z*)

Returns the Struve function M(nu, z) = L(nu,z) - I(n, z).. See also Wikipedia [1393], MathWorld [1027], NIST [462].

$$\mathbf{M}_\nu\left(z\right) = \mathbf{L}_\nu\left(z\right) - I_\nu\left(z\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveM(3, 0.5)
ereal('5.235987755982988730 7E-1')

12.8 Anger, Weber and Lommel functions

12.8.1 Anger function $\mathrm{J}_\nu(x)$

`ctx.anger_j(`n, z`)`

Returns the Anger function J. See also Wikipedia [1367], MathWorld [1020], NIST [458].

Gives the Anger function

$$\mathbf{J}_\nu(z) = \frac{1}{\pi}\int_0^\pi \cos(\nu t - z\sin t)dt$$

which is an entire function of both the parameter ν and the argument z. It solves the inhomogeneous Bessel differential equation

$$f''(z) + \frac{1}{z}f'(z) + \left(1 - \frac{\nu^2}{z^2}\right) f(z) = \frac{(z-\nu)}{\pi z^2}\sin(\pi\nu).$$

We also have

$$\begin{aligned}\mathbf{J}_\nu(z) &= \frac{z}{2}\sin\left(\tfrac{1}{2}\pi\nu\right) {}_1\widetilde{F}_2\left(1; \tfrac{1}{2}(3-\nu), \tfrac{1}{2}(3+\nu); -\frac{z^2}{4}\right) \\ &+ \cos\left(\tfrac{1}{2}\pi\nu\right) {}_1\widetilde{F}_2\left(1; 1-\tfrac{1}{2}\nu, 1+\tfrac{1}{2}\nu; -\frac{z^2}{4}\right)\end{aligned} \tag{12.9}$$

An example with real input:

```
>>> from xlcalcnet import dpm, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 10; x = 3
>>> dx = dpm.angerj(n, x); mx = mpm.angerj(n, x); gx = gmp.angerj(n, x)
>>> fx = fpm.angerj(n, x); ax = apm.angerj(n, x)
>>> mpm.show([dx, mx, gx, fx, ax],  aligned=True)

```

12.8.2 Weber function $\mathbf{E}_\nu(x)$

`ctx.weber_e(`n, z`)`

Returns the Weber function E. See also Wikipedia [1367], MathWorld [1029], NIST [458].

Gives the Weber function

$$\mathbf{E}_\nu(z) = \frac{1}{\pi}\int_0^\pi \sin(\nu t - z\sin t)dt$$

which is an entire function of both the parameter ν and the argument z. It solves the inhomogeneous Bessel differential equation

$$f''(z) + \frac{1}{z}f'(z) + \left(1 - \frac{\nu^2}{z^2}\right)f(z) = -\frac{1}{\pi z^2}(z + \nu + (z-\nu)\cos(\pi\nu)).$$

We also have

$$\begin{aligned}\mathbf{E}_\nu(z) &= \sin\left(\tfrac{1}{2}\pi\nu\right){}_1\widetilde{F}_2\left(1; \tfrac{1}{2}(2-\nu), \tfrac{1}{2}(2+\nu); -\frac{z^2}{4}\right) \\ &- \frac{z}{2}\cos\left(\tfrac{1}{2}\pi\nu\right){}_1\widetilde{F}_2\left(1; \tfrac{1}{2}(3-\nu), \tfrac{1}{2}(3+\nu); -\frac{z^2}{4}\right)\end{aligned} \tag{12.10}$$

An example with real input:

```
>>> from xlcalcnet import dpm, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 10; x = 3
>>> dx = dpm.webere(n, x); mx = mpm.webere(n, x); gx = gmp.webere(n, x)
>>> fx = fpm.webere(n, x); ax = apm.webere(n, x)
>>> mpm.show([dx, mx, gx, fx, ax],  aligned=True)

```

12.8.3 Lommel function $s_{\mu,\nu}(x) = s^{(1)}_{\mu,\nu}(x)$

`ctx.lommel_s1(mu, nu, z)`

Returns the Lommel function S1. See also Wikipedia [1389], MathWorld [1035], NIST [461].

Gives the Lommel function $s_{\mu,\nu}$ or $s^{(1)}_{\mu,\nu}$

$$s_{\mu,\nu}(z) = \frac{z^{\mu+1}}{(\mu-\nu+1)(\mu+\nu+1)}\,{}_1F_2\left(1; \frac{\mu-\nu+3}{2}, \frac{\mu+\nu+3}{2}; -\frac{z^2}{4}\right)$$

which solves the inhomogeneous Bessel equation

$$z^2 f''(z) + z f'(z) + (z^2 - \nu^2) f(z) = z^{\mu+1}.$$

An integral representation is given by

$$s_{\mu,\nu}(z) = \frac{\pi^2}{2}\left[Y_\nu(z)\int_0^z t^\mu J_\nu(t)\,dt - J_\nu(z)\int_0^z t^\mu Y_\nu(t)\,dt\right].$$

A second solution is given by *lommels2()*.

An example with real input:

```
>>> from xlcalcnet import dpm, mpm, gmp, fpm, apm
>>> mpm.dps = 40; mu = '11.3'; nu = '2.7'; x = '0.3'
>>> dx = dpm.lommels1(nu, mu, x); mx = mpm.lommels1(nu, mu, x); gx = gmp.lommels1(nu, mu, x)
>>> fx = fpm.lommels1(nu, mu, x); ax = apm.lommels1(nu, mu, x)
>>> mpm.show([dx, mx, gx, fx, ax])
dpm:  -1.020597995063898424938319205823615501143E-4

```

12.8.4 Lommel function $S_{\mu,\nu}(x) = s^{(2)}_{\mu,\nu}(x)$

`ctx.lommel_s2(`*mu*, *nu*, *z*`)`

Returns the Lommel function S2. See also Wikipedia [1389], MathWorld [1035], NIST [461].

Gives the second Lommel function $S_{\mu,\nu}$ or $s^{(2)}_{\mu,\nu}$

$$S_{\mu,\nu}(z) = s_{\mu,\nu}(z) + 2^{\mu-1}\Gamma\left(\tfrac{1}{2}(\mu-\nu+1)\right)\Gamma\left(\tfrac{1}{2}(\mu+\nu+1)\right)\times \left[\sin(\tfrac{1}{2}(\mu-\nu)\pi)J_\nu(z) - \cos(\tfrac{1}{2}(\mu-\nu)\pi)Y_\nu(z)\right]$$

which solves the same differential equation as *lommels1()*.

An example with real input:

```
>>> from xlcalcnet import dpm, mpm, gmp, fpm, apm
>>> mpm.dps = 40; mu = '11.3'; nu = '2.7'; x = '0.3'
>>> dx = dpm.lommels2(nu, mu, x); mx = mpm.lommels2(nu, mu, x); gx = gmp.lommels2(nu, mu, x)

Part III

Supporting Functions

CHAPTER

THIRTEEN

ALGEBRA WITH RANDOM VARIABLES

13.1 Probability density function (pdf)

13.1.1 Calculating the pdf from the cdf

`ctx.pdf_from_cdf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns $\text{pdf}_X(x)$ from the cumulative distribution function (cdf) of a random variable X:

$$\text{pdf}_X(x) = \frac{\mathrm{d}}{\mathrm{d}x}\text{cdf}_X(x).$$

Using this method can be a viable option when the cdf, but not the pdf, is available in closed form.

13.1.2 Calculating the pdf from the characteristic function

`ctx.pdf_from_cf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Calculates the pdf as the inverse Fourier transform of its characteristic function.

The PDF of Y is the inverse Fourier transform of its characteristic function,

$$\text{pdf}_X(x) = \frac{1}{2\pi}\int_{-\infty}^{\infty} e^{ity}C_X(t)\mathrm{d}y = \frac{1}{\pi}\int_0^{\infty} \Re\left(e^{-itx}C_X(t)\right)\mathrm{d}t.$$

where $\Re(z)$ denotes the real part of z. We also have

$$\int_0^{\infty} \Re\left(e^{-itx}C_X(t)\right)\mathrm{d}t = \int_0^{\infty} \Re\left(C_X(t)\right)\cos(tx)\mathrm{d}t + \int_0^{\infty} \Im\left(C_X(t)\right)\sin(tx)\mathrm{d}t.$$

Using the right-hand side of this equation allows for efficient use of the quadrature formula of Fillon, with the half-period $\omega = \pi/x$.

13.2 Probability mass function (pmf)

13.2.1 Calculating the pmf from the cdf

`ctx.pmf_from_cdf`(*x*, *cdf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns $\text{pmf}_X(x)$, the probability mass function, calculated from the cumulative distribution function (cdf) of a random variable X:

$$\text{pmf}_X(x) = (\text{cdf}_X(x+d) - \text{cdf}_X(x))/d.$$

Using this method can be a viable option when the cdf, but not the pmf, is available in closed form.

13.2.2 Calculating the pmf from the characteristic function

`ctx.pmf_from_cf_lattice`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns $\text{pmf}_X(x)$, the probability mass function, calculated from the characteristic function $C_X(t)$ of a random variable X:

$$\text{pmf}(x) = \frac{1}{2\pi}\int_{-\pi}^{\pi} e^{-itx} C_X(t)\mathrm{d}t.$$

Using this method can be a viable option when the characteristic function, but not the pmf, is available in closed form.

13.2.3 Calculating the pmf from the factorial moments

`ctx.pmf_from_factorialmoments`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns $\text{pmf}_X(x)$, the probability mass function, of a random variable X, calculated from the factorial moments $\mu_{[r]}$:

$$\Pr[X = x] = \sum_{j\ge x}(-1)^{x+j}\binom{j}{x}\frac{\mu'_{[j]}}{j!} = \sum_{r\ge 0}(-1)^r\frac{\mu'_{[x+r]}}{x!r!}$$

and

$$\sum_{i\ge x}\Pr[X = i] = \sum_{j\ge x}(-1)^{x+j}\binom{j-1}{x-1}\frac{\mu'_{[j]}}{j!}$$

Using this method can be a viable option when the factorial moments, but not the pmf, are available in closed form.

13.2.4 Approximating the pmf with asymptotic expansions

This call Edgeworth, Cornish-Fisher, or Lugganinni-Rice.

13.3 Cumulative distribution function (cdf)

13.3.1 Calculating the cdf from the pdf

`ctx.cdf_from_pdf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns $\mathrm{cdf}_X(x)$, the cumulative distribution function (cdf) of a random variable X:

$$\mathrm{cdf}_X(x) = \int_0^x \mathrm{pdf}_X(x)\mathrm{d}t.$$

Using this method can be a viable option when the pdf, but not the cdf, is available in closed form.

13.3.2 Calculating the cdf from the pmf

`ctx.cdf_from_pmf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

If X is a purely discrete random variable, then it attains values $x_1, x_2, \ldots$ with probability $p_i = p(x_i)$, and the CDF of X will be discontinuous at the points x_i:

$$F_X(x) = \mathrm{P}(X \leq x) = \sum_{x_i \leq x} \mathrm{P}(X = x_i) = \sum_{x_i \leq x} p(x_i).$$

13.3.3 Calculating the cdf from the characteristic function

`ctx.cdf_from_cf_continuous`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Calculates the cdf from the characteristic function using the procedure of Gil-Pelaez.

Assuming that the characteristic function is absolutely integrable over $(-\infty, \infty)$, Gil-Pelaez derived the following inversion formula which requires integration of a real-valued function only. In particular,

$$\mathrm{cdf}_X(x) = \frac{1}{2} - \frac{1}{2\pi}\int_{-\infty}^{\infty} \frac{e^{-itx}C_X(t) - e^{itx}C_X(t)}{it}\mathrm{d}t = \frac{1}{2} - \frac{1}{\pi}\int_0^{\infty} \Im\left(\frac{e^{-itx}C_X(t)}{t}\right)\mathrm{d}t.$$

where $\Im(z)$ denotes the imaginary part of z. We also have

$$\int_0^{\infty} \Im\left(\frac{e^{-itx}C_X(t)}{t}\right)\mathrm{d}t = \int_0^{\infty} \Im\left(\frac{C_X(t)}{t}\right)\cos(tx)\mathrm{d}t - \int_0^{\infty} \Re\left(\frac{C_X(t)}{t}\right)\sin(tx)\mathrm{d}t.$$

Using the right-hand side of this equation allows for efficient use of the quadrature formula of Fillon, with the half-period $\omega = \pi/x$.

The python code is currently in Charfun.py

The following code provides a test-suite for the numerical inversion of the characteristic function:

```
class tests_charfunc(rv_cont):

    def __init__(self, rv2, x = 5, a = 0, b = 2):

        cdf_value = rv2.cdf(x)
        print ("rv2.cdf(x): ", cdf_value)

        rv2.set_x(x)
        plot(rv2.gil_pelaez_imag, [a, b], points=200)
```

(continues on next page)

(continued from previous page)

```
        print

        rv2.set_x(x)
        plot(rv2.gil_pelaez_cos, [a, b], points=200)
        print

        rv2.set_x(x)
        plot(rv2.gil_pelaez_sin, [a, b], points=200)
        print

        rv2.set_x(x)
        I0 = quad(rv2.gil_pelaez_imag, [0, +inf])
        print("Integral: ", I0)
        result0 = 0.5 - I0/pi
        print("result0:", result0 )
        print("diff0:", result0 - cdf_value)

        rv2.set_x(x)
        I1 =quadosc(rv2.gil_pelaez_cos, [0, inf], period=1*pi/x) # half period
        print("I1:", I1 )

        rv2.set_x(x)
        I2 =quadosc(rv2.gil_pelaez_sin, [0, inf], period=1*pi/x) # half period
        print("I2:", I2 )

        I3 = I1 + I2
        print("I3:", I3 )
        print("Int diff:", I3 - I0)
        result3 = 0.5 - I3/pi
        print("result3:", result3 )
        print("diff3:", result3 - cdf_value)
```

Example: non-central chi-squared distribution

The following code shows the difference between using the generic integration (error: diff0: -6.1218939724378892896e-6) and quadrature for oscillatory functions (error: diff3: 8.4703294725430033907e-22).

```
mp.dps = 20
print()
print ("Hello mpDistributions local ! ")
print()

a = 0.0
b = 2

n = mpf("5")
x = mpf("10")
rv2 = mpr().chisquare(n)

tests_charfunc(rv2, x, a, b)
```

This produces the following output (plots are to be added):

```
Hello mpDistributions local !

rv2.cdf(x):  0.92476475385348782128

Integral:  -1.334418597712864291
result0: 0.92475863195951538339

I1: 0.11817924829245123086
I2: -1.4526170785024453884
```

(continues on next page)

(continued from previous page)

```
I3: -1.3344378302099941575
Int diff: -0.00001923249712986651 1475
result3: 0.92476475385348782128
diff3: 8.4703294725430033907e-22
```

13.3.4 Calculating the cdf and sf from the characteristic function (lattice distribution)

`ctx.cdf_from_cf_lattice`(x, cf)

where `ctx` is `dec`, `mpm`, or `gmp`.

The corresponding inversion formula for discrete distributions on the nonnegative integers is

$$\operatorname{cdf}(x) = \frac{1}{\pi}\int_0^\pi \Re\left(C_X(t)\sum_{z=0}^{x} e^{-itz}\right)\mathrm{d}t.$$

$$\operatorname{sf}(x) = 1 - \operatorname{cdf}(x) = \frac{1}{\pi}\int_0^\pi \Re\left(C_X(t)\sum_{z=x+1}^{N(N+1)/2} e^{-itz}\right)\mathrm{d}t.$$

13.3.5 Calculating the cdf from the factorial moments (lattice distributions)

The following relationships hold between the probabilities and the factorial moments in the case of a discrete distribution:

$$\Pr[X = x] = \sum_{j\geq x}(-1)^{x+j}\binom{j}{x}\frac{\mu'_{[j]}}{j!} = \sum_{r\geq 0}(-1)^r\frac{\mu'_{[x+r]}}{x!r!}$$

and

$$\sum_{i\geq x}\Pr[X = i] = \sum_{j\geq x}(-1)^{x+j}\binom{j-1}{x-1}\frac{\mu'_{[j]}}{j!}$$

See also Johnson(2005), page 59.

13.4 Quantile function

See also Wikipedia [1139].

13.4.1 Calculating the quantile function from the cdf

ctx.qtf_from cdf(x, cf)

where ctx is dec, mpm, or gmp.

This requires a starting point for a Newton iteration. If a specific starting point is not available, then a Cornish-Fisher expansion can be tried first.

13.4.2 Approximating the quantile function from the cumulant generating function

See inverse Jension saddlepoint approximation for examples

13.4.3 Approximating the quantile function from the cumulants

See Cornish-Fisher expansion for example.

13.5 Characteristic function

13.5.1 Calculating the characteristic function from the pdf (continuous distribution)

ctx.cf_from pdf(x, cf)

where ctx is dec, mpm, or gmp.

Let X denote a continuous univariate random variable with probability density function (PDF) $\text{pdf}_X(x)$, cumulative distribution function (CDF) $\text{cdf}_X(x)$, and moment generating function $M_X(t)$. The characteristic function of the distribution of X, given by the Fourier transform of its PDF, is defined as

$$C_X(t) = \mathrm{E}\left[e^{itX}\right] = M_X(it) = \int_{-\infty}^{\infty} e^{itx}\text{pdf}_X(x)\mathrm{d}x.$$

Note however that the characteristic function of a distribution always exists, even when the probability density function or moment-generating function do not.

13.5.2 Calculating the characteristic function from the pmf (lattice distribution)

ctx.cf_from pmf(x, cf)

where ctx is dec, mpm, or gmp.

For a discrete distribution on the nonnegative integers, it is defined as

$$C_X(t) = \mathrm{E}[e^{itX}] = \sum_{j=0}^{\infty} e^{ijt}\text{pmf}(j)$$

See Johnson(2005), p. 50

13.5.3 Calculating the characteristic function from the quantile function

ctx.cf_from qtf(x, cf)

where ctx is dec, mpm, or gmp.

$$C_X(t) = \mathrm{E}\left[e^{itX}\right] = \int_0^1 e^{it\,\text{qtf}_X(p)}dp.$$

13.5.4 Calculating the characteristic function from the raw moments

ctx.**cf_from_rawmoments**(*x*, *cf*)

where ctx is dec, mpm, or gmp.

Formally, we can write

$$C_X(t) = 1 + \sum_{k=1}^{\infty} \mu'_X(k)\frac{i^k t^k}{k!}$$

$$C_X(t) = 1 + \sum_{k=1}^{\infty} \mathrm{E}\left[X^k\right]\frac{i^k t^k}{k!}$$

See also http://mathworld.wolfram.com/RawMoment.html for an expression involving cumulants.

13.6 Moment generating function

See also Wikipedia [1136].

13.6.1 Calculating the moment-generating function from the pdf

`ctx.mgf_from_pdf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The moment-generating function's definition expands to

$$M_X(t) = \mathrm{E}\left[e^{tX}\right] = \int_{-\infty}^{\infty} e^{tx} f_X(x)\,\mathrm{d}x$$

13.6.2 Calculating the moment-generating function from the characteristic function

`ctx.mgf_from_cf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The characteristic function $\varphi_X(t)$ is related to the moment-generating function via $\varphi_X(t) = M_{iX}(t) = M_X(it)$: the characteristic function is the moment-generating function of iX or the moment generating function of X evaluated on the imaginary axis. This function can also be viewed as the Fourier transform of the probability density function, which can therefore be deduced from it by inverse Fourier transform.

13.6.3 Calculating the moment-generating function from the cumulant-generating function

`ctx.mgf_from_cgf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The cumulant-generating function is defined as the logarithm of the moment-generating function; some instead define the cumulant-generating function as the logarithm of the characteristic function, while others call this latter the second cumulant-generating function.

13.6.4 Calculating the moment-generating function from the probability-generating function

`ctx.mgf_from_pgf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The probability-generating function is defined as $G(z) = E\left[z^X\right]$. This immediately implies that $G(e^t) = E\left[e^{tX}\right] = M_X(t)$.

```
>>> from xlcalcnet import *
>>> mp.dps = 30
>>> mu = 0; sigma = 1; t = 0.3;
>>> print ("c_x: ", chi_squared(mu, sigma).c_x(t))
6.356352346256452561561561561456 1356E+00
```

13.6.5 Calculating the moment-generating function from the raw moments

`ctx.mgf_from_rawmoments`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

$$M_X(t) = 1 + tm_1 + \frac{t^2 m_2}{2!} + \frac{t^3 m_3}{3!} + \cdots + \frac{t^n m_n}{n!} + \cdots$$

where m_n is the nth moment. Differentiating $M_X(t) i$ times with respect to t and setting $t = 0$, we obtain the ith moment about the origin.

13.7 Cumulant generating function

See also Wikipedia [1124].

13.7.1 Calculating the cumulant-generating function from the characteristic function

`ctx.cgf_from_cf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The characteristic function $\varphi_X(t)$ is related to the moment-generating function via $\varphi_X(t) = M_{iX}(t) = M_X(it)$: the characteristic function is the moment-generating function of iX or the moment generating function of X evaluated on the imaginary axis. This function can also be viewed as the Fourier transform of the probability density function, which can therefore be deduced from it by inverse Fourier transform.

13.7.2 Calculating the cumulant-generating function from the moment-generating function

`ctx.cgf_from_mgf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The cumulant-generating function is defined as the logarithm of the moment-generating function; some instead define the cumulant-generating function as the logarithm of the characteristic function, while others call this latter the second cumulant-generating function.

13.7.3 Calculating the cumulant-generating function from the probability-generating function

`ctx.cgf_from_pgf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The cumulant-generating function is defined as the logarithm of the moment-generating function; some instead define the cumulant-generating function as the logarithm of the characteristic function, while others call this latter the second cumulant-generating function.

13.7.4 Calculating the cumulant-generating function from the cumulants

`ctx.cgf_from_cumulants`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The cumulants κ_n are obtained from a power series expansion of the cumulant generating function:

$$K(t) = \sum_{n=1}^{\infty} \kappa_n \frac{t^n}{n!} = \mu t + \sigma^2 \frac{t^2}{2} + \cdots .$$

This expansion is a Maclaurin series, so the n-th cumulant can be obtained by differentiating the above expansion n times and evaluating the result at zero:

$$\kappa_n = K^{(n)}(0).$$

13.8 Probability generating function

13.8.1 Calculating the probability-generating function from the pmf vector

`ctx.`**`pgf_from_pmf_vector`**(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Some text

13.8.2 Calculating the probability-generating function from the moment-generating function

`ctx.`**`pgf_from_mgf`**(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Some text

13.9 Factorial Moments

13.9.1 Calculating the factorial moments from the raw moments

`ctx.factorial_moments_from_rawmoments`(x, cf)

where `ctx` is `dec`, `mpm`, or `gmp`.

Calculates the factorial moments $\mu'_{[r]}$ from the raw moments μ'_r

$$\mu'_{[r]} = \sum_{j=0}^{r} s(r,j)\mu'_j,$$

where $s(r,j)$ is the Stirling number of the first kind.

13.9.2 Calculating the factorial moments from the cumulants

`ctx.factorial_moments_from_cumulants`(x, cf)

where `ctx` is `dec`, `mpm`, or `gmp`.

Calculates the factorial moments $\mu'_{[r]}$ from the raw moments μ'_r

$$\mu'_{[r]} = \sum_{j=0}^{r} s(r,j)\mu'_j,$$

where $s(r,j)$ is the Stirling number of the first kind.

13.10 Raw Moments

See also Wikipedia [1135]

13.10.1 Calculating the raw moments from the pdf

`ctx.rawmoments_from_pdf`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

The n-th moment of a real-valued continuous function f(x) of a real variable about a value c is

$$\mu_n = \int_{-\infty}^{\infty} (x-c)^n \, f(x) \, \mathrm{d}x.$$

It is possible to define moments for random variables in a more general fashion than moments for real values—see moments in metric spaces. The moment of a function, without further explanation, usually refers to the above expression with c = 0.

13.10.2 Calculating the raw moments from the pmf

`ctx.rawmoments_from_pmf_vector`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

If X is a purely discrete random variable, then it attains values $x_1, x_2, \ldots$ with probability $p_i = p(x_i)$, and the CDF of X will be discontinuous at the points x_i:

$$\mu_n = \sum_{x_i \leq x} x_i^n p(x_i).$$

13.10.3 Calculating the raw moments from the factorial moments

`ctx.rawmoments_from_factorial_moments`(*x*, *cf*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Calculates the raw moments μ'_r from the factorial moments $\mu'_{[r]}$

$$\mu'_r = \sum_{j=0}^{r} S(r,j) \mu'_{[j]},$$

where $S(r,j)$ is the Stirling number of the second kind.

13.10.4 Calculating the raw moments from the central moments

`ctx.rawmoments_from_centralmoments`(*central*, *raw*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Calculates the raw moments μ'_r from the central moments μ_r (see Lee and Lin [404], Rinne [481], p. 36):

$$\mu'_r = \sum_{j=0}^{r} \binom{r}{j} \mu_{r-j} (\mu'_1)^r$$

```
>>> from xlcalcnet import dec, mpr, ivr, ivc
>>> ivr.dps = 25; ivr.pretty = True
>>> ivr.exp([-inf,0])
[0.0, 1.0]
>>> ivr.exp([0,1])
[1.0, 2.7182818284590452353602874955 8]
```

13.10.5 Calculating the raw moments from the cumulants

`ctx.rawmoments_from_cumulants()`

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Calculates the raw moments μ'_r from the cumulants κ_r (see Lee and Lin [404], Rinne [481], p. 36):

$$\mu'_r = \kappa_r + \sum_{j=1}^{r-1} \binom{r-1}{j-1} \mu'_{r-j} \kappa_j$$

```
>>> from xlcalcnet import dec, mpr, ivr, ivc
>>> ivr.dps = 25; ivr.pretty = True
>>> ivr.exp([-inf,0])
[0.0, 1.0]
>>> ivr.exp([0,1])
[1.0, 2.7182818284590452353602874955 8]
```

13.10.6 Calculating the raw moments from the moment-generating function

`ctx.rawmoments_from_mgf()`

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

The moment-generating function is so called because if it exists on an open interval around t = 0, then it is the exponential generating function of the moments of the probability distribution:

$$m_n = E\left(X^n\right) = M_X^{(n)}(0) = \left.\frac{d^n M_X}{\mathrm{d}t^n}\right|_{t=0}.$$

That is, with n being a nonnegative integer, the nth moment about 0 is the nth derivative of the moment generating function, evaluated at t = 0.

13.10.7 Calculating the raw moments from the characteristic function

`ctx.rawmoments_from_cf()`

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Characteristic functions can also be used to find moments of a random variable. Provided that the nth moment exists, the characteristic function can be differentiated n times and

$$\mathrm{E}\left[X^n\right] = i^{-n}\,\varphi_X^{(n)}(0) = i^{-n}\left[\frac{d^n}{\mathrm{d}t^n}\varphi_X(t)\right] t = 0$$

13.10.8 Calculating the raw moments from the probability-generating function

`ctx.rawmoments_from_pgf()`

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

The kth raw moment of X is given by

$$\mathrm{E}(X^k) = \left(z\frac{\partial}{\partial z}\right)^k G(z)\Big|_{z=1^-}$$

More generally, the kth factorial moment,

$\mathrm{E}(X(X-1)\cdots(X-k+1))$ of X is given by

$$\mathrm{E}\left(\frac{X!}{(X-k)!}\right) = G^{(k)}(1^-), \quad k \geq 0.$$

13.11 Central Moments

See also Wikipedia [1124]

13.11.1 Calculating the central moments from the factorial moments

`ctx.centralmoments_from_factorialmoments`(*self*, *mfac*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Calculates the central moments μ_r from the factorial moments.

13.11.2 Calculating the central moments from the raw moments

`ctx.centralmoments_from_rawmoments`(*central*, *raw*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Calculates the central moments μ_r from raw the moments μ'_r (see Lee and Lin [404], Rinne [481], p. 36):

$$\mu_r = \sum_{j=0}^{r} \binom{r}{j} \mu'_{r-j} (-\mu'_1)^j$$

```
>>> from xlcalcnet import dec, mpr, ivr, ivc
>>> ivr.dps = 25; ivr.pretty = True
>>> ivr.exp([-inf,0])
[0.0, 1.0]
>>> ivr.exp([0,1])
[1.0, 2.7182818284590452353602874956]
```

13.11.3 Calculating the central moments from the cumulants

`ctx.centralmoments_from_cumulants`()

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Calculates the central moments μ_r from the cumulants κ_r (see Lee and Lin [404], Rinne [481], p. 36):

$$\mu_r = \kappa_r + \sum_{j=1}^{r-1} \binom{r-1}{j-1} \mu_{r-j} \kappa_j$$

```
>>> from xlcalcnet import dec, mpr, ivr, ivc
>>> ivr.dps = 25; ivr.pretty = True
>>> ivr.exp([-inf,0])
[0.0, 1.0]
>>> ivr.exp([0,1])
[1.0, 2.7182818284590452353602874956]
```

13.12 Cumulants

See also Wikipedia [1124]

13.12.1 Calculating the cumulants from the pmf vector

cumulants_from_pmfvector(*self*, *x*, *nl*, *order*, *show=False*)

where ctx is ipm, dec, mpm, or gmp.

Calculates the cumulants κ_r from the pmf vector.

13.12.2 Calculating the cumulants from the factorial moments

ctx.**cumulants_from_factorialmoments**(*self*, *mfac*)

where ctx is ipm, dec, mpm, or gmp.

Calculates the cumulants κ_r from the factorial moments.

13.12.3 Calculating the cumulants from the raw moments

ctx.**cumulants_from_rawmoments**(*raw_moments*)

where ctx is ipm, dec, mpm, or gmp.

Calculates the cumulants κ_r from the raw moments μ'_r (see Lee and Lin [404], Rinne [481], p. 36):

$$\kappa_r = \mu'_r - \sum_{j=1}^{r-1} \binom{r-1}{j-1} \mu'_{r-j} \kappa_j$$

13.12.4 Calculating the cumulants from the central moments

ctx.**cumulants_from_centralmoments**(*cumulants*, *central*)

where ctx is ipm, dec, mpm, or gmp.

Calculates the cumulants κ_r from the central moments μ_r :

$$\kappa_r = \mu_r - \sum_{j=2}^{r-1} \binom{r-1}{j-1} \mu_{r-j} \kappa_j, \quad r > 1, \quad \kappa_1 = \mu_1.$$

```
>>> from xlcalcnet import dec, mpr, ivr, ivc
>>> ivr.dps = 25; ivr.pretty = True
>>> ivr.exp([-inf,0])
[0.0, 1.0]
>>> ivr.exp([0,1])
[1.0, 2.71828182845904523536028749558]
```

13.12.5 Calculating the cumulants from the cumulant-generating function

ctx.**cumulants_from_cdf**(*k*, *cgf*)

where ctx is ipm, dec, mpm, or gmp.

The cumulants κ_n are obtained from a power series expansion of the cumulant generating function:

$$K(t) = \sum_{n=1}^{\infty} \kappa_n \frac{t^n}{n!} = \mu t + \sigma^2 \frac{t^2}{2} + \cdots .$$

This expansion is a Maclaurin series, so the n-th cumulant can be obtained by differentiating the above expansion n times and evaluating the result at zero:

$$\kappa_n = K^{(n)}(0).$$

CHAPTER

FOURTEEN

SERIES AND INTEGRALS

14.1 Finite series algorithms for selected distributions

This section provides distribution functions in interval arithmetic for some special cases. These function can be used to assess the accuracy for other algorithms without verification.

14.1.1 Central χ^2 distribution, cdf (integer degrees of freedom)

`ctx.chi2_cohen_cdf`(*x*, *nu*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the central chi-square distribution for integer degrees of freedom. See also Wikipedia [1150], MathWorld [798], BoostMath [53], Witkovský [1466].

The cdf can be expressed as a finite sum if n is an integer:

$$F_{\chi^2}(n,x) = 1 + 2\Phi(-\sqrt{x}) + 2\phi\left(\sqrt{x}\right) \sum_{r=1}^{(n-1)/2} \frac{\sqrt{x}^{2r-1}}{1\cdot 3\cdot 5\ldots(2r-1)}, \qquad \text{for } n \text{ odd},$$

$$F_{\chi^2}(n,x) = e^{-x/2}\left(1 + \sum_{r=1}^{(n-2)/2} \frac{x^r}{2\cdot 4\cdot 6\ldots(2r)}\right), \qquad \text{for } n \text{ even},$$

where $\phi(\cdot)$ denotes the pdf of the normal distribution (see) and $\Phi(\cdot)$ denotes the cdf of the normal distribution (see).

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 12; n = 10
>>> dx = dec.chi2_cohen_cdf(x, n); mx = mpm.chi2_cohen_cdf(x, n)
>>> ix = ipm.chi2_cohen_cdf(x, n); fx = fpm.chi2_cohen_cdf(x, n)
>>> gx = gmp.chi2_cohen_cdf(x, n); ax = apm.chi2_cohen_cdf(x, n)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

14.1.2 Central Student t distribution, cdf (integer degrees of freedom)

ctx.**student_t_owen_cdf**(*x*, *nu*, *cdf=True*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the cdf of the central Student t distribution for integer degrees of freedom. See also Wikipedia [1173], MathWorld [815], BoostMath [69], Broda and Paolella [160], Witkovský [1462], Witkovský [1481].

The cdf can be expressed as a finite sum if n is an integer:

$$F_t\left(n,x\right)=\tfrac{1}{2}+z_n+(c_1+c_3+\cdots+c_{n-2}),\qquad\text{for } n \text{ odd},$$

$$\text{where } z_n=\frac{1}{\pi}\arctan(\frac{x}{\sqrt{n}});a_n=\frac{1}{\sqrt{n}\pi};b_n=\frac{n}{n+x^2};c_1=xa_nb_n;c_k=c_{k-2}b_n(1-1/k)$$

$$F_t\left(n,x\right)=\tfrac{1}{2}+(c_0+c_2+\cdots+c_{n-2}),\qquad\text{for } n \text{ even},$$

$$\text{where } d_n=\frac{1}{2\sqrt{n+x^2}};b_n=\frac{n}{n+x^2};c_0=xd_n;c_k=c_{k-2}b_n(1-1/k)$$

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 2; n = 10;
>>> dx = dec.student_t_owen_cdf(x, n); mx = mpm.student_t_owen_cdf(x, n)
>>> ix = ipm.student_t_owen_cdf(x, n); fx = fpm.student_t_owen_cdf(x, n)
>>> gx = gmp.student_t_owen_cdf(x, n); ax = apm.student_t_owen_cdf(x, n)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1
mpm:  3.1138774234168360557146160900744444149943e-1
ipm:  3.1138774234168360557146160900744444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.1138774234168360557146160900744444149943E-01
ipm:  3.1138774234168360557146160900744444149943e-1 (4.055e-38%)
```

14.1.3 Central Fisher F distribution, cdf (integer degrees of freedom)

ctx.**fisher_f_seber_cdf**(*x*, *m*, *n*, *cdf=True*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the cdf of the central Fisher F distribution for integer degrees of freedom. See also Wikipedia [1153], MathWorld [801], BoostMath [56], Witkovský [1468], Abramowitz and Stegun. [3], Butler and Paolella [166], Chattamvelli and Jones [175], Witkovský [1462].

The cdf can be expressed as a finite sum if m is an integer, and n is a positive real number:

$$1-F_F\left(m,n,x\right)=a_m+b_m(c_1+c_3+\cdots+c_{m-2}),\qquad\text{for } m \text{ odd},$$

$$\text{where } a_m=2T(n,-z_m);b_m=2t(n,z_m)\cdot z_m;z_m=\sqrt{mx};$$

$$1-F_F\left(m,n,x\right)=d_m(c_0+c_2+\cdots+c_{m-2}),\qquad\text{for } m \text{ even},$$

$$\text{where } d_m=(1-u_m)^{n/2}$$

$$\text{and } u_m=mx/(mx+n),\quad c_0=c_1=1,\quad c_k=c_{k-2}u_m\cdot(n+k-2)/k$$

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 3; m = 10; n = 20
>>> dx = dec.fisher_f_seber_cdf(x, m, n); mx = mpm.fisher_f_seber_cdf(x, m, n)
>>> ix = ipm.fisher_f_seber_cdf(x, m, n); fx = fpm.fisher_f_seber_cdf(x, m, n)
>>> gx = gmp.fisher_f_seber_cdf(x, m, n); ax = apm.fisher_f_seber_cdf(x, m, n)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
```

(continues on next page)

(continued from previous page)

```
dec:  3.11387742341683605571461609007444414994 3E-1
mpm:  3.11387742341683605571461609007444414994 3e-1
ipm:  3.11387742341683605571461609007444414994 4e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.11387742341683605571461609007444414994 3E-01
ipm:  3.11387742341683605571461609007444414994 3e-1 (4.055e-38%)
```

14.1.4 Central Beta distribution, cdf ($2a$ an integer, $2b$ an integer)

`ctx.beta_seber_cdf`(*x*, *a*, *b*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the central Fisher F distribution for integer degrees of freedom. See also Wikipedia [1148], MathWorld [797], BoostMath [51], Witkovský [1465].

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.3'; a = '10'; b = '20'
>>> dx = dec.beta_seber_cdf(x, a, b); mx = mpm.beta_seber_cdf(x, a, b)
>>> ix = ipm.beta_seber_cdf(x, a, b); fx = fpm.beta_seber_cdf(x, a, b)
>>> gx = gmp.beta_seber_cdf(x, a, b); ax = apm.beta_seber_cdf(x, a, b)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.11387742341683605571461609007444414994 3E-1
mpm:  3.11387742341683605571461609007444414994 3e-1
ipm:  3.11387742341683605571461609007444414994 4e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.11387742341683605571461609007444414994 3E-01
ipm:  3.11387742341683605571461609007444414994 3e-1 (4.055e-38%)
```

14.1.5 Noncentral χ^2 distribution, cdf (integer degrees of freedom)

`ctx.chi2_nc_cohen_cdf`(*x*, *nu*, *lambda1*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the central chi-square distribution for integer degrees of freedom. See also Wikipedia [1166], MathWorld [810], Patnaik [465], Penev and Raykov [467], Wang and Gray [795], Winterbottom [1456], BoostMath [64], Witkovský [1476], Johansson [386], András and Baricz [10].

For odd degrees of freedom, the pdf and cdf can be expressed as a finite sum, using the recurrence relations given in section ref{NoncentralChiSquareDistributionRecur}, and defining $h(n, x, \lambda) = e^{(1/2)(x+\lambda)} f_{\chi^2}(n, x; \lambda)$:

$$F_{\chi^2}\left(1, x; \delta^2\right) = \Phi(x - \delta) - \Phi(-x - \delta)$$

$$h(1, x; \lambda) = \frac{\cosh(\sqrt{x\lambda})}{\sqrt{2\pi x}}, \quad h(3, x; \lambda) = \frac{\sinh(\sqrt{x\lambda})}{\sqrt{2\pi\lambda}}$$

where $\Phi(\cdot)$ denotes the cdf of the normal distribution.

NOTE: This needs to be extended using Marcum Q.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 12; nu = 7; l = 30
>>> dx = dec.chi2_nc_cohen_cdf(x, n, l); mx = mpm.chi2_nc_cohen_cdf(x, n, l)
>>> ix = ipm.chi2_nc_cohen_cdf(x, n, l); fx = fpm.chi2_nc_cohen_cdf(x, n, l)
>>> gx = gmp.chi2_nc_cohen_cdf(x, n, l); ax = apm.chi2_nc_cohen_cdf(x, n, l)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.11387742341683605571461609007444414994 3E-1
```

(continues on next page)

(continued from previous page)

```
mpm:  3.11387742341683605571461609007444414994 3e-1
ipm:  3.11387742341683605571461609007444414994 4e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.11387742341683605571461609007444414994 3E-01
ipm:  3.11387742341683605571461609007444414994 3e-1 (4.055e-38%)
```

14.1.6 Noncentral Student t distribution, cdf (integer degrees of freedom)

`ctx.student_t_nc_owen_cdf`(*x*, *n*, *delta*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the noncentral Student t distribution for integer degrees of freedom $n \geq 1$, noncentrality parameter $\delta \in \mathbb{R}$ and the support interval $(-\infty, +\infty)$. See also Wikipedia [1167], MathWorld [812], BoostMath [66], Benton and Krishnamoorthy [30], Broda and Paolella [160], Owen [455], Wang and Gray [795], Witkovský [1463], Johansson [386].

The function uses the following algorithm given by Owen [455]:

$$F_{t'}\left(n, x, \delta\right) = \Phi(-\delta\sqrt{B}) + 2(M_1 + M_3 + \cdots + M_n) \quad \text{for odd degrees of freedom}$$

$$F_{t'}\left(n, x, \delta\right) = \Phi(-\delta) + \sqrt{2\pi}(M_2 + M_4 + \cdots + M_n) \quad \text{for even degrees of freedom}$$

$$A = \frac{t}{\sqrt{n}}, \quad B = \frac{n}{n + t^2}$$

$$M_1 = T_{\text{Owen}}(\delta\sqrt{B}, A), \quad M_2 = A\sqrt{B}\phi(\delta\sqrt{B}) - \Phi(\delta A\sqrt{B})$$

$$M_3 = B(\delta A M_2 + A\phi(\delta)/\sqrt{2\pi}), \quad M_4 = \tfrac{1}{2}B(\delta A M_3 + M_2)$$

$$M_k = \frac{k-3}{k-2}B(a_k \delta A M_{k-1} + M_{k-2}), \quad a_k = \frac{1}{(k-4)a_{k-1}} \quad \text{for } k \geq 5,$$

where $T_{\text{Owen}}(\cdot, \cdot)$ denotes Owen's T function , and $\Phi(\cdot)$ and $\phi(\cdot)$ denote the cdf and pdf of the normal distribution, respectively.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 20; n = 10; d = 30
>>> dx = dec.student_t_nc_owen_cdf(x, n, d); mx = mpm.student_t_nc_owen_cdf(x, n, d)
>>> ix = ipm.student_t_nc_owen_cdf(x, n, d); fx = fpm.student_t_nc_owen_cdf(x, n, d)
>>> gx = gmp.student_t_nc_owen_cdf(x, n, d); ax = apm.student_t_nc_owen_cdf(x, n, d)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.11387742341683605571461609007444414994 3E-1
mpm:  3.11387742341683605571461609007444414994 3e-1
ipm:  3.11387742341683605571461609007444414994 4e-1 (4.147e-38%)

14.1.7 Noncentral Fisher F distribution, cdf (m an even integer)

`ctx.fisher_f_nc_seber_cdf`(*x*, *m*, *n*, *lambda1*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the noncentral Fisher F distribution for integer degrees of freedom. See also Wikipedia [1164], MathWorld [811], BoostMath [65], Benton and Krishnamoorthy [30], Butler and Paolella [166], Chou [179], Chattamvelli and Jones [175], Wang and Gray [795], Witkovský [1477], Johansson [386].

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 13; m = 10; n = 20; l1 = 30
>>> dx = dec.fisher_f_nc_seber_cdf(x, m, n, l1); mx = mpm.fisher_f_nc_seber_cdf(x, m, n, l1)
>>> ix = ipm.fisher_f_nc_seber_cdf(x, m, n, l1); fx = fpm.fisher_f_nc_seber_cdf(x, m, n, l1)
>>> gx = gmp.fisher_f_nc_seber_cdf(x, m, n, l1); ax = apm.fisher_f_nc_seber_cdf(x, m, n, l1)
>>> mpm.show([dx, mx, ix]); mpm.show([fx, gx, ax])
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

14.1.8 Noncentral Beta distribution, cdf (b an integer)

`ctx.beta_nc_seber_cdf`(x, a, b, *lambda1*, *cdf=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the noncentral Fisher F distribution for integer degrees of freedom. See also Wikipedia [1165], BoostMath [63], Wang and Gray [795], Witkovský [1475], Seber [497], Johansson [386].

CDF: Finite Series for even error degrees of freedom:

This is code for noncentral beta and needs to be adapted for noncentral F.

The cdf can be calculated using the following finite series, if b is an integer:

$$I(x; a, b, \lambda) = e^{-\lambda(1-x)} \sum_{n=0}^{b-1} L_n, \quad \text{where}$$

$$L_0 = 1, \quad L_1 = (1-x)(a+\lambda x),$$

$$L_n = \frac{1-x}{n}\left((2n-2+a+\lambda x)L_{n-1} - (n+a-2)(1-x)L_{n-2}\right)$$

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 0.25; a = 10; b = 20; l = 30
>>> dx = dec.beta_nc_seber_cdf(x, a, b, l); mx = mpm.beta_nc_seber_cdf(x, a, b, l)
>>> ix = ipm.beta_nc_seber_cdf(x, a, b, l); fx = fpm.beta_nc_seber_cdf(x, a, b, l)
>>> gx = gmp.beta_nc_seber_cdf(x, a, b, l); ax = apm.beta_nc_seber_cdf(x, a, b, l)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

```

14.1.9 Pearson's ρ distribution, pdf (integer N)

`ctx.pearson_rho_nc_owen_pdf`(r, N, *rho*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the Pearson rho distribution for integer degrees of freedom. See also Wikipedia [1170], MathWorld [799], Hotelling [375], Odeh [427].

See Hotelling [375].

For $N = 3, 4$ the probability density function can be expressed in closed form Odeh [427]:

$$f_R(3, r; \rho) = \frac{A^2(1 + xU)}{\pi B^2 C}$$

$$f_R(4, r; \rho) = \frac{AC^3(B^2U + 3x(1 + xU))}{\pi B^4}$$

where x, A, B, C and U are defined as follows:

$$x = \rho r, \qquad A = \sqrt{1 - \rho^2}, \quad B = \sqrt{1 - x^2}, \quad C = \sqrt{1 - r^2}, \quad U = \frac{\arccos(-x)}{B}$$

The probability density function $f_R(N, r; \rho)$ satisfies the following recurrence formula for $N \geq 5$ (see Hotelling [375]):

$$f_R(N, r; \rho) = \frac{2N - 5}{B^2(N - 3)} xAC f_R(N - 1, r; \rho) + \frac{N - 3}{B^2(N - 4)} A^2C^2 f_R(N - 2, r; \rho)$$

For $0 \leq x \leq 1$,this recurrence formula can be safely used to find a sequence of values for $f_R(5, r; \rho)$, $f_R(6, r; \rho), ..., f_R(N, r; \rho)$. However, for $-1 < x < 0$ the recurrence formula is numerically unstable, since the two terms on the right-hand of the equation are of opposite sign.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; r = '0.25'; N = '20'; rho = '0.1'
>>> dx = dec.pearson_rho_nc_owen_pdf(x, N, rho); mx = mpm.pearson_rho_nc_owen_pdf(x, N, rho)
>>> ix = ipm.pearson_rho_nc_owen_pdf(x, N, rho); fx = fpm.pearson_rho_nc_owen_pdf(x, N, rho)
>>> gx = gmp.pearson_rho_nc_owen_pdf(x, N, rho); ax = apm.pearson_rho_nc_owen_pdf(x, N, rho)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

14.1.10 Pearson's ρ distribution, cdf (integer N)

`ctx.pearson_rho_nc_owen_cdf`(*x*, *N*, *rho*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the Pearson rho distribution for integer degrees of freedom. See also Wikipedia [1170], MathWorld [799], Hotelling [375], Odeh [427].

For $N = 3, 4, 5, 6$ the cumulative distribution function $F_R(N, r; \rho)$ can be expressed in closed form

$$F_R(3, r; \rho) = \frac{\arccos(-r)}{\pi} - \frac{\rho CU}{\pi}$$

$$F_R(4, r; \rho) = \frac{\arccos(\rho)}{\pi} - \frac{\rho AC^2}{\pi B^2} - \frac{rA^3U}{\pi B^2}$$

$$F_R(5, r; \rho) = \frac{\arccos(-r)}{\pi} - \frac{(x^2 - 3\rho^3 + 2)rA^2C}{2\pi B^4} + \frac{(\rho^2 - 3 + 2\rho^2x^2)\rho C^3U}{2\pi B^4}$$

$$F_R(6, r; \rho) = \frac{\arccos(\rho)}{\pi} - \frac{[\rho r^2(2x^2 + 13) - 2\rho(4x^4 + 6x^2 + 5) + \rho^3(11x^2 + 4)`AC^2}{6\pi B^6} + \frac{2x^2(-2r^2 + 1)rA^5U}{6\pi B^6} \tag{14.1}$$

where x, A, B, C and U are defined as follows:

$$x = \rho r, \qquad A = \sqrt{1-\rho^2}, \quad B = \sqrt{1-x^2}, \quad C = \sqrt{1-r^2}, \quad U = \frac{\arccos(-x)}{B}$$

The cumulative distribution function $F_R(N, r; \rho)$ satisfies the following recurrence formula for $N \geq 7$ (see Hotelling [375]):

$$\begin{aligned} F_R(N,r;\rho) \quad = \quad & \frac{2(N-4)\rho^2 - N + 5}{(N-3)\rho^2} F_R(N-2,r;\rho) \\ & + \frac{(N-5)A^2}{(N-3)\rho^2} F_R(N-4,r;\rho) \\ & + \frac{(N-4)A^2C^2 - (2N-9)B^2}{(N-4)(N-3)\rho^2 AC} \rho f_R(N-1,r;\rho) \\ & + \frac{(N-4)^2 + (3N(N-8)+47)\rho^2}{(N-4)^2(N-3)\rho^2} r f_R(N-2,r;\rho) \end{aligned} \tag{14.2}$$

For N odd, the above formula can be used repeatedly to find $F_7, F_9, ..., F_N$ starting with values of F_3 and F_5.

For N even, the formula can be used repeatedly to find $F_8, F_{10}, ..., F_N$ starting with values of F_4 and F_6.

However, in many situations the formula is numerically unstable, e.g. if $\rho^2 < \frac{N-5}{2(N-4)}$, the first two terms on the right hand side of equation (ref{eq:PearsonRho_Closed_Recur_1}) are of opposite sign.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; r = '0.25'; N = '20'; rho = '0.1'
>>> dx = dec.pearson_rho_nc_owen_cdf(x, N, rho); mx = mpm.pearson_rho_nc_owen_cdf(x, N, rho)
>>> ix = ipm.pearson_rho_nc_owen_cdf(x, N, rho); fx = fpm.pearson_rho_nc_owen_cdf(x, N, rho)
>>> gx = gmp.pearson_rho_nc_owen_cdf(x, N, rho); ax = apm.pearson_rho_nc_owen_cdf(x, N, rho)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

```

14.1.11 Fisher's R^2 distribution, cdf (finite sum for $N - p$ even)

`ctx.fisher_r2_gd1_cdf`(*x*, *a*, *b*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the cdf of the multiple correlation coefficient distribution for $N - p$ an even integer. See also Lee [407], Lee [408], Gurland [357], Gurland and Milton [359], Gurland and Asiribo [358], Muirhead [418], Benton and Krishnamoorthy [30], Fisher [336], Gatsonis and Sampson [343].

CDF: Finite Series of Gurland:

$$F_{R^2}(x; p, N, \rho^2) = \sum_{j=0}^{k} b_j I_y\left(\tfrac{1}{2}(p-1+2j), k\right) \quad \text{where}$$

$$k = \tfrac{1}{2}(N-p), \quad y = \frac{x(1-\rho^2)}{1-x\rho^2}, \quad b_j = \binom{k}{j}(\rho^2)^j(1-\rho^2)^{k-j}$$

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; r2 = '0.25'; p = '3'; N = '20'; rho2 = '0.1'
>>> dx = dec.fisher_r2_gd1_cdf(r2, p, N, rho2); mx = mpm.fisher_r2_gd1_cdf(r2, p, N, rho2)
>>> ix = ipm.fisher_r2_gd1_cdf(r2, p, N, rho2); fx = fpm.fisher_r2_gd1_cdf(r2, p, N, rho2)
>>> gx = gmp.fisher_r2_gd1_cdf(r2, p, N, rho2); ax = apm.fisher_r2_gd1_cdf(r2, p, N, rho2)

```

14.1.12 Roy's largest root distribution, pdf, cdf and sf

`ctx.`**`roy_pdf_cdf_sf`**(*x*, *p*, *n1*, *n2*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns simultaneouly $\text{pdf}_X(r)$, the probability density function , $\text{cdf}_X(x)$, the cumulative distribution function, and $\text{sf}_X(x)$, the survival function, of a random variable X, following the distribution of Roy's largest root, with parameters *p*, *n1* and *n2* and the support interval $(0, 1)$.

Let X, Y denote two independent real Gaussian $p \times n_1$ and $p \times n_2$ matrices with $n_1, n_2 \geq p$, each constituted by zero mean independent, identically distributed columns with common covariance. Then Roy's largest root criterion, used in multivariate analysis of variance (MANOVA), is based on the statistic of the largest eigenvalue, Θ_1, of $(X + Y)^{-1}Y$, where X and Y are independent central Wishart matrices.

See also Anderson [9], Muirhead [418], Butler [165], Chiani [177], Chiani [178], and *dist_roy()*.

See also Chen 2002 (Tables), Turgeon (2018), R Package rootWishart.

The pdf and cdf of Θ_1 are given by:

$$\text{pdf}_X(\theta_1) = C\sqrt{|A(\theta_1)|} \times \tfrac{1}{2}\text{tr}\left(A(\theta_1)^{-1} \cdot \frac{\text{d}A(\theta_1)}{\text{d}\theta_1}\right)$$

$$\text{cdf}_X(\theta_1) = C\sqrt{|A(\theta_1)|}, \quad \text{where}$$

$$C = \pi^{s/2} \prod_{i=1}^{s} \frac{\Gamma\left(\frac{1}{2}(i + 2m + 2n + s + 2)\right)}{\Gamma\left(\frac{i}{2}\right)\Gamma\left(\frac{1}{2}(i + 2m + 1)\right)\Gamma\left(\frac{1}{2}(i + 2n + 1)\right)},$$

$$s = p, \quad m = (n_1 - p - 1)/2, \quad n = (n_2 - p - 1)/2.$$

When s is even, we have $n_{mat} = s$ and the elements of the $s \times s$ skew-symmetric matrix $A(\theta_1)$ are:

$$a_{i,j}(\theta_1) = E(\theta_1; m + j, m + i) - E(\theta_1; m + i, m + j) \quad i, j = 1, \ldots, s, \quad \text{where}$$

$$E(x; a, b) = \int_0^x t^{a-1}(1 - t)^n B(t; b, n + 1)\text{d}t.$$

When s is odd, we have $n_{mat} = s + 1$ and the elements of the $(s + 1) \times (s + 1)$ skew-symmetric matrix $A(\theta_1)$ are as above, with the additional elements

$$a_{i,s+1}(\theta_1) = I(\theta_1; m + i, n + 1) \quad i = 1, \ldots, s; \quad a_{s+1,j}(\theta_1) = -a_{j,s+1}(\theta_1) \quad j = 1, \ldots, s..$$

Note that $a_{i,j}(\theta_1) = -a_{j,i}(\theta_1)$ and $a_{i,i}(\theta_1) = a_{s+1,s+1}(\theta_1) = 0$.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; p = 3; n1 = 10; n2 = 12
>>> dx = dec.roy_pdf_cdf_sf(x, p, n1, n2); mx = mpm.roy_pdf_cdf_sf(x, p, n1, n2);
>>> ix = ipm.roy_pdf_cdf_sf(x, p, n1, n2); fx = fpm.roy_pdf_cdf_sf(x, p, n1, n2);
>>> gx = gmp.roy_pdf_cdf_sf(x, p, n1, n2); ax = apm.roy_pdf_cdf_sf(x, p, n1, n2)

14.2 Infinite series algorithms for selected functions and distributions

This section provides additional finite sums algorithms.

14.2.1 Incomplete gamma function, continued fractions (Peizer)

`ctx.gamma_peizer_cdf_sf_pdf(`a, x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

See also Peizer and Pratt [466].

The integral can be calculated using continued fractions. This method provides rigorous error bounds for for `ipm.` and `apm.`.

If $a - \frac{1}{2} > x$ let P be a left tail. Then

$$P = \frac{M^b}{\Gamma(b+1)} e^{-M} \frac{1}{(1 + u_1/(v_1 + u_2/(v_2 + u_3/(v_3 + \ldots))))}$$

where $M = x, b = a, u_1 = -M, u_{2j} = jM, u_{2j+1} = -(b+j)M, v_j = b + j, j = 1, 2, \ldots$

The approximants obtained by terminating at u_k/v_k for $k = 1, 2, 5, 6, 9, 10, \ldots$ decrease monotonically toward P and those for $k = 0, 3, 4, 7, 8, 11, 12, \ldots$ increase monotonically toward P as long as $k \leq 2B - 1$, where B is the integer part of b; for $k \geq 2B - 2$, the even approximants approach P monotonically from above and the odd ones from below if B is even, vice versa if B is odd. The monotonicity is strict throughout except that, if b is an integer, the fraction terminates at $k = 2b - 2$.

If $a - \frac{1}{2} \leq x$ let Q be a right tail. Then

$$Q = \frac{M^{b-1}}{\Gamma(b)} e^{-M} \frac{1}{(1 + u_1/(v_1 + u_2/(v_2 + u_3/(v_3 + \ldots))))}$$

where $M = x, b = a, u_{2j-1} = j - b, v_{2j-1} = M, u_{2j} = j, v_{2j} = 1, j = 1, 2, \ldots$

The approximants obtained by terminating at u_k/v_k approach Q strictly monotonically from above for

$k = 1, 2, 5, 6, 9, 10, \ldots$ and from below for $k = 0, 3, 4, 7, 8, 11, 12, \ldots$

> **Note**
>
> While the algorithm given above seems to offer an easy way to calculate the function in interval arithmetic, one needs to remember that forward recurrence of continuous fractions is entirely unstable in interval arithmetic (see Cuyt *et al.* [189], pages 154 - 159). Therefore one first needs to evaluate the algorithm using forward recurrence in floating point arithmetic to determine the index of the (likely) highest required approximant, and then again using backward recurrence to actually evaluate it in interval arithmetic.

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; a = 10.4; x = 8.7

14.2.2 Incomplete gamma function, asymptotic expansion (Paris)

`ctx.gamma_paris_cdf_sf`(a, x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

This method does not provide rigorous error bounds for for `ipm.` and `apm.`.

[Paris2016` gives the following expansion (for source code, see Sub demoParis() in DistXArb):

Let $m = 0, 1, 2...$ and $\chi = (z-a)/\sqrt{z}$. Then, when $\Re(z-a) \geq 0$, we have the expansion

$$\Gamma(a,z) = z^{a-\frac{1}{2}} e^{-z} \left(d_0(\chi) \sum_{k=0}^{m} \frac{A_k(\chi)}{z^{k/2}} - \sum_{k=1}^{m} \frac{B_k(\chi)}{z^{k/2}} + O\left(z^{-(m+1)/2}\right) \right)$$

as $z \to \infty$ in the sector $|\arg z| < \frac{1}{2}\pi$.

Let $m = 0, 1, 2...$ and $\chi = (z-a)/\sqrt{z}$. Then, when $\Re(z-a) \leq 0$, we have the expansion

$$\gamma(a,z) = z^{a-\frac{1}{2}} e^{-z} \left(d_0(-\chi) \sum_{k=0}^{m} \frac{A_k(\chi)}{z^{k/2}} + \sum_{k=1}^{m} \frac{B_k(\chi)}{z^{k/2}} + O\left(z^{-(m+1)/2}\right) \right)$$

as $z \to \infty$ in the sector $|\arg z| < \frac{1}{2}\pi$.

$$A_k(\chi) = \sum_{j=0}^{k} (-1)^j S_3(k+2j, j) p_{k+2j}(\chi), \quad B_k(\chi) = \sum_{j=0}^{k} (-1)^j S_3(k+2j, j) q_{k+2j}(\chi).$$

$$d_0(\chi) = \sqrt{\pi/2}\, e^{\chi^2/2}\, \operatorname{erfc}(\chi/\sqrt{2})$$

$$p_0(\chi) = 1, \quad p_1(\chi) = -\chi, \quad p_{k+1}(\chi) = \frac{1}{k+1}\left(p_{k-1}(\chi) - \chi p_k(\chi)\right), \quad k \geq 1$$

$$q_0(\chi) = 0, \quad q_1(\chi) = -1, \quad q_{k+1}(\chi) = \frac{1}{k+1}\left(q_{k-1}(\chi) - \chi q_k(\chi)\right), \quad k \geq 1$$

The coefficients $S_3(k, j)$ are the 3-associated Stirling numbers of the second kind. They are determined recursively:

$$S_3(n+1, k) = k\, S_3(n, k) + \binom{n}{2} S_3(n-2, k-1)$$

```

14.2.3 Incomplete beta function, continued fractions (Peizer)

`ctx.beta_peizer_cdf_sf_pdf`(a, b, q, p)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The integral can be calculated using continued fractions (see Peizer and Pratt [466]). This method provides rigorous error bounds for for `ipm.` and `apm.`. By transforming the problem if necessary (using the equation $I_x(a,b) = 1 - I_{1-x}(b,a)$), let P be a lefttail probability with $b - \frac{1}{2} \le (a+b-1)(1-x)$. Then

$$P = I_x(a,b) = \binom{n}{a} p^{b-1} q^a \frac{1}{(1 + u_1/(v_1 + u_2/(v2 + u3/(v_3 + \cdots))))}, \quad \text{where}$$

$$p = (1-x), \quad q = x, \quad n = a+b-1, \quad u_1 = \frac{-(b-1)q}{p}, \quad u_{2j} = \frac{j(n+j)q}{p},$$

$$u_{2j+1} = \frac{-(a+j)(b-j-1)q}{p}, \quad v_j = a+j, \quad j = 1, 2, \ldots$$

The approximants obtained by terminating at u_k/v_k for $k = 1, 2, 5, 6, 9, 10, \ldots$ decrease monotonically toward P and those for $k = 0, 3, 4, 7, 8, 11, 12, \ldots$ increase monotonically toward P as long as $k \le 2B - 1$, where B is the integer part of b; for $k \ge 2B - 2$, the even approximants approach P monotonically from above and the odd ones from below if B is even, vice versa if B is odd. The monotonicity is strict throughout except that, if b is an integer, the fraction terminates at $k = 2b - 2$.

For a combined fraction see Tretter and Walster [789].

Note

While the algorithm given above seems to offer an easy way to calculate the function in interval arithmetic, one needs to remember that forward recurrence of continuous fractions is entirely unstable in interval arithmetic (see Cuyt *et al.* [189], pages 154 - 159). Therefore one first needs to evaluate the algorithm using forward recurrence in floating point arithmetic to determine the index of the (likely) highest required approximant, and then again using backward recurrence to actually evaluate it in interval arithmetic.

```

14.2.4 Noncentral χ^2 distribution, pdf, cdf and sf (Boost)

`ctx.chi2_nc_benton_cdf_sf`(*x*, *n*, *lambda1*, *cdf=True*, ***options*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns $\text{cdf}_X(x)$, the cumulative distribution function, for `cdf=True`, or $\text{sf}_X(x)$, the survival function, for `cdf=False`, of a random variable X, noncentral chi-squared distribution with degrees of freedom $n > 0$, noncentrality parameter λ_1, and support interval $(0, +\infty)$. See also Wikipedia [1166], MathWorld [810], Patnaik [465], Penev and Raykov [467], Wang and Gray [795], Winterbottom [1456], BoostMath [64], Witkovský [1476], Johansson [386].

Noncentral CDF: Infinite series in terms of the central cdf:

The cdf of a noncentral chi-square variable with n degrees of freedom and λ is given by

$$F_{\chi^2}(n, x; \lambda) = e^{-\lambda/2} \sum_{j=0}^{\infty} \frac{(\lambda/2)^j}{j!} F_{\chi^2}(n + 2 + j, x)$$

where $F_{\chi^2}(n,\cdot)$ is the cdf of the (central) χ^2 distribution.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 12; nu = 10; l1 = 30
>>> dx = dec.chi2_nc_benton_cdf_sf(x, nu, l1); mx = mpm.chi2_nc_benton_cdf_sf(x, nu, l1)
>>> ix = ipm.chi2_nc_benton_cdf_sf(x, nu, l1); fx = fpm.chi2_nc_benton_cdf_sf(x, nu, l1)
>>> gx = gmp.chi2_nc_benton_cdf_sf(x, nu, l1); ax = apm.chi2_nc_benton_cdf_sf(x, nu, l1)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.2.5 Noncentral Student t distribution, pdf, cdf and sf (Boost)

`ctx.student_t_nc_benton_cdf_sf`(*x*, *nu*, *delta*, *cdf=True*, ***options*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns $\mathrm{cdf}_X(x)$, the cumulative distribution function, for `cdf=True`, or $\mathrm{sf}_X(x)$, the survival function, for `cdf=False`, of a random variable X, following a noncentral t-distribution with $n > 0$ degrees of freedom, noncentrality parameter δ, and support interval $(-\infty, +\infty)$. See also Wikipedia [1167], MathWorld [812], BoostMath [66], Benton and Krishnamoorthy [30], Broda and Paolella [160], Owen [455], Wang and Gray [795], Witkovský [1463], Johansson [386].

The pdf of a variable following a noncentral t-distribution with n degrees of freedom and noncentrality parameter δ is given by (boost_math)

$$f_{t'}(n,x,\delta) = \frac{nt}{n^2+2nt^2+t^4} + \frac{1}{2}\sum_{i=0}^{\infty} P_i I'_x\left(i+\frac{1}{2},\frac{n}{2}\right) + \frac{\delta}{\sqrt{2}} Q_i I'_x\left(i+1,\frac{n}{2}\right), \quad \text{and}$$

$I'_x(\cdot,\cdot)$ denotes the density of the beta distribution (see section ref{BetaDistributionDensity}), and P_i and Q_i are defined in equation (eq:NonCentralTSeriesCoeff).

The cdf of a variable following a noncentral t-distribution with n degrees of freedom and noncentrality parameter δ is given by (Benton, 2003)

$$F_{t'}(n,x,\delta) = \Phi(-\delta) + \frac{1}{2}\sum_{i=0}^{\infty} P_i I_x\left(i+\frac{1}{2},\frac{n}{2}\right) + \frac{\delta}{\sqrt{2}} Q_i I_x\left(i+1,\frac{n}{2}\right), \quad \text{and}$$

$$1 - F_{t'}(n,x,\delta) = \frac{1}{2}\sum_{i=0}^{\infty} P_i I_y\left(\frac{n}{2},i+\frac{1}{2}\right) + \frac{\delta}{\sqrt{2}} Q_i I_y\left(\frac{n}{2},i+1\right), \quad \text{where}$$

$$\lambda = \tfrac{1}{2}\delta^2; \quad P_i = \frac{e^{-\lambda}\lambda^i}{i!}; \quad Q_i = \frac{e^{-\lambda}\lambda^i}{\Gamma(i+3/2)}; \quad x = \frac{t^2}{n+t^2}; \quad y = 1-x,$$

$I_x(\cdot,\cdot)$ denotes the (normalized) incomplete beta function, and $\Phi(\cdot)$ denotes the cdf of the normal distribution.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = 20.2; nu = 10; d = 30
>>> dx = dec.student_t_nc_benton_cdf_sf(x, n, d); mx = mpm.student_t_nc_benton_cdf_sf(x, n, d)
>>> ix = ipm.student_t_nc_benton_cdf_sf(x, n, d); fx = fpm.student_t_nc_benton_cdf_sf(x, n, d)
>>> gx = gmp.student_t_nc_benton_cdf_sf(x, n, d); ax = apm.student_t_nc_benton_cdf_sf(x, n, d)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

14.2.6 Noncentral Beta distribution, pdf, cdf and sf (Boost)

`ctx.beta_nc_benton_cdf_sf(`*x*, *a*, *b*, *lambda1*`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns simulataneously $\text{pdf}_X(x)$, the probability density function, $\text{cdf}_X(x)$, the cumulative distribution function, and $\text{sf}_X(x)$, the survival function, of a random variable X, following a noncentral Beta distribution with shape parameters a and b, noncentrality parameter λ_1 and the support interval $(0, 1)$. See also Wikipedia [1165], BoostMath [63], Wang and Gray [795], Witkovský [1475], Johansson [386].

CDF: Infinite Series:

The cdf of a variable following a (singly) noncentral F-distribution with n and m degrees of freedom and noncentrality parameter λ_1 and is given by

$$\Pr(F \le x) = F_{F'}(x; m, n, \lambda) = e^{-\lambda} \sum_{j=0}^{\infty} \frac{(\lambda/2)^j}{j!} F(m + 2j, n, x)$$

where $F_F(\cdot)$ denotes the cdf of the central F-distribution.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.3'; a = '10'; b = '20'; l1 = '30'
>>> dx = dec.beta_nc_benton_cdf_sf(x, a, b, l1); mx = mpm.beta_nc_benton_cdf_sf(x, a, b, l1)
>>> ix = ipm.beta_nc_benton_cdf_sf(x, a, b, l1); fx = fpm.beta_nc_benton_cdf_sf(x, a, b, l1)
>>> gx = gmp.beta_nc_benton_cdf_sf(x, a, b, l1); ax = apm.beta_nc_benton_cdf_sf(x, a, b, l1)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.2.7 Noncentral F distribution, pdf, cdf and sf (Benton)

`ctx.fisher_f_nc_benton_cdf_sf(`*x*, *m*, *n*, *lambda1*`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns simulataneously $\text{pdf}_X(x)$, the probability density function, $\text{cdf}_X(x)$, the cumulative distribution function, and $\text{sf}_X(x)$, the survival function, of a random variable X, following a noncentral F distribution with degrees of freedom m and n, noncentrality parameter λ_1 and the support interval $(0, \infty)$. See also Wikipedia [1165], BoostMath [63], Wang and Gray [795], Witkovský [1475], Johansson [386].

CDF: Infinite Series:

The cdf of a variable following a (singly) noncentral F-distribution with n and m degrees of freedom and noncentrality parameter λ_1 and is given by

$$\Pr(F \le x) = F_{F'}(x; m, n, \lambda) = e^{-\lambda} \sum_{j=0}^{\infty} \frac{(\lambda/2)^j}{j!} F(m + 2j, n, x)$$

where $F_F(\cdot)$ denotes the cdf of the central F-distribution.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.3'; m = '10'; n = '20'; l1 = '30'

```

14.2.8 Pearson's ρ distribution, cdf and sf (Hotelling's series)

`ctx.pearson_rho_nc_ht_cdf`(r, N, *rho*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns simulaneously $\mathrm{cdf}_X(r)$, the cumulative distribution function, and $\mathrm{sf}_X(r)$, the survival function, of a random variable X, following the distribution of Pearson's rho (the distribution of the sample correlation coefficient), with sample size $N \geq 3$, noncentrality parameter $\rho \in (-1, +1)$ and support interval $(-1, +1)$. See also Wikipedia [1170], MathWorld [799], Hotelling [375], Guenther [355], Winterbottom [1456], Winterbottom [1457], Odeh [427], Ruben [494], Subrahmaniam and Subrahmaniam [509].

Hotelling (1953) defines $Q_N(r;\rho) = \Pr(\rho < R < r)$ and develops $Q_N(r;\rho)$ in the following uniformly convergent series for $-1 < \rho < r < 1$.

$$Q_N(r,\rho) = K_1 \sum_{j=0}^{\infty} \frac{(1 \cdot 3 \cdots (2j-1))^2 S_j}{j! 2^{2j} \cdot (2N+1) \cdots (2N+2j-1)},$$

where K_1 and S_j are defined in equations (ref{eq:PearsonRho_K1}) and (ref{eq:PearsonRho_Hotelling_Sj}), respectively. From the relationships

$$P_N(r,\rho) = 1 - F_R(r,N;\rho) = Q_N(1,\rho) - Q_N(r,\rho)$$

$$P_N(-1,\rho) = 1$$

$$F_R(r,N;\rho) = 1 - P_N(r,\rho)$$

$$F_R(-r,N;-\rho) = 1 - F_R(r,N;\rho)$$

we can compute $F_N(r;\rho)$ for any value of r and ρ with $-1 \leq r \leq 1$, $-1 < \rho < 1$. Hotelling shows that the error committed by truncating the series at any point is less than $\frac{2}{1-|\rho|}$ times the last term used. However, it is important to note that the series converges very slowly for small values of N, and in this case a large number of terms must be computed.

$$S_j = \sum_{k=0}^{j} \binom{j}{k} (-1)^k \, \tfrac{1}{2}(1-\rho^2)^k \, 2^{j-k} N_k$$

$$N_k = \sum_{s=0}^{\infty} \frac{\Gamma\left(\frac{3}{2}-k\right)}{\Gamma\left(\frac{3}{2}-k-s\right) s!} \cdot I\left(\tfrac{1}{2}(s+1), \tfrac{1}{2}(n-1), \frac{(r-\rho)^2}{(1-\rho r)^2}\right),$$

where $I(a,b;x)$ denotes the Incomplete Beta Function (see section ref{sec:IncompleteBetaFunction}). Hotelling shows that in the evaluation of N_k for large s the absolute value of the ratio of the term of order $(s+1)$ to the term of order s is bounded by $|\rho(r-\rho)/(1-\rho r)|$, so that the series converges rapidly.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; r = '0.3'; N = '10'; rho = '0.1'
>>> dx = dec.pearson_rho_nc_ht_cdf(r, N, rho); mx = mpm.pearson_rho_nc_ht_cdf(r, N, rho)
>>> ix = ipm.pearson_rho_nc_ht_cdf(r, N, rho); fx = fpm.pearson_rho_nc_ht_cdf(r, N, rho)
>>> gx = gmp.pearson_rho_nc_ht_cdf(r, N, rho); ax = apm.pearson_rho_nc_ht_cdf(r, N, rho)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.2.9 Pearson's ρ distribution, cdf and sf (Guenther's series)

`ctx.pearson_rho_nc_gt_cdf`(r, N, *rho*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns simulaneously $\mathrm{cdf}_X(r)$, the cumulative distribution function, and $\mathrm{sf}_X(r)$, the survival function, of a random variable X, following the distribution of Pearson's rho (the distribution of the sample correlation coefficient), with sample size $N \geq 3$, noncentrality parameter $\rho \in (-1, +1)$ and support interval $(-1, +1)$. See also Wikipedia [1170], MathWorld [799], Hotelling [375], Guenther [355], Winterbottom [1456], Winterbottom [1457], Odeh [427], Ruben [494], Subrahmaniam and Subrahmaniam [509].

The functions uses an algorithm by Guenther [355], :

Guenther writes $P_N(r;\rho) = \Pr(R > 0) - \Pr(0 < R < r)$ and develops $\Pr(0 < R < r)$ in an infinite series involving the Incomplete Beta Function denoted by $I(a, b; x)$. The result is

$$\Pr(R > 0) = \tfrac{1}{2}\left(1 + \mathrm{sgn}(\rho) \cdot I\left(\tfrac{1}{2}(N-1), \tfrac{1}{2}; \rho^2\right)\right)$$

$$\begin{aligned} \Pr(0 < R < r) \quad &= \textstyle\sum_{j=0}^{\infty} K_1(j) \cdot I\left(\tfrac{1}{2}(N-2), \tfrac{1}{2}(2j+1); r^2\right) \\ &+ \textstyle\sum_{j=0}^{\infty} K_2(j) \cdot I\left(\tfrac{1}{2}(N-2), j+1; r^2\right) \end{aligned} \tag{14.3}$$

where $K_1(j), K_2(j)$ are defined recursively by

$$K_1(0) = \tfrac{1}{2}\left(1-\rho^2\right)^{\frac{1}{2}(N-1)}, \quad K_1(j) = \frac{2j+N-3}{2j}\rho^2 K_1(j-1)$$

$$K_2(0) = \frac{\Gamma\left(\frac{1}{2}N\right)}{\sqrt{\pi}\,\Gamma\left(\frac{1}{2}(N-1)\right)}\rho\left(1-\rho^2\right)^{\frac{1}{2}(N-1)}, \quad K_2(j) = \frac{2j+N-2}{2j+1}\rho^2 K_2(j-1)$$

These equations are used together to give $P_N(r;\rho)$. Guenther also obtains error bounds for truncating the infinite series.

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; r = '0.3'; N = '10'; rho = '0.1'
>>> dx = dec.pearson_rho_nc_gt_cdf(r, N, rho); mx = mpm.pearson_rho_nc_gt_cdf(r, N, rho)
>>> ix = ipm.pearson_rho_nc_gt_cdf(r, N, rho); fx = fpm.pearson_rho_nc_gt_cdf(r, N, rho)
>>> gx = gmp.pearson_rho_nc_gt_cdf(r, N, rho); ax = apm.pearson_rho_nc_gt_cdf(r, N, rho)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

14.2.10 Fisher's R^2 distribution, cdf and sf (Boost, Benton)

`ctx.fisher_r2_gd2_cdf`(*x*, *p*, *N*, *rho2*, ***options*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns $\text{pdf}_X(x)$, the probability density function (pdf) of a random variable X, following the distribution of Fisher's R^2 (the distribution of the square of the sample multiple correlation coefficient), with $p \geq 1$ predictor variables, sample size $N \geq p + 2$, noncentrality parameter $\rho^2 \in (0, 1)$ and the support interval $(0, 1)$. See also Lee [407], Lee [408], Gurland [357], Gurland and Milton [359], Gurland and Asiribo [358], Muirhead [418], Benton and Krishnamoorthy [30], Fisher [336], Gatsonis and Sampson [343].

Density: Infinite series:

The density function of the multiple sample correlation coefficient is given by citep{Ding_1996,Benton_2003}

$$f_{R^2}(x; p, N, \rho^2) = \sum_{i=0}^{\infty} f_{\text{NegBin}}\left((N-1)/2, i; 1-\rho^2\right) \times f_{\text{Beta}}\left(x; \tfrac{1}{2}(p-1)+i, \tfrac{1}{2}(N-p)\right)$$

where $f_{\text{NegBin}}(\cdot)$ denotes the pmf of the negative binomial distribution and $f_{\text{Beta}}(\cdot)$ denotes the pdf of the Beta distribution

CDF: Infinite series:

The CDF of the multiple sample correlation coefficient is given by citep{Ding_1996,Benton_2003}

$$F_{R^2}(x; p, N, \rho^2) = \sum_{i=0}^{\infty} f_{\text{NegBin}}\left((N-1)/2, i; 1-\rho^2\right) \times F_{\text{Beta}}\left(x; \tfrac{1}{2}(p-1)+i, \tfrac{1}{2}(N-p)\right)$$

where $f_{\text{NegBin}}(\cdot)$ denotes the pmf of the negative binomial distribution and $F_{\text{Beta}}(\cdot)$ denotes the CDF of the Beta distribution

CDF: Series of Gurland:

$$\Pr[F \leq x` = F_{R^2}(x; a, b, \rho^2) = \frac{b^m}{a^{n/2}} \sum_{j=0}^{\infty} c_j I(m+j, k, y) \quad \text{where}$$

$$z = F(p-1), \quad y = \frac{z}{z+(N-p)}, \quad a = \frac{1}{1-\rho^2}, \quad n = (N-p)/2, \quad m = (p-1)/2$$

$$c_0 = 1, \quad c_j = \frac{c_{j-1}(-n/2-j+1)\rho^2}{j}$$

An example:

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.3'; p = '3'; N = '20'; rho2 = '0.6'
>>> dx = dec.fisher_r2_gd2_cdf(x, p, N, rho2); mx = mpm.fisher_r2_gd2_cdf(x, p, N, rho2)
>>> ix = ipm.fisher_r2_gd2_cdf(x, p, N, rho2); fx = fpm.fisher_r2_gd2_cdf(x, p, N, rho2)
>>> gx = gmp.fisher_r2_gd2_cdf(x, p, N, rho2); ax = apm.fisher_r2_gd2_cdf(x, p, N, rho2)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1

```

14.3 Finite series for lattice distributions, based on factorial moments

14.3.1 Fréchet's formula for calculating the pmf from the factorial moments

`ctx.frechet_pmf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

For lattice distributions, the pmf can be calculated from the factorial moments as follows (see Fréchet 1940, 1943):

$$\mathrm{pmf}_X(x) = \sum_{j=x}^{M} (-1)^{x+j} \binom{j}{x} \frac{\mu'_{[j]}}{j!}, \tag{14.4}$$

where $\mu'_{[j]}$ is the j^{th} factorial moment.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; k = '34'; n = '100'; p = '0.5';
>>> dx = dec.binomial_pmf(k, n, p); mx = mpm.binomial_pmf(k, n, p)
>>> ix = ipm.binomial_pmf(k, n, p); fx = fpm.binomial_pmf(k, n, p)
>>> gx = gmp.binomial_pmf(k, n, p); ax = apm.binomial_pmf(k, n, p)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.3.2 Laurent's formula for calculating the cdf from the factorial moments

`ctx.laurent_cdf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

For lattice distributions, the cdf can be calculated from the factorial moments as follows (see Laurent 1965):

$$\mathrm{cdf}_X(x) = \sum_{j=x}^{M} (-1)^{x+j} \binom{j-1}{x-1} \frac{\mu'_{[j]}}{j!}, \tag{14.5}$$

$$\mathrm{sf}_X(x) = 1 - \sum_{j=x}^{M} (-1)^{x+j} \binom{j-1}{x-1} \frac{\mu'_{[j]}}{j!}, \tag{14.6}$$

where $\mu'_{[j]}$ is the j^{th} factorial moment.

An example (cdf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; k = '34'; n = '100'; p = '0.5';
>>> dx = dec.binomial_cdf(k, n, p); mx = mpm.binomial_cdf(k, n, p)
>>> ix = ipm.binomial_cdf(k, n, p); fx = fpm.binomial_cdf(k, n, p)
>>> gx = gmp.binomial_cdf(k, n, p); ax = apm.binomial_cdf(k, n, p)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  8.949651957434262965349913219213965127993E-4

```

14.3.3 Binomial distribution, pmf, cdf

`ctx.binomial_fm_pmf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf and cdf are calculated using equations (14.4) and (14.5), respectively.

If a random variable X has a binomial distribution with success probability $p \in [0, 1]$ and number of trials n, then the factorial moments of X are

$$\mathrm{E}\big[(X)_r\big] = \binom{n}{r} p^r r! = (n)_r p^r = \frac{n!}{(n-r)!} p^r, \tag{14.7}$$

where by convention, $\binom{n}{r}$ is understood to be zero if $r > n$.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; k = '34'; n = '100'; p = '0.5';
>>> dx = dec.binomial_pmf(k, n, p); mx = mpm.binomial_pmf(k, n, p)
>>> ix = ipm.binomial_pmf(k, n, p); fx = fpm.binomial_pmf(k, n, p)
>>> gx = gmp.binomial_pmf(k, n, p); ax = apm.binomial_pmf(k, n, p)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.3.4 Classical hypergeometric distribution, pmf, cdf

`ctx.hypergeo_fm_pmf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf and cdf are calculated using equations (14.4) and (14.5), respectively.

If a random variable X has a hypergeometric distribution with population size N, number of success states $K \in \{0, ..., N\}$ in the population, and draws $n \in \{0, ..., N\}$, then the factorial moments of X are

$$\mathrm{E}\big[(X)_r\big] = \frac{\binom{K}{r}\binom{n}{r} r!}{\binom{N}{r}} = \frac{(K)_r (n)_r}{(N)_r}. \tag{14.8}$$

An example (pmf):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; k = 2; n = 3; K = 10; N = 30
>>> dx = dec.hypergeo_pmf(k, n, K, N); mx = mpm.hypergeo_pmf(k, n, K, N)
>>> ix = ipm.hypergeo_pmf(k, n, K, N); fx = fpm.hypergeo_pmf(k, n, K, N)

14.3.5 Wilcoxon distribution, pmf, cdf

`ctx.`**`wilcoxon_fm_pmf`**(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf and cdf are calculated using equations (14.4) and (14.5), respectively.

The factorial moments are calculated from the cumulants (see *factorial_moments_from_cumulants()*), and the cumulants are given by

$$\kappa_{2j} = \frac{2^{2j}(2^{2j}-1)B_{2j}}{2j}\sum_{i=1}^{N} r_i^{2j} = \frac{2^{2j}(2^{2j}-1)B_{2j}}{2j}\,\frac{B_{2j+1}(N+1)-B_{2j+1}}{2j+1}, \tag{14.9}$$

where $\kappa_1 = N(N+1)/4$, $\kappa_{2j+1} = 0$ for $j \geq 1$, and B_{2j} and $B_{2j}(x)$ are the Bernoulli numbers and polynomials, respectively, of degree $2j$.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '10'; N = '30';
>>> dx = dec.wilcoxon_pmf(x, N); mx = mpm.wilcoxon_pmf(x, N)

```

14.3.6 Mann-Whitney distribution, pmf, cdf

`ctx.`**`mannwhitney_fm_pmf`**(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf and cdf are calculated using equations (14.4) and (14.5), respectively.

The factorial moments are calculated from the cumulants (see *factorial_moments_from_cumulants()*), and the cumulants are given by

$$\kappa_{2j} = \frac{B_{2j}}{2j(2j+1)}\left[B_{2j+1}(N_2+N_1+1) + B_{2j+1} - B_{2j+1}(N_1+1) - B_{2j+1}(N_2+1)\right] \tag{14.10}$$

and $\kappa_{2j+1} = 0$, $j \geq 1$, and B_{2j} and $B_{2j}(x)$ are the Bernoulli numbers and polynomials, respectively, of degree $2j$.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '10'; m = '20'; n = '20';
>>> dx = dec.mannwhitney_pmf(x, m, n); mx = mpm.mannwhitney_pmf(x, m, n)
>>> ix = ipm.mannwhitney_pmf(x, m, n); fx = fpm.mannwhitney_pmf(x, m, n)

14.3.7 Kendall distribution, pmf, cdf

`ctx.kendall_fm_pmf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf is calculated using equation (14.4).

The factorial moments are calculated from the cumulants (see *factorial_moments_from_cumulants()*), and the cumulants are given by

$$\kappa_{2j}(T_N) = \frac{B_{2j}}{2j}\sum_{s=1}^{N} s^{2j} = \frac{B_{2j}}{2j}\left[\frac{B_{2j+1}(N+1) - B_{2j+1}}{2j+1} - N\right], \quad \text{and} \tag{14.11}$$

$$\kappa_{2j+1}(W_N) = 0, \quad \text{for } j \geq 1.$$

B_{2j} and $B_{2j}(x)$ are the Bernoulli numbers and polynomials, respectively, of degree $2j$.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '10'; N = '30';
>>> dx = dec.kendall_tau_pmf(x, N); mx = mpm.kendall_tau_pmf(x, N)
>>> ix = ipm.kendall_tau_pmf(x, N); fx = fpm.kendall_tau_pmf(x, N)
>>> gx = gmp.kendall_tau_pmf(x, N); ax = apm.kendall_tau_pmf(x, N)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

14.3.8 Jonckheere-Terpsta T distribution, pmf, cdf

`ctx.jterpsta_fm_pmf`(x, N)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The pmf and cdf are calculated using equations (14.4) and (14.5), respectively.

The factorial moments are calculated from the cumulants (see *factorial_moments_from_cumulants()*), and the cumulants are given by

$$\kappa_{2j} = \frac{B_{2j}}{2j(2j+1)}\left[B_{2j+1}(N+1) + (k-1)B_{2j+1} - \sum_{i=1}^{k} B_{2j+1}(n_i+1)\right] \tag{14.12}$$

where $\kappa_1 = M/2$, $\kappa_{2j+1} = 0$ for $j \geq 1$, and B_{2j} and $B_{2j}(x)$ are the Bernoulli numbers and polynomials, respectively, of degree $2j$.

An example (pmf):

```
>>> from xlcalcnet import dec, mpm, ipm, fpm, gmp, apm
>>> mpm.dps = 40; x = '10'; k = '4'; n = '10';
>>> dx = dec.jterpsta_s_pmf(x, k, n); mx = mpm.jterpsta_s_pmf(x, k, n)
>>> ix = ipm.jterpsta_s_pmf(x, k, n); fx = fpm.jterpsta_s_pmf(x, k, n)
>>> gx = gmp.jterpsta_s_pmf(x, k, n); ax = apm.jterpsta_s_pmf(x, k, n)

```

14.4 Efficient integration of bell-shaped functions

quad_bellshaped(*f*, **points*, ***kwargs*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Computes a single, double or triple integral over a given, 1D interval, 2D rectangle, or 3D cuboid, providing optionalle a guaranteed error bound.

14.4.1 Introduction

Some text explaining search for optimum and using 4 standard subintervals

14.4.2 Error function

`ctx.`**quad_erf**(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the error function of erf(z). See also BoostMath [74], Wikipedia [1236] , MathWorld [845], NIST [777], Mpmath [546]. The error function defined by

$$\mathrm{erf}(z) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-z^2} \mathrm{d}t,$$

References for integration with erf(z) as argument:

https://math.stackexchange.com/questions/712434/erfaib-error-function-separate-into-real-and-imaginary-part

https://www.wolframalpha.com/input/?i=integrate+exp%28x%5E2%29

http://fredrikj.net/blog/2016/03/taking-the-error-out-of-the-error-function/

Bounds on the complex error function:

$$\mathrm{erf}(x+iy) = \mathrm{erf}x \pm ie^{-x^2}\mathrm{erfi}y \pm e^{-x^2}\mathrm{erfi}y.$$

14.4.3 Lower non-normalised incomplete gamma function, $\gamma(a, x)$ (Continued fractions)

`ctx.`**quad_gamma_lower**(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the real lower non-normalised incomplete gamma function $\gamma(a, x)$. See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Mpmath [551]. The function is defined as

$$\gamma(a, x) = \int_0^x t^{a-1} e^{-t} \mathrm{d}t$$

for $a \geq 0$ and $x \geq 0$.

14.4.4 Real upper non-normalised incomplete gamma function, $\Gamma(a, x)$ (Quadrature)

`ctx.`**quad_gamma_upper**(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the real lower non-normalised incomplete gamma function $\Gamma(a, x)$. See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Mpmath [551]. The function is defined as:

$$\Gamma(a, x) = \int_x^\infty t^{a-1} e^{-t} \mathrm{d}t$$

for $a \geq 0$ and $x \geq 0$.

14.4.5 Normalised incomplete beta function, $I_x(a, b)$

`ctx.quad_ibeta`(a, b, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the normalised incomplete beta function $I_x(a, b)$ for $a > 0$, $b > 0$, and $0 \le x \le 1$:

$$I_x(a,b) = \frac{B_x(a,b)}{B(a,b)}, \quad B_x(a,b) = \int_0^x t^{a-1}(1-t)^{b-1}\mathrm{d}t.$$

See also Wikipedia [1224], MathWorld [856], NIST [459], BoostMath [79], BoostMath [87], Mpmath [550].

```
>>> from mpformula import mp4
>>> mp4.dps = 30;
>>> matrix(2)
matrix(
[['0.0', '0.0'],
 ['0.0', '0.0']])
>>> matrix(2, 3)
```

14.4.6 Non-central chi-square cdf and sf (Chow)

`ctx.chi_squared_nc_quad_cdf`(n, x, *lambda*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

[Chou1985` gives the following representation for $n \ge 2$ and $\lambda \ge 0$:

$$F_{\chi^2}(n, x; \lambda) = \frac{2^{(1-n)/2}\sqrt{2\pi}}{\Gamma((n-1)/2))} \int_0^x y^{(n-3)/2}\phi\left(\sqrt{y}\right)\left[\Phi\left(\sqrt{x-y}-\sqrt{\lambda}\right) - \Phi\left(-\sqrt{x-y}-\sqrt{\lambda}\right)\right]\mathrm{d}y$$

where $\phi(\cdot)$ denotes the pdf of the normal distribution (see section ref{sec:NormalDistribution_pdf}) and $\Phi(\cdot)$ denotes the cdf of the normal distribution (see section ref{sec:NormalDistribution_CDF}).

14.4.7 Marcum Q function

`ctx.marcumq1`(a, b)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The Marcum Q-function is defined as

$$Q(a,b) = \int_b^\infty x \exp\left(-\frac{x^2+a^2}{2}\right) I_0(ax)\,\mathrm{d}x$$

where $b \ge 0$, $a > 0$ and I_0 is the modified Bessel function of first kind of order 0. It is a special case of the generalized Marcum $Q_m(a, b)$ function with $m = 1$. It is made available as a separate function because it can be calculated in a particularly simple way.

Special cases are

$$Q(a,0) = 1, \quad Q(0,b) = e^{-b^2/2}, \quad Q(a,a) = \tfrac{1}{2}\left(1 + \frac{I_0(a^2)}{\exp(a^2)}\right)$$

The function can also be evaluated as

$$Q(a,b) = \begin{cases} H(a,b), & a < b, \\ \frac{1}{2} + H(a,a), & a = b, \\ 1 + H(a,b) & a > b, \end{cases}$$

where

$$H(a,b) = \frac{1}{\pi}\exp\left(-\frac{a^2+b^2}{2}\right)\int_0^\pi G(t)\exp(ab\cos(t))\mathrm{d}t, \quad \text{and}$$

$$G(t) = \begin{cases} \frac{1}{2}, & t = 0, a = b \\ \frac{1-z\cos(t)}{1-2z\cos(t)+z^2} & \text{otherwise, with } z = \frac{a}{b} \end{cases}$$

Available in Amath.

14.4.8 Owen's T function

`ctx.owent`(*h*, *a*, *boost=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns Owen's T function $T(h,a)$. See also Wikipedia [1355], MathWorld [1015], Owen [454], and Patefield and Tand [464]. The function is defined by

$$T(h,a) = \frac{1}{2\pi}\int_0^a f(x)\mathrm{d}x = \frac{a}{4\pi}\int_{-1}^1 f(ax)\mathrm{d}x, \quad f(x) = \frac{e^{-\frac{1}{2}h^2(1+x^2)}}{1+x^2}, \quad (-\infty < h, a < +\infty)\,.$$

It has the following properties:

$$T(h,0) = 0$$

$$T(0,a) = \frac{1}{2\pi}\arctan(a)$$

$$T(-h,a) = T(h,a)$$

$$T(h,-a) = -T(h,a)$$

$$T(h,a) + T(ah,\frac{1}{a}) = \frac{1}{2}\left(\Phi(h)+\Phi(ah)\right) - \Phi(h)\Phi(ah) \quad \text{if} \quad a \geq 0$$

$$T(h,a) + T(ah,\frac{1}{a}) = \frac{1}{2}\left(\Phi(h)+\Phi(ah)\right) - \Phi(h)\Phi(ah) - \frac{1}{2} \quad \text{if} \quad a < 0$$

$$T(h,1) = \frac{1}{2}\Phi(h)\left(1-\Phi(h)\right).$$

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; h = 3.7; a = 10.3

```

14.5 Verified numerical integration

14.5.1 Error function

`ctx.quad_erf_verified`(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the error function of $\mathrm{erf}(z)$. See also BoostMath [74], Wikipedia [1236] , MathWorld [845], NIST [777], Mpmath [546]. The error function defined by

$$\mathrm{erf}(z) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-z^2} \mathrm{d}t,$$

Bounds on the complex error function:

$$\mathrm{erf}(x + iy) = \mathrm{erf}x \pm ie^{-x^2}\mathrm{erfi}y \pm e^{-x^2}\mathrm{erfi}y.$$

14.5.2 Lower non-normalised incomplete gamma function, $\gamma(a, x)$ (Continued fractions)

`ctx.quad_gamma_lower_verified`(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the real lower non-normalised incomplete gamma function $\gamma(a, x)$. See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Mpmath [551]. The function is defined as

$$\gamma(a, x) = \int_0^x t^{a-1} e^{-t} \mathrm{d}t$$

for $a \geq 0$ and $x \geq 0$.

14.5.3 Real upper non-normalised incomplete gamma function, $\Gamma(a, x)$ (Quadrature)

`ctx.quad_gamma_upper_verified`(a, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the real lower non-normalised incomplete gamma function $\Gamma(a, x)$. See also Wikipedia [1225], MathWorld [850], NIST [460], BoostMath [81], Mpmath [551]. The function is defined as:

$$\Gamma(a, x) = \int_x^\infty t^{a-1} e^{-t} \mathrm{d}t$$

for $a \geq 0$ and $x \geq 0$.

14.5.4 Normalised incomplete beta function, $I_x(a, b)$

`ctx.quad_ibeta_verified`(a, b, x)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

Returns the normalised incomplete beta function $I_x(a, b)$ for $a > 0$, $b > 0$, and $0 \leq x \leq 1$:

$$I_x(a, b) = \frac{B_x(a, b)}{B(a, b)}, \quad B_x(a, b) = \int_0^x t^{a-1}(1 - t)^{b-1} \mathrm{d}t.$$

See also Wikipedia [1224], MathWorld [856], NIST [459], BoostMath [79], BoostMath [87], Mpmath [550].

```
>>> from mpformula import mp4
>>> mp4.dps = 30;
>>> matrix(2)
matrix(
[['0.0', '0.0'],
 ['0.0', '0.0']])
>>> matrix(2, 3)
```

14.5.5 Non-central chi-square cdf and sf (Chow)

`ctx.chi_squared_nc_quad_cdf_verified`(*n*, *x*, *lambda*)

where `ctx` is `ipm`, `dec`, `mpm`, or `gmp`.

[Chou1985` gives the following representation for $n \geq 2$ and $\lambda \geq 0$:

$$F_{\chi^2}(n, x; \lambda) = \frac{2^{(1-n)/2}\sqrt{2\pi}}{\Gamma((n-1)/2))} \int_0^x y^{(n-3)/2} \phi(\sqrt{y}) \left[\Phi\left(\sqrt{x-y} - \sqrt{\lambda}\right) - \Phi\left(-\sqrt{x-y} - \sqrt{\lambda}\right)\right] \mathrm{d}y$$

where $\phi(\cdot)$ denotes the pdf of the normal distribution (see section ref{sec:NormalDistribution_pdf}) and $\Phi(\cdot)$ denotes the cdf of the normal distribution (see section ref{sec:NormalDistribution_CDF}).

14.5.6 Marcum Q function

`ctx.marcumq1_verified`(*a*, *b*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

The Marcum Q-function is defined as

$$Q(a, b) = \int_b^\infty x \exp\left(-\frac{x^2 + a^2}{2}\right) I_0(ax)\, \mathrm{d}x$$

where $b \geq 0$, $a > 0$ and I_0 is the modified Bessel function of first kind of order 0. It is a special case of the generalized Marcum $Q_m(a, b)$ function with $m = 1$. It is made available as a separate function because it can be calculated in a particularly simple way.

Special cases are

$$Q(a, 0) = 1, \quad Q(0, b) = e^{-b^2/2}, \quad Q(a, a) = \tfrac{1}{2}\left(1 + \frac{I_0(a^2)}{\exp(a^2)}\right)$$

The function can also be evaluated as

$$Q(a, b) = \begin{cases} H(a, b), & a < b, \\ \frac{1}{2} + H(a, a), & a = b, \\ 1 + H(a, b) & a > b, \end{cases}$$

where

$$H(a, b) = \frac{1}{\pi} \exp\left(-\frac{a^2 + b^2}{2}\right) \int_0^\pi G(t) \exp(ab\cos(t)) \mathrm{d}t, \quad \text{and}$$

$$G(t) = \begin{cases} \frac{1}{2}, & t = 0, a = b \\ \frac{1 - z\cos(t)}{1 - 2z\cos(t) + z^2} & \text{otherwise, with } z = \frac{a}{b} \end{cases}$$

Available in Amath.

14.5.7 Owen's T function

`ctx.owent_verified`(*h*, *a*, *boost=True*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns Owen's T function $T(h, a)$. See also Wikipedia [1355], MathWorld [1015], Owen [454], and Patefield and Tand [464].

See also: https://docs.scipy.org/doc/scipy/reference/generated/scipy.special.owens_t.html#scipy.special.owens_t

The function is defined by

$$T(h,a) = \frac{1}{2\pi}\int_0^a f(x)\mathrm{d}x = \frac{a}{4\pi}\int_{-1}^1 f(ax)\mathrm{d}x, \quad f(x) = \frac{e^{-\frac{1}{2}h^2(1+x^2)}}{1+x^2}, \quad (-\infty < h, a < +\infty)\,.$$

It has the following properties:

$$T(h,0) = 0$$

$$T(0,a) = \frac{1}{2\pi}\arctan(a)$$

$$T(-h,a) = T(h,a)$$

$$T(h,-a) = -T(h,a)$$

$$T(h,a) + T(ah,\frac{1}{a}) = \frac{1}{2}\left(\Phi(h)+\Phi(ah)\right) - \Phi(h)\Phi(ah) \quad \text{if} \quad a \geq 0$$

$$T(h,a) + T(ah,\frac{1}{a}) = \frac{1}{2}\left(\Phi(h)+\Phi(ah)\right) - \Phi(h)\Phi(ah) - \frac{1}{2} \quad \text{if} \quad a < 0$$

$$T(h,1) = \frac{1}{2}\Phi(h)\left(1-\Phi(h)\right).$$

CHAPTER

FIFTEEN

PMF VECTORS

15.1 Basic discrete (lattice) distribution functions

15.1.1 Poisson distribution, pmf vector

`ctx.`**`poisson_pmf_vector`**(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Poisson distribution. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also Wikipedia [1191], MathWorld [837], BoostMath [84] , and Witkovský [1494].

$\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Poisson distribution is given by:

$$\text{pmf}_X(x) = \frac{\mu^k}{k!}e^{-\mu}.$$

The following recursions are used for the pmf:

$$\Pr(X = k+1|n) = \frac{\lambda}{k+1}\Pr(X = k|n)$$

$$\Pr(X = k-1|n) = \frac{k}{\lambda}\Pr(X = k|n)$$

15.1.2 Binomial distribution, pmf vector

`ctx.`**`binomial_pmf_vector`**(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the binomial distribution. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also Wikipedia [1175], MathWorld [818], BoostMath [71] , and Witkovský [1484].

$\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following an binomial distribution is given by:

$$\text{pmf}_X(x) = \binom{n}{k}p^k(1-p)^{n-k} = f_{\text{Beta}}(k+1, n-k+1, p)/(n+1).$$

and $f_{\text{Beta}}(\cdot)$ denote the pdf of the central beta distribution. The following recursions are used for the pmf:

$$\Pr(X = k+1|n) = \frac{(n-k)P}{(k+1)Q}\Pr(X = k|n),$$

$$\Pr(X = k-1|n) = \frac{kQ}{(n-k+1)P}\Pr(X = k|n).$$

15.1.3 Negative binomial distribution, pmf vector

`ctx.negative_binomial_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the negative binomial distribution. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also Wikipedia [1190], MathWorld [834], BoostMath [83] , and Witkovský [1491].

$\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following an negative binomial distribution is given by:

$$\text{pmf}_X(x) = \frac{\Gamma(n+k)}{K!\Gamma(n)} P^n (1-P)^k.$$

and $f_{\text{Beta}}(\cdot)$ denotes the pdf of the central beta distribution. The following recursions are used for the pmf:

$$\Pr(X = k+1|n) = \frac{(n+k)(1-P)}{(k+1)} \Pr(X = k|n)$$

$$\Pr(X = k-1|n) = \frac{k}{(n-k+1)(1-P)} \Pr(X = k|n)$$

15.1.4 Hypergeometric distribution, pmf vector

`ctx.hypergeometric_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the hypergeometric distribution. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1181], MathWorld [826], BoostMath [78], Berkopec [31], and *dist_hypergeometric()*.

$\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following an hypergeometric distribution is given by:

$$\text{pmf}_X(x) = \frac{\binom{n_1}{k}\binom{n_2}{n-k}}{\binom{n_1+n_2}{n}}, \quad (n, n_1, n_2 \geq 0; n \leq n_1 + n_2).$$

The following recursions are used for the pmf:

$$f(k+1) = \frac{(n_1-k)(n-k)}{(k+1)(n_2-n+k+1)} f(k)$$

$$f(k-1) = \frac{k(n_2-n+k)}{(n_1-k+1)(n-k+1)} f(k)$$

15.1.5 Noncentral hypergeometric distribution (Fisher), pmf vector

`ctx.hypergeo_nc_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the noncentral hypergeometric distribution (Fisher). The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also: Wikipedia [1223], Johnson *et al.* [389] page 293.

$$\text{pmf}_X(x) = \text{h}(x; n_1, m_1, N, \theta) = \frac{\binom{n_1}{x}\binom{n_2}{m_1-x}\theta^x}{\binom{n_2}{m_1}{}_2F_1(-n_1, -m_1; n_2+1-m_1; \theta)},$$

where $\theta = p_1 q_2/(q_1 p_2)$ and $\max(0, m_1 - n_2) \leq x \leq \min(n_1, m_1)$.

The following recursions are used for the PMF (see Wikipedia):

$$\mathrm{h}(x; n_1, m_1, N, \theta) = \frac{(m_1 - x + 1)(n_1 - x + 1)\theta}{x(m_2 - n_1 + x)} \mathrm{h}(x - 1; n_1, m_1, N, \theta)$$

15.2 Discrete (lattice) distribution functions related to (stratified) rank tests

15.2.1 Sign test distribution (under H_0), pmf vector

`ctx.signtest_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Sign test distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1197], vandeWiel [791], Bennett [29] and Zimmermann [1503], and *dist_wilcoxon()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Wilcoxon signed rank T distribution. The null distribution can be calculated as follows: Let $p_N(w)$ denote the probability $\Pr[W_N = w]$ in a sample of size N. Then the following recurrence relation holds (see Zimmermann [1503]) :

$$p_N(w) = \tfrac{1}{2}\left(p_{N-1}(w) + p_{N-1}(w-N)\right).$$

15.2.2 Wilcoxon T distribution (under H_0), pmf vector

`ctx.wilcoxon_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Wilcoxon distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1197], Fellingham and Stoker [300], vandeWiel [791], Bennett [29] and Zimmermann [1503], and *dist_wilcoxon()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Wilcoxon signed rank T distribution. The null distribution can be calculated as follows: Let $p_N(w)$ denote the probability $\Pr[W_N = w]$ in a sample of size N. Then the following recurrence relation holds (see Zimmermann [1503]) :

$$p_N(w) = \tfrac{1}{2}\left(p_{N-1}(w) + p_{N-1}(w-N)\right).$$

15.2.3 Wilcoxon T distribution (under Bennett alternatives), pmf vector

`ctx.wilcoxon_bennett_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Wilcoxon T distribution under Bennett alternatives. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1197], Fellingham and Stoker [300], vandeWiel [791], Bennett [29] and Zimmermann [1503], and *dist_wilcoxon()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Wilcoxon signed rank T distribution. The null distribution can be calculated as follows: Let $p_N(w)$ denote the probability $\Pr[W_N = w]$ in a sample of size N. Then the following recurrence relation holds (see Zimmermann [1503]) :

$$p_N(w) = \tfrac{1}{2}\left(p_{N-1}(w) + p_{N-1}(w-N)\right).$$

15.2.4 Kendall S (or tau) distribution (under H_0), pmf vector

ctx.**kendall_tau_pmf_vector**(*x*, *n*, *lambda*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the vector of all pmf values of the Kendall S (or tau) distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also Wikipedia [1184], Noether [425], vandeWiel [791], and *dist_kendall()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Kendall tau distribution.

The null distribution can be calculated as follows: Let $p_N(t) = \Pr[T_N = t]$. Then the following recurrence relation holds:

$$p_N(t) = p_N(t-1) + [p_{N-1}(t) - p_{N-1}(t-N)]/N,$$

where $p_N(t) = 0$ for $t < 0$ or $t > N(N-1)/2$, and $p_N(0) = 1/N!$.

15.2.5 Mann-Whitney U distribution (under H_0), pmf vector

ctx.**mannwhitney_u_pmf_vector**(*x*, *n*, *lambda*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the vector of all pmf values of the Mann-Whitney U distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1187], Murakami and Kamakura [420], Robillard [483], vandeWiel [791] and Zimmermann [1504], and *dist_mann_whitney()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Mann-Whitney U distribution. The null distribution of the MW test can be calculated as follows: Let $p_{n,m}(u)$ denote the probability that $U = u$ in samples of size n and m. Then (see Zimmermann [1504])

$$(m+n)p_{n,m}(u) = np_{n-1,m}(u-m) + mp_{n,m-1}(u) = np_{n-1,m}(u) + mp_{n,m-1}(u-n)$$

15.2.6 Jonckheere-Terpsta S distribution (under H_0), pmf vector

ctx.**jterpsta_s_pmf_vector**(*x*, *n*, *lambda*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the vector of all pmf values of the Jonckheere-Terpsta S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], Murakami and Kamakura [420], Robillard [483], vandeWiel [791], and Skillings [502] and *dist_jterpsta()*.

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t-x)$$

where the sum is over all x with positive $p(\cdot)$.

15.2.7 Spearman ρ distribution (under H_0), pmf vector

ctx.**spearman_rho_pmf_vector**(*x*, *n*, *lambda*)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns the vector of all pmf values of the Page L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791] and Skillings [502] .

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.2.8 Page L distribution (under H_0), pmf vector

`ctx.page_l_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Page L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.2.9 Quade L distribution (under H_0), pmf vector

`ctx.quade_l_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Quade L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.2.10 Mann-Whitney U distribution (under Lehmann alternatives), pmf vector

`ctx.mannwhitney_u_lehmann_pmf_vector(x, n, lambda)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Lehmann alternatives are of the form $F_1(x) =: cite : t : `F_0(x)]^k$ or $F_1(x) = 1 - [1 - F_0(x)]^k$.

See also: Shorack [498], Shorack [499].

Under Lehmann alternatives, rank order probabilities can be expressed in closed form for $F_1 = (F_0)^k$: let $S_1, \ldots, S_n$ denote the ranks of Y in the combined sample, e.g. $\Pr[S_1 = 3, S_2 = 5)] = P_{3,2}(0, 0, 1, 0, 1)$. Then

$$\Pr[S_1 = s_1, \ldots, , S_n = s_n) = k^n \frac{n!m!}{\Gamma(n + m + 1 + n(k-1))} \prod_{j=1}^{n} \frac{\Gamma(s_j + j(k-1))}{\Gamma(s_j + (j-1)(k-1))}.$$

The exact distribution under this alternative can also be calculated using recurrence relations, similar to the null-distribution (Shorack_1966):

Let $p_{n,m}(u)$ denote the probability that $U = u$ in samples of size n and m. Then

$$(km + n)p_{n,m}(u) = np_{n-1,m}(u - m) + kmp_{n,m-1}(u) \quad \text{for } F_1 = (F_0)^k$$

$$(km + n)p_{n,m}(u) = np_{n-1,m}(u) + kmp_{n,m-1}(u - n) \quad \text{for } F_1 = 1 - (1 - F_0)^k$$

This recursive procedure allows the calculation of the exact noncentral distribution also for larger samples.

15.2.11 Mann-Whitney U distribution (under Milton alternatives), pmf vector

`ctx.`**`mannwhitney_u_milton_pmf_vector`**(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Mann-Whitney U distribution under Milton alternatives. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also: Milton [415]

We consider k continuous random variables X_i with density functions f_i and sample sizes n_i, $i = 1 \ldots k$, and $N = n_1 + \ldots + n_k$.

Let $\mathbf{U} = (U_1, \ldots, U_N), U_1 < \cdots < U_N$, denote the order statistics of the random variables $(X_{1,1}, \ldots, X_{1,n_1}, \ldots, X_{k,1}, \ldots, X_{k,n_k})$, and let $\mathbf{Z} = (Z_1, \ldots, Z_N)$ denote a random vector of integers $1, 2, \ldots, k$, where the i^{th} component $\mathbf{Z}_i$ is i if U_i is an X_i.

If $\mathbf{z} = (z_1, \ldots, z_N)$ is a fixed vector of integers $1, 2, \ldots, k$ (with each i occurring n_i times), the probability of the rank order z, Pr $[\mathbf{Z} = \mathbf{z}]$, is given by

$$P_{n_1,\ldots,n_k}(\mathbf{z}|d) = n_1! \ldots n_k! \int_R \cdots \int \prod_{i=1}^{N} f_i(t_i) dt_i,$$

where the region of integration R is $-\infty < t_1 \leq t_2 \leq \cdots \leq t_N < \infty$

The original algorithm by Milton [415] has been developed for the normal distribution, but it has been found to also work well for the logistic distribution and for Lehmann alternatives, if the reference distribution is normal.

15.3 Discrete (non-lattice) distribution functions related to rank tests

15.3.1 Cochran S distribution (under H_0), pmf vector

`ctx.cochran_s_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Cochran S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.3.2 Friedman S distribution (under H_0), pmf vector

`ctx.friedman_s_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Friedman S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also: https://www.statsdirect.com/help/nonparametric_methods/friedman.htm

See also Wikipedia [1183], vandeWiel [791] and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.3.3 Quade S distribution (under H_0), pmf vector

`ctx.quade_s_pmf_vector`(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Quade S distribution distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502] .

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

15.3.4 Kruskal-Wallis H distribution (under H_0), pmf vector

`ctx.`**`kruskal_wallis_h_pmf_vector`**(*x*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the vector of all pmf values of the Kruskal-Wallis H distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], Murakami and Kamakura [420], Robillard [483], vandeWiel [791], and Skillings [502] .

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

CHAPTER

SIXTEEN

FAST APPROXIMATIONS

16.1 Approximations based on the normal distribution

16.1.1 Non-central chi-squared distribution: cdf and sf (Penev)

`ctx.chi2_nc_penev_cdf(`*x*, *nu*, *nc*`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the (non-)central chi-squared distribution.

[Penev2000` give the following first and second order Wiener germ approximation:

$$F_{\chi^2}(n,x;\lambda) \approx \Phi\left(\operatorname{sgn}(s)\sqrt{n(s-1)^2(1/(2s)+m-h(1-s)/s)-\log(A(s))+2B(s)/n}\right)$$

$$\text{where } m=\lambda/n; \quad h(y)=\frac{(1-y)\log(1-y)+y-\frac{1}{2}y^2}{y^2}; \quad s=\frac{\sqrt{1+4xm/n}-1}{2m}$$

$$A(s)=\frac{1}{s}-\frac{2}{s}\cdot\frac{h(1-s)}{1+2ms}; \quad B(s)=\frac{(1+3m)^2}{9(1+2m)^3}$$

where $\Phi(\cdot)$ denotes the cdf of the normal distribution (see).

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.cdisn_penev(x, nu, nc); mx = mpm.cdisn_penev(x, nu, nc)
>>> ix = ipm.cdisn_penev(x, nu, nc); fx = fpm.cdisn_penev(x, nu, nc)
>>> gx = gmp.cdisn_penev(x, nu, nc); ax = apm.cdisn_penev(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.2 (Non-central) chi-squared distribution: qtf and isf (Canal)

`ctx.chi2_nc_canal_qtf(`*LeftTail*, *RightTail*, *n*`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the quantile of the (non-)central chi-squared distribution.

Let z_α and $\chi^2_{n,\alpha}$ be the α-quantiles of the standard normal distribution and central chi-square distribution with n the degrees of freedom. For $n=1$ and $n=2$, the following closed form expressions can be used:

$$\chi^2_{1,\alpha}=z^2_\alpha, \quad \chi^2_{2,\alpha}=2\log(1-\alpha)$$

At the extreme left tail of the distribution, for small x, the CDF of a χ^2 variable with n degrees of freedom can be approximated by the density of a χ^2 variable with $n+2$ degrees of freedom:

$$F_{\chi^2}(n,x) \approx 2f_{\chi^2}(n+2,x).$$

The density of a χ^2 variable with $n+2$ degrees of freedom can be inverted in closed form using the Lambert W function, which leads to the following approximation:

$$\chi^2_{n,\alpha} \approx f^{-1}_{\chi^2}(n+2,\alpha) = -2W(t)/a, \quad \text{where}$$

$$a = \frac{1}{(n+2)/2-1}, \quad k = \log(\Gamma((n+2)/2), \quad d = a - \log(1-\alpha) + k, \quad t = -ae^{p+d}$$

This approximation is used for $|t| < 0.1$, and the Lambert W function is approximated as

$$W(x) \approx x - x^2 + \tfrac{3}{2}x^3 - \tfrac{8}{3}x^4 - \tfrac{125}{24}x^5.$$

Otherwise, the quantile is approximated by inverting a formula proposed by Canal [170]:

$$\chi^2_{n,\alpha} \approx n\left(\frac{1}{2} + \frac{t}{2} - \frac{3}{2t}\right)^6, \quad \text{where}$$

$$t = \left(-5 + 2L + 2\sqrt{13 - 5L + L^2}\right)^{1/3}, \quad L = 6\left(m + s\left(z_\alpha + a(z_\alpha^2 - 1) - a^2(2z_\alpha^3 - 5z_\alpha)\right)\right)$$

$$m = \frac{5}{6} - \frac{1}{9n} - \frac{7}{648n^2} - \frac{25}{2187n^3}, \quad s^2 = \frac{1}{18n} + \frac{1}{162n^2} - \frac{37}{11664n^3}, \quad a = \frac{1}{162\sqrt{2n^3}} = \gamma_1/6.$$

The noncentral quantile is approximated as

$$\chi^2_{n,\lambda,\alpha} \approx (1+b)\chi^2_{n_1,\alpha}, \quad \text{where } n_1 = \frac{(n+\lambda)^2}{n+2\lambda}, \quad b = \frac{\lambda}{n+\lambda}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.chi2_nc_canal_qtf(x, nu, nc); mx = mpm.chi2_nc_canal_qtf(x, nu, nc)
>>> ix = ipm.chi2_nc_canal_qtf(x, nu, nc); fx = fpm.chi2_nc_canal_qtf(x, nu, nc)
>>> gx = gmp.chi2_nc_canal_qtf(x, nu, nc); ax = apm.chi2_nc_canal_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

16.1.3 Gamma distribution: qtf and isf (Canal)

`ctx.gamma_canal_qtf`(*LeftTail*, *RightTail*, *a*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the quantile of the gamma distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.gamma_canal_qtf(x, nu, nc); mx = mpm.gamma_canal_qtf(x, nu, nc)
>>> ix = ipm.gamma_canal_qtf(x, nu, nc); fx = fpm.gamma_canal_qtf(x, nu, nc)
>>> gx = gmp.gamma_canal_qtf(x, nu, nc); ax = apm.gamma_canal_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.4 F distribution: qtf and isf (Davis)

`ctx.`**`fisher_f_davis_qtf`**(*LeftTail*, *RightTail*, *m*, *n*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the quantile of the F distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_davis_qtf(x, nu, nc); mx = mpm.fisher_f_davis_qtf(x, nu, nc)
>>> ix = ipm.fisher_f_davis_qtf(x, nu, nc); fx = fpm.fisher_f_davis_qtf(x, nu, nc)
>>> gx = gmp.fisher_f_davis_qtf(x, nu, nc); ax = apm.fisher_f_davis_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.5 Beta distribution: qtf and isf (Davis)

`ctx.`**`beta_davis_qtf`**(*LeftTail*, *RightTail*, *a*, *b*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the quantile of the beta distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.beta_davis_qtf(x, nu, nc); mx = mpm.beta_davis_qtf(x, nu, nc)
>>> ix = ipm.beta_davis_qtf(x, nu, nc); fx = fpm.beta_davis_qtf(x, nu, nc)
>>> gx = gmp.beta_davis_qtf(x, nu, nc); ax = apm.beta_davis_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.6 Pearson's rho distribution: pdf (Winterbottom)

`ctx.pearson_rho_wb_pdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the pdf of Pearson's rho distribution. See also Winterbottom [1456], Winterbottom [1457].

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pearson_rho_wb_pdf(x, nu, nc); mx = mpm.pearson_rho_wb_pdf(x, nu, nc)
>>> ix = ipm.pearson_rho_wb_pdf(x, nu, nc); fx = fpm.pearson_rho_wb_pdf(x, nu, nc)
>>> gx = gmp.pearson_rho_wb_pdf(x, nu, nc); ax = apm.pearson_rho_wb_pdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.7 Pearson's rho distribution: cdf and sf (Winterbottom)

`ctx.pearson_rho_wb_cdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of Pearson's rho distribution. See also Winterbottom [1456], Winterbottom [1457].

An improved approximation has been found by inverting Winterbottom's approximation for the confidence limits of ρ:

$$F_R(N, r, \rho) \approx \Phi\left(\frac{k}{6} - \frac{2c}{k} - \frac{b}{3}\right), \quad \text{where} \quad m = N - 1,$$

$$a = \frac{1}{12\sqrt{m^3}} + \frac{6r^4 - 3r^2 + 2}{48\sqrt{m^5}}, \quad b = \frac{-r3}{6am^2}, \quad s = \frac{1}{a\sqrt{m}} + \frac{1 + r^2}{4a\sqrt{m^3}} + \frac{11r^4 - 2r^2 + 1}{32a\sqrt{m^5}}$$

$$t = \frac{Z(r) - Z(\rho)}{a} + \frac{r}{2am} + \frac{5r^3 + 9r}{24am^2}, \quad d = t + \frac{bs}{3} - \frac{2b^3}{27}$$

$$c = s - b^2/3, \quad p = \sqrt{|12c^3 + 81d^2|}, \quad k = (108d + 12p)^{1/3}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pearson_rho_wb_cdf(x, nu, nc); mx = mpm.pearson_rho_wb_cdf(x, nu, nc)
>>> ix = ipm.pearson_rho_wb_cdf(x, nu, nc); fx = fpm.pearson_rho_wb_cdf(x, nu, nc)
>>> gx = gmp.pearson_rho_wb_cdf(x, nu, nc); ax = apm.pearson_rho_wb_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.8 Pearson's rho distribution: qtf and isf (Winterbottom)

`ctx.pearson_rho_wb_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of Pearson's rho distribution. See also Winterbottom [1456], Winterbottom [1457].

Asymptotic expansions typically rely on the Fisher z-transform $Z(a) = \operatorname{atanh}(a)$ and its inverse $Z^{-1}(a) = \tanh(a)$.

Let $m = N - 1$ and let $u_\alpha = \Phi^{-1}(\alpha)$ be the lower 100α percentage point of the standard normal distribution. An approximation to the 100α percentage point r_α and the lower $100(1-\alpha)$ confidence limit on ρ, ρ_L, is then obtained by $r_\alpha \approx Z^{-1}(y_1)$, where

$$\begin{aligned} y_1 &= Z(\rho) + \frac{u_\alpha}{\sqrt{m}} + \frac{\rho}{2m} + \frac{u_\alpha^3 + 3(3-\rho^2)u_\alpha}{12\sqrt{m^3}} + \frac{4\rho^3 u_\alpha^2 + 15\rho - \rho^3}{24m^2} \\ &\quad + \frac{u_\alpha^5 + (-60\rho^4 + 30\rho^2 + 80)u_\alpha^3 + (45\rho^4 - 21\rho^2 + 375)u_\alpha}{480\sqrt{m^5}}, \quad \text{and} \end{aligned} \tag{16.1}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pearson_rho_wb_qtf(x, nu, nc); mx = mpm.pearson_rho_wb_qtf(x, nu, nc)
>>> ix = ipm.pearson_rho_wb_qtf(x, nu, nc); fx = fpm.pearson_rho_wb_qtf(x, nu, nc)
>>> gx = gmp.pearson_rho_wb_qtf(x, nu, nc); ax = apm.pearson_rho_wb_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.1.9 Pearson's rho distribution: confidence limit for ρ (Winterbottom)

`ctx.pearson_rho_wb_cl(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the confidence interval (CI) for the noncentrality parameter ρ of Pearson's rho distribution, as decribed in Winterbottom [1457].

We use the Fisher z-transform $Z(a) = \operatorname{atanh}(a)$ and its inverse $Z^{-1}(a) = \tanh(a)$.

Let $m = N - 1$ and let $u_\alpha = \Phi^{-1}(\alpha)$ be the lower 100α percentage point of the standard normal distribution. An approximation to the 100α percentage point r_α and the lower $100(1-\alpha)$ confidence limit on ρ, ρ_L, is then obtained by $\rho_L \approx Z^{-1}(y_2)$, where

$$\begin{aligned} y_2 &= Z(r) + \frac{u_\alpha}{\sqrt{m}} - \frac{r}{2m} + \frac{u_\alpha^3 + 3(1+r^2)u_\alpha}{12\sqrt{m^3}} - \frac{4r^3 u_\alpha^2 + 5r^3 + 9r}{24m^2} \\ &\quad + \frac{u_\alpha^5 + (60r^4 - 30r^2 + 20)u_\alpha^3 + (165r^4 + 30r^2 + 15)u_\alpha}{480\sqrt{m^5}}. \end{aligned} \tag{16.2}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm

16.1.10 Singly noncentral t: pdf (Broda)

`ctx.student_t_nc_broda_pdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the pdf of the singly noncentral t distribution, as decribed in Witkovský [1463], using the approximation to the cdf of the singly noncentral t distribution as decribed Broda and Paolella [160].

$$f_{\text{StudentT}}(x,n,\delta) = \frac{n}{x}\left(F_{\text{StudentT}}\left(x\sqrt{(n+2)/n}, n+2, \delta\right) - F_{\text{StudentT}}(x,n,\delta)\right), \quad x \neq 0,$$

$$f_{\text{StudentT}}(x,n,\delta) = \frac{\Gamma((n+1)/2)}{\sqrt{n\pi}\Gamma(n/2)} e^{-\frac{1}{2}\delta^2}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc_broda_pdf(x, nu, nc); mx = mpm.student_t_nc_broda_pdf(x, nu, nc)

```

16.1.11 Singly noncentral t: cdf, sf (Broda)

`ctx.student_t_nc_broda_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the singly noncentral t distribution, as decribed in Broda and Paolella [160].

Singly noncentral t: A saddlepoint approximation based on the joint cumulant generating function of (x_1, x_2), with $x_1 \sim N(\mu, 1)$ and $x_2 \sim \chi^2(n)$, is possible (see Broda (2007)), and takes the following form:

$$F_{t'}(x;n,\mu) = \Phi(w) + \phi(w)\left(\frac{1}{w} - \frac{d}{u}\right) + O(n^{-3/2}), \quad \text{where}$$

$$s = \left(\mu x + \sqrt{4n(x^2+n) + \mu^2 x^2}\right)/(2x^2+2n),$$

$$t_1 = -\mu + xs, \quad t_2 = -xt_1/(2ns), \quad d = 1/(t_1 s),$$

$$u = \sqrt{(\mu x s + 2n)/(2n)}/s, \quad w = \text{sgn}(x-\mu)\sqrt{-\mu t_1 - 2n\log(s)},$$

and $\Phi(\cdot)$ and $\phi(\cdot)$ denote the cdf and pdf of the normal distribution, respectively.

For $\mu = 0$, these equations simplify to

$$s = \sqrt{n/(x^2+n)}, \quad d = 1/(xs), \quad u = 1/s, \quad w = \text{sgn}(x)\sqrt{-2n\log(s)},$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc_broda_cdf(x, nu, nc); mx = mpm.student_t_nc_broda_cdf(x, nu, nc)
>>> ix = ipm.student_t_nc_broda_cdf(x, nu, nc); fx = fpm.student_t_nc_broda_cdf(x, nu, nc)
>>> gx = gmp.student_t_nc_broda_cdf(x, nu, nc); ax = apm.student_t_nc_broda_cdf(x, nu, nc)
```

(continues on next page)

(continued from previous page)

```

16.1.12 Singly noncentral t: qtf, isf (Harley)

`ctx.student_t_nc_harley_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the singly noncentral t distribution, as decribed in Harley [363].

The qtf of the noncentral t-distribution can be approximated by the qtf of Pearson's rho as follows: Let $N = f + 2$ and

$$\rho = \Re\left(\delta\sqrt{\frac{2}{2N - 3 + \delta^2}}\right).$$

Determine $r_{\alpha;\rho;N} = r_\alpha$, using Winterbottom's approximation. Calculate $t_{\alpha;\delta;f} = t_\alpha$ as

$$t_\alpha = \Re\left(\frac{r_\alpha}{1 - r_\alpha^2}\sqrt{\frac{2f(1-\rho^2)}{1-\rho^2}}\right)$$

Note that in these equations both ρ and r_α can assume values > 1. Luckily, Winterbottom's approximation can handle this; we always take only the real part of the functions results to avoid issues with the branch cuts of the complex square root.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc_broda_qtf(x, nu, nc); mx = mpm.student_t_nc_broda_qtf(x, nu, nc)
>>> ix = ipm.student_t_nc_broda_qtf(x, nu, nc); fx = fpm.student_t_nc_broda_qtf(x, nu, nc)
>>> gx = gmp.student_t_nc_broda_qtf(x, nu, nc); ax = apm.student_t_nc_broda_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

16.1.13 Singly noncentral t: confidence limit for δ (Akahira)

`ctx.student_t_nc_akahira_cl(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the confidence interval (CI) for the noncentrality parameter of the singly noncentral t distribution, as decribed in Akahira *et al.* [6].

Let T be a statistic according to the non-central t-distribution with n degrees of freedom and a non-centrality parameter δ. Then the lower confidence limit $\widehat{\delta}$ of level $1 - \alpha$ and the two-sided confidence interval $(\underline{\delta}, \overline{\delta})$ of the non-centrality parameter δ of level $1 - \alpha$ are given by Akahira *et al.* [6]:

$$\widehat{\delta} = bT - z_\alpha\sqrt{k} + hT^3(z_\alpha^2 - 1)/k,$$

$$\underline{\delta} = bT - z_{\alpha/2}\sqrt{k} + hT^3(z_{\alpha/2}^2 - 1)/k,$$

$$\overline{\delta} = bT + z_{\alpha/2}\sqrt{k} - hT^3(z_{\alpha/2}^2 - 1)/k,$$

$$h = \frac{1}{24}\left(\frac{1}{n^2} + \frac{1}{4n^3}\right) \quad b = \sqrt{\frac{2}{n}}\frac{\Gamma(\frac{1}{2}n + \frac{1}{2})}{\Gamma(\frac{1}{2}n)}$$

where $k = 1 + (1 - b^2)T^2$, and z_α denotes the α-quantile of the normal distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc_akahira_cl(x, nu, nc); mx = mpm.student_t_nc_akahira_cl(x, nu, nc)
>>> ix = ipm.student_t_nc_akahira_cl(x, nu, nc); fx = fpm.student_t_nc_akahira_cl(x, nu, nc)
>>> gx = gmp.student_t_nc_akahira_cl(x, nu, nc); ax = apm.student_t_nc_akahira_cl(x, nu, nc)

16.1.14 Doubly noncentral t: cdf, sf (Broda)

`ctx.student_t_nc2_broda_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the doubly noncentral t distribution, as decribed in Broda and Paolella [160].

A saddlepoint approximation based on the joint cumulant generating function of (x_1, x_2), with $x_1 \sim N(\mu, 1)$ and $x_2 \sim \chi^2(n, \theta)$, is possible (see Broda (2007)), and takes the following form:

$$F_{t''}(x; n; \mu, \theta) = \Phi(w) + \phi(w)\left(\frac{1}{w} - \frac{d}{u}\right) + O(n^{-3/2}), \quad \text{where}$$

$$a = x^4 + 2nx^2 + n^2, \quad c_2 = (-2x^3\mu - 2xn\mu)/a, \quad c_1 = (x^2\mu^2 - nx^2 - n^2 - \theta n)/a, \quad c_0 = (xn\mu)/a,$$

$$q = \tfrac{1}{3}c_1 - \tfrac{1}{9}c_2^2, \quad r = \tfrac{1}{6}(c_1c_2 - 3c_0) - \tfrac{1}{27}c_2^3,$$

$$s = \sqrt{-4q}\cos\left(\tfrac{1}{3}\arccos\left(r/\sqrt{-q^3}\right)\right) - \tfrac{1}{3}c_2,$$

$$t_1 = -\mu + xs, t_2 = -xt_1/(2ns), \quad d = 1/(t_1 s), \quad \nu = 1/(1 - 2t_2), \quad \alpha = \mu/\sqrt{1 + \theta/n},$$

$$u = \sqrt{(x^2 + 2nt_2)(2n\nu^2 + 4\theta\nu^3) + 4n^2s^2}/(2ns^2), \quad w = \operatorname{sgn}(x - \alpha)\sqrt{-\mu t_1 - n\log(\nu) - 2\theta\nu t_2},$$

and $\Phi(\cdot)$ and $\phi(\cdot)$ denote the cdf and pdf of the normal distribution, respectively.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc2_broda_cdf(x, nu, nc); mx = mpm.student_t_nc2_broda_cdf(x, nu, nc)
>>> ix = ipm.student_t_nc2_broda_cdf(x, nu, nc); fx = fpm.student_t_nc2_broda_cdf(x, nu, nc)
>>> gx = gmp.student_t_nc2_broda_cdf(x, nu, nc); ax = apm.student_t_nc2_broda_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

16.1.15 Doubly noncentral t: qtf, isf (Broda)

`ctx.student_t_nc2_broda_qtf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the doubly noncentral t distribution, as decribed in Broda and Paolella [160].

Broda_2007_WorkingPaper proposes the following approximation:

$$F_{t''}(t;n;\mu,\theta) \approx F_{t'}(t/c;f;\mu), \quad \text{where}$$

$$f = \frac{7}{2}\left(-1+\sqrt{15-7g^2/h}\right)^{-1}, \quad c = \sqrt{h(1-2/f)}, \quad g = m_1/\sqrt{\mu^2/2}, h = m_2/(1+\mu^2),$$

$$m_1 = \mu\binom{n}{2}^{1/2}\frac{\Gamma((n-1)/2)}{\Gamma(n/2)}{}_1F_1\left(\frac{1}{2},\frac{n}{2},-\frac{\theta}{2}\right)$$

$$m_2 = (1+\mu^2)\frac{n}{n-2}{}_1F_1\left(\frac{2}{2},\frac{n}{2},-\frac{\theta}{2}\right)$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.student_t_nc2_broda_qtf(x, nu, nc); mx = mpm.student_t_nc2_broda_qtf(x, nu, nc)

16.1.16 Spearman's rho, first 8 cumulants (David)

`ctx.spearman_mu8(N)`

where `ctx` is `dec`, `mpm`, `fpm`, `gmp` or `apm`.

Returns an approximation to the central distribution of Spearman's ρ, based on the first 8 moments.

Spearman's ρ is calculated like Pearsons's correlation coefficient, using the rank-transform on the x_i and y_i. The exact test for H_0 is the permutation test. Techniques for obtaining the exact distribution and approximations are given below

The first 8 cumulants are given by David *et al.* [199]

$$\kappa_2 = \frac{1}{n-1}$$

$$\kappa_4 = \frac{-6(19n^2+5n-36)}{25n(n+1)(n-1)^3}$$

$$\kappa_6 = \frac{48(583n^6+723n^5-2603n^4-2637n^3+4054n^2+2760n-1800)}{(245n^3(n-1)^5n1^3)}$$

$$\begin{aligned}\kappa_8 &= \frac{144(41939n^{10}-83709n^9+304254n^8+578442n^7-1012323n^6-1690125n^5)}{875n^5(n+1)^5(n-1)^7} \\ &+ \frac{144(1800776n^4+2358048n^3-1616688n^2-1080567n+846720)}{875n^5(n+1)^5(n-1)^7}\end{aligned} \tag{16.3}$$

Note: See PermCumulants.SpearmanCum for further details.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm

16.1.17 Mann-Whitney U distribution: general alternatives specified by rank order probabilities (Sundrum)

`ctx.mannwhitney_nc_mu4`(N)

where `ctx` is `dec`, `mpm`, `fpm`, `gmp` or `apm`.

Returns an approximation to the noncentral distribution of Mann-Whitney's U, based on the first 4 moments.

The first 4 moments under the alternative are given by Sundrum [511] (note that $\kappa_4 = \mu_4 - 3\mu 2^3$):

$$\mu_1 = p$$

$$\mu_2 = (p^2 + p - q - r)/mn + (q - p^2)/n + (r - p^2)/m + p^2$$

$$\begin{aligned}\mu_3 &= 6(p^3 + u - pq - pr)/mn + (2p^3 + s - 3pq)/n^2 + (2p^3 + t - 3pr)/m^2 \\ &+ 3(3pq + 2(pr - u - p^3) + q - s - p^2)/mn^2 + 3(3pr + 2(pq - u - p^3) \\ &+ r - t - p^2)/m^2n + (4p^3 + 3p^2 + p + 6u + 2(s + t) - 3(q + r)(1 + 2p))/m^2n^2\end{aligned} \tag{16.4}$$

$$\begin{aligned}\mu_4 &= 3(q - p^2)2/n^2 + 6(q - p^2)(r - p^2)/mn + 3(r - p^2)2/m^2 \\ &+ (12qp^2 + a - 4sp - 3q^2 - 6p^4)/n^3 + (12rp^2 + b - 4tp - 3r2 - 6p^4)/m^3 \\ &+ 6(7(rp^2 - p^4) + 12qp^2 + qp + 2(w - sp) - 3(q^2 + qr) - 8up - p^3)/mn^2 \\ &+ (42qp^2 + 72rp^2 + 6rp + 12x - 42p^4 - 18r2 - 18qr - 12tp - 48up - 6p^3)/m^2n \\ &+ 6(6(p^4 - rp^2) + 3(q^2 - qp) - 12qp^2 + 4sp + 8up + 2(p^3 + qr - w) + s - a)/mn^3 \\ &+ (36p^4 + 18r2 + 12qr - 72rp^2 - 36qp^2 + 24tp - 6b + 48up \\ &- 12x + 12p^3 - 18rp + 6t)/m^3n \\ &+ (105p^4 + 42p^3 + 3p^2 + 33q^2 + 33r2 + 54qr - 174qp^2 - 174rp^2 - 42pq \\ &- 42pr + 36sp + 36tp + 192up - 36w - 36x + 6v + 36u)/m^2n^2 \\ &+ (132qp^2 + 108rp^2 - 66p^4 - 33q^2 - 36qr - 18r2 - 44sp - 24tp + 11a \\ &- 144up + 36w + 24x - 6v - 36p^3 - 36u - 7p^2 + 54pq + 36pr - 18s + 7q)/m^2n^3 \\ &+ (132rp^2 + 108qp^2 - 66p^4 - 33r2 - 36qr - 18q^2 - 44tp - 24sp + 11b \\ &- 144up + 24w + 36x - 6v - 36p^3 - 36u - 7p^2 + 54pr + 36pq - 18t + 7r)/m^3n^2 \\ &+ (6(3(q^2 + r2) - 12((q + r)p^2) + 4(p^3 + qr + sp + tp - w - x) - (a + b - v) + 16up \\ &- 6(p^4 + pq + pr + u) + 2(s + t)) - 7(q + r - p^2) + p)/m^3n^3\end{aligned} \tag{16.5}$$

The parameters $p, q, r, s, t, v, u, a, b, w$ and x can be calculated from the following rank order probabilities:

$$\begin{aligned} p &= P_{1,1}(0,0) \\ q &= P_{2,1}(0,0,1) \\ r &= P_{1,2}(0,1,1) \\ s &= P_{3,1}(0,0,0,1) \\ t &= P_{1,3}(0,1,1,1) \\ v &= P_{2,2}(0,0,1,1) \\ u &= v + (1/4)P_{2,2}(0,1,0,1) \\ a &= P_{4,1}(0,0,0,0,1) \\ b &= P_{1,4}(0,1,1,1,1) \\ w &= 2a + (2/3)P_{3,2}(0,0,1,0,1) + (1/6)P_{3,2}(0,1,0,0,1) \\ x &= 2b + (2/3)P_{2,3}(0,1,0,1,1) + (1/6)P_{2,3}(0,1,1,0,1) \end{aligned} \tag{16.6}$$

The rank order probabilities which are required for the calculation of the first 4 moments can be estimated from the sample as follows: Let U_i be the number of $Y `sinthesamplegreaterthan` X_{(i)}$, where $X_{(i)}$ is the ith ordered values of the X amongst themselves. Then the probabilities are calculated according to the following scheme :

$$P_{1,1}(0,1) = \frac{1}{mn}\sum_{i=1}^{m} U_i$$

$$P_{2,1}(0,0,1) = \frac{2}{mn(m-1)}\sum_{i=1}^{m}(i-1)U_i$$

$$P_{3,1}(0,0,0,1) = \frac{3}{mn(m-1)(m-2)}\sum_{i=1}^{m}(i-1)(i-2)U_i$$

$$P_{4,1}(0,0,0,0,1) = \frac{4}{mn(m-1)(m-2)(m-3)}\sum_{i=1}^{m}(i-1)(i-2)(i-3)U_i$$

$$P_{1,2}(0,1,1) = \frac{1}{mn(n-1)}\sum_{i=1}^{m} U_i(U_i-1)$$

$$P_{1,3}(0,1,1,1) = \frac{1}{mn(n-1)(n-2)}\sum_{i=1}^{m} U_i(U_i-1)(U_i-2)$$

$$P_{1,4}(0,1,1,1,1) = \frac{1}{mn(n-1)(n-2)(n-3)}\sum_{i=1}^{m} U_i(U_i-1)(U_i-2)(U_i-3)$$

$$P_{2,2}(0,0,1,1) = \frac{2}{mn(m-1)(n-1)}\sum_{i=1}^{m}(i-1)U_i(U_i-1)$$

$$P_{3,2}(0,0,0,1,1) = \frac{3}{mn(m-1)(m-2)(n-1)}\sum_{i=1}^{m}(i-1)(i-2)U_i(U_i-1)$$

$$P_{2,3}(0,0,1,1,1) = \frac{2}{mn(m-1)(n-1)(n-2)}\sum_{i=1}^{m}(i-1)U_i(U_i-1)(U_i-2)$$

$$P_{2,2}(0,1,0,1) = \frac{4}{mn(m-1)(n-1)}\sum_{i=1}^{m}\sum_{j=i+1}^{m}(U_i-U_j)U_j$$

$$P_{3,2}(0,0,1,0,1) = \frac{12}{mn(m-1)(m-2)(n-1)} \sum_{i=1}^{m} \sum_{j=i+1}^{m} (i-1)(U_i - U_j)U_j$$

$$P_{3,2}(0,1,0,0,1) = \frac{12}{mn(m-1)(m-2)(n-1)} \sum_{i=1}^{m} \sum_{j=i+1}^{m} (i-j-1)(U_i - U_j)U_j$$

$$P_{2,3}(0,1,0,1,1) = \frac{6}{mn(m-1)(n-1)(n-2)} \sum_{i=1}^{m} \sum_{j=i+1}^{m} (U_i - U_j)U_j(U_j - 1)$$

$$P_{2,3}(0,1,0,1,1) = \frac{6}{mn(m-1)(n-1)(n-2)} \sum_{i=1}^{m} \sum_{j=i+1}^{m} (U_i - U_j)U_j(U_j - 1)$$

$$P_{2,3}(0,1,1,0,1) = \frac{6}{mn(m-1)(n-1)(n-2)} \sum_{i=1}^{m} \sum_{j=i+1}^{m} (U_i - U_j)(U_i - U_j - 1)U_j$$

An example (CDF):

16.1.18 First 4 moments of Kendalls τ in the general case (Sundrum)

`ctx.kendall_tau_nc_mu4(N)`

where `ctx` is `dec`, `mpm`, `fpm`, `gmp` or `apm`.

Returns an approximation to the noncentral distribution of Kendall's τ, based on the first 4 moments.

Consider k pairs of random variables $(x_1, y_1), \ldots, (x_k, y_k)$. Let $r_1, \ldots, r_k$ be a permutaton of $1, \ldots, k$ and let $s_1, \ldots, s_k$ be its reciprocal. We define as in Snow [504].

$P(r_1, \ldots, r_k)$ = Pr[if x's are ranked in order, ranks of corresponding y's are $r_1, \ldots, r_k$].

$P(r_1, \ldots, r_k)$ = Pr[if y's are ranked in order, ranks of corresponding x's are $s_1, \ldots, s_k$].

Let $H(t) = 1$ if $t > 0$ and $H(t) = 0$ otherwise. Then

$$P(r_1, \ldots, r_k) = k!P\left[\prod_{i=2}^{k} H(x_i - x_{i-1})H(y_{s_i} - y_{s_{i-1}})\right] = k!P\left[\prod_{i=2}^{k} H(y_i - y_{i-1})H(x_{r_i} - x_{r_{i-1}})\right]$$

The rank order probabilities can then be estimated from the sample as

$$\hat{P}_{(12)} = \frac{1}{n(n-1)} \sum_{i \neq j} I\left[(x_i - x_j)(y_i - y_j) > 0\right]$$

$$\hat{P}_{(123)} = \frac{1}{n(n-1)(n-2)} \sum_{i \neq j_1 \neq j_2} I\left[(x_i - x_{j_1})(y_i - y_{j_1})(x_i - x_{j_2})(y_i - y_{j_2}) > 0\right]$$

The first 4 moments of T_N are given as Sundrum [510]:

$$\mu_1 = p$$

$$\mu_2 = 2[p(1-p) + 2(k-p^2)(n-2)]/[n(n-1)]$$

$$\begin{aligned} \mu_3 &= 4[(t - 18kp + 10p^3)n^2 + (6k + 2u - 6p^2 - 5t + 72kp - 34p^3)n \\ &+ (p + 9p^2 + 30p^3 - 12k - 4u + 6t - 72kp)]/[n(n-1)]^2 \end{aligned} \tag{16.7}$$

$$\begin{aligned} \mu_4 &= 8[6(k-p^2)2n^4 + (6kp + 2y - 6p^3 - 16tp - 84k2 + 270kp^2 - 108p4)n^3 \\ &+ (1.5p^2 + 6t + 2b - 126kp - 24up - 18y + 75p^3 + 120tp + 426k2 - 1446kp^2 + 505.5p4)n^2 \\ &+ (14k + 12u - 15.5p^2 - 30t - 10b + 444kp + 96up + 52y - 213p^3 - 296tp - 924k2 \\ &+ 2988kp^2 - 943.5p4)n \\ &+ (p - 28k - 24u + 21p^2 + 36t + 12b - 432kp - 96up - 48y + 180p^3 + 240tp + 720k2 \\ &- 2160kp^2 + 630p4)]/[n(n-1)]^3 \end{aligned} \tag{16.8}$$

The parameters p, k, u, t, b, y can be calculated from the following rank order probabilities, writing $P_{(1423)}$ for the probility that the ranks of the Y occur in this order when the X are sorted in ascending order:

$$\begin{aligned} p &= P_{(12)} \\ u &= P_{(123)} \\ k &= P_{(123)} + \tfrac{1}{4}P_{(132)} \\ t &= 8(P_{(1234)} + P_{(1243))} + 6P_{(1342)} + 4P_{(1324)} + 2P_{(2143)} + P_{(2413)} + P_{(1432)} \\ b &= 15P_{(1234)} + 10P_{(1243)} + 5P_{(1324)} + 4P_{(1342)} + P_{(2143)} \\ y &= (160P_{(12453)} + 150(P_{(12435)} + P_{(12354))} + 125P_{(12345)} + 96P_{(21453)} + 90P_{(13254)} + 84P_{(13524)} \\ &+ 80P_{(13425)} + 64P_{(13452)} + 45P_{(21354)} + 40P_{(12543)} + 32(P_{(23514)} + P_{(14352)} + P_{(13542))} \\ &+ 24P_{(21543)} + 22P_{(24153)} + 20P_{(14325)} + 18P_{(14523)} + 16P_{(25143)} + 12(P_{(24513)} + P_{(14532))} \\ &+ 6(P_{(25314)} + P_{(15342))} + 4P_{(25413)} + 2(P_{(15432)} + P_{(35142)}))/5 \end{aligned} \tag{16.9}$$

When $(x_i, y_i), i = 1, 2, \ldots, k$, are normal variables with correlation ρ, then closed form expressions exist for p, k and u (writing $a = \arcsin(\rho)/\pi$ and $b = 2\arcsin\left(\frac{1}{2}\rho\right)/\pi$:

$$\begin{aligned} p &= \tfrac{1}{2} + a \\ k &= \tfrac{1}{4}(\tfrac{10}{9} + 4a + 4a^2 - b^2) \\ u &= \tfrac{3}{8}(\tfrac{4}{9} + 4a - 2b + 4a^2 - b^2) \end{aligned} \tag{16.10}$$

The parameters t, b and y have to be evaluated by numerical intergration of the rank order probabilities

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30

```

16.2 Approximations based on the chi-squared distribution

16.2.1 Non-Central chi-squared : cdf, sf (Patnaik)

`ctx.chi2_nc_mu2_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral chi-squared distribution by matching the first 2 moments.

Patnaik [465] gives the following 2-moment approximation based on the central χ^2-distribution:

$$F_{\chi^2}(n, x; \lambda) \approx F_{\chi^2}(n_1, x_1;), \quad \text{where } n_1 = \frac{(n+\lambda)^2}{n+2\lambda}, \quad x_1 = \frac{x(n+\lambda)}{n+2\lambda}$$

where $F_{\chi^2}(n, \cdot)$ is the cdf of the (central) χ^2 distribution (see section ref{sec:ChiSquareDistribution_cdf}).

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.chi2_nc_mu2_cdf(x, nu, nc); mx = mpm.chi2_nc_mu2_cdf(x, nu, nc)
>>> ix = ipm.chi2_nc_mu2_cdf(x, nu, nc); fx = fpm.chi2_nc_mu2_cdf(x, nu, nc)
>>> gx = gmp.chi2_nc_mu2_cdf(x, nu, nc); ax = apm.chi2_nc_mu2_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.2.2 Non-Central chi-squared: qtf, isf (Patnaik)

`ctx.chi2_nc_mu2_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the noncentral chi-squared distribution.

The noncentral quantile is approximated as in Patnaik [465]:

$$\chi^2_{n,\lambda,\alpha} \approx (1+b)\chi^2_{n_1,\alpha}, \quad \text{where } n_1 = \frac{(n+\lambda)^2}{n+2\lambda}, \quad b = \frac{\lambda}{n+\lambda}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.chi2_nc_mu2_qtf(x, nu, nc); mx = mpm.chi2_nc_mu2_qtf(x, nu, nc)
>>> ix = ipm.chi2_nc_mu2_qtf(x, nu, nc); fx = fpm.chi2_nc_mu2_qtf(x, nu, nc)
>>> gx = gmp.chi2_nc_mu2_qtf(x, nu, nc); ax = apm.chi2_nc_mu2_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

16.2.3 Non-Central chi-squared: confidence limit for λ (Winterbottom)

`ctx.chi2_nc_wb_cl(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the confidence interval (CI) for the noncentrality parameter λ of noncentral chi-squared distribution, as decribed in Winterbottom [1457].

[Winterbottom1979` gives the following formula to determine the paramter λ of a noncentral χ^2 distribution with n degrees of freedom, so that $F_{\chi^2}(n, x; 0) = 1 - \alpha$ and $F_{\chi^2}(n, x; \lambda) = 1 - \beta$. Let c be the $1 - \alpha$ percentage point of a χ^2-distribution with n degrees of freedom, let x be the $1 - \beta$ percentage point of a $N(0, 1)$ distribution, and $T = (c - n)/n$, $Y = 2T + 1$. Then

$$\begin{aligned}\lambda \approx\ & nT + \sqrt{2nY}x + \frac{2((3T+2)x^2 + 3T + 1))}{3Y} - \frac{(6T+5)x^3 - (36T^2 + 42T + 17)x}{18\sqrt{nY^5/2}} \\ & + \frac{(324T^2 + 594T + 276)x^4}{405nY^4} - \frac{(1080T^3 + 2484T^2 + 976)x^2}{405nY^4} \\ & + \frac{1080T^3 + 1512T^2 + 612T + 148}{405nY^4} - \frac{(10368T^3 + 30780T^2 + 30564T + 10143)x^5}{9720\sqrt{n^3Y^{11}/2}} \\ & + \frac{(25920T^4 + 98928T^3 + 163080T^2 + 137544T + 47188)x^3}{9720\sqrt{n^3Y^{11}/2}} \\ & + \frac{(45360T^4 + 106704T^3 + 80460T^2 + 31092T + 13489)x}{9720\sqrt{n^3Y^{11}/2}}\end{aligned} \tag{16.11}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.chi2_nc_wb_cl(x, nu, nc); mx = mpm.chi2_nc_wb_cl(x, nu, nc)

16.2.4 Roy's largest root θ: pdf (Chiani)

`ctx.roy_chiani_pdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the pdf of the distribution of Roy's largest root θ.

See Chiani [177], Chiani [178] proposes the following algorithm:

$$F_{\Theta_1}(\theta_1) \approx P\left(k, \frac{\log(\theta_1/(1-\theta_1)) - \mu + \sigma\alpha}{\delta}\right)$$

and for its inverse, useful for evaluating the percentiles,

$$F^{-1}_{\Theta_1}(\theta_1) \approx \frac{\exp(\sigma(\delta P^{-1}(k, y) - \alpha)) + \mu}{1 + \exp(\sigma(\delta P^{-1}(k, y) - \alpha)) + \mu},$$

where

$$\mu = 2\log\tan\left(\frac{\gamma + \phi}{2}\right), \quad \sigma^3 = \frac{16}{(m+n+1)^2}\frac{1}{\sin^2(\gamma+\phi)\sin\gamma\sin\phi}$$

$$\gamma = \arccos\left(\frac{m+n-2p}{m+n-1}\right), \quad \phi = \arccos\left(\frac{m-n}{m+n-1}\right),$$

and the constants $k = 46.446$, $\delta = 0.186054$, $\alpha = 9.84801$ have been chosen to match the moments of the approximation to that of the Tracy-Widom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.roy_chiani_pdf(x, nu, nc); mx = mpm.roy_chiani_pdf(x, nu, nc)
>>> ix = ipm.roy_chiani_pdf(x, nu, nc); fx = fpm.roy_chiani_pdf(x, nu, nc)

```

16.2.5 Roy's largest root: cdf and sf (Chiani)

`ctx.roy_chiani_cdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the distribution of Roy's largest root θ.

See Chiani [177], Chiani [178] proposes the following algorithm:

$$F_{\Theta_1}(\theta_1) \approx P\left(k, \frac{\log(\theta_1/(1-\theta_1)) - \mu + \sigma\alpha}{\delta}\right)$$

and for its inverse, useful for evaluating the percentiles,

$$F^{-1}_{\Theta_1}(\theta_1) \approx \frac{\exp(\sigma(\delta P^{-1}(k,y) - \alpha)) + \mu}{1 + \exp(\sigma(\delta P^{-1}(k,y) - \alpha)) + \mu},$$

where

$$\mu = 2\log\tan\left(\frac{\gamma+\phi}{2}\right), \quad \sigma^3 = \frac{16}{(m+n+1)^2}\frac{1}{\sin^2(\gamma+\phi)\sin\gamma\sin\phi}$$

$$\gamma = \arccos\left(\frac{m+n-2p}{m+n-1}\right), \quad \phi = \arccos\left(\frac{m-n}{m+n-1}\right),$$

and the constants $k = 46.446$, $\delta = 0.186054$, $\alpha = 9.84801$ have been chosen to match the moments of the approximation to that of the Tracy-Widom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.roy_chiani_cdf(x, nu, nc); mx = mpm.roy_chiani_cdf(x, nu, nc)
>>> ix = ipm.roy_chiani_cdf(x, nu, nc); fx = fpm.roy_chiani_cdf(x, nu, nc)
>>> gx = gmp.roy_chiani_cdf(x, nu, nc); ax = apm.roy_chiani_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

16.2.6 Roy's largest root: qtf and isf (Chiani)

`ctx.roy_chiani_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the distribution of Roy's largest root θ.

See Chiani [177], Chiani [178] proposes the following algorithm:

$$F_{\Theta_1}(\theta_1) \approx P\left(k, \frac{\log(\theta_1/(1-\theta_1)) - \mu + \sigma\alpha}{\delta}\right)$$

and for its inverse, useful for evaluating the percentiles,

$$F^{-1}_{\Theta_1}(\theta_1) \approx \frac{\exp(\sigma(\delta P^{-1}(k,y) - \alpha)) + \mu}{1 + \exp(\sigma(\delta P^{-1}(k,y) - \alpha)) + \mu},$$

where

$$\mu = 2\log\tan\left(\frac{\gamma+\phi}{2}\right), \quad \sigma^3 = \frac{16}{(m+n+1)^2}\frac{1}{\sin^2(\gamma+\phi)\sin\gamma\sin\phi}$$

$$\gamma = \arccos\left(\frac{m+n-2p}{m+n-1}\right), \quad \phi = \arccos\left(\frac{m-n}{m+n-1}\right),$$

and the constants $k = 46.446$, $\delta = 0.186054$, $\alpha = 9.84801$ have been chosen to match the moments of the approximation to that of the Tracy-Widom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.roy_chiani_qtf(x, nu, nc); mx = mpm.roy_chiani_qtf(x, nu, nc)
>>> ix = ipm.roy_chiani_qtf(x, nu, nc); fx = fpm.roy_chiani_qtf(x, nu, nc)
>>> gx = gmp.roy_chiani_qtf(x, nu, nc); ax = apm.roy_chiani_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1

```

16.3 Approximations based on the central t, F or beta distribution

16.3.1 Dunn-Šidák percentage points

`ctx.dunn_sidak_qtf`(q, *nu*, C)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns the percentage points of Dunn-Šidák.

See also: Kirk, Games.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.dunn_sidak_qtf(x, nu, nc); mx = mpm.dunn_sidak_qtf(x, nu, nc)
>>> ix = ipm.dunn_sidak_qtf(x, nu, nc); fx = fpm.dunn_sidak_qtf(x, nu, nc)
>>> gx = gmp.dunn_sidak_qtf(x, nu, nc); ax = apm.dunn_sidak_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

```

16.3.2 Singly non-central Fisher F distribution: cdf, sf (Patnaik)

`ctx.fisher_f_nc_mu2_cdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Fisher F distribution.

[Patnaik1949` suggests the following approximation, see also Tiku [786]:

$$F_{F'}(x; n_1, n_2, \lambda) \approx F_F\left(y; m_1, n_2\right), \quad \text{where}$$

$A_1 = (n_1 + \lambda)$,

$B_1 = (n_1 + 2\lambda)$,

$m_1 = A_1^2 / B_1$,

$y = n_1 / A_1$,

and $F_F\left(\cdot; m_1, n_2\right)$ denotes the CDF of a central F distribution with m_1 and n_2 degrees of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_nc_mu2_cdf(x, nu, nc); mx = mpm.fisher_f_nc_mu2_cdf(x, nu, nc)
>>> ix = ipm.fisher_f_nc_mu2_cdf(x, nu, nc); fx = fpm.fisher_f_nc_mu2_cdf(x, nu, nc)
>>> gx = gmp.fisher_f_nc_mu2_cdf(x, nu, nc); ax = apm.fisher_f_nc_mu2_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.3.3 Singly non-central F distribution: qtf, isf (Patnaik)

`ctx.fisher_f_nc_mu2_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to $F_{\alpha,n_1,n_2,\lambda}$, the α-quantile of a non-central F-distribution with n_1 and n_2 degress of freedom and noncentrality parameter λ.

$$F_{\alpha,n_1,n_2,\lambda} \approx c \cdot F_{\alpha,m_1,n_2,}$$

$A_1 = (n_1 + \lambda)$,

$B_1 = (n_1 + 2\lambda)$,

$m_1 = A_1^2/B_1$,

$c = A_1/n_1$,

and $F_{\alpha,m_1,n_2,}$ denotes the α-quantile of a central F-distribution with m_1 and n_2 degress of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_nc_mu2_qtf(x, nu, nc); mx = mpm.fisher_f_nc_mu2_qtf(x, nu, nc)
>>> ix = ipm.fisher_f_nc_mu2_qtf(x, nu, nc); fx = fpm.fisher_f_nc_mu2_qtf(x, nu, nc)
>>> gx = gmp.fisher_f_nc_mu2_qtf(x, nu, nc); ax = apm.fisher_f_nc_mu2_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.3.4 Singly non-central F: confidence interval for the noncentrality parameter λ

`ctx.fisher_f_nc_mu2_cl(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the confidence interval (CI) for the noncentrality parameter λ of a singly non-central F-distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_nc_mu2_cl(x, nu, nc); mx = mpm.fisher_f_nc_mu2_cl(x, nu, nc)
>>> ix = ipm.fisher_f_nc_mu2_cl(x, nu, nc); fx = fpm.fisher_f_nc_mu2_cl(x, nu, nc)
>>> gx = gmp.fisher_f_nc_mu2_cl(x, nu, nc); ax = apm.fisher_f_nc_mu2_cl(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.3.5 Doubly non-central F distribution: cdf, sf (Patnaik)

`ctx.fisher_f_nc2_mu2_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the doubly noncentral Fisher F distribution.

Mudholkar (1976) suggests an approximation by noncentral F, which can be converted into an approximation by central F as follows:

$$F_{F''}(x; n_1, n_2, \lambda_1, \lambda_2) \approx F_F(y; m_1, m_2), \quad \text{where}$$

$A_1 = (n_1 + \lambda_1), A_2 = (n_2 + \lambda_2),$

$B_1 = (n_1 + 2\lambda_1), B_2 = (n_2 + 2\lambda_2),$

$m_1 = A_1^2/B_1, m_2 = A_2^2/B_2,$

$y = x(n_1 A_2)/(n_2 A_1),$

and $F_F(\cdot; m_1, m_2)$ denotes the CDF of a central F distribution with m_1 and m_2 degrees of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_nc2_mu2_cdf(x, nu, nc); mx = mpm.fisher_f_nc2_mu2_cdf(x, nu, nc)
>>> ix = ipm.fisher_f_nc2_mu2_cdf(x, nu, nc); fx = fpm.fisher_f_nc2_mu2_cdf(x, nu, nc)
>>> gx = gmp.fisher_f_nc2_mu2_cdf(x, nu, nc); ax = apm.fisher_f_nc2_mu2_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1
mpm:  3.1138774234168360557146160900744444149943e-1
ipm:  3.1138774234168360557146160900744444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.1138774234168360557146160900744444149943E-01
ipm:  3.1138774234168360557146160900744444149943e-1 (4.055e-38%)
```

16.3.6 Doubly non-central F distribution: qtf, isf (Patnaik)

`ctx.fisher_f_nc2_mu2_qtf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to $F_{\alpha,n_1,n_2,\lambda_1,\lambda_2}$, the α-quantile of a doubly non-central F-distribution with n_1 and n_2 degress of freedom and noncentrality parameters λ_1 and λ_2, is obtained as

$$F_{\alpha,n_1,n_2,\lambda_1,\lambda_2} \approx c \cdot F_{\alpha,m_1,m_2,}$$

$A_1 = (n_1 + \lambda_1), A_2 = (n_1 + \lambda_2),$

$B_1 = (n_1 + 2\lambda_1), B_2 = (n_1 + 2\lambda_2),$

$m_1 = A_1^2/B_1, m_2 = A_2^2/B_2,$

$c = (n_2 A_1)/(n_1 A_2),$

and denotes the α-quantile of a central F-distribution with m_1 and m_2 degress of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_f_nc2_mu2_qtf(x, nu, nc); mx = mpm.fisher_f_nc2_mu2_qtf(x, nu, nc)
>>> ix = ipm.fisher_f_nc2_mu2_qtf(x, nu, nc); fx = fpm.fisher_f_nc2_mu2_qtf(x, nu, nc)
>>> gx = gmp.fisher_f_nc2_mu2_qtf(x, nu, nc); ax = apm.fisher_f_nc2_mu2_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1
mpm:  3.1138774234168360557146160900744444149943e-1
ipm:  3.1138774234168360557146160900744444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.1138774234168360557146160900744444149943E-01
ipm:  3.1138774234168360557146160900744444149943e-1 (4.055e-38%)
```

16.3.7 Multiple correlation coefficient: cdf, sf (Lee and Gurland)

`ctx.fisher_r2_lee_cdf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the Fisher R^2 distribution.

See also Lee [407], Gurland [357], Gurland and Milton [359].

$$F_{F'}(x; n_1, n_2, \rho^2) \approx F_F\left(x/c; m_1, n_2\right),$$

where $c = A_1/n_1$, $m_1 = A_1^2/A_2$, $A_1 = (n_1 + n_2)(\gamma - 1) + n_1$, $A_2 = (n_1 + n_2)(\gamma^2 - 1) + n_1$, $\gamma = 1/(1 - \rho^2)$, and $F_F\left(\cdot; m_1, n_2\right)$ denotes the CDF of a central F distribution with m_1 and n_2 degrees of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_r2_lee_cdf(x, nu, nc); mx = mpm.fisher_r2_lee_cdf(x, nu, nc)
>>> ix = ipm.fisher_r2_lee_cdf(x, nu, nc); fx = fpm.fisher_r2_lee_cdf(x, nu, nc)
>>> gx = gmp.fisher_r2_lee_cdf(x, nu, nc); ax = apm.fisher_r2_lee_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.3.8 Multiple correlation coefficient: qtf, isf (Lee and Gurland)

`ctx.fisher_r2_lee_qtf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the Fisher R^2 distribution.

See also Lee [407], Gurland [357], Gurland and Milton [359].

$$F_{F'}(x; n_1, n_2, \rho^2) \approx F_F\left(x/c; m_1, n_2\right),$$

where $c = A_1/n_1$, $m_1 = A_1^2/A_2$, $A_1 = (n_1 + n_2)(\gamma - 1) + n_1$, $A_2 = (n_1 + n_2)(\gamma^2 - 1) + n_1$, $\gamma = 1/(1 - \rho^2)$, and $F_F\left(\cdot; m_1, n_2\right)$ denotes the CDF of a central F distribution with m_1 and n_2 degrees of freedom.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_r2_lee_qtf(x, nu, nc); mx = mpm.fisher_r2_lee_qtf(x, nu, nc)
>>> ix = ipm.fisher_r2_lee_qtf(x, nu, nc); fx = fpm.fisher_r2_lee_qtf(x, nu, nc)
>>> gx = gmp.fisher_r2_lee_qtf(x, nu, nc); ax = apm.fisher_r2_lee_qtf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1

```

16.3.9 Fisher R^2,: confidence limit for ρ^2

ctx.**fisher_r2_lee_cl**(x)

where ctx is fpm, mpm, ipm, dec, gmp or apm.

Returns an approximation to the confidence interval (CI) for the noncentrality parameter ρ^2 of Fisher R^2 distribution.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.fisher_r2_lee_cl(x, nu, nc); mx = mpm.fisher_r2_lee_cl(x, nu, nc)
>>> ix = ipm.fisher_r2_lee_cl(x, nu, nc); fx = fpm.fisher_r2_lee_cl(x, nu, nc)
>>> gx = gmp.fisher_r2_lee_cl(x, nu, nc); ax = apm.fisher_r2_lee_cl(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.1138774234168360557146160900744444149943E-1

```

16.3.10 Central Wilks' Lambda: cdf, sf (Rao)

`ctx.wilks_lambda_rao_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns Rao's F approximation to the cdf of Wilk's Λ

Define

$$z = \frac{1-\Lambda^{1/r}}{\Lambda^{1/r}}\frac{rt-2u}{pq}, \quad \text{where } r = v - \frac{p-q+1}{2}, u = \frac{pq-2}{4}, \quad \text{and}$$

$$t = \sqrt{\frac{p^2q^2-4}{p^2+q^2-5}} \text{ if } p^2+q^2-5 > 0 \text{ or 1 otherwise.}$$

Then z is approximately distributed as $F(z; pq, rt-2u)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.wilks_lambda_rao_cdf(x, nu, nc); mx = mpm.wilks_lambda_rao_cdf(x, nu, nc)
>>> ix = ipm.wilks_lambda_rao_cdf(x, nu, nc); fx = fpm.wilks_lambda_rao_cdf(x, nu, nc)

ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.3.11 Central Wilks' Lambda: qtf, isf (Rao)

`ctx.wilks_lambda_rao_qtf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns Rao's F approximation to the cdf of Wilk's Λ

Define

$$z = \frac{1-\Lambda^{1/r}}{\Lambda^{1/r}}\frac{rt-2u}{pq}, \quad \text{where } r = v - \frac{p-q+1}{2}, u = \frac{pq-2}{4}, \quad \text{and}$$

$$t = \sqrt{\frac{p^2q^2-4}{p^2+q^2-5}} \text{ if } p^2+q^2-5 > 0 \text{ or 1 otherwise.}$$

Then z is approximately distributed as $F(z; pq, rt-2u)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.wilks_lambda_rao_qtf(x, nu, nc); mx = mpm.wilks_lambda_rao_qtf(x, nu, nc)
>>> ix = ipm.wilks_lambda_rao_qtf(x, nu, nc); fx = fpm.wilks_lambda_rao_qtf(x, nu, nc)

```

16.3.12 Central Hotelling's T^2: cdf, sf (Pillai and Young)

`ctx.hotelling_t2_mu3_cdf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the central Hotelling's T^2 distribution. See also Pillai and Young [472].

Let $m = (n_1 - p - 1)/2$, $n = (n_2 - p - 1)/2$, and $r = 2m + p + 1$. Define

$$\mu_1 = \frac{pr}{2n}, \quad \mu_2 = \mu_1 \frac{(2n+r)(2n+p)}{2n(n-1)(2n+1)}, \quad \mu_3 = \mu_2 \frac{2(n+r)(n+p)}{n(n-2)(n+1)},$$

$$a = \frac{(2\mu_1 3\mu_2 + 3\mu_1^2\mu_3 - 6\mu_1\mu_2^2 - \mu_2\mu_3)}{(\mu_2\mu_3 + 4\mu_1\mu_2^2 - \mu_1^2\mu_3)} + 1, \quad b = \frac{a(a+2) - \mu_1^2/\mu_2}{a - \mu_1^2/\mu_2} - a,$$

$$K = \frac{\mu_1(b-1)}{a}, \quad w = \frac{x}{x+K}.$$

Then $x = T^2/n_2$ is approximately distributed as $I_w(a, b)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hotelling_t2_mu3_cdf(x, nu, nc); mx = mpm.hotelling_t2_mu3_cdf(x, nu, nc)
>>> ix = ipm.hotelling_t2_mu3_cdf(x, nu, nc); fx = fpm.hotelling_t2_mu3_cdf(x, nu, nc)
>>> gx = gmp.hotelling_t2_mu3_cdf(x, nu, nc); ax = apm.hotelling_t2_mu3_cdf(x, nu, nc)

```

16.3.13 Central Hotelling's T^2: qtf, isf (Pillai and Young)

`ctx.hotelling_t2_mu3_qtf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the central Hotelling's T^2 distribution, based on matching the first 3 moments.. See also Pillai and Young [472].

Let $m = (n_1 - p - 1)/2$, $n = (n_2 - p - 1)/2$, and $r = 2m + p + 1$. Define

$$\mu_1 = \frac{pr}{2n}, \quad \mu_2 = \mu_1 \frac{(2n+r)(2n+p)}{2n(n-1)(2n+1)}, \quad \mu_3 = \mu_2 \frac{2(n+r)(n+p)}{n(n-2)(n+1)},$$

$$a = \frac{(2\mu_1 3\mu_2 + 3\mu_1^2\mu_3 - 6\mu_1\mu_2^2 - \mu_2\mu_3)}{(\mu_2\mu_3 + 4\mu_1\mu_2^2 - \mu_1^2\mu_3)} + 1, \quad b = \frac{a(a+2) - \mu_1^2/\mu_2}{a - \mu_1^2/\mu_2} - a,$$

$$K = \frac{\mu_1(b-1)}{a}, \quad w = \frac{x}{x+K}.$$

Then $x = T^2/n_2$ is approximately distributed as $I_w(a, b)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hotelling_t2_mu3_qtf(x, nu, nc); mx = mpm.hotelling_t2_mu3_qtf(x, nu, nc)

16.3.14 Central Pillai's V: cdf, sf (Ginzberg)

`ctx.pillay_v_mu3_cdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the central Pillai V distribution, based on matching the first 3 moments. See also Ginzberg [349].

Let $m = (n_1 - p - 1)/2$, $n = (n_2 - p - 1)/2$, and $r = m + n + p$. Define

$$\mu_1 = \frac{p(2m+p+1)}{2(r+1)}, \quad \mu_2 = \mu_1 \frac{(2n+p+1)(2r-p+2)}{2(r+1)(r+2)(2r+1)}, \quad \mu_3 = \mu_2 \frac{4(n-m)(m+n+1)}{(r+1)(r+3)(2r)},$$

$$c = 4\mu_1\mu_2^2 - \mu_1^2\mu_3 + \mu_2\mu_3, \quad d = 2\mu_2^2 - \mu_1\mu_3,$$

$$a = \frac{2\mu_1(\mu_1^2\mu_2 - \mu_2^2 + \mu_1\mu_3)}{c}, \quad b = \frac{a}{d}\,\frac{\mu_2(2\mu_1\mu_2 + \mu_3)}{\mu_1}, \quad w = \frac{d}{c}x.$$

Then $x = V/n_2$ is approximately distributed as $I_w(a, b)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pillay_v_mu3_cdf(x, nu, nc); mx = mpm.pillay_v_mu3_cdf(x, nu, nc)

```

16.3.15 Central Pillai's V: qtf, isf (Ginzberg)

`ctx.pillay_v_mu3_qtf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the central Pillai V distribution. See also Ginzberg [349].

Let $m = (n_1 - p - 1)/2$, $n = (n_2 - p - 1)/2$, and $r = m + n + p$. Define

$$\mu_1 = \frac{p(2m+p+1)}{2(r+1)}, \quad \mu_2 = \mu_1 \frac{(2n+p+1)(2r-p+2)}{2(r+1)(r+2)(2r+1)}, \quad \mu_3 = \mu_2 \frac{4(n-m)(m+n+1)}{(r+1)(r+3)(2r)},$$

$$c = 4\mu_1\mu_2^2 - \mu_1^2\mu_3 + \mu_2\mu_3, \quad d = 2\mu_2^2 - \mu_1\mu_3,$$

$$a = \frac{2\mu_1(\mu_1^2\mu_2 - \mu_2^2 + \mu_1\mu_3)}{c}, \quad b = \frac{a}{d}\,\frac{\mu_2(2\mu_1\mu_2 + \mu_3)}{\mu_1}, \quad w = \frac{d}{c}x.$$

Then $x = V/n_2$ is approximately distributed as $I_w(a, b)$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pillay_v_mu3_qtf(x, nu, nc); mx = mpm.pillay_v_mu3_qtf(x, nu, nc)

16.3.16 Product of independent beta variables: cdf, sf (Nagarsenker)

`ctx.beta_product_mu3_cdf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the product of independent beta variables distribution.

Nagarsenker and Suniaga [422] proposes the following approximation:

$$\Pr(W_p \le \lambda) = I(x; sm + d, \nu_1 + r) + O(sm^{-3}), \quad \text{where}$$

$$x = \lambda^{1/s}; \quad a = \frac{\nu_1 - \nu_2}{2\nu_1}; \quad d = \frac{1 - \nu_1}{2}; \quad \nu_r = \sum_{i=1}^{p} c_i^r - b_i^r$$

$$s^2 = \frac{-2B_2((1 + \nu_1)/2)}{\sum_{i=1}^{p} B_3(a + b_i) - B_3(a + c_i)}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.beta_product_mu3_cdf(x, nu, nc); mx = mpm.beta_product_mu3_cdf(x, nu, nc)
>>> ix = ipm.beta_product_mu3_cdf(x, nu, nc); fx = fpm.beta_product_mu3_cdf(x, nu, nc)
>>> gx = gmp.beta_product_mu3_cdf(x, nu, nc); ax = apm.beta_product_mu3_cdf(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

```

16.3.17 Product of independent beta variables: qtf, isf (Nagarsenker)

`ctx.beta_product_mu3_qtf`(x)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the qtf of the product of independent beta variables distribution.

Nagarsenker and Suniaga [422] proposes the following approximation:

$$\Pr(W_p \le \lambda) = I(x; sm + d, \nu_1 + r) + O(sm^{-3}), \quad \text{where}$$

$$x = \lambda^{1/s}; \quad a = \frac{\nu_1 - \nu_2}{2\nu_1}; \quad d = \frac{1 - \nu_1}{2}; \quad \nu_r = \sum_{i=1}^{p} c_i^r - b_i^r$$

$$s^2 = \frac{-2B_2((1+\nu_1)/2)}{\sum_{i=1}^{p} B_3(a+b_i) - B_3(a+c_i)}$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.beta_product_mu3_qtf(x, nu, nc); mx = mpm.beta_product_mu3_qtf(x, nu, nc)

16.4 Approximations based on the noncentral chi-squared distribution

16.4.1 Non-central Wilks' Lambda (GLM): cdf and sf (Fujikoshi)

`ctx.`**`wilks_lambda_glm_chi2_cdf`**(*x*, *p*, *q*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Wilks' Lambda (GLM) distribution.

Fujikoshi [339] proposes the following noncentral chi-square approximation to the cdf and sf:

$$
\begin{aligned}
F_{\Lambda,GLM}(p,q,n;z;\Theta) &= F_{\chi^2}\left(pq,x;\theta_1\right) + \frac{1}{4n}\sum_{k=1}^{3} a_k F_{\chi^2}\left(pq+2k,x;\theta_1\right) \\
&+ \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k,x;\theta_1\right) + \frac{1}{96n^3}\sum_{k=1}^{9} c_k F_{\chi^2}\left(pq+2k,x;\theta_1\right) + O(n^{-4}) \\
&\Theta = \Lambda^{-1}MM', \quad \theta_j = \operatorname{tr}\Theta^j, \\
&m = n + (pq-1)/2, \quad x = m\log(z), \quad s = (p+q+1)/4, \quad r = pq(p^2+q^2-5)/48,
\end{aligned}
\tag{16.12}
$$

$$
\begin{aligned}
a_1 &= 2s\theta_1 \\
a_2 &= 2s\theta_1 - \theta_2 \\
a_3 &= \theta_2
\end{aligned}
\tag{16.13}
$$

$$
\begin{aligned}
b_0 &= r \\
b_1 &= 0 \\
b_2 &= r4s^2\theta_1 + 2s^2\theta_1^2 + 2s\theta_2 \\
b_3 &= 4s^2\theta_1 - (1+4s^2)\theta_1^2 - (1+8s)\theta_2 + 2s\theta_1\theta_2 + (4/3)\theta_3 \\
b_4 &= (1+2s^2)\theta_1^2 + (1+6s)\theta_2 - 4s\theta_1\theta_2 - 4\theta_3 + \theta_2^2/2 \\
b_5 &= 2s\theta_1\theta_2 + (8/3)\theta_3 - \theta_2^2 \\
b_6 &= \theta_2^2/2
\end{aligned}
\tag{16.14}
$$

$$
\begin{aligned}
c_1 &= 2rs\theta_1 \\
c_2 &= r(2s\theta_1\theta_2) \\
c_3 &= 2s(r+4s^2)\theta_1 + 2s(1+4s^2)\theta_1^2 + (-r+2s+12s^2)\theta_2 - \tfrac{4}{3}s^3\theta_1^3 - 4s^2\theta_1\theta_2 - \tfrac{8}{3}s\theta_3 \\
c_4 &= 2s(r+4s^2)\theta_1 - (1+10s+16s^3)\theta_1^2 - (3+r+10s+36s^2)\theta_2 + 2s(1+2s^2)\theta_1^3 \\
&+ 2(2+s+12s^2)\theta_1\theta_2 + 4(1+6s)\theta_3 - 2s^2\theta_1^2\theta_2 - 2s\theta_2^2 - \tfrac{8}{3}s\theta_1\theta_3 - 2\theta_4 \\
c_5 &= (1+8s+8s^3)\theta_1^2 + (3+r+8s+24s^2)\theta_2 - 4s(1+s^2)\theta_1^3 - 4(3+s+9s^2)\theta_1\theta_2 - 12(1+4s)\theta_3 \\
&+ (1+6s^2)\theta_1^2\theta_2 + (1+10s)\theta_2^2 + \tfrac{32}{3}s\theta_1\theta_3 + 12\theta_4 - \tfrac{4}{3}\theta_2\theta_3 - s\theta_1\theta_2^2 \\
c_6 &= s(2+\tfrac{4}{3}s^2)\theta_1^3 + 2(4+s+8s^2)\theta_1\theta_2 + 8(1+\tfrac{10}{3}s)\theta_3 - 2(1+3s^2)\theta_1^2\theta_2 - 2(1+7s)\theta_2^2 \\
&- \tfrac{40}{3}s\theta_1\theta_3 - 20\theta_4 + \tfrac{16}{3}\theta_2\theta_3 + 3s\theta_1\theta_2^2 - \tfrac{1}{6}\theta_2^3 \\
c_7 &= (1+2s^2)\theta_1^2\theta_2 + (1+6s)\theta_2^2 + \tfrac{16}{3}s\theta_1\theta_3 + 10\theta_4 - \tfrac{20}{3}\theta_2\theta_3 - 3s\theta_1\theta_2^2 + \tfrac{1}{2}\theta_2^3 \\
c_8 &= \tfrac{8}{3}\theta_2\theta_3 + s\theta_1\theta_2^2 - \tfrac{1}{2}\theta_2^3 \\
c_9 &= \tfrac{1}{6}\theta_2^3
\end{aligned}
\tag{16.15}
$$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30

Fujikoshi [339]

Pillai: coeff p. 93 (5.10), GLM p. 96 (5.2), CORR p. 113/114 (8.1)

Hotelling: coeff p. 105 (6.18), GLM p. 105 (6.19), CORR p. 119 (9.9)

16.4.2 Non-central Wilks' Lambda (independence): cdf and sf (Lee)

`ctx.wilks_lambda_ind_chi2_cdf`(*x*, *p*, *q*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Wilks' Lambda (independence) distribution.

Lee [406] proposes the following noncentral chi-square approximation:

$$\text{cdf}_X(x) == F_{\chi^2}\left(pq, x; s1\right) + \frac{1}{4n}\sum_{k=0}^{3} a_k F_{\chi^2}\left(pq+2k, x; s1\right) + \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k, x; s1\right) + O(n^{-3}),$$

$\Omega = \Lambda^{-1}MM'$, $\theta_j = \text{tr}\,\Omega^j$, $m = n + (pq-1)/2$, $x = m\log(z)$, $f = pq$, $s = (p+q+1)/4$, $r = f(p^2+q^2-5)/48$,

$a_0 = -q\theta_1 + \theta_2$, $a_1 = (2s+q)\theta_1 - 2\theta_2$, $a_2 = -2s\theta_1 + 2\theta_2$, $a_3 = -\theta_2$,

$b_0 = -r - ql\theta_1 + (q+l)\theta_2 + \frac{1}{2}q^2\theta_1^2 - \frac{4}{3}\theta_3 - q\theta_1\theta_2 + \frac{1}{2}\theta_2^2$,

$b_1 = q^2\theta_1 - 4q\theta_2 - q(q+2s)\theta_1^2 + 4\theta_3 + (3q+2s)\theta_1\theta_2 - 2\theta_2^2$,

$b_2 = r - 2s(q+2s)\theta_1 + (2p+6q+3)\theta_2 + (\frac{1}{2}l^2 + 6qs + 1)\theta_1^2 - 8\theta_3 - (4q+6s)\theta_1\theta_2 + 4\theta_2^2$,

$b_3 = 4s^2\theta_1 - (3p+5q+5)\theta_2 - (4s^2+2qs+2)\theta_1^2 + \frac{32}{3}\theta_3 + (3q+8s)\theta_1\theta_2 - 5\theta_2^2$,

$b_4 = (6s+1)\theta_2 + (2s^2+1)\theta_1^2 - 8\theta_3 - (q+6s)\theta_1\theta_2 + 4\theta_2^2$,

$b_5 = \frac{8}{3}\theta_3 + 2s\theta_1\theta_2 - 2\theta_2^2$,

$b_6 = \frac{1}{2}\theta_2^2$.

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30

```

16.4.3 Non-central Pillai's V (GLM): cdf and sf Fujikoshi

`ctx.pillai_v_glm_chi2_cdf`(*x*, *p*, *q*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Pillai's V (GLM) distribution.

Fujikoshi [340] proposes the following noncentral chi-square approximation to the cdf and sf:

$$\text{cdf}_X(x) == F_{\chi^2}\left(pq, x; s1\right) + \frac{1}{4n}\sum_{k=0}^{3} a_k F_{\chi^2}\left(pq+2k, x; s1\right) + \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k, x; s1\right) + O(n^{-3}),$$

$l_0 = (3f-8)g^2 + 4g + 4(f+2)$

$l_1 = -12fg^2$

$l_2 = 6(3f+8)g^2$

$l_3 = -4((3f+16)g^2 + 4g + 4(f+2))$

$l_4 = 3((f+8)g^2 + 4g + 4(f+2))$

$a_0 = -fg$

$a_1 = 2fg$

$a_2 = -fg + 4g\lambda_1 + 4\lambda_2$

$a_3 = -4g\lambda_1$

$a_4 = -4\lambda_2$

$b_0 = fl_0$

$b_1 = fl_1$

$b_2 = fl_2 + 2l_1\lambda_1 - 24fg\lambda_2$

$b_3 = fl_3 + 4l_2\lambda_1 + 48(f+4)g\lambda_2 + 128\lambda_3$

$b_4 = fl_4 + 6l_3\lambda_1 + 48(g^2-2)\lambda_1^2 - 96(g+1)\lambda_2 + 96g\lambda_1\lambda_2 + 48\lambda_2^2$

$b_5 = 8(l_4\lambda_1 - 12(g^2+2)\lambda_1^2 - 6((f+12)g+4)\lambda_2 - 12g\lambda_1\lambda_2 - 48\lambda_3)$

$b_6 = 8(6(g^2+6)\lambda_1^2 + 3((f+20)g+12)\lambda_2 - 12g\lambda_1\lambda_2 - 16\lambda_3 - 12\lambda_2^2)$

$b_7 = 96(g\lambda_1\lambda_2 + 4\lambda_3)$

$b_8 = 48\lambda_2^2$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pillai_v_glm_chi2_cdf(x, nu, nc); mx = mpm.pillai_v_glm_chi2_cdf(x, nu, nc)
>>> ix = ipm.pillai_v_glm_chi2_cdf(x, nu, nc); fx = fpm.pillai_v_glm_chi2_cdf(x, nu, nc)
>>> gx = gmp.pillai_v_glm_chi2_cdf(x, nu, nc); ax = apm.pillai_v_glm_chi2_cdf(x, nu, nc)

```

16.4.4 Non-central Pillai's V (independence): cdf and sf (Lee)

`ctx.pillai_v_ind_chi2_cdf`(*x*, *p*, *q*, *n*, *lambda*)

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Pillai's V (independence) distribution.

Lee [406] proposes the following noncentral chi-square approximation. See also

$$\text{cdf}_X(x) == F_{\chi^2}\left(pq, x; s1\right) + \frac{1}{4n}\sum_{k=0}^{3} a_k F_{\chi^2}\left(pq+2k, x; s1\right) + \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k, x; s1\right) + O(n^{-3}),$$

$a_0 = -fg - 4\lambda_2$

$a_1 = 2fg$

$a_2 = -fg + 4g\lambda_1 + 8\lambda_2$

$a_3 = -4g\lambda_1$

$a_4 = -4\lambda_2$

$b_0 = fl_0 + 24fg\lambda_2 - 128\lambda_3 + 48\lambda_2^2$

$b_1 = fl_1 - 48fg\lambda_2$

$b_2 = fl_2 + 2l_1\lambda_1 + 96\lambda_1^2 - 24(qp^2 + q(q+1)p - 4)\lambda_2 - 96g\lambda_1\lambda_2 - 192\lambda_2^2$

$b_3 = fl_3 + 4l_2\lambda_1 + 96(qp^2 + (q^2+q+4)p + 4(q+1))\lambda_2 + 96g\lambda_1\lambda_2 + 640\lambda_3$

$b_4 = fl_4 + 6l_3\lambda_1 + 48(p^2 + 2(q+1)p + q^2 + 2q - 3)\lambda_1^2 - 24(qp^2 + (q^2+q+12)p + 4(3q+5))\lambda_2 + 192g\lambda_1\lambda_2 + 288\lambda_2^2$

$b_5 = 8l_4\lambda_1 - 96(p^2 + 2(q+1)p + q^2 + 2q + 3)\lambda_1^2 - 48(qp^2 + (q^2+q+12)p + 4(3q+4))\lambda_2 - 192g\lambda_1\lambda_2 - 768\lambda_3$

$b_6 = 48(p^2 + 2(q+1)p + q^2 + 2q + 7)\lambda_1^2 + 24(qp^2 + (q^2+q+20)p + 4(5q+8))\lambda_2 - 96g\lambda_1\lambda_2 - 128\lambda_3 - 192\lambda_2^2$

$b_7 = 96(g\lambda_1\lambda_2 + 4\lambda_3)$

$b_8 = 48\lambda_2^2$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.pillai_v_ind_chi2_cdf(x, nu, nc); mx = mpm.pillai_v_ind_chi2_cdf(x, nu, nc)
>>> ix = ipm.pillai_v_ind_chi2_cdf(x, nu, nc); fx = fpm.pillai_v_ind_chi2_cdf(x, nu, nc)
>>> gx = gmp.pillai_v_ind_chi2_cdf(x, nu, nc); ax = apm.pillai_v_ind_chi2_cdf(x, nu, nc)

16.4.5 Non-central Hotelling T^2 (GLM): cdf and sf (Fujikoshi)

`ctx.hotelling_t2_glm_chi2_cdf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Hotelling T^2 (GLM) distribution.

Fujikoshi [340] proposes the following noncentral chi-square approximation to the pdf and cdf:

$$\text{cdf}_X(x) == F_{\chi^2}\left(pq, x; s1\right) + \frac{1}{4n}\sum_{k=0}^{3} a_k F_{\chi^2}\left(pq+2k, x; s1\right) + \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k, x; s1\right) + O(n^{-3}),$$

$a_0 = fg$

$a_1 = -2g(f - 2\lambda_1)$

$a_2 = fg - 8g\lambda_1 + 4\lambda_2$

$a_3 = 4(g\lambda_1 - 2\lambda_2)$

$a_4 = 4\lambda_2$

$b_0 = fl_0$

$b_1 = l_1(f - 2\lambda_1)$

$b_2 = fl_2 + 2(l_1 - 2l_2)\lambda_1 + 48g^2\lambda_1^2 + 24(f+4)g\lambda_2$

$b_3 = fl_3 + 2(2l_2 - 3l_3)\lambda_1 - 192(g^2+1)\lambda_1^2 - 96((f+8)g + 2)\lambda_2 + 96g\lambda_1\lambda_2 + 128\lambda_3$

$b_4 = fl_4 + 2(3l_3 - 4l_4)\lambda_1 + 96(3g^2+7)\lambda_1^2 + 48(3(f+12)g + 14)\lambda_2 - 384g\lambda_1\lambda_2 - 768\lambda_3 + 48\lambda_2^2$

$b_5 = 8l_4\lambda_1 - 192(g^2+4)\lambda_1^2 - 96((f+16)g + 8)\lambda_2 + 576g\lambda_1\lambda_2 + 1536\lambda_3 - 192\lambda_2^2$

$b_6 = 48(g^2+6)\lambda_1^2 + 24((f+20)g + 12)\lambda_2 - 384g\lambda_1\lambda_2 - 1280\lambda_3 + 288\lambda_2^2$

$b_7 = 96g\lambda_1\lambda_2 + 384\lambda_3 - 192\lambda_2^2$

$b_8 = 48\lambda_2^2$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hotelling_t2_glm_chi2_cdf(x, nu, nc); mx = mpm.hotelling_t2_glm_chi2_cdf(x, nu, nc)

```

16.4.6 Non-central Hotelling T^2 (independence): cdf and sf (Lee)

`ctx.hotelling_t2_ind_chi2_cdf(x)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Returns an approximation to the cdf of the noncentral Hotelling T^2 (independence) distribution.

Lee [406] proposes the following noncentral chi-square approximation:

$$\text{cdf}_X(x) == F_{\chi^2}\left(pq, x; s1\right) + \frac{1}{4n}\sum_{k=0}^{3} a_k F_{\chi^2}\left(pq+2k, x; s1\right) + \frac{1}{96n^2}\sum_{k=0}^{6} b_k F_{\chi^2}\left(pq+2k, x; s1\right) + O(n^{-3}),$$

$s_1 = 2\lambda_1$

$s_2 = 4\lambda_2$

$s_3 = 8\lambda_3$

$a_0 = qp(q-p-1) - 2qs_1 + s_2$

$a_1 = -2q^2p + 4qs_1 - 2s_2$

$a_2 = qp(q+p+1) - 2(2q+p+1)s_1 + 2s_2$

$a_3 = 2(q+p+1)s_1 - 2s_2$

$a_4 = s_2$

$b_0 = qp(3qp^3 - 2(3q^2 - 3q + 4)p^2 + 3(q^3 - 2q^2 + 5q - 4)p - 8q^2 + 12q + 4) - 12q^2p(q-p-1)s_1 - 6q(p^2 - qp + p - 4)s_2 + 12q^2s_1^2 - 16s_3 - 12qs_1s_2 + 3s_22$

$b_1 = -12q^3p^2(q-p-1) - 24q^2(p^2 - 2qp + p - 2)s_1 + 12q(p^2 - 2qp + p - 8)s_2 - 48q^2s_1^2 + 48s_3 + 48qs_1s_2 - 12s_22$

$b_2 = -6q^2p^4 - 12q^2p^3 + 18q^2(q^2+1)p^2 + 24q^2(2q+1)p + 12q(p^3 + 2p^2 - 7(q^2+1)p - 16q - 8)s_1 - 6(qp^2 - (7q^2 - q + 8)p - 40q - 12)s_2 + 24(qp + 4q^2 + q + 1)s_1^2 - 12(p + 8q + 1)s_1s_2 - 96s_3 + 24s_22$

$b_3 = -(12q^3+16q)p^3 - (12q^4+12q^3+96q^2+48q)p^2 - (64q^3+96q^2+64q)p + 12(-qp^3 + (4q^2-2q+4)p^2 + (7q^3+4q^2+31q+12)p + 4(7q^2+8q+4))s_1 - 48((q^2+3)p+9q+5)s_2 - 24(3qp+5q^2+3q+4)s_1^2 + 176s_3 + 12(3p+11q+3)s_1s_2 - 36s_22$

$b_4 = 3q^2p^4 + (6q^3+6q^2+24q)p^3 + (3q^4+6q^3+63q^2+60q)p^2 + (24q^3+60q^2+60q)p - 12(qp^3 + (5q^2+2q+12)p^2 + (4q^3+5q^2+45q+32)p + 4(6q^2+11q+9))s_1 + 6(qp^2 + (7q^2+q+44)p + 88q + 76)s_2 + 12(p^2 + 2(4q+1)p + 8q^2 + 8q + 17)s_1^2 - 12(4p + 11q + 4)s_1s_2 - 240s_3 + 42s_22$

$b_5 = (12qp^3 + 24(q^2+q+4)p^2 + 12(q^3+2q^2+21q+20)p + 48(2q^2+5q+5))s_1 - 12(qp^2 + (2q^2+q+24)p + 32q + 40)s_2 - 24(p^2 + (3q+2)p + 2q^2 + 3q + 9)s_1^2 + 240s_3 + 48(p+2q+1)s_1s_2 - 36s_22$

$b_6 = (6qp^2+6(q^2+q+20)p+120q+192)s_2 + (12p^2+24(q+1)p+12(q^2+2q+7))s_1^2 - 12(3p+4q+3)s_1s_2 - 160s_3 + 24s_22$

$b_7 = 48s_3 + 12(q+p+1)s_1s_2 - 12s_22$

$b_8 = 3s_22$

An example (CDF):

```

16.5 Approximations based on the noncentral F or beta distribution

16.5.1 Multiple correlation coefficient (Lee and Gurland)

`ctx.fisher_r2_lee_mu3_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

Lee [407] suggests the following approximation, based on the noncentral F distribution:

$$F_{R^2}(x; n_1, n_2, \rho^2) \approx F_{F'}(y; \nu, n_2, \lambda),$$

where $\gamma = 1/(1-\rho^2), \quad A_j = (n_1+n_2)(\gamma^j - 1) + n_1, \quad j = 1, 2, 3,$

$G = (A_2 - \sqrt{A_2^2 - A_1 A_3})/A_1, \quad \lambda = \rho^2 \gamma \sqrt{\gamma(n_1+n_2)n_2}/G^2, \quad \nu = (A_2/G^2) - 2\lambda, \quad y = x/(1-x) \times n_2/(\nu \cdot G),$

and $F_{F'}(\cdot; \nu, n_2, \lambda)$ denotes the CDF of the noncentral F distribution with ν and n_2 degrees of freedom and noncentrality parameter λ

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hotelling_t2_ind_chi2_cdf(x, nu, nc); mx = mpm.hotelling_t2_ind_chi2_cdf(x, nu, nc)
>>> ix = ipm.hotelling_t2_ind_chi2_cdf(x, nu, nc); fx = fpm.hotelling_t2_ind_chi2_cdf(x, nu, nc)
>>> gx = gmp.hotelling_t2_ind_chi2_cdf(x, nu, nc); ax = apm.hotelling_t2_ind_chi2_cdf(x, nu, nc)

```

16.5.8 Noncentral Roy's largest root under the GLM alternative

`ctx.roy_glm_mu2_cdf(`x`)`

where `ctx` is `fpm`, `mpm`, `ipm`, `dec`, `gmp` or `apm`.

See Muirhead and Chikuse [419].

Let $l_1 \geq l_2 \geq \cdots \geq l_m > 0$ be the latent roots of $S_1 S_2^{-1}$.$Let`\Omega = \Sigma^{-1} M' M$, and ω_i are the latent roots of Ω. An upper bound for the distribution function of l_1 is given by

$$P(l_1 \leq x) \leq \prod_{i=1}^{m} (F_{n1,n2}(\omega_i) \leq x)$$

and a lower bound for the distribution function of l_m is given by

$$P(l_m \leq x) \geq \prod_{i=1}^{m} (F_{n1,n2}(\omega_i) \geq x)$$

where $F_{n1,n2}(\omega_i)$ denotes a random variable having the noncentral F distribution on n1 and n2 degrees of freedom and noncentrality parameter ω_i.

Muirhead,R.J.; Chikuse,Y. (1975): Approximations for the distributions of the extreme latent roots of three matrices. Ann. Inst. Statist. Math., 27, 473-478

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm

16.6 Approximations based on hypergeometric functions of scalar argument

See also Koev and Edelman [395], Butler and Wood [167], Butler [165].

16.6.1 Hypergeometric function ${}_1F_1$ for matrix argument (Butler's approximation)

`ctx.hypermat_1f1_butler(`*res*, *a*, *b*, *X*`)`

where `ctx` is `dec`, `mpm`, `fpm`, `gmp` or `apm`.

Returns Butler's approximation to Kummer's confluent hypergeometric function for matrix argument, ${}_1F_1(a;b;\mathbf{T})$, which is defined as (see {NIST})

$$ {}_1F_1(a;b;\mathbf{T}) = \sum_{k=0}^{\infty} \frac{1}{k!} \sum_{|\kappa|=k} \frac{[a]_\kappa}{[b]_\kappa} Z_\kappa(\mathbf{T}) $$

with $-b + \frac{1}{2}(j+1) \notin \mathbb{N}, 1 \le j \le m; ||\mathbf{T}|| < 1$. Here $Z_\kappa(\mathbf{T})$ is a zonal polynomial.

Butler's approximation takes the form

$$ {}_1F_1(a;b;X) \approx \frac{b^{pb-p(p+1)/4}}{\sqrt{R_{1,1}}} \times \prod_{i=1}^{p} \left[\left(\frac{y_i}{a}\right)^a \left(\frac{1-y_i}{b-a}\right)^{b-a} e^{x_i y_i} \right], \quad \text{where} $$

$$ X = \text{diag}(x_1, \ldots, x_p, y_i = \frac{2a}{b - x_i + \sqrt{(x_i-b)^2 + 4ax_i}}, \text{ and} $$

$$ R_{1,1} = \prod_{i=1}^{p} \prod_{j=i}^{p} \left[\frac{y_i y_j}{a} + \frac{(1-y_i)(1-y_j)}{b-a} \right]. $$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hypermat_1f1_butler(x, nu, nc); mx = mpm.hypermat_1f1_butler(x, nu, nc)
>>> ix = ipm.hypermat_1f1_butler(x, nu, nc); fx = fpm.hypermat_1f1_butler(x, nu, nc)
>>> gx = gmp.hypermat_1f1_butler(x, nu, nc); ax = apm.hypermat_1f1_butler(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])
dec:  3.113877423416836055714616090074444149943E-1
mpm:  3.113877423416836055714616090074444149943e-1
ipm:  3.113877423416836055714616090074444149944e-1 (4.147e-38%)
fpm:  3.11387742341684E-01
gmp:  3.113877423416836055714616090074444149943E-01
ipm:  3.113877423416836055714616090074444149943e-1 (4.055e-38%)
```

16.6.2 Comparisons with MATLAB: some results

Text for examples

Matlab insert

EXAMPLE 1: CF of log MeansRatio RV with and n = 5 and alpha = 7/2

```
n     = 5;
alpha = 7/2;
t     = linspace(-100,100,201);
cf    = cf_LogRV_MeansRatioW(t,n,alpha);
figure; plot(t,real(cf),t,imag(cf)); grid on;
title('CF of log MeansRatio RV with and n = 5 and alpha = 7/2')
```

16.6.3 Hypergeometric function ${}_2F_1$ for matrix argument (Butler's approximation)

`ctx.hypermat_2f1_butler`(*res*, *a*, *b*, *c*, *X*)

where `ctx` is `dec`, `mpm`, `fpm`, `gmp` or `apm`.

Returns Butler's approximation to the Gauss hypergeometric function for matrix argument, ${}_2F_1(a, b; c; \mathbf{T})$, which is defined as (see {NIST})

$$ {}_2F_1(a, b; c; \mathbf{T}) = \sum_{k=0}^{\infty} \frac{1}{k!} \sum_{|\kappa|=k} \frac{[a]\,\kappa\,[b]\,\kappa}{[c]\,\kappa} Z_\kappa(\mathbf{T}) $$

with $-c + \frac{1}{2}(j+1) \notin \mathbb{N}, 1 \le j \le m; ||\mathbf{T}|| < 1$. Here $Z_\kappa(\mathbf{T})$ is a zonal polynomial.

Butler's approximation takes the form

$$ {}_2F_1(a, b; c; X) \approx \frac{c^{pc-p(p+1)/4}}{\sqrt{R_{2,1}}} \times \prod_{i=1}^{p} \left[\left(\frac{y_i}{a}\right)^a \left(\frac{1-y_i}{c-a}\right)^{c-a} (1 - x_i y_i)^{-b} \right], $$

where $X = \mathrm{diag}(x_1, \ldots, x_p)$, $S_i = x_i y_i (1 - y_i)/(1 - x_i y_i)$, $\tau_i = x_i(b - a) - c$,

$$ y_i = \frac{2a}{\sqrt{t_i^2 - 4a x_i (c - b)} - \tau_i}, \text{ and} $$

$$ R_{2,1} = \prod_{i=1}^{p} \prod_{j=i}^{p} \left[\frac{y_i y_j}{a} + \frac{(1 - y_i)(1 - y_j)}{c - a} - \frac{b}{a(c - a)} S_i S_j \right]. $$

An example (CDF):

```
>>> from xlcalcnet import fpm, mpm
>>> mpm.dps = 40; x = 12; nu = 10; nc = 30
>>> dx = dec.hypermat_2f1_butler(x, nu, nc); mx = mpm.hypermat_2f1_butler(x, nu, nc)
>>> ix = ipm.hypermat_2f1_butler(x, nu, nc); fx = fpm.hypermat_2f1_butler(x, nu, nc)
>>> gx = gmp.hypermat_2f1_butler(x, nu, nc); ax = apm.hypermat_2f1_butler(x, nu, nc)
>>> mpm.show([dx, mx, ix, fx, gx, ax])

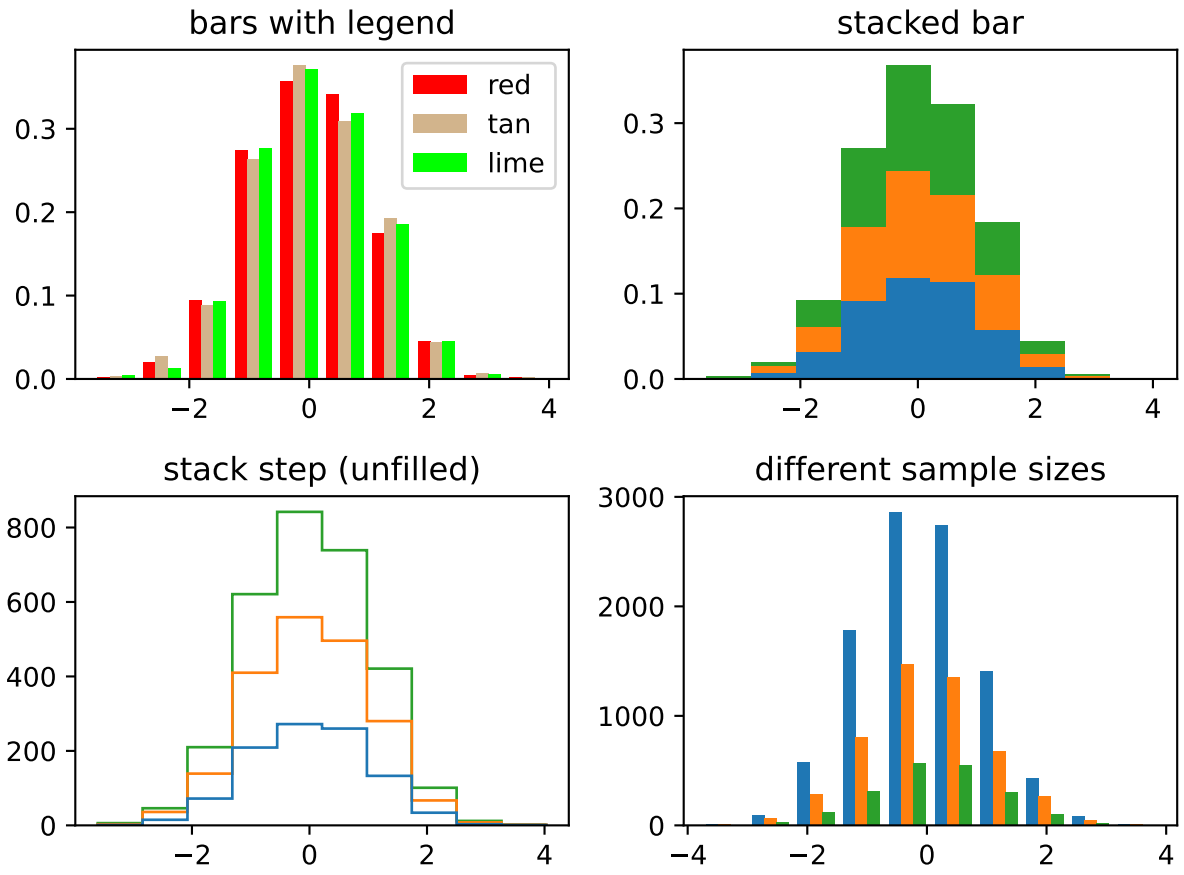
17.1 Bar Charts

17.1.1 Bar chart, part 1

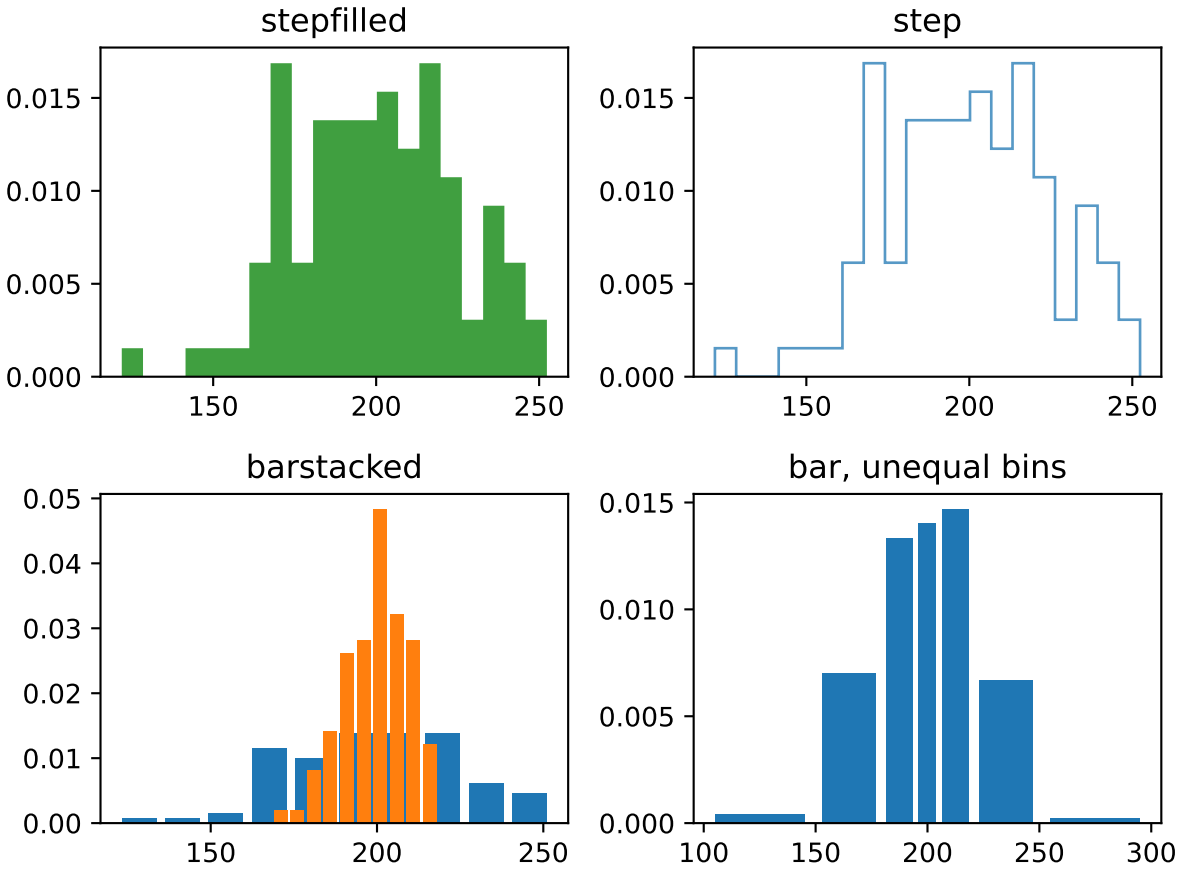
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_BarChartPart1.py, and the XML code in the file D01_BarChartPart1.2D.xml.



Bar chart, part 1

17.1.2 Bar chart, part 2

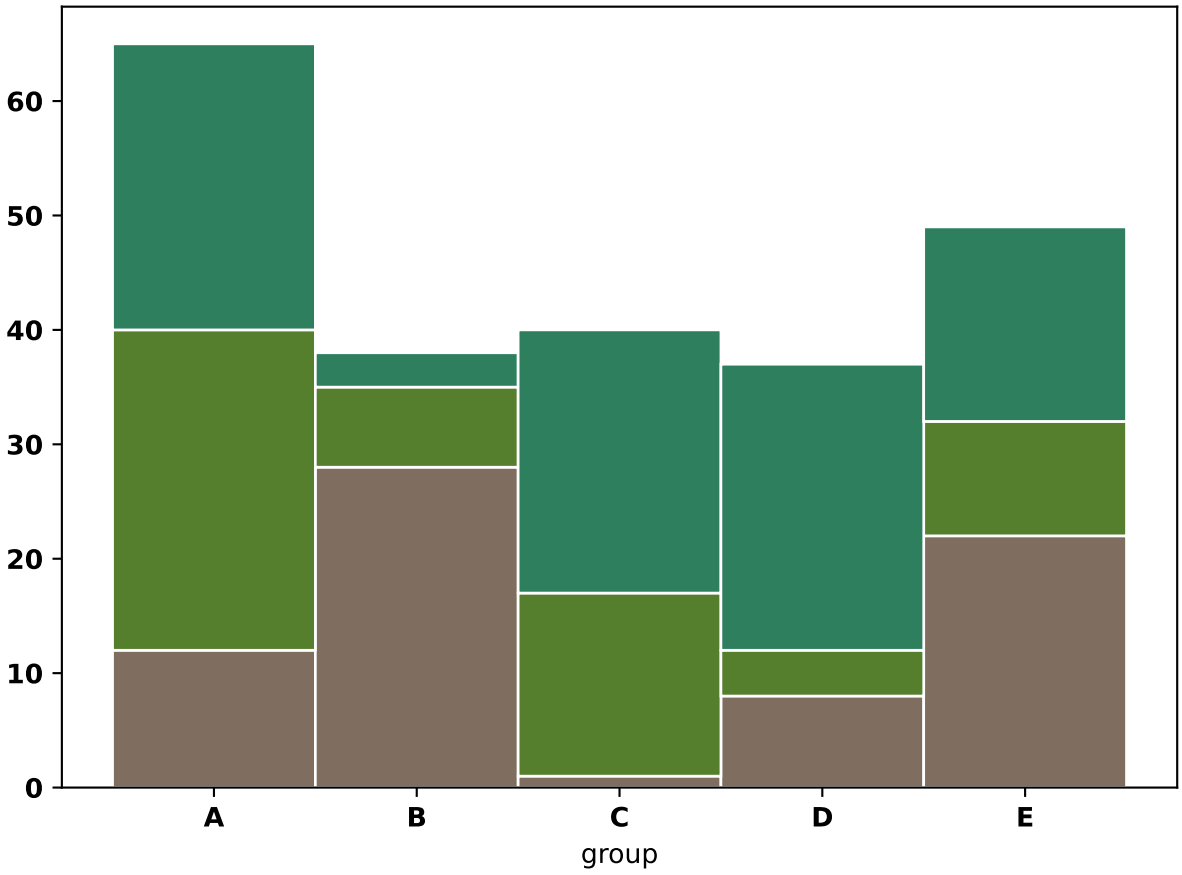
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_BarChartPart2.py, and the XML code in the file D02_BarChartPart2.2D.xml.



Bar chart, part 2

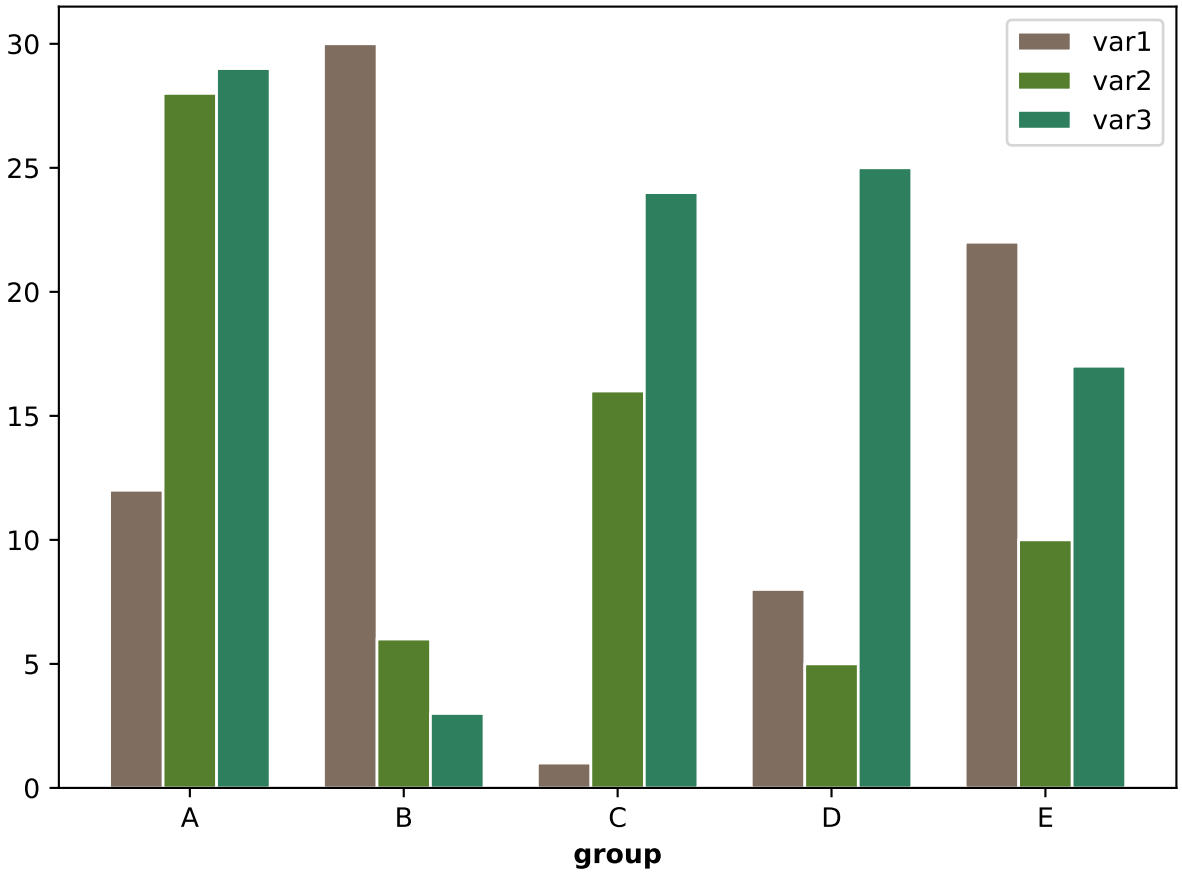
17.1.3 Stacked Bar Plot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_StackedBarPlot.py, and the XML code in the file D03_StackedBarPlot.2D.xml.



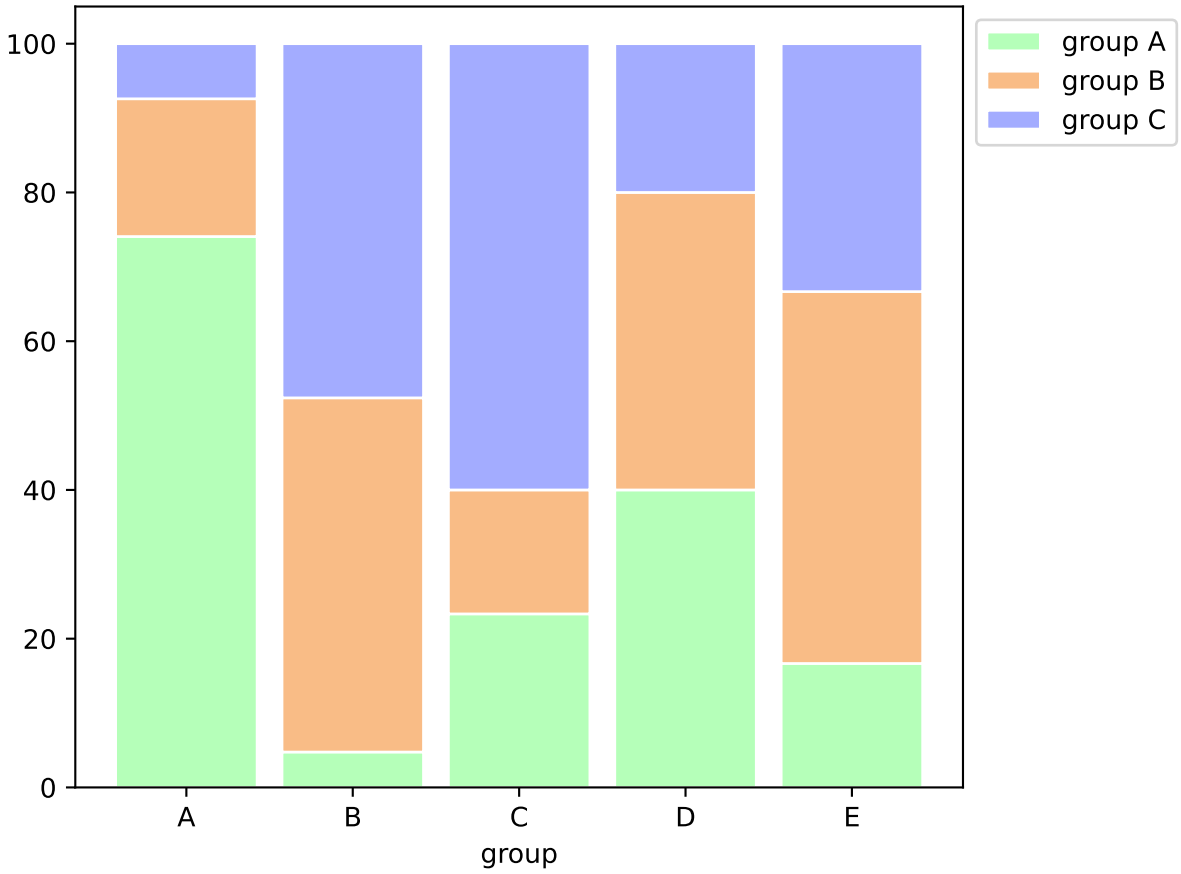
17.1.4 Grouped Bar Plot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_GroupedBarPlot.py, and the XML code in the file D04_GroupedBarPlot.2D.xml.



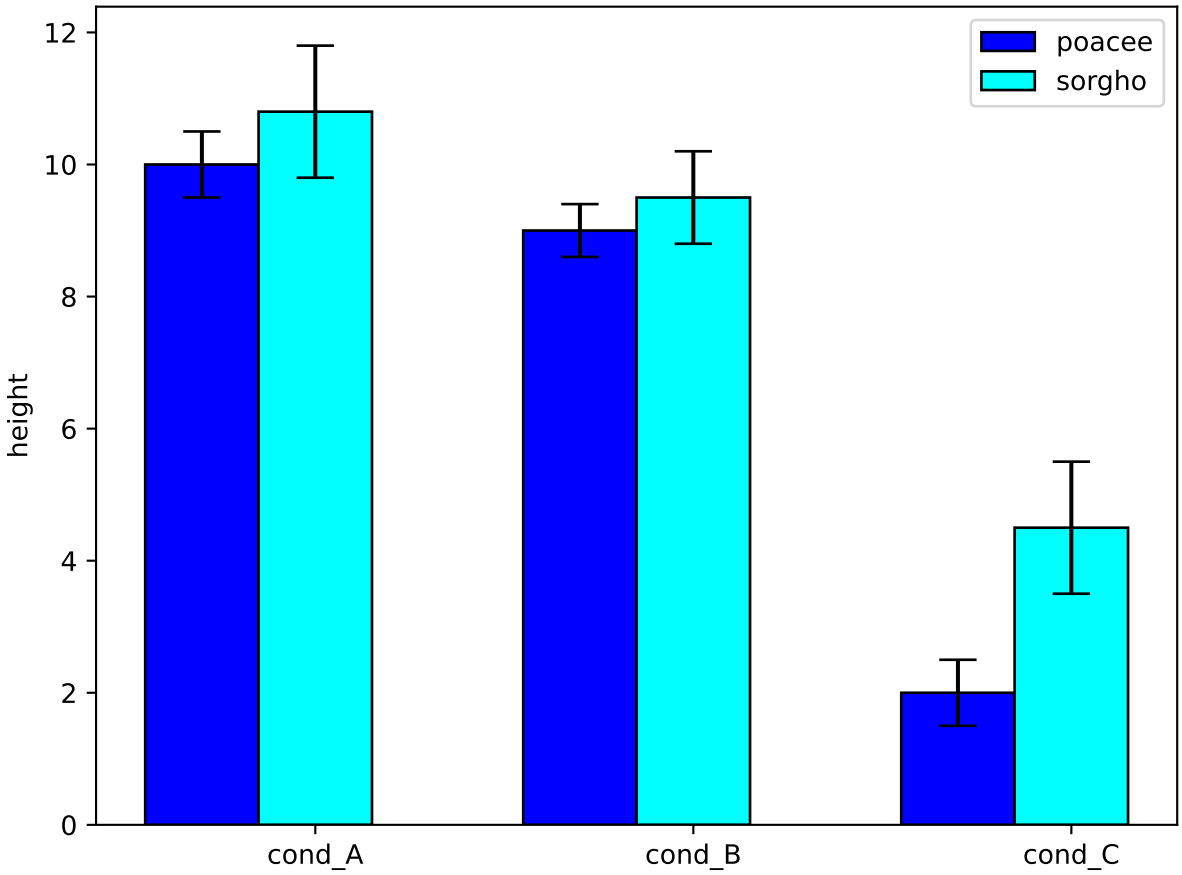
17.1.5 Grouped StackedBar Plot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_GroupedStackedBarPlot.py, and the XML code in the file D05_GroupedStackedBarPlot.2D.xml.



17.1.6 Barplot with error bar

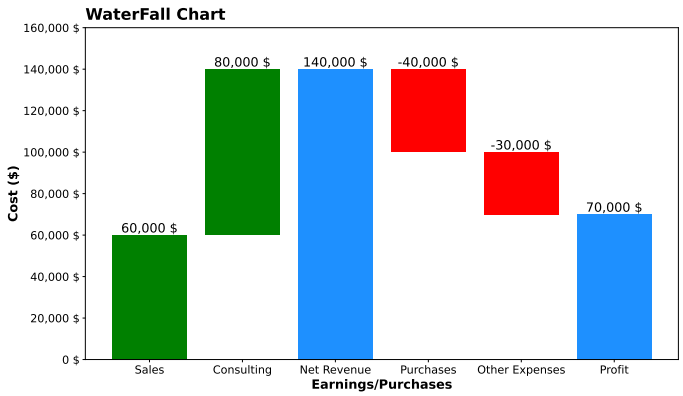
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_BarPlotWithErrorBar.py, and the XML code in the file D06_BarPlotWithErrorBar.2D.xml.

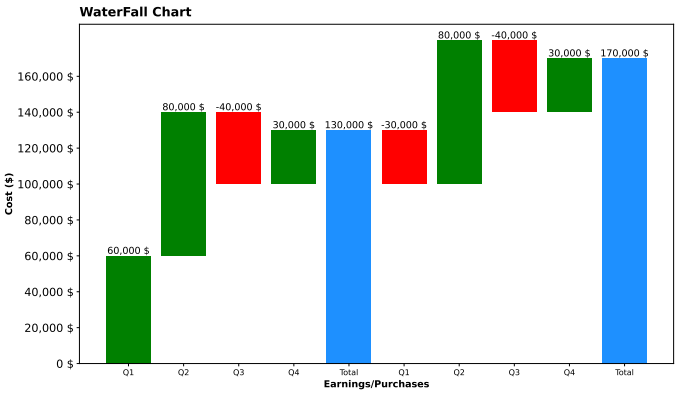


17.1.7 Waterfall Plot

The Python code for the first example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_WaterfallChart1.py, and the XML code in the file D07a_WaterfallChart1.2D.xml.

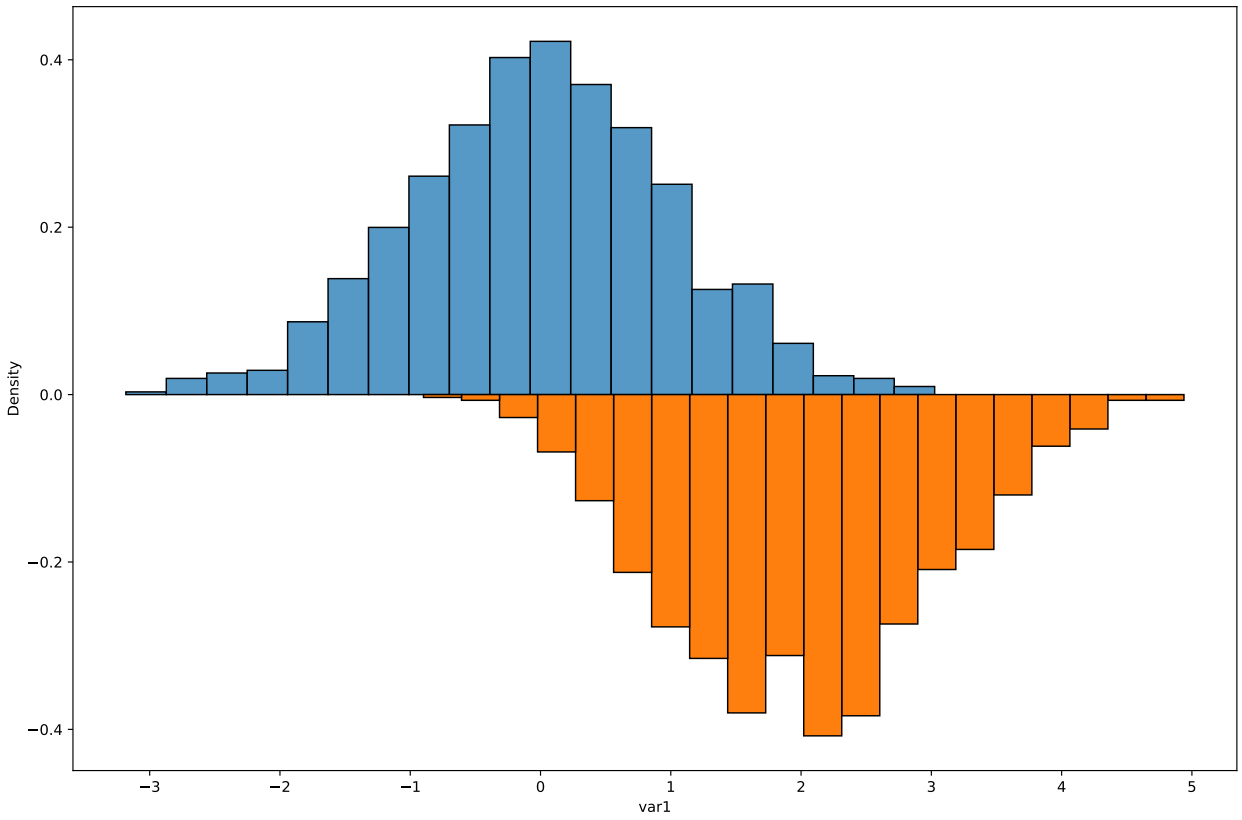
The Python code for the second example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_WaterfallChart2.py, and the XML code in the file D07b_WaterfallChart2.2D.xml.





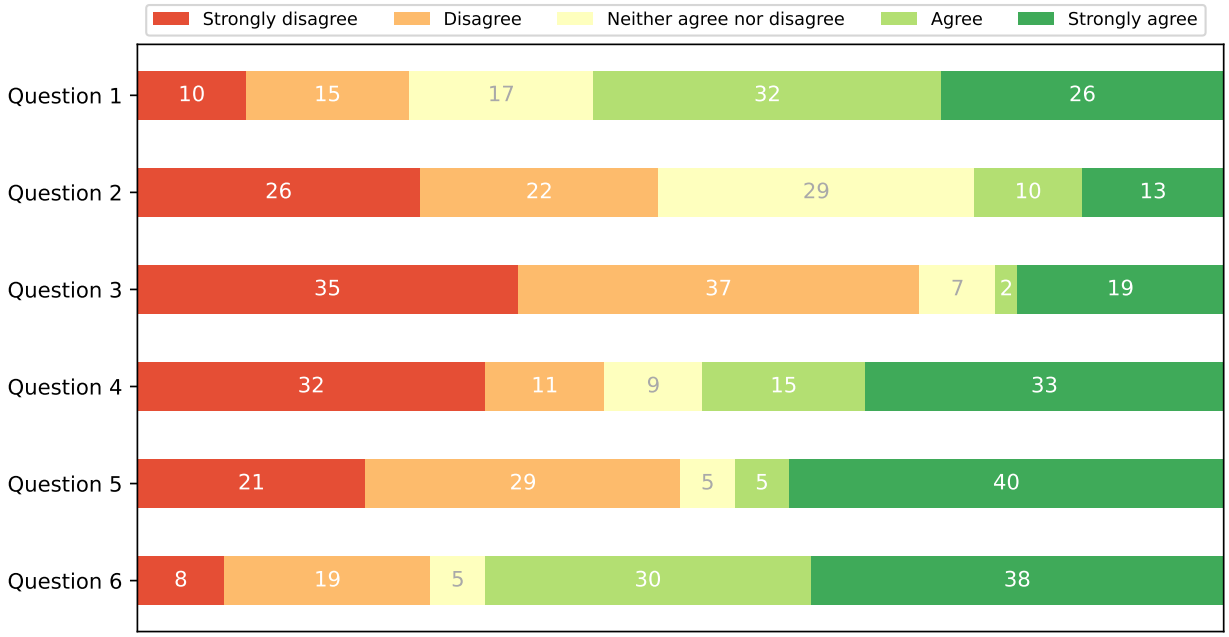
17.1.8 Mirror Histogram

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_MirrorHistogram.py, and the XML code in the file D08_MirrorHistogram.2D.xml.



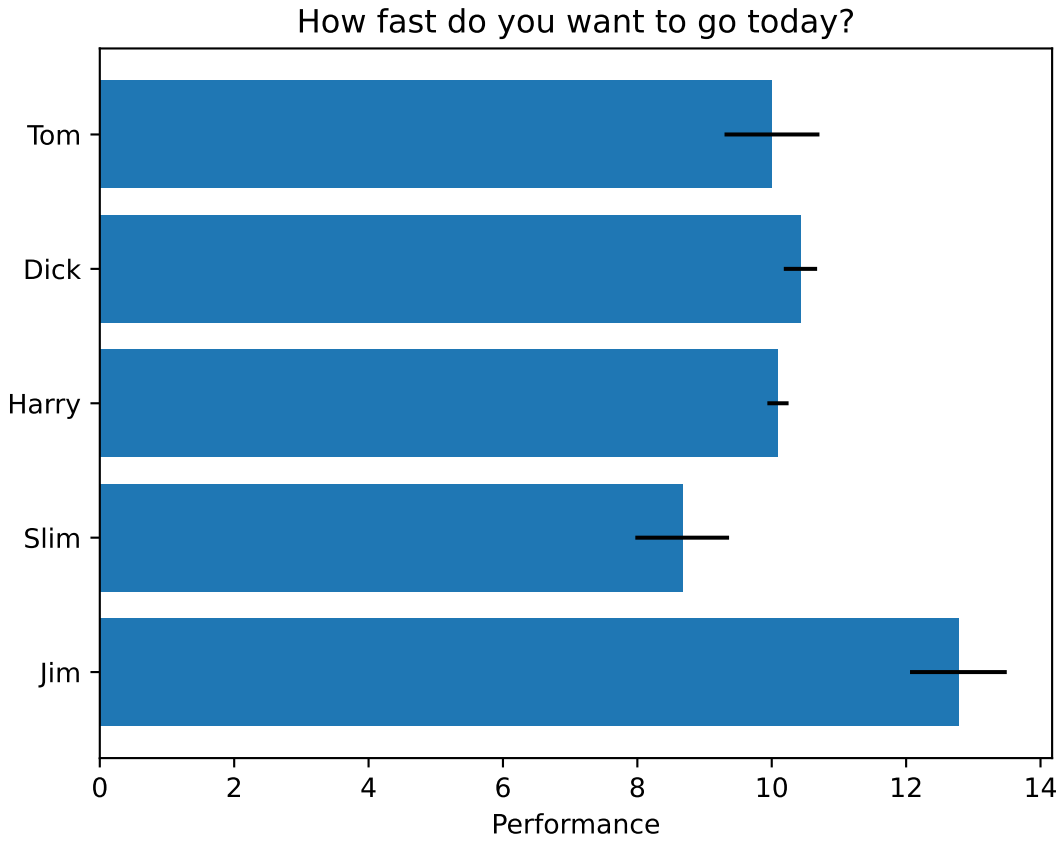
17.1.9 Horizontal Bar

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_HorizontalBarDist.py, and the XML code in the file D09_HorizontalBarDist.2D.xml.



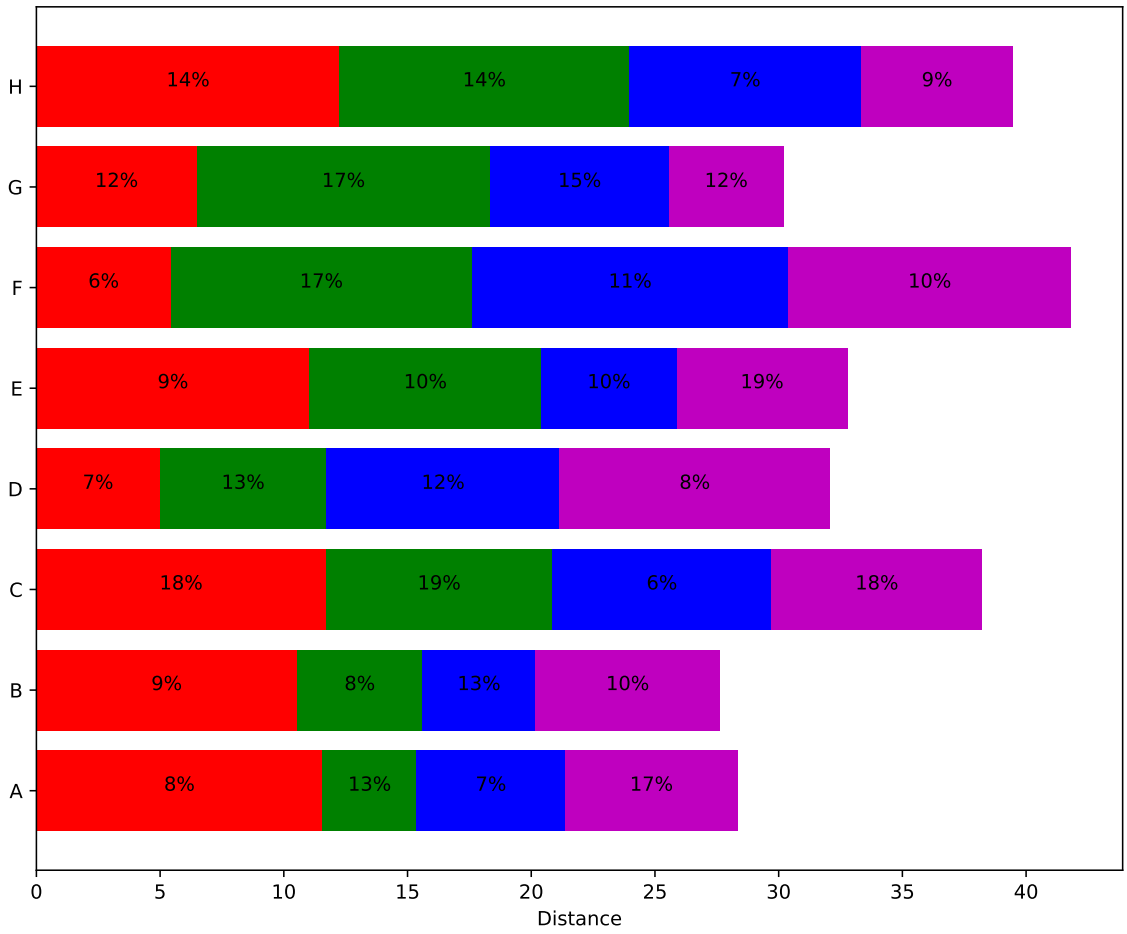
17.1.10 Horizontal Error Bar

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_HorizontalErrorBar.py, and the XML code in the file D10_HorizontalErrorBar.2D.xml.



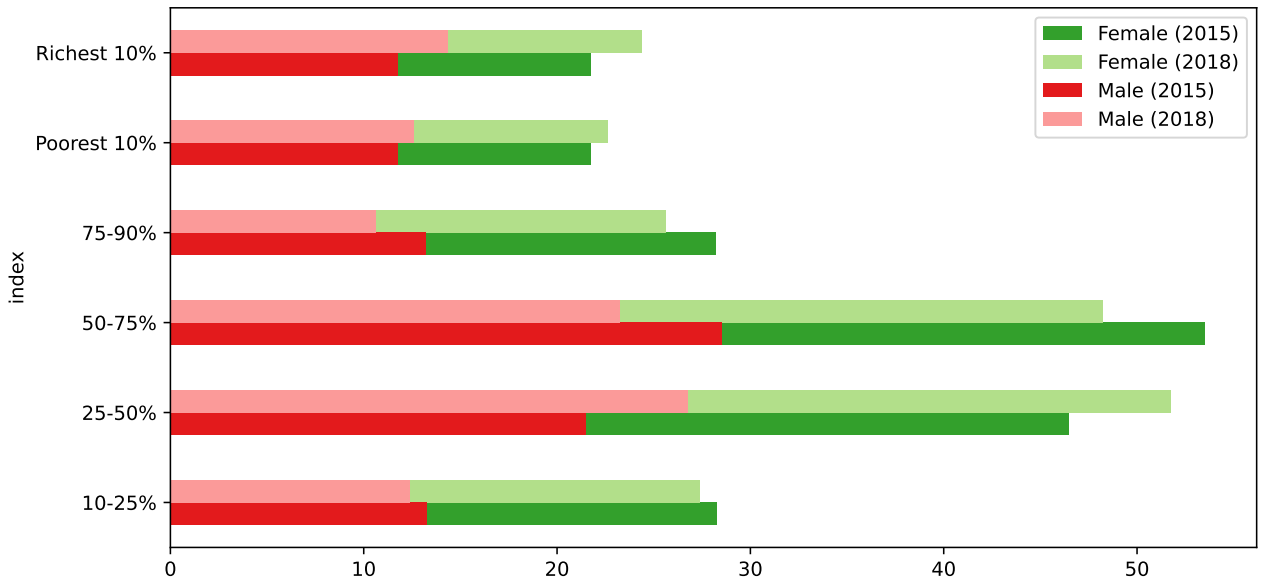
17.1.11 Stacked horizontal bar with labels

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_StackedHBarWithLabels.py, and the XML code in the file D11_StackedHBarWithLabels.2D.xml.



17.1.12 Stacked and grouped horizontal bar

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_StackedAndGroupedHBar.py, and the XML code in the file D12_StackedAndGroupedHBar.2D.xml.

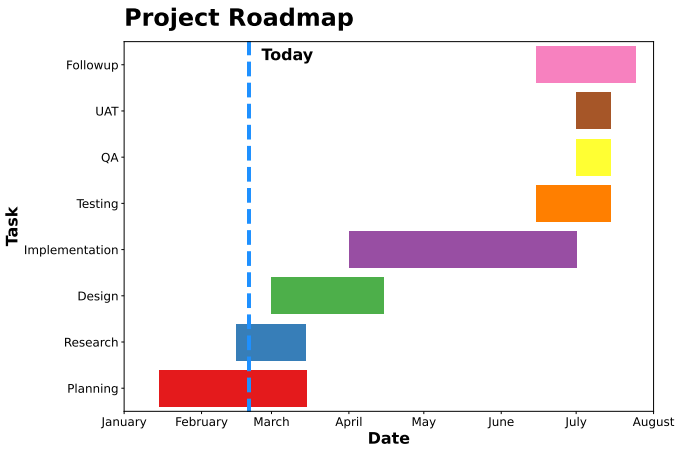


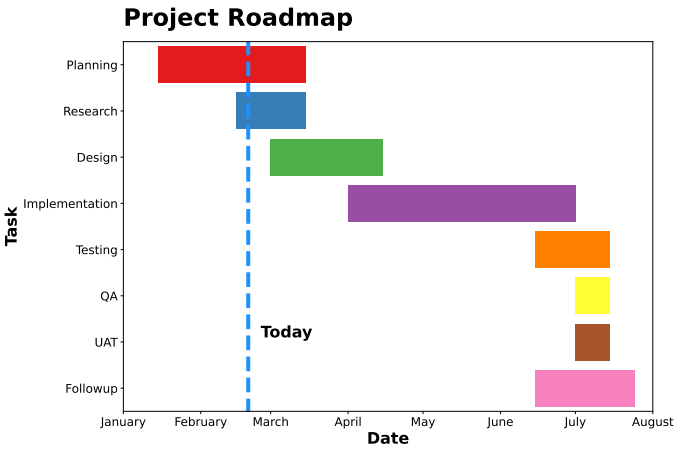
17.1.13 Gantt Chart

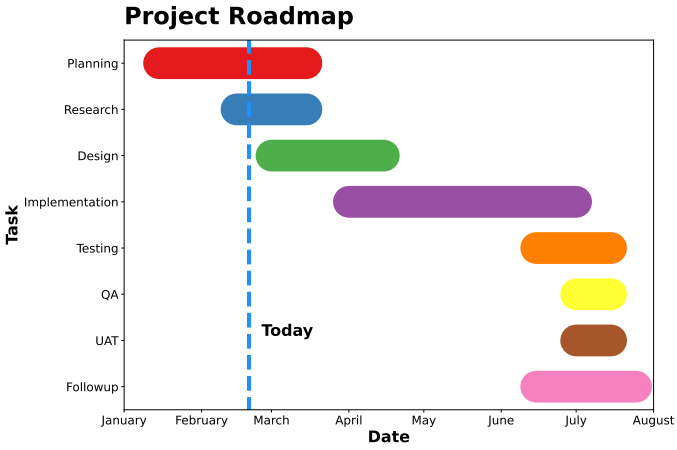
The Python code for the first example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13a_GanttChart1.py, and the XML code in the file D13a_GanttChart1.2D.xml.

The Python code for the second example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13b_GanttChart2.py, and the XML code in the file D13b_GanttChart2.2D.xml.

The Python code for the third example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13c_GanttChart3.py, and the XML code in the file D13c_GanttChart3.2D.xml.

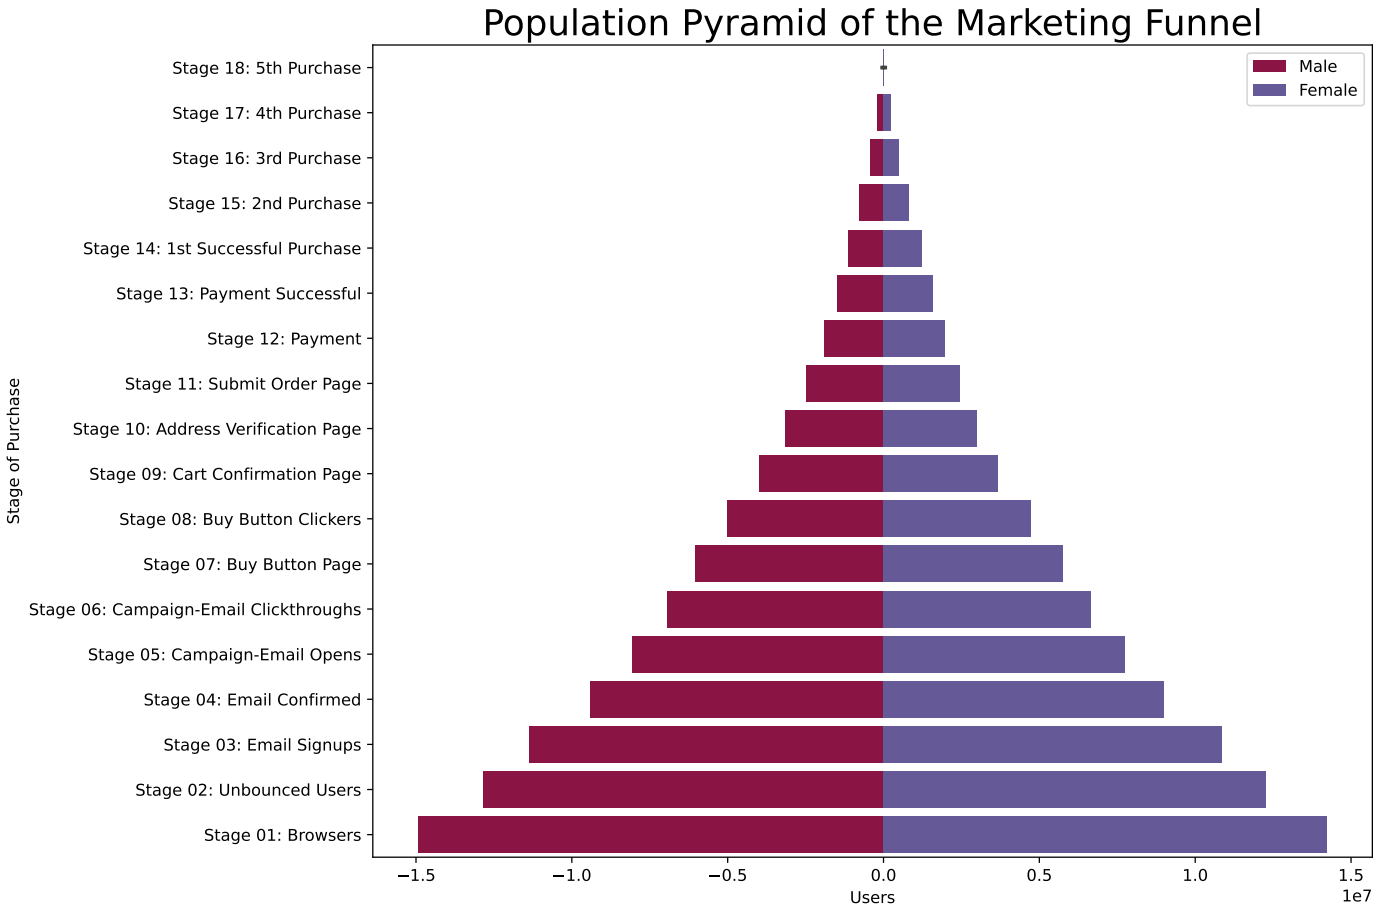






17.1.14 Marketing Funnel

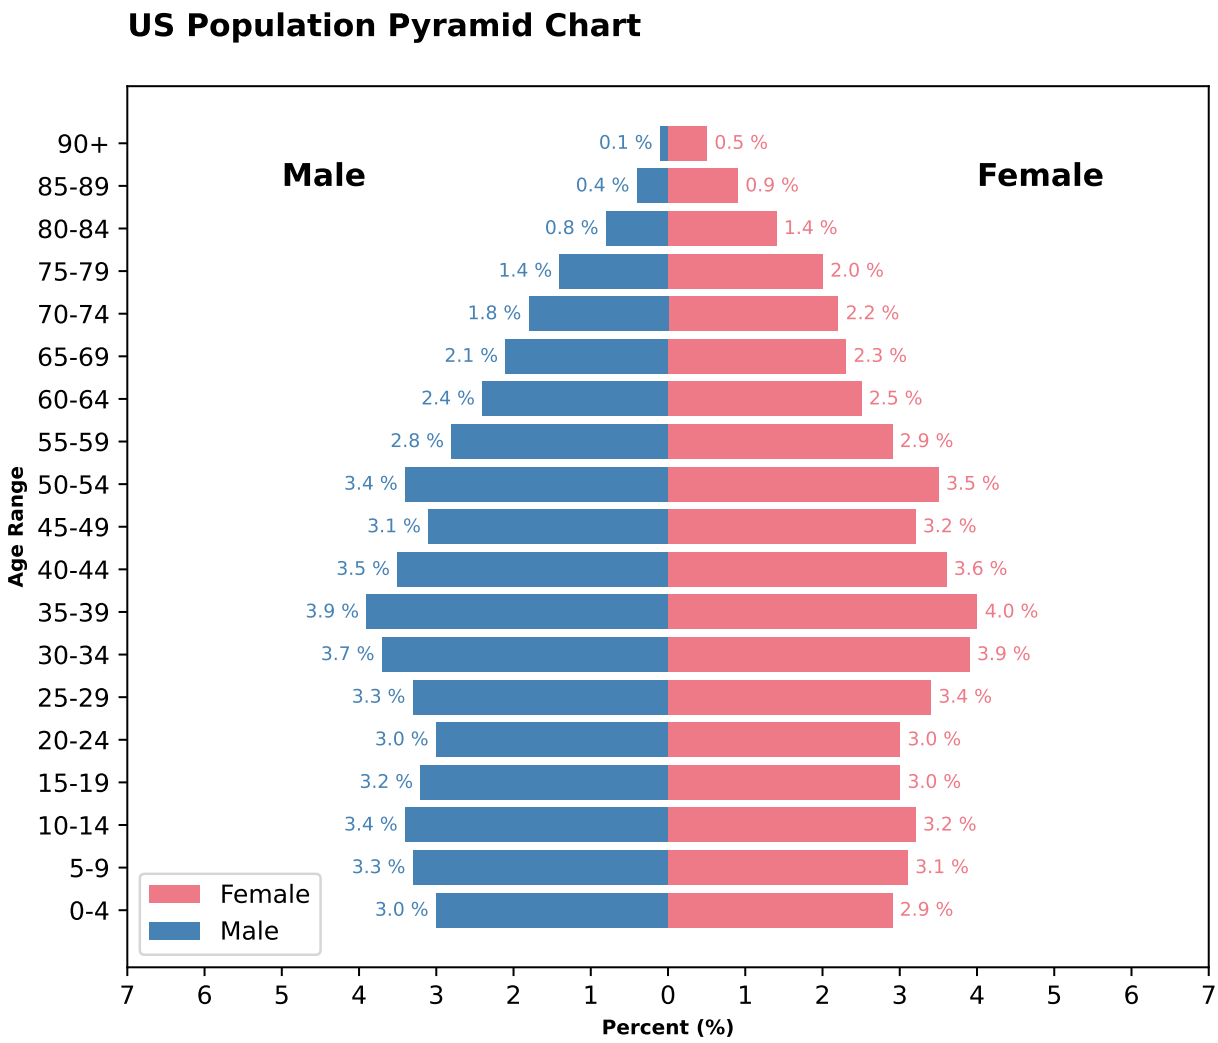
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14_MarketingFunnel.py, and the XML code in the file D14_MarketingFunnel.2D.xml.



Some text

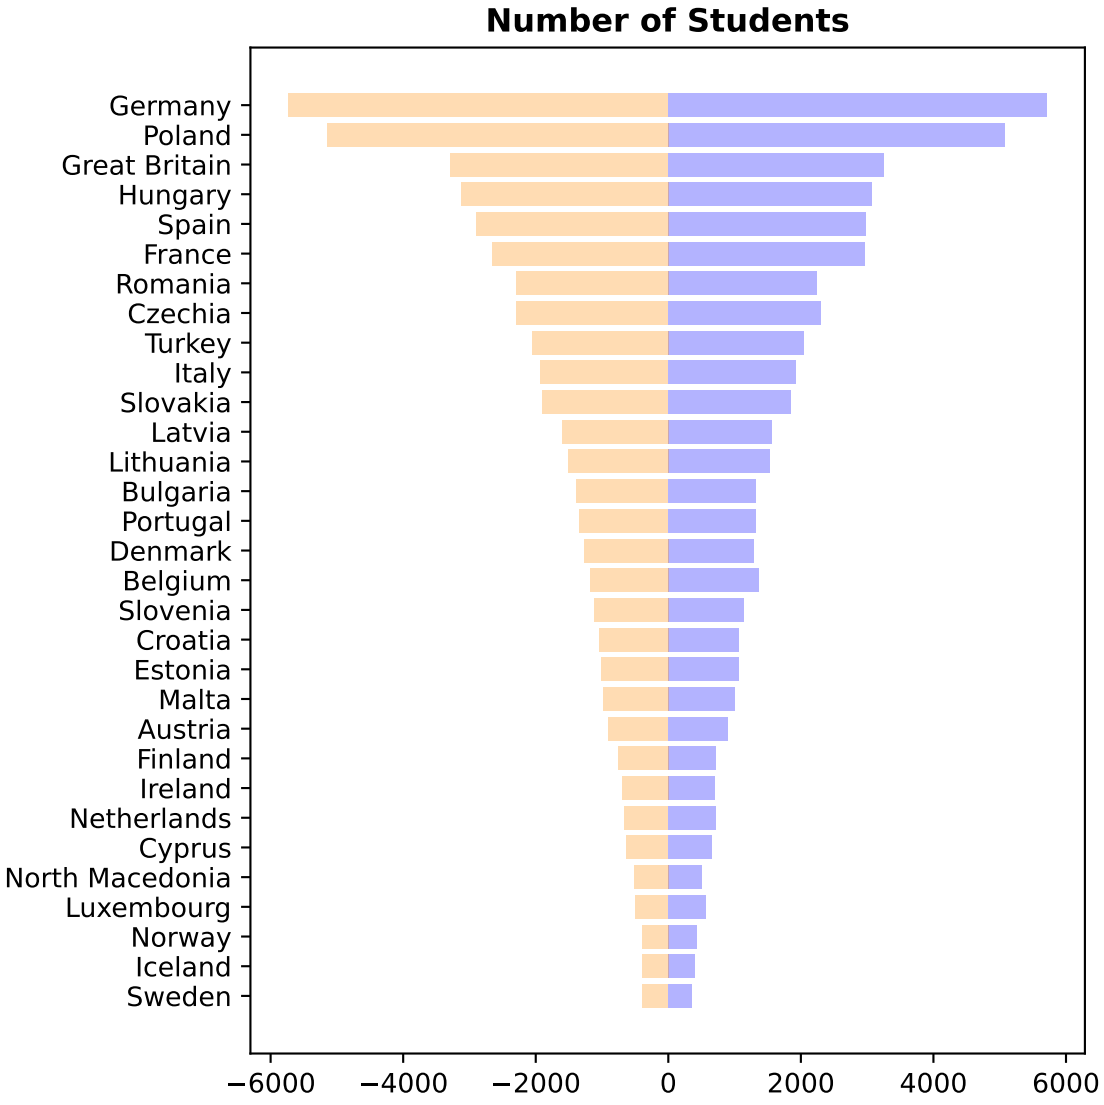
17.1.15 Population Pyramid

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D15_PopulationPyramid.py, and the XML code in the file D15_PopulationPyramid.2D.xml.



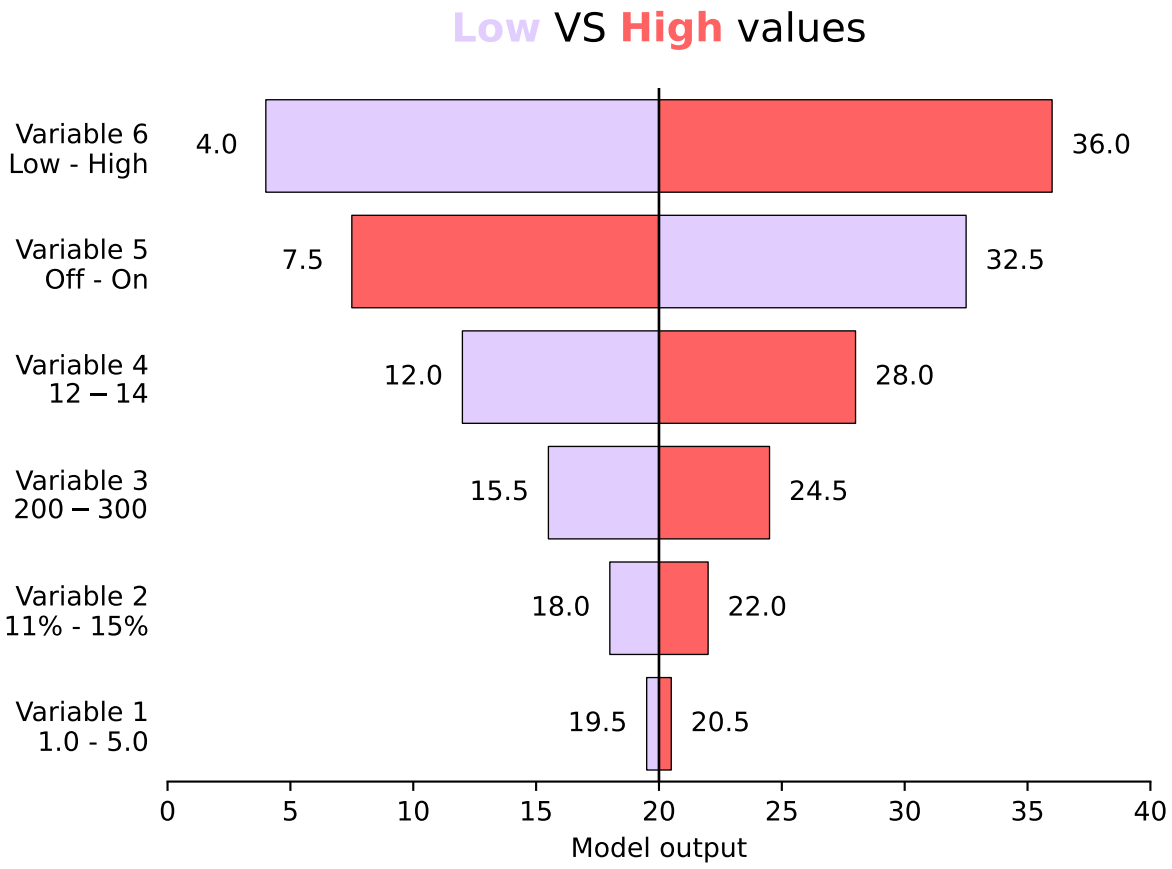
17.1.16 Mirror Bar Plot (horizontal)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D16_MirrorBarPlot.py, and the XML code in the file D16_MirrorBarPlot.2D.xml.



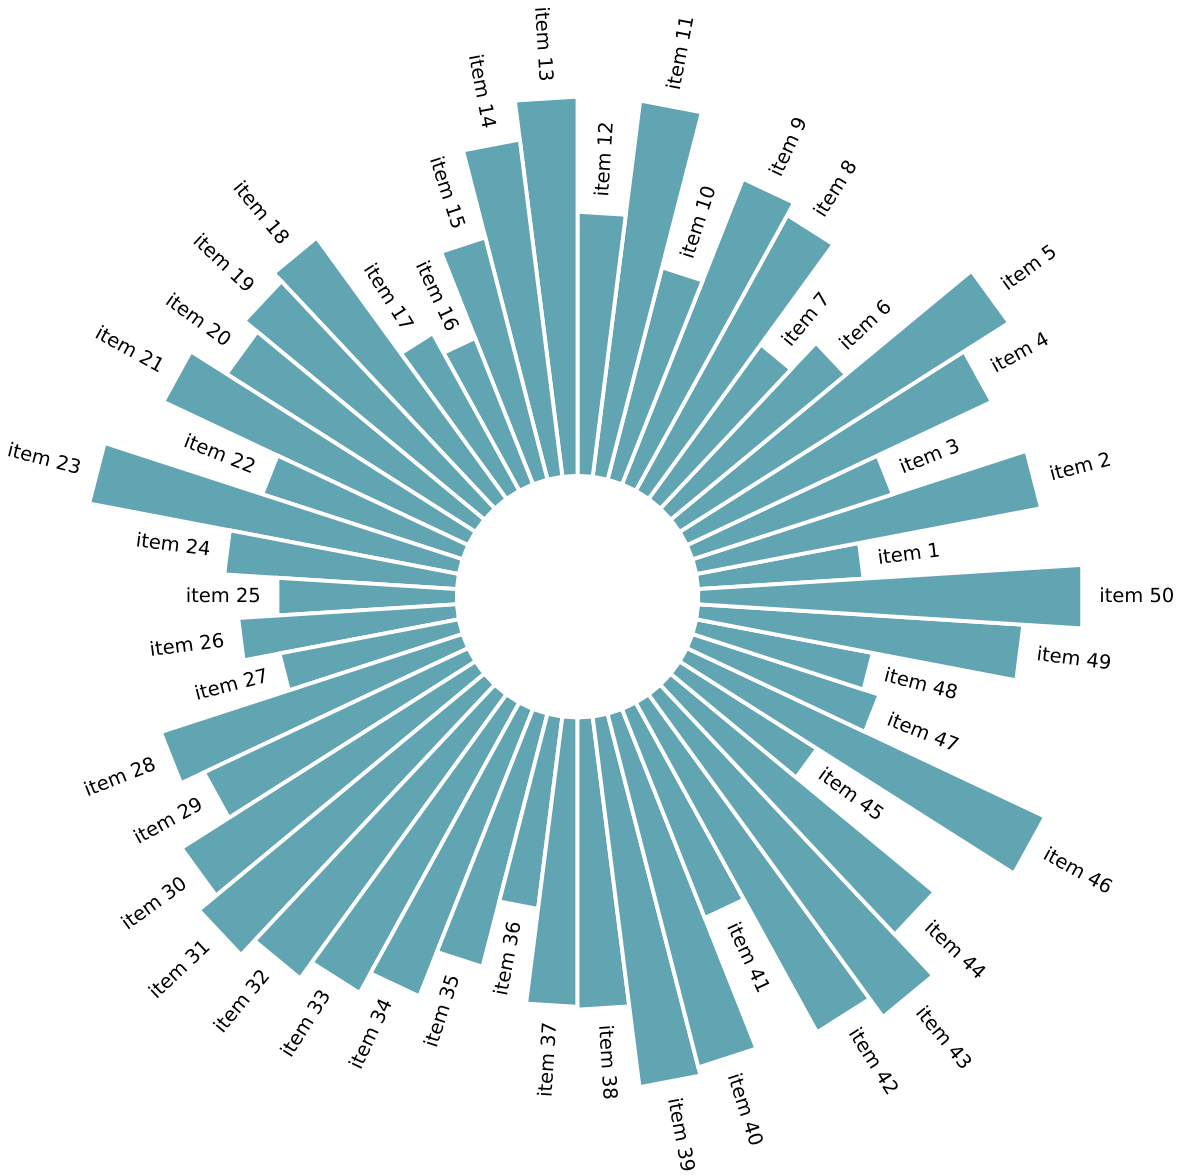
17.1.17 Tornado Chart

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D17_TornadoChart.py, and the XML code in the file D17_TornadoChart.2D.xml.



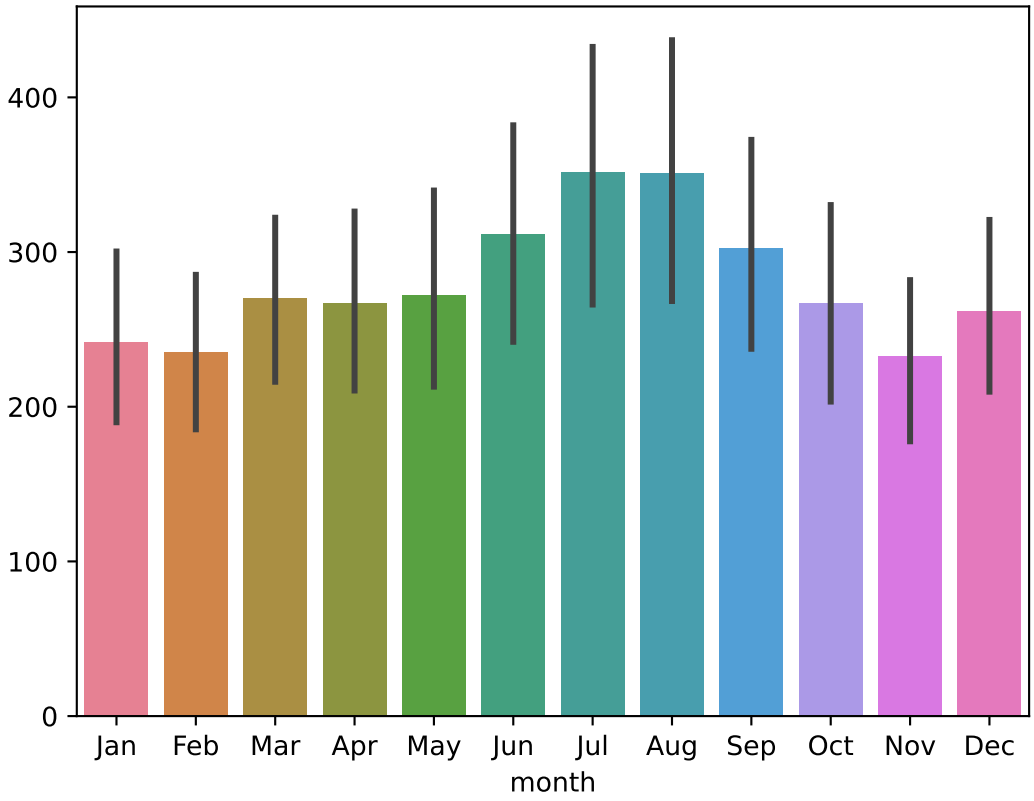
17.1.18 Circular Barplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D18_CircularBarplot.py, and the XML code in the file D18_CircularBarplot.2D.xml.



17.1.19 Barplot with color

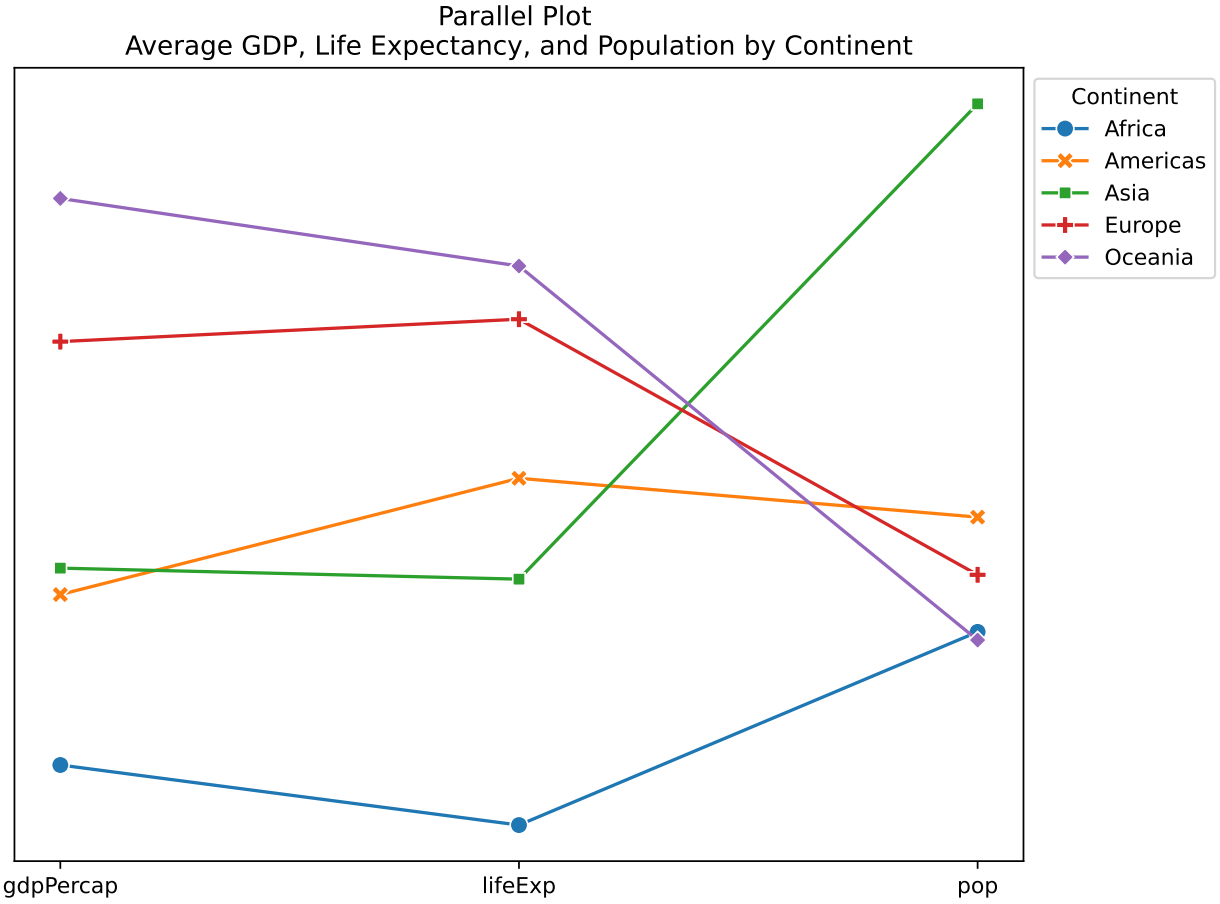
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D19_BarplotColor.py, and the XML code in the file D19_BarplotColor.2D.xml.



17.2 Line and lollipop charts

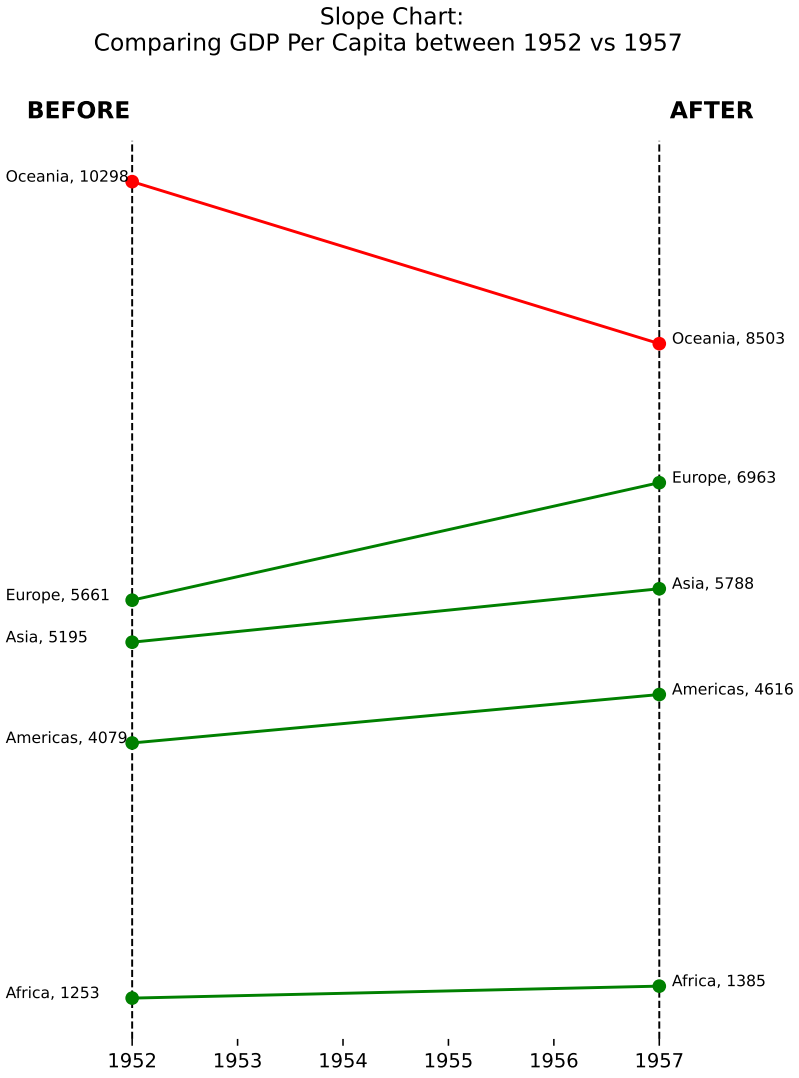
17.2.1 Line chart (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_LineChartSeaborn.py, and the XML code in the file D01_LineChartSeaborn.2D.xml.



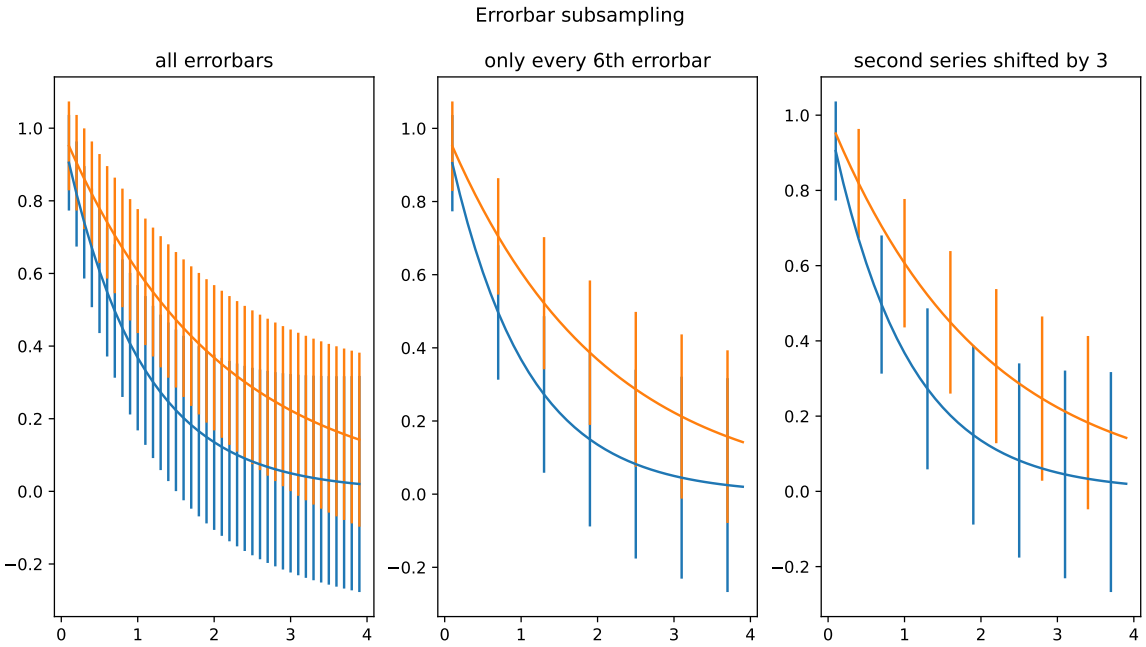
17.2.2 Slope Chart

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_SlopeCharts.py, and the XML code in the file D02_SlopeCharts.2D.xml.



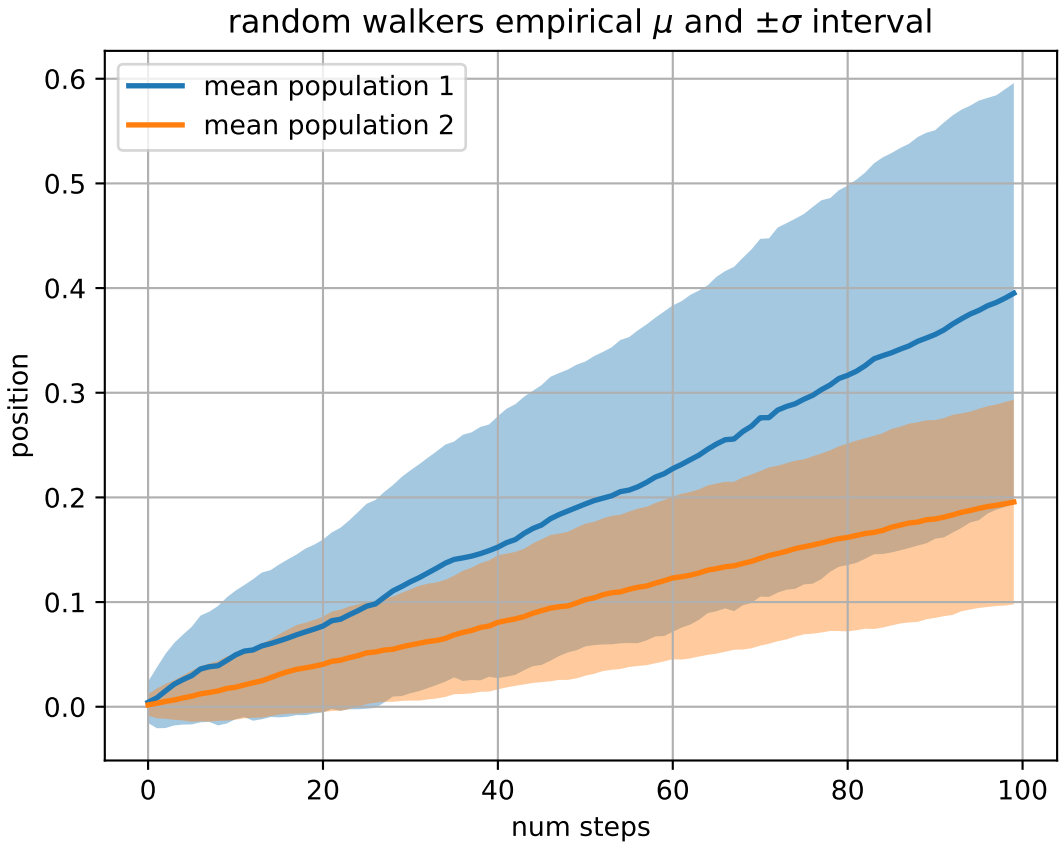
17.2.3 Line chart with error Bar

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_LineErrorBars.py, and the XML code in the file D03_LineErrorBars.2D.xml.



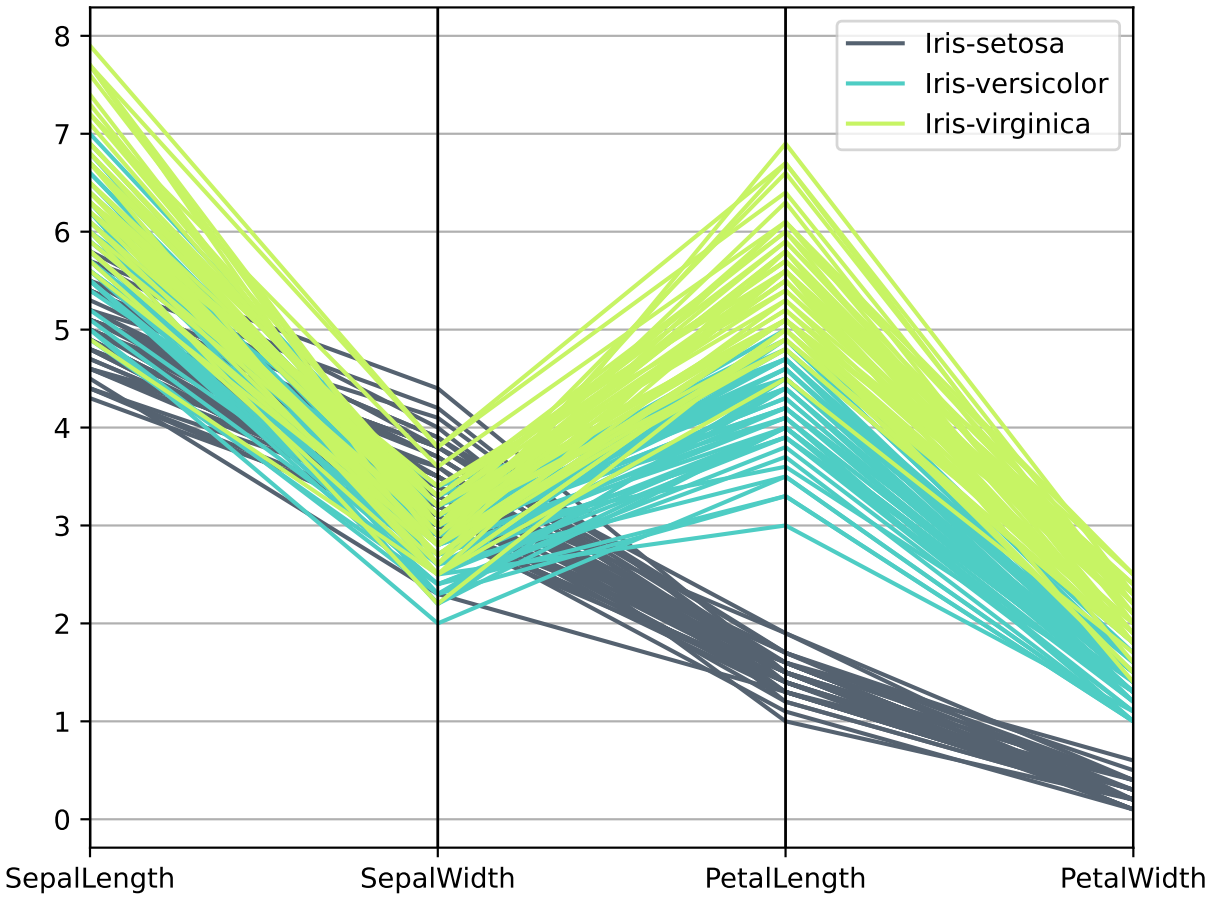
17.2.4 Confidence band (RandomWalk)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_ConfidenceBand_RandomWalk.py, and the XML code in the file D04_ConfidenceBand_RandomWalk.2D.xml.



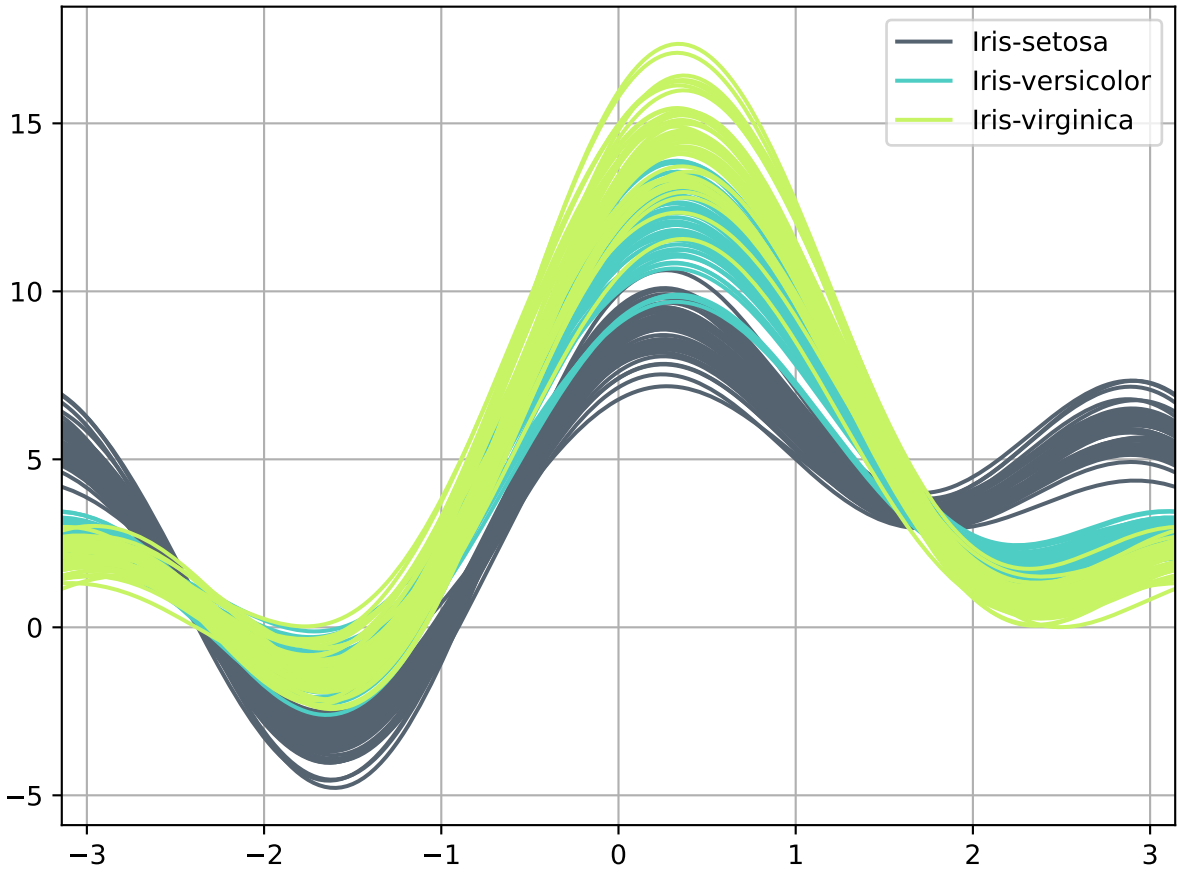
17.2.5 Plotting Parallel (Pandas)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_PandasPlottingParallel.py, and the XML code in the file D05_PandasPlottingParallel.2D.xml.



17.2.6 Andrew Curves (Pandas)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_PandasAndrewCurves.py, and the XML code in the file D06_PandasAndrewCurves.2D.xml.



17.2.7 Highlighted LinePlot

The Python code for the first example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_HighlightedLinePlot1.py, and the XML code in the file D07a_HighlightedLinePlot1.2D.xml.

The Python code for the second example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_HighlightedLinePlot2.py, and the XML code in the file D07b_HighlightedLinePlot2.2D.xml.

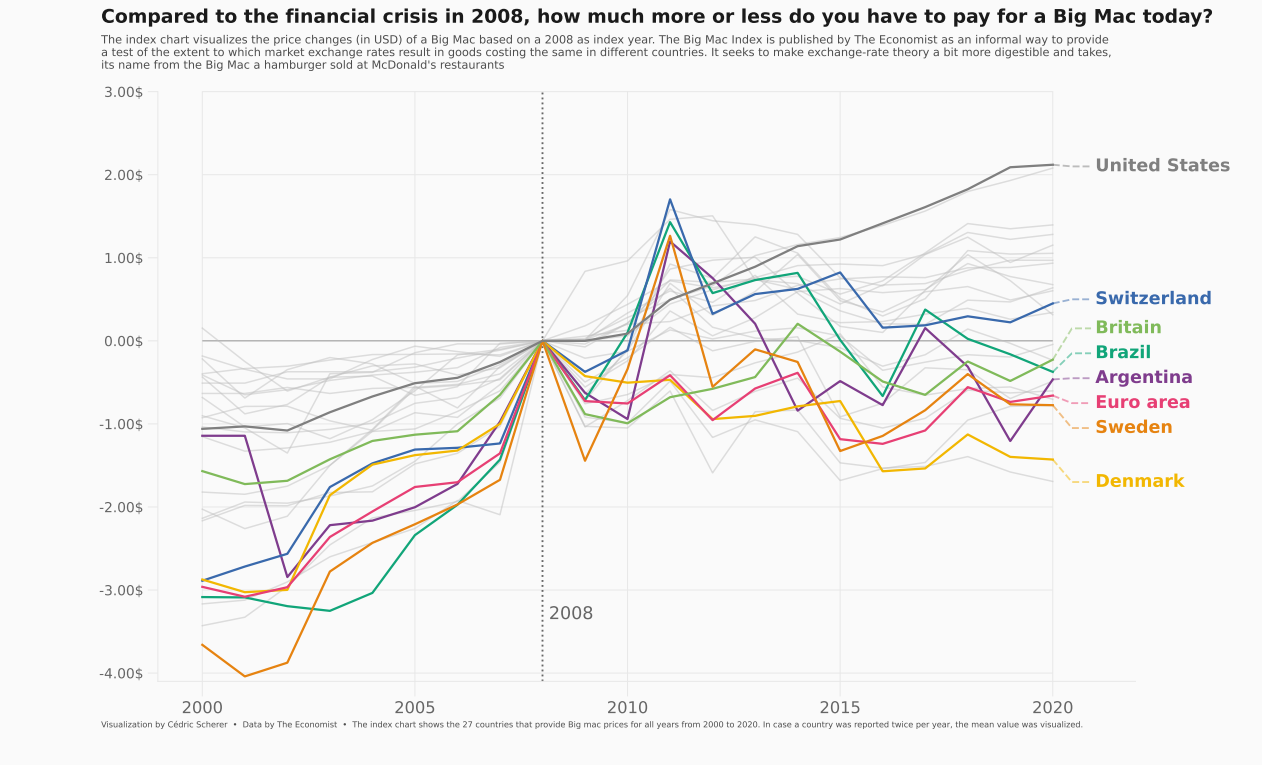
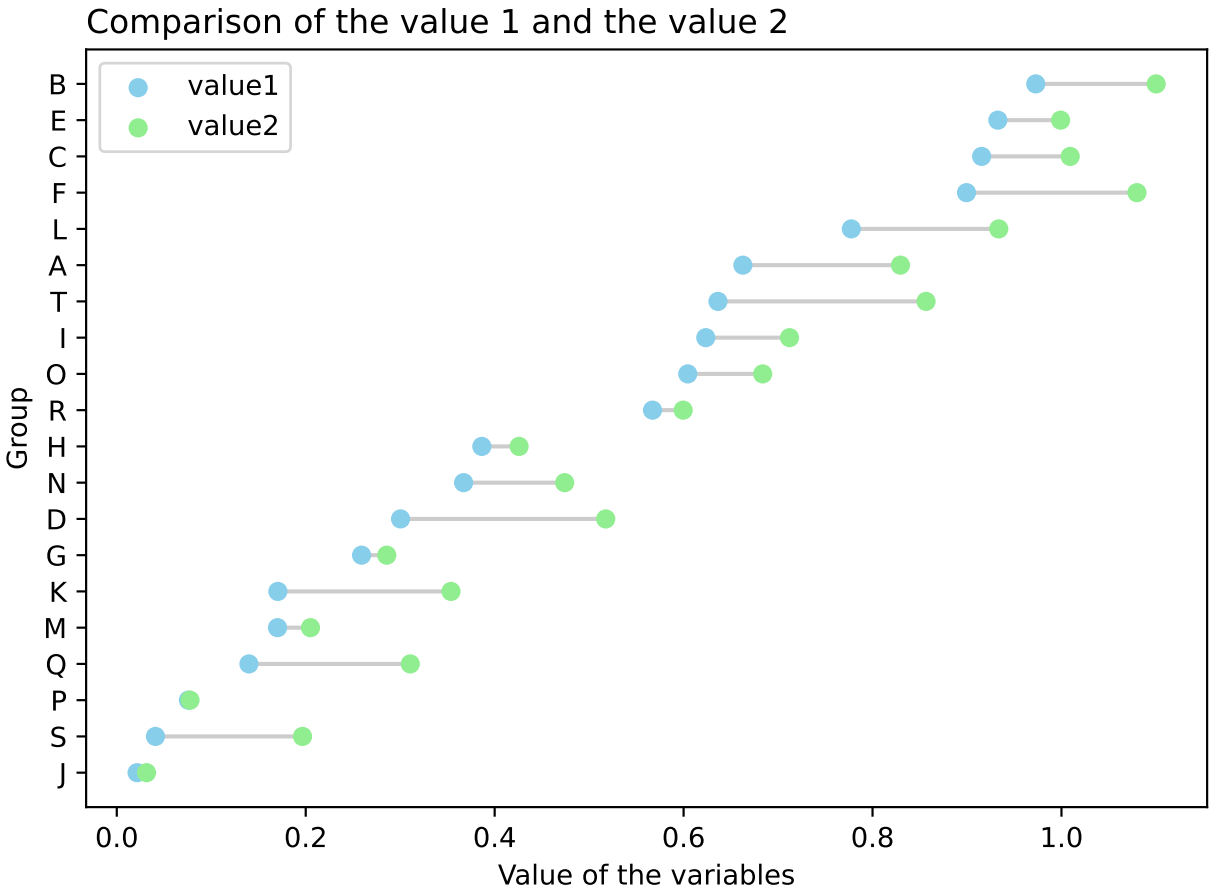
17.2.9 Line chart with fancy formatting

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_LineChartWithFancyFormatting.py, and the XML code in the file D09_LineChartWithFancyFormatting.2D.xml.



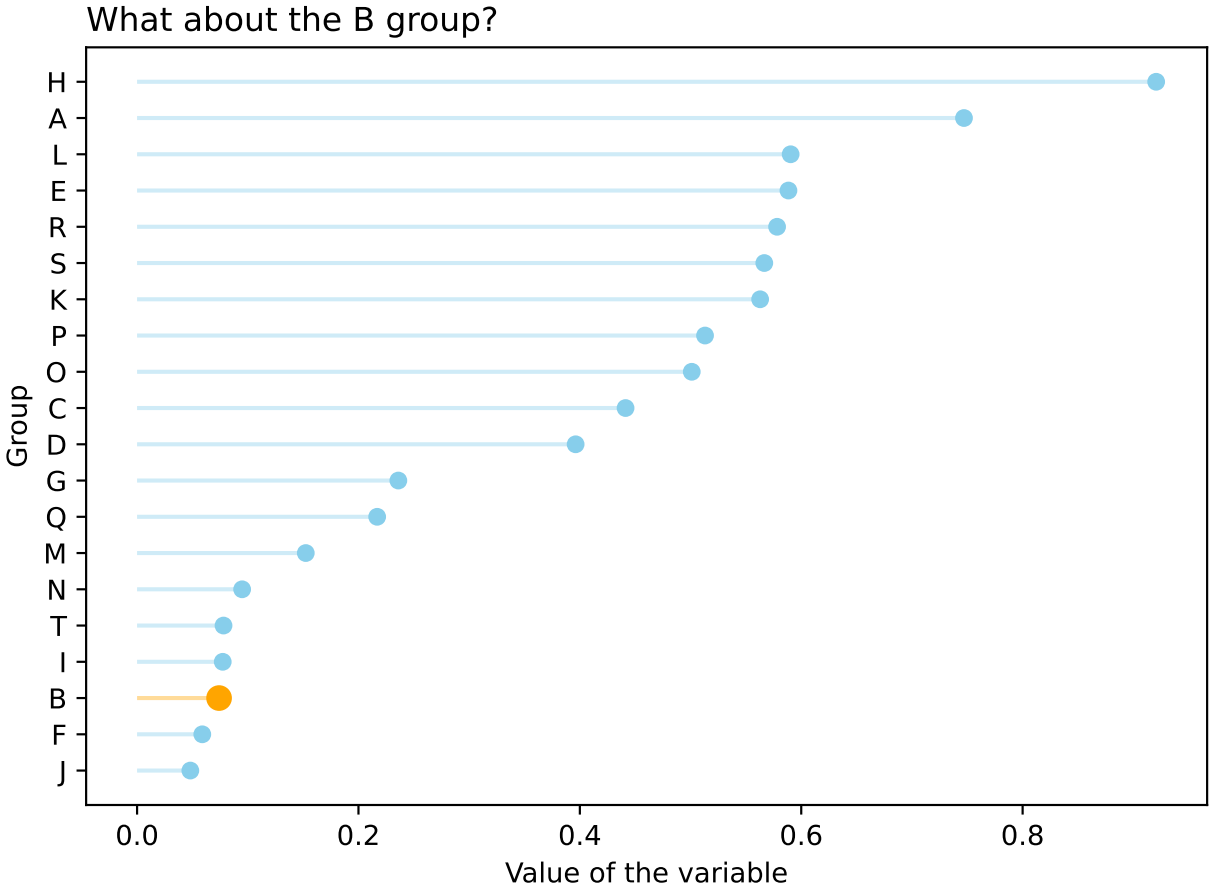
17.2.10 Lolllipop 2 Groups

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_Lolllipop2Groups.py, and the XML code in the file D10_Lolllipop2Groups.2D.xml.



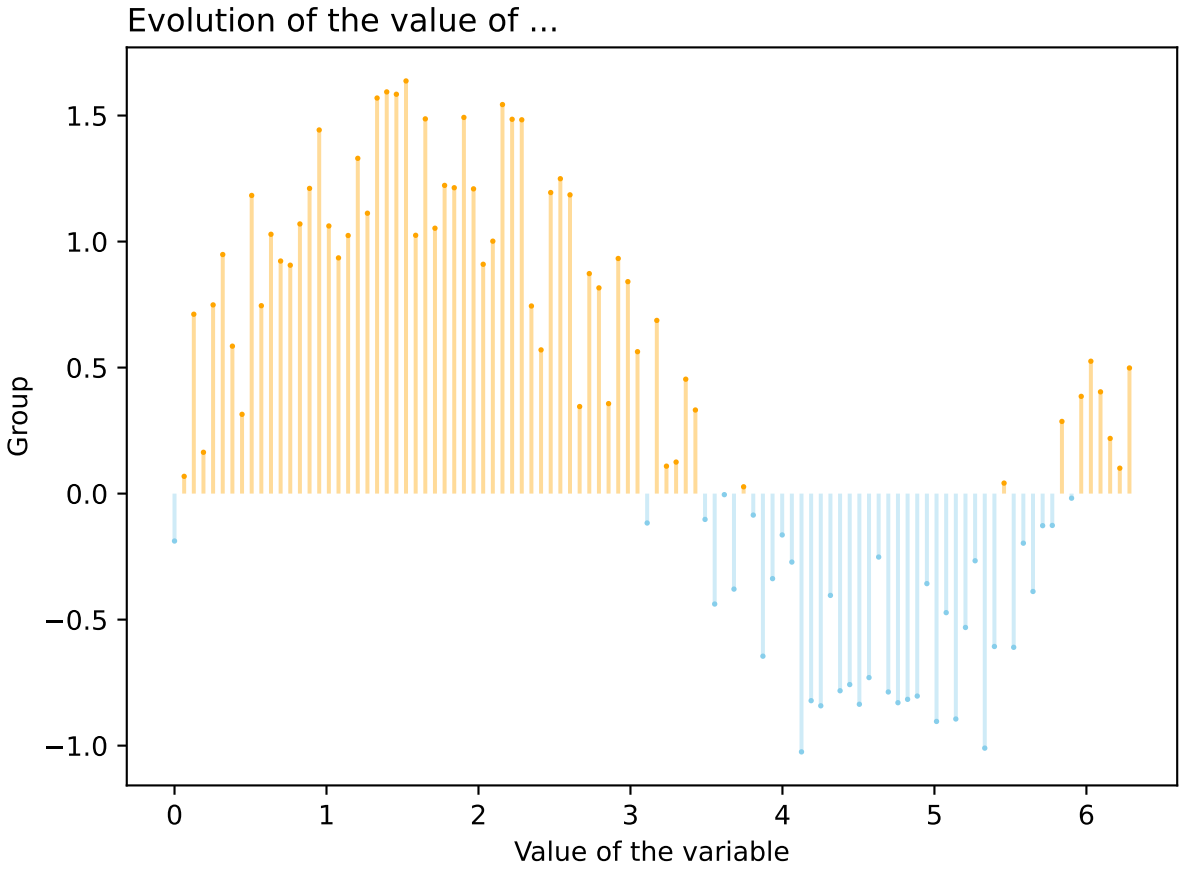
17.2.11 Highlight Group In Lollipop

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_HighlightGroupInLollipop.py, and the XML code in the file D11_HighlightGroupInLollipop.2D.xml.



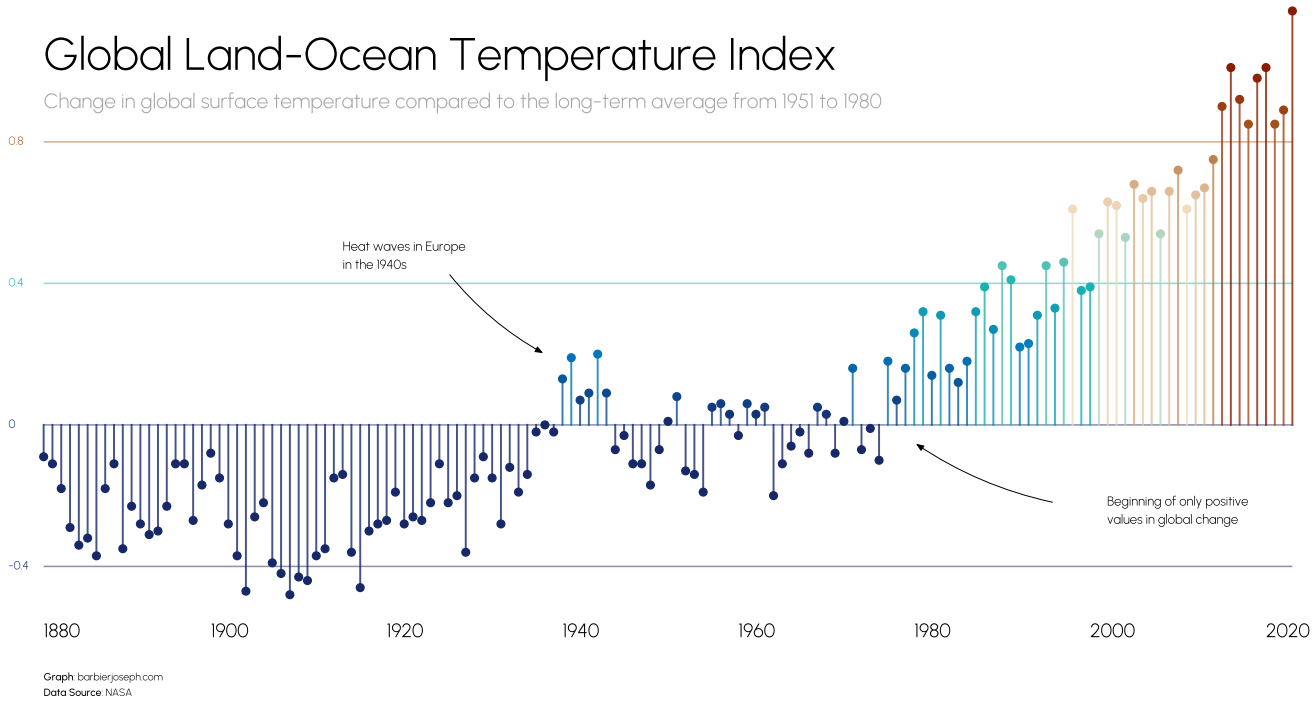
17.2.12 Lolllipop Conditional Color

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_LolllipopConditionalColor.py, and the XML code in the file D12_LolllipopConditionalColor.2D.xml.



17.2.13 Lollipop chart with fancy formatting

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13_LollipopFancyFormatting.py, and the XML code in the file D13_LollipopFancyFormatting.2D.xml.



17.2.14 Circular Lolllipop

The Python code for the first example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14a_CircularLolllipop1.py, and the XML code in the file D14a_CircularLolllipop1.2D.xml.

The Python code for the second example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14b_CircularLolllipop2.py, and the XML code in the file D14b_CircularLolllipop2.2D.xml.

The Python code for the third example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14b_CircularLolllipop3.py, and the XML code in the file D14c_CircularLolllipop3.2D.xml.

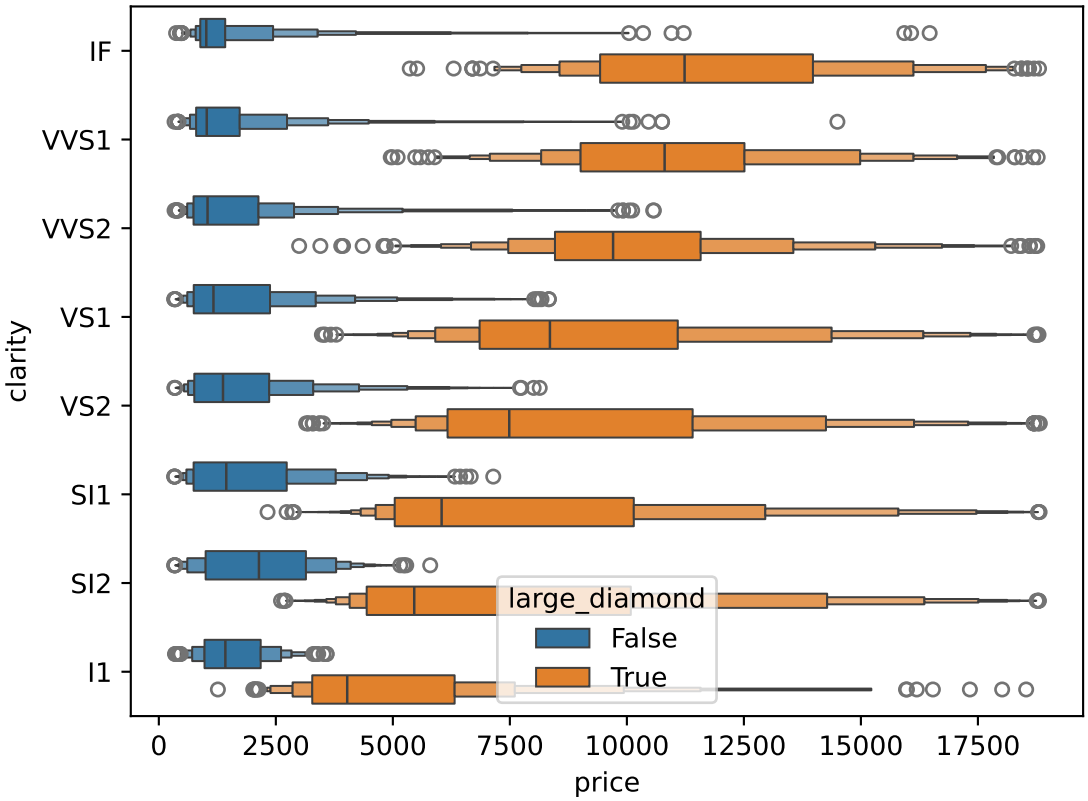
17.4.5 Boxenplot

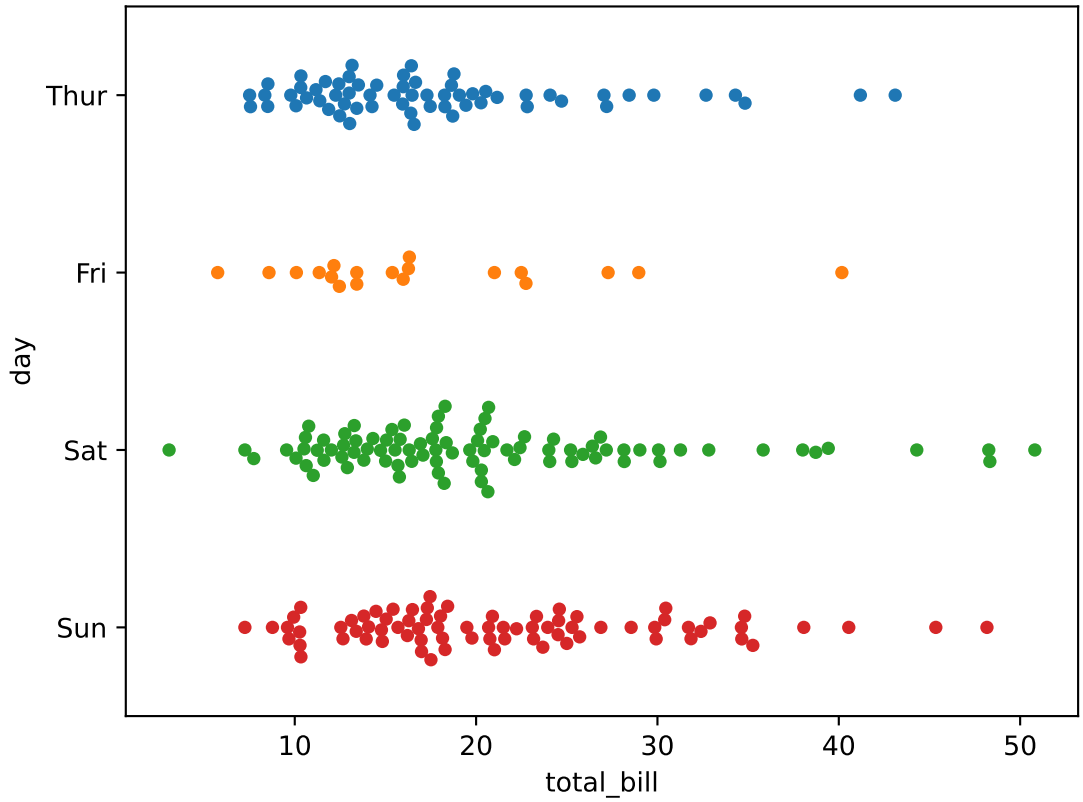
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Boxenplot.py, and the XML code in the file D05_Boxenplot.2D.xml.



Some text

17.4.6 Swarmplot

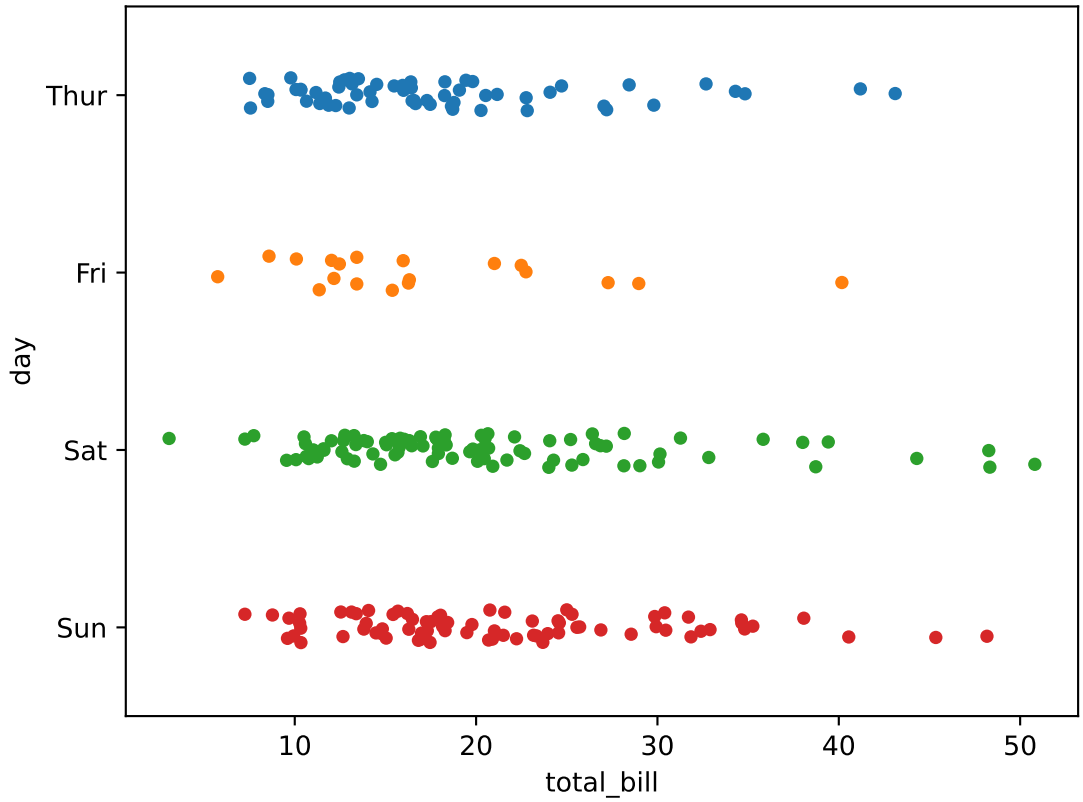
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Swarmplot.py, and the XML code in the file D06_Swarmplot.2D.xml.



Some text

17.4.7 Stripplot

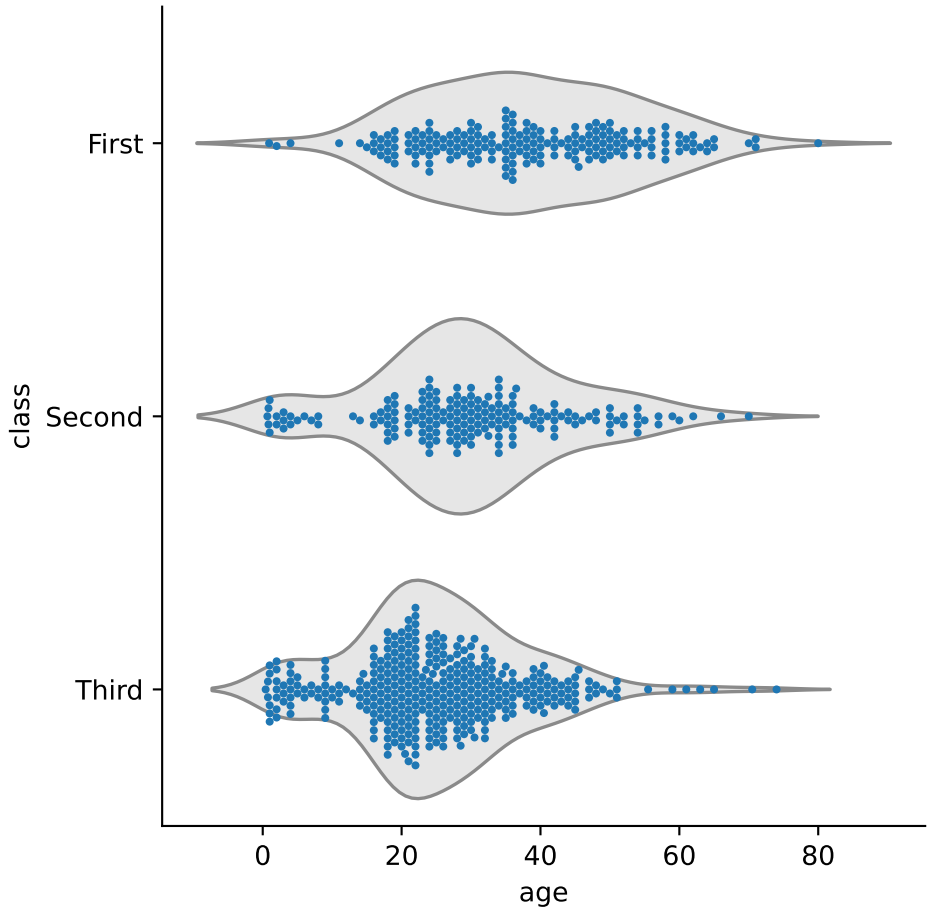
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Stripplot.py, and the XML code in the file D07_Stripplot.2D.xml.



Some text

17.4.8 Catplot

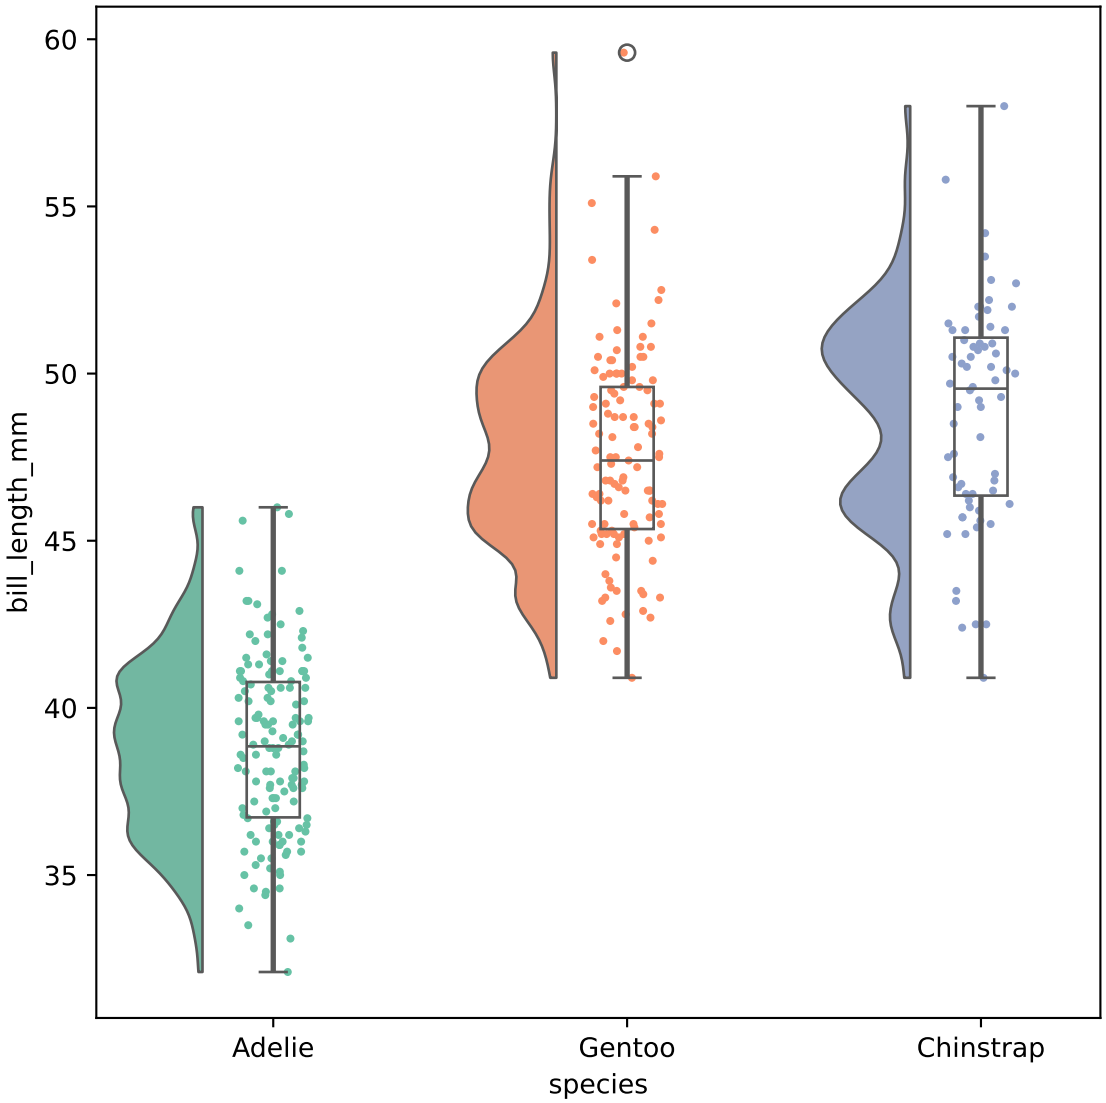
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Catplot.py, and the XML code in the file D08_Catplot.2D.xml.



Some text

17.4.9 Raincloud Plot

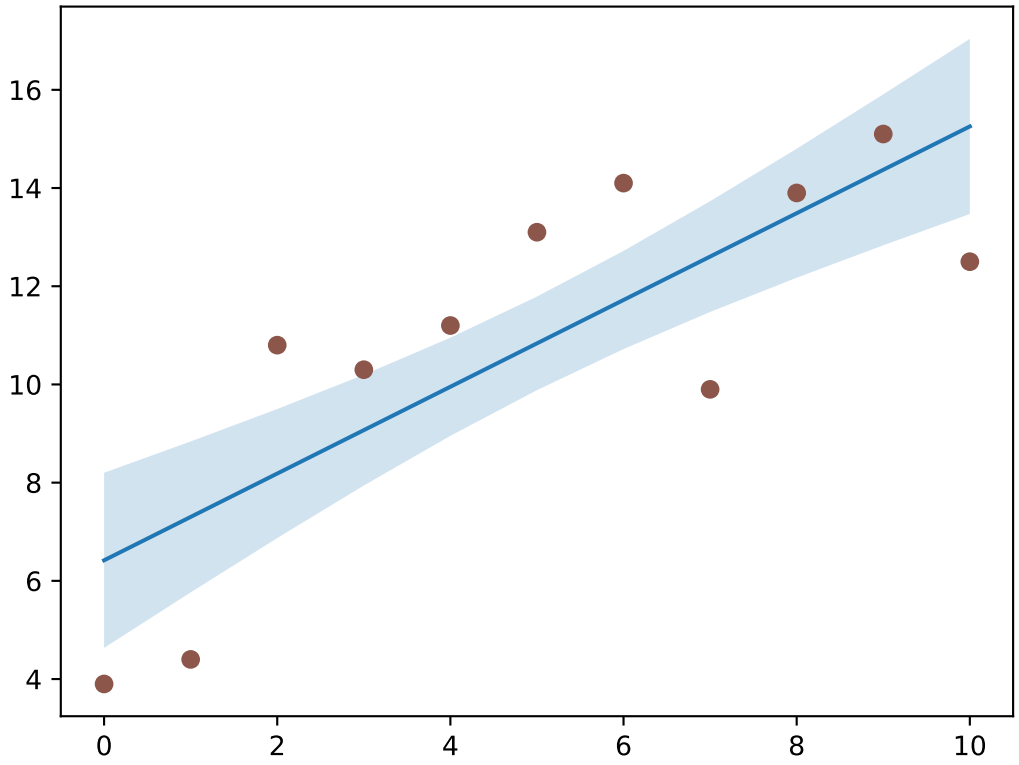
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_RaincloudPlot.py, and the XML code in the file D09_RaincloudPlot.2D.xml.



17.5 Correlation and regression

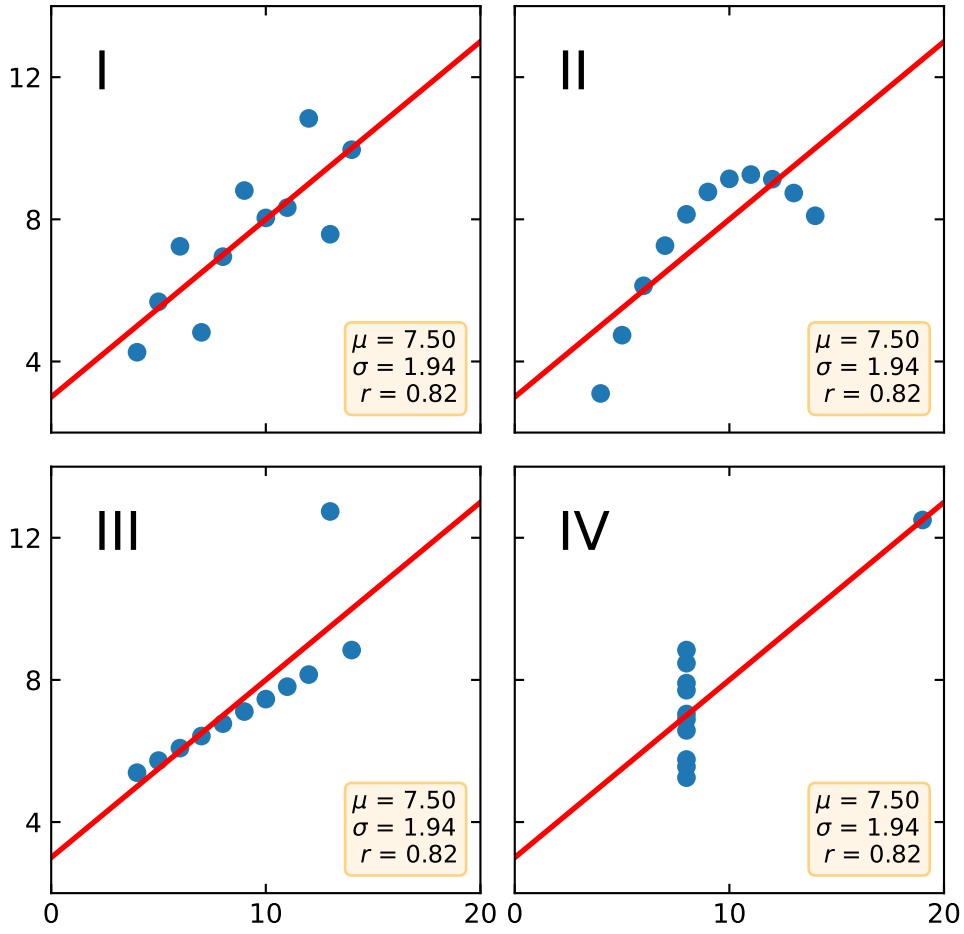
17.5.1 Linear regression with confidence Band

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_LinRegWithConfidenceBand.py, and the XML code in the file D01_LinRegWithConfidenceBand.2D.xml.



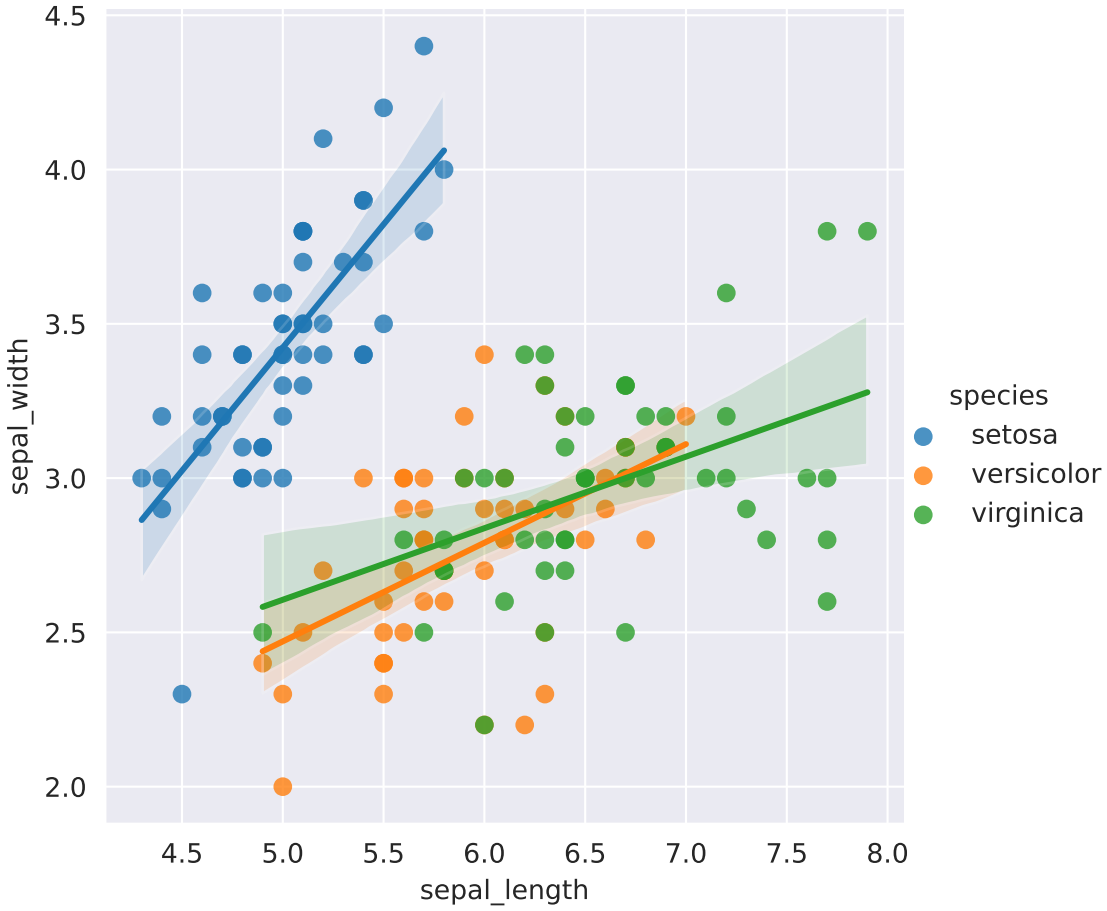
17.5.2 Anscombe example

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_AnscombeExample.py, and the XML code in the file D02_AnscombeExample.2D.xml.



17.5.3 Faceted Scatter Plots: all in one plot

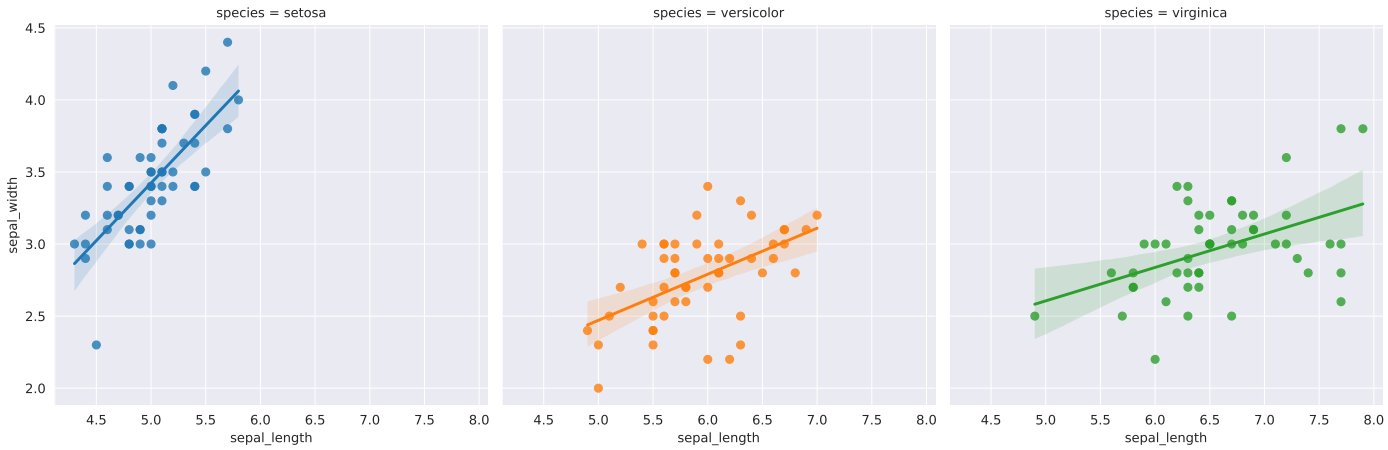
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_FacetedScatterPlot1.py, and the XML code in the file D03_FacetedScatterPlot1.2D.xml.



Some text

17.5.4 Faceted Scatter Plots: separate plots

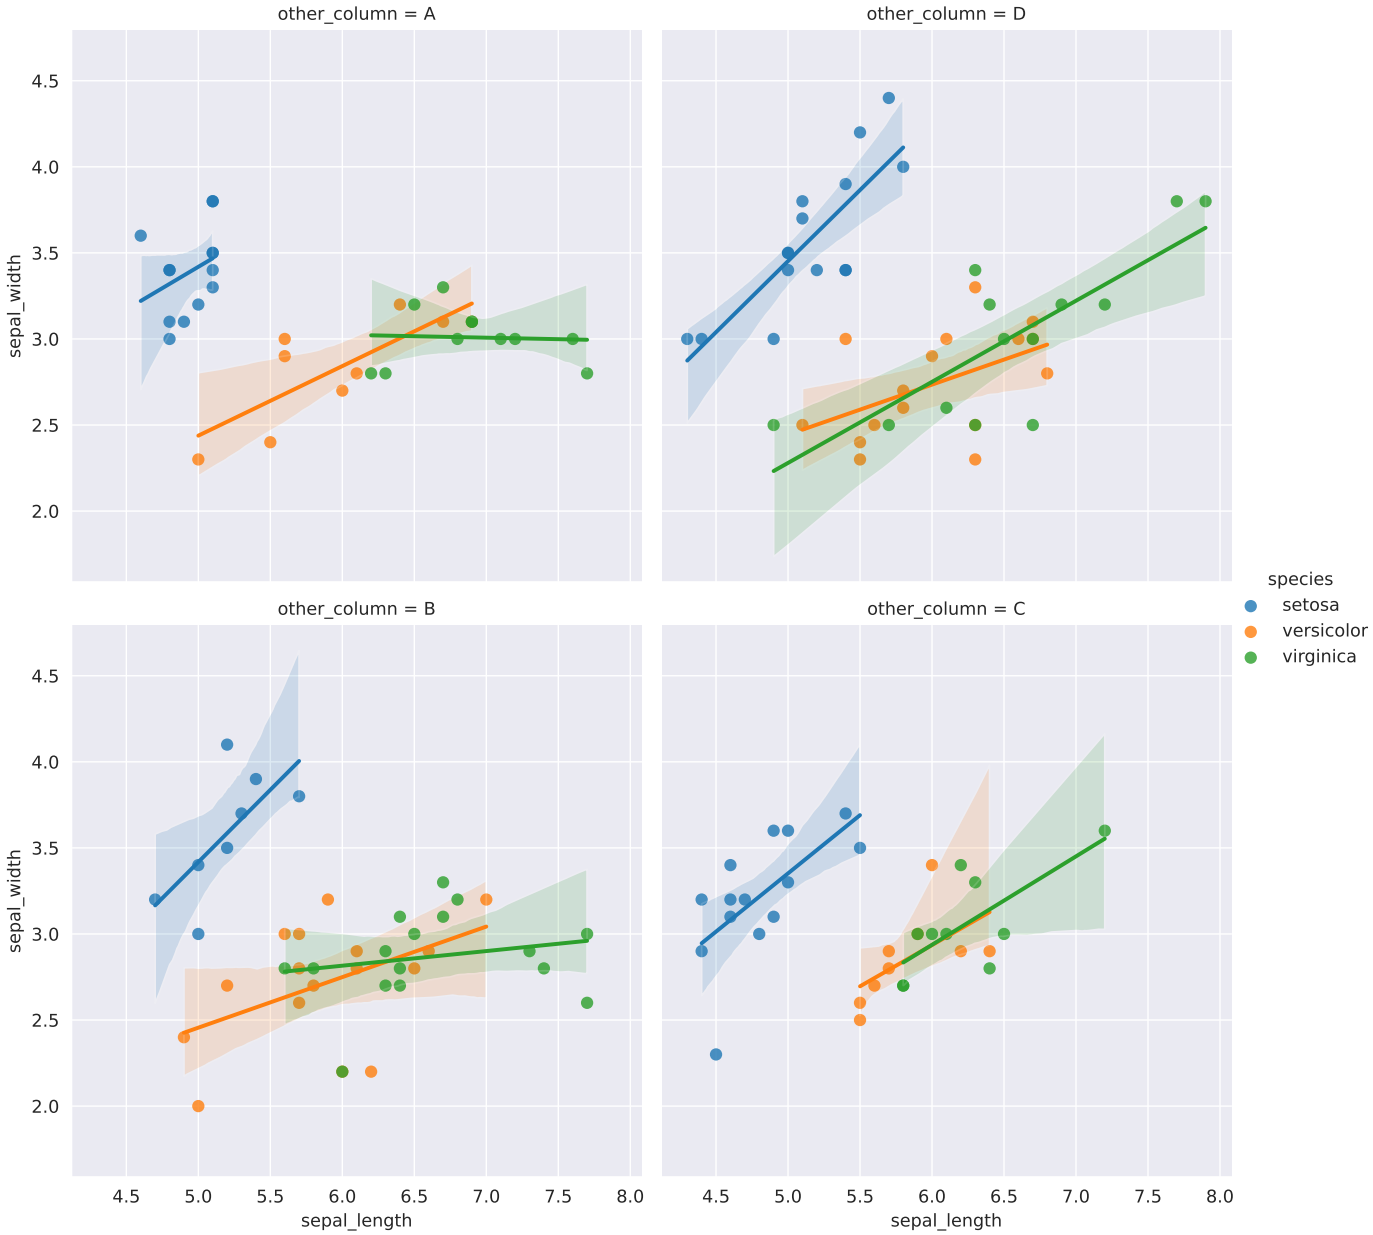
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_FacetedScatterPlot2.py, and the XML code in the file D04_FacetedScatterPlot2.2D.xml.



Some text

17.5.5 Faceted Scatter Plots: further subgrouping

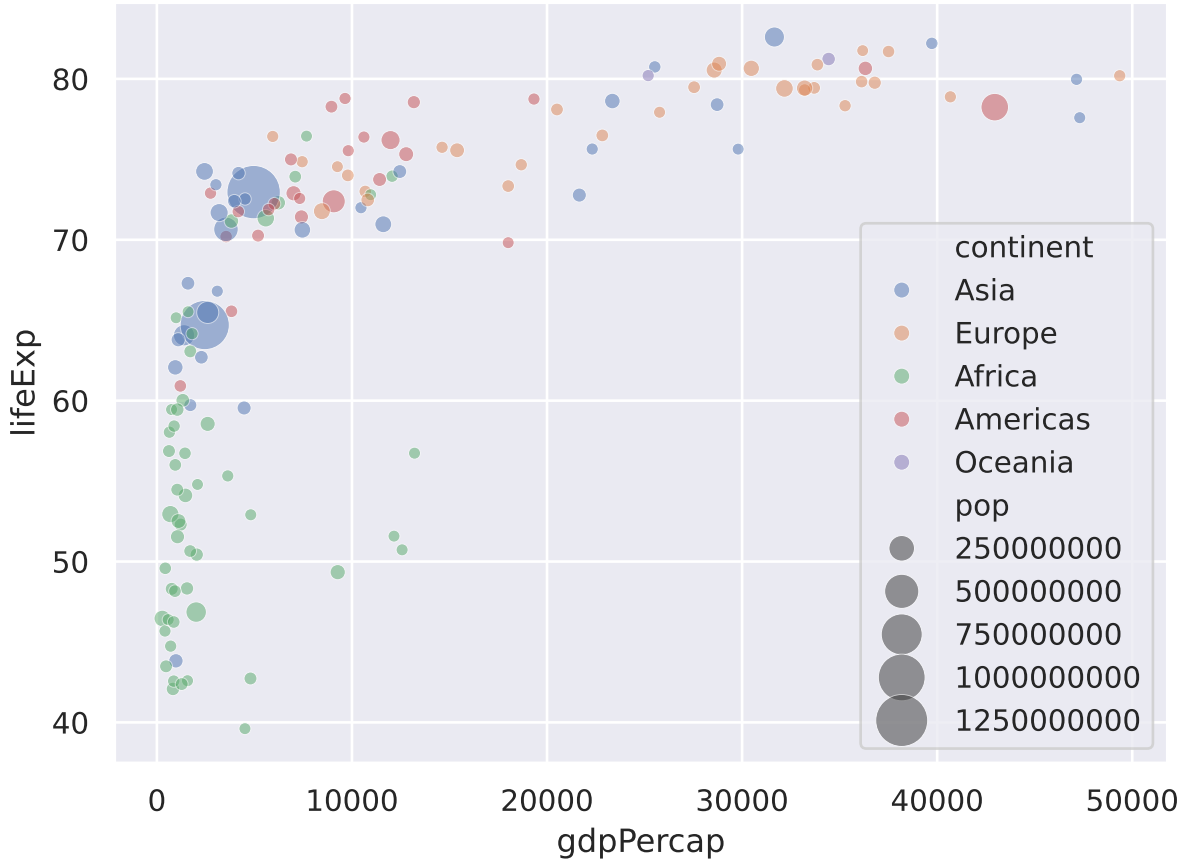
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_FacetedScatterPlot3.py, and the XML code in the file D05_FacetedScatterPlot3.2D.xml.



Some text

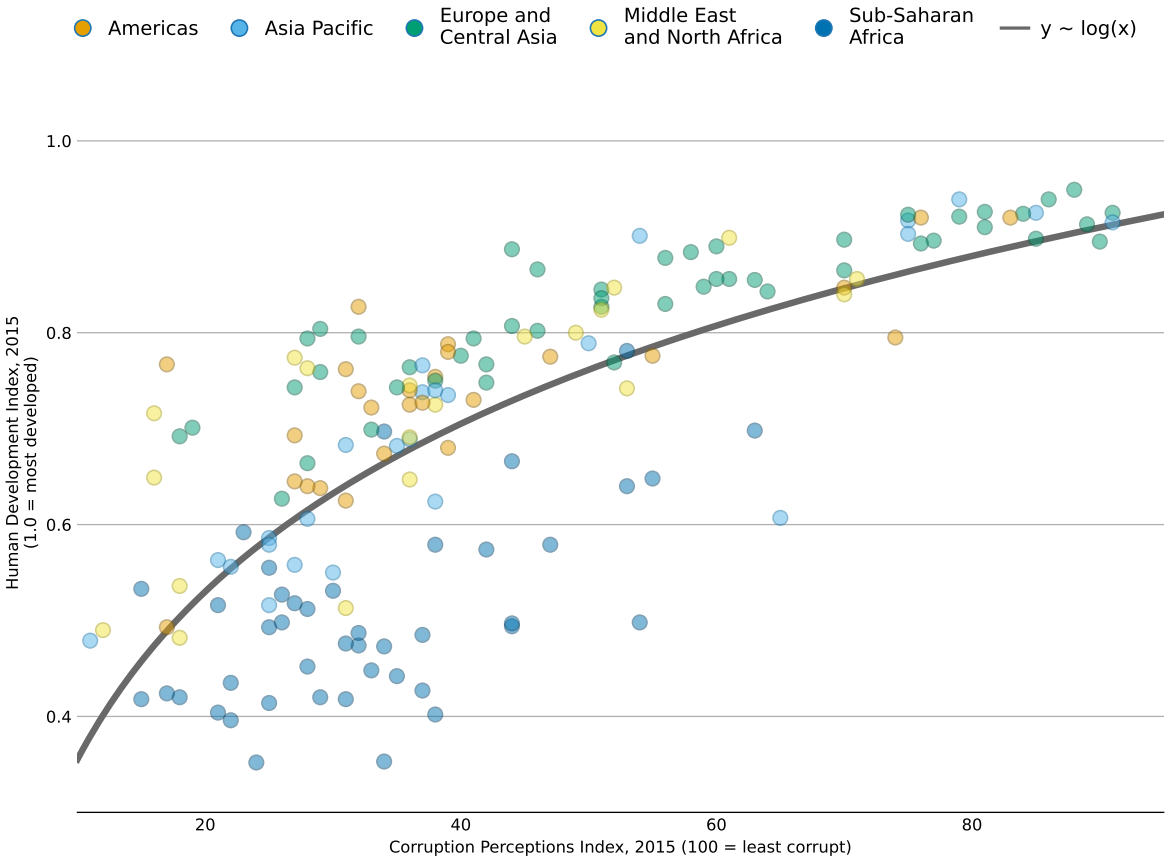
17.5.6 Bubbleplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Bubbleplot.py, and the XML code in the file D06_Bubbleplot.2D.xml.



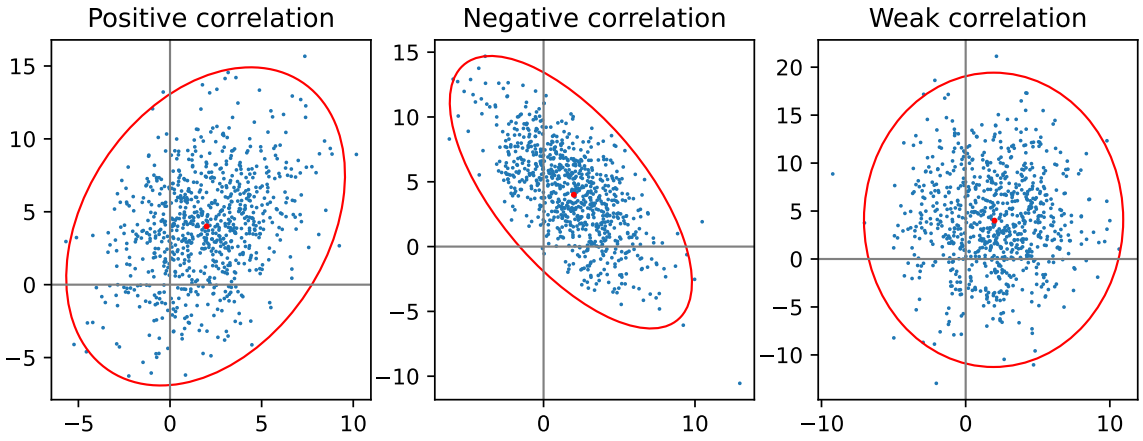
17.5.7 Scatterplot with fancy formatting

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_ScatterplotWithFancyFomatting.py, and the XML code in the file D07_ScatterplotWithFancyFomatting.2D.xml.



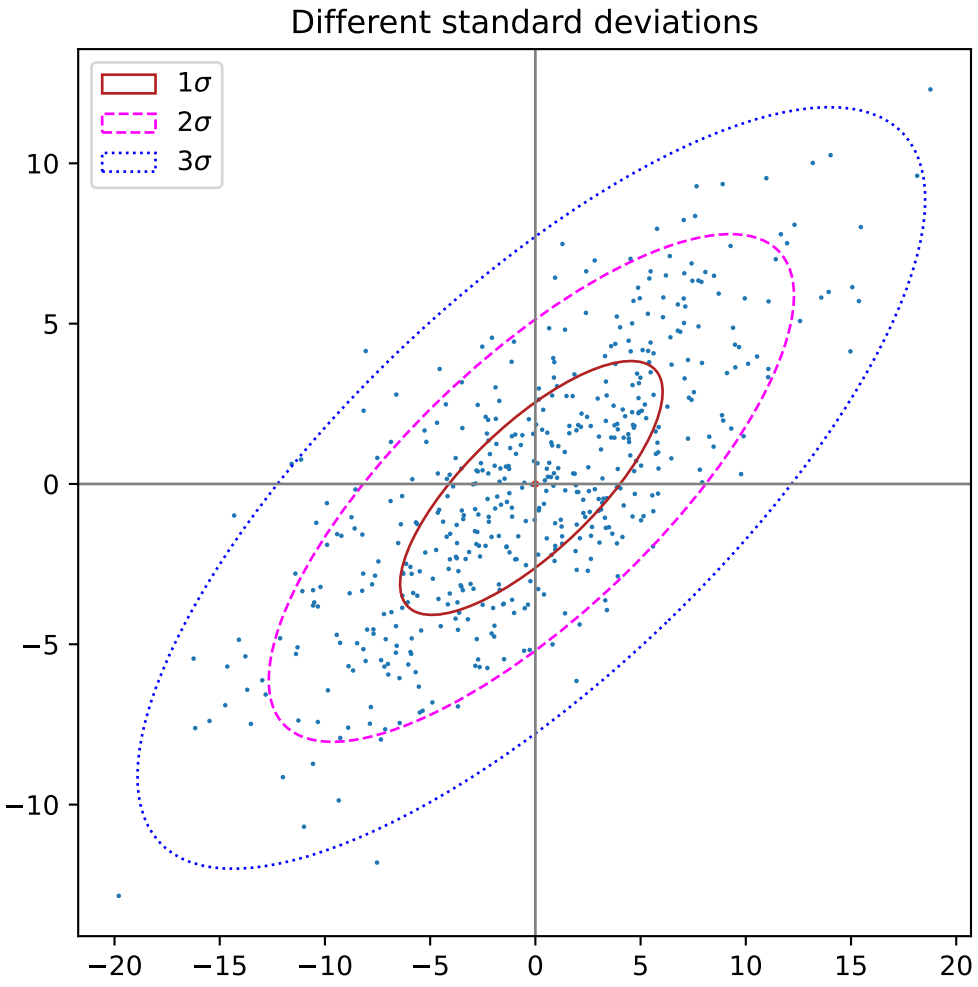
17.5.8 Scatterplots with positive, negative and weak correlation: confidence ellipses

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_ConfidenceEllipse.py, and the XML code in the file D08_ConfidenceEllipse.2D.xml.



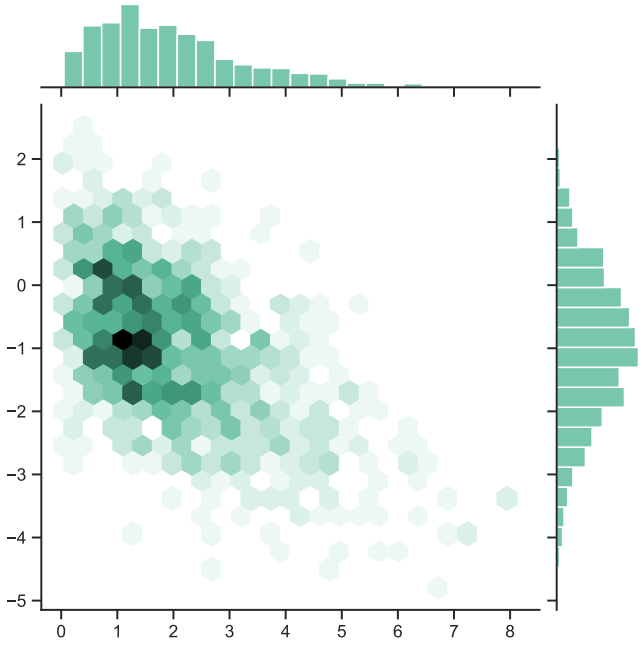
17.5.9 Scatterplot with confidence confidence ellipses at different standard deviations

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_ConfidenceEllipse2.py, and the XML code in the file D09_ConfidenceEllipse2.2D.xml.



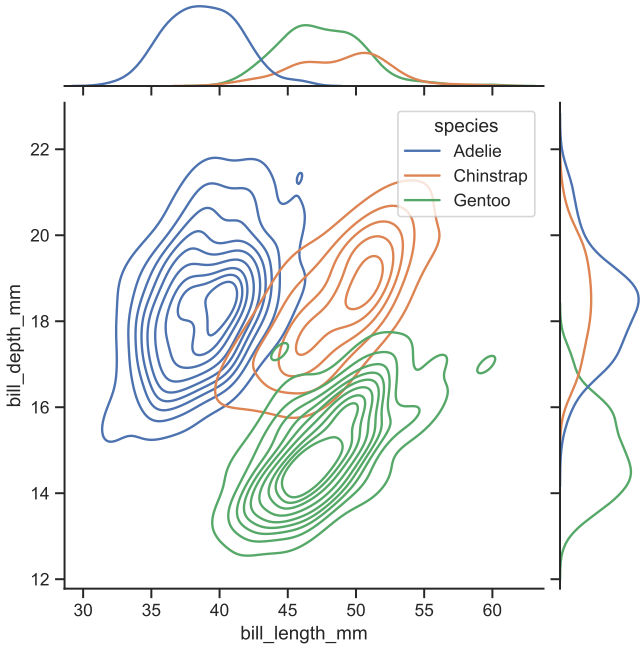
17.5.10 Hexagonal binned plot and marginal histograms (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_Hexagonalbinnedplot.py, and the XML code in the file D10_Hexagonalbinnedplot.2D.xml.



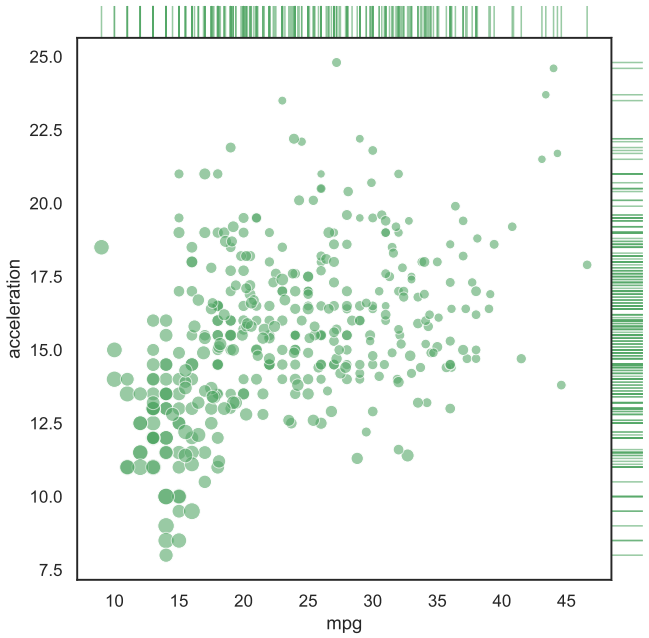
17.5.11 Joint and marginal Kde (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_JointAndMarginalKde.py, and the XML code in the file D11_JointAndMarginalKde.2D.xml.



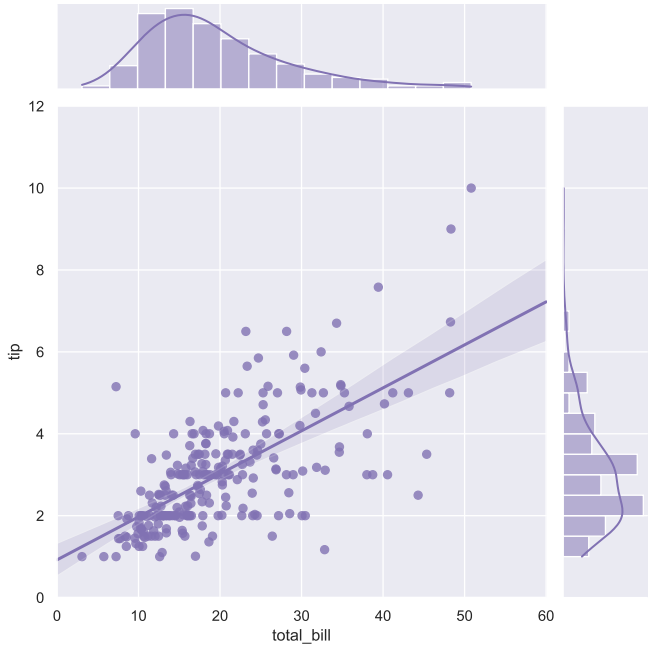
17.5.12 Marginal ticks

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_MarginalTicks.py, and the XML code in the file D12_MarginalTicks.2D.xml.



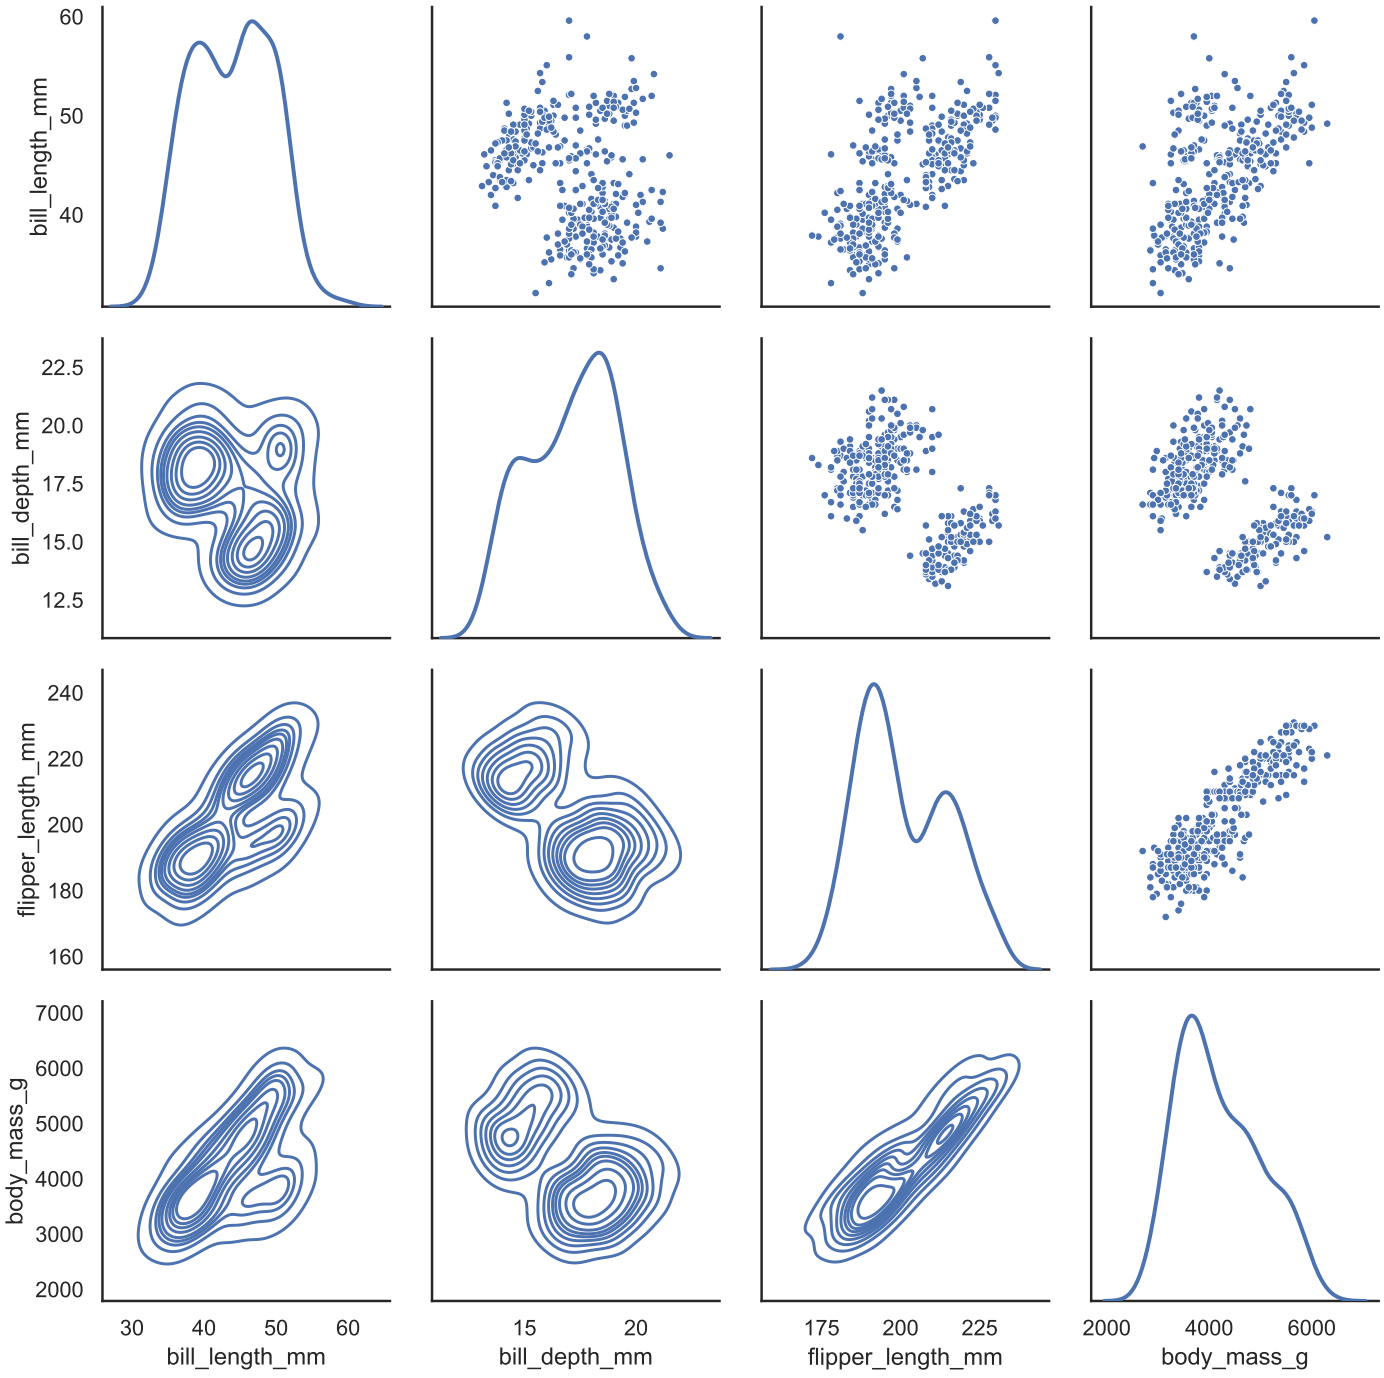
17.5.13 Regression_marginals (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13_RegressionMarginals.py, and the XML code in the file D13_RegressionMarginals.2D.xml.



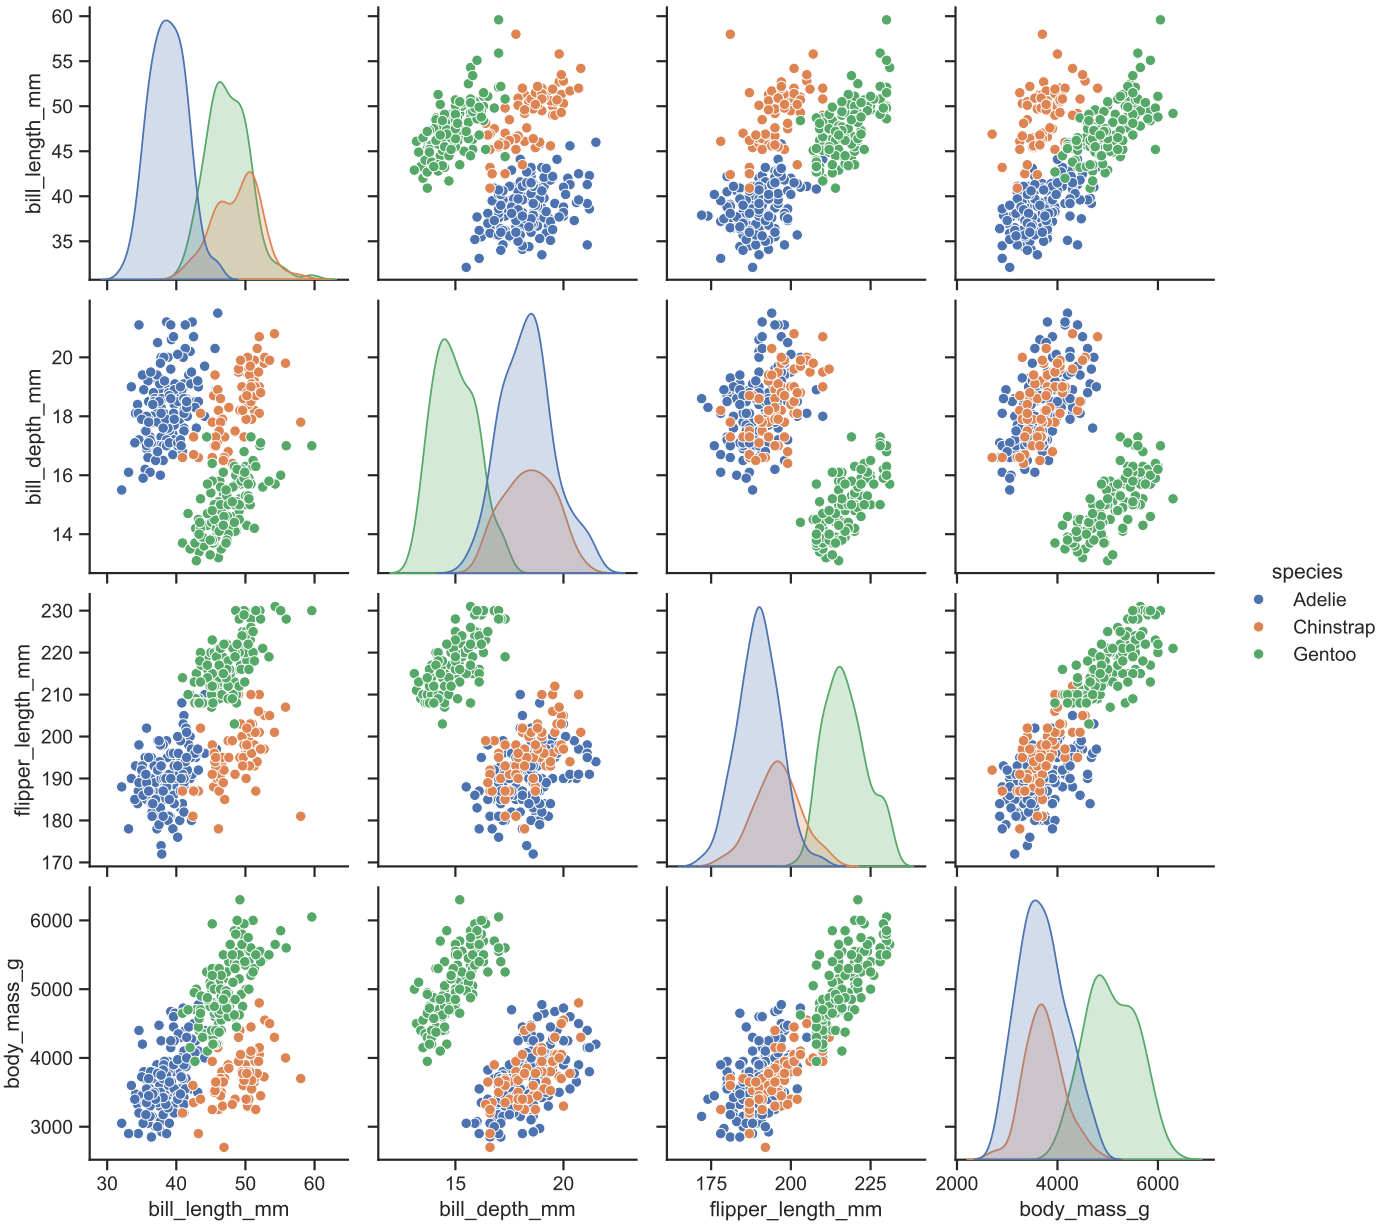
17.5.14 Pair grid with kde (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14_PairGridWithKde.py, and the XML code in the file D14_PairGridWithKde.2D.xml.



17.5.15 Scatterplot matrix (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D15_ScatterplotMatrix.py, and the XML code in the file D15_ScatterplotMatrix.2D.xml.



17.6 Financial plots (requires mplfinance)

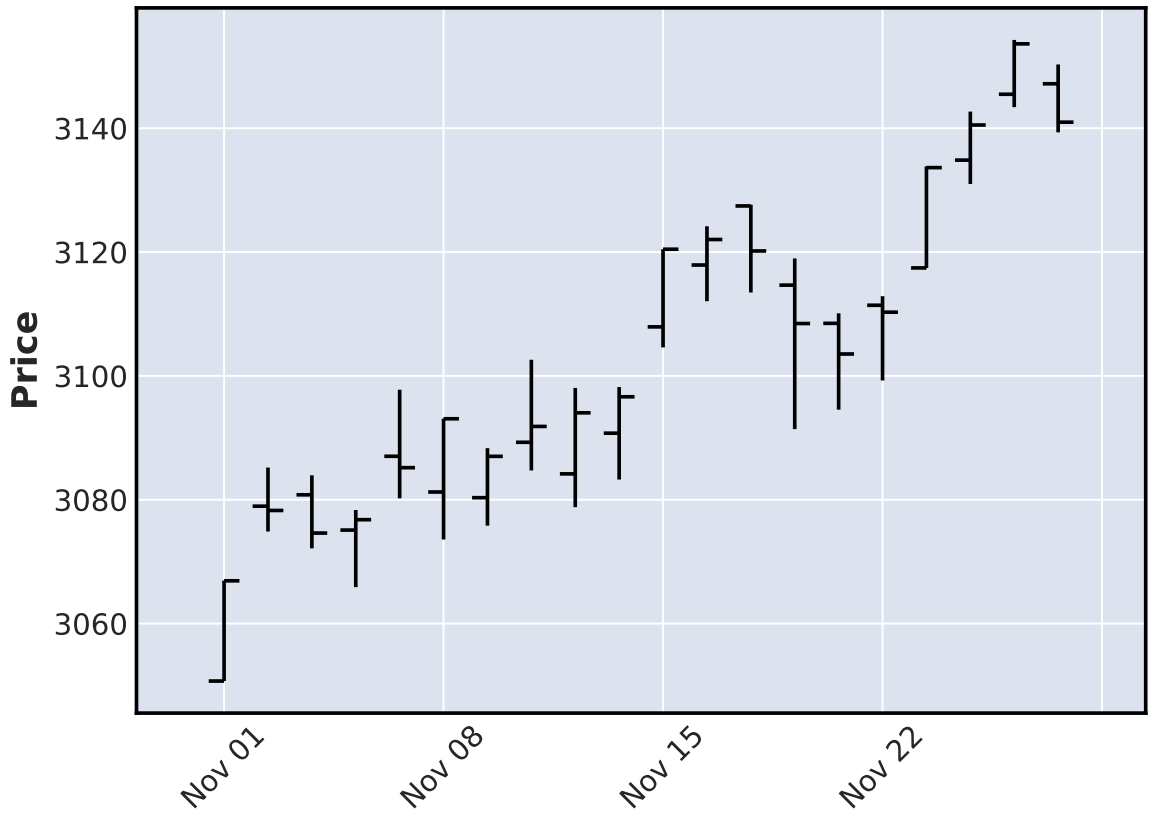
See also: https://pypi.org/project/mplfinance/

See also: https://github.com/matplotlib/mplfinance

See also for styling : https://coderzcolumn.com/tutorials/data-science/candlestick-chart-in-python-mplfinance-plotly-bokeh

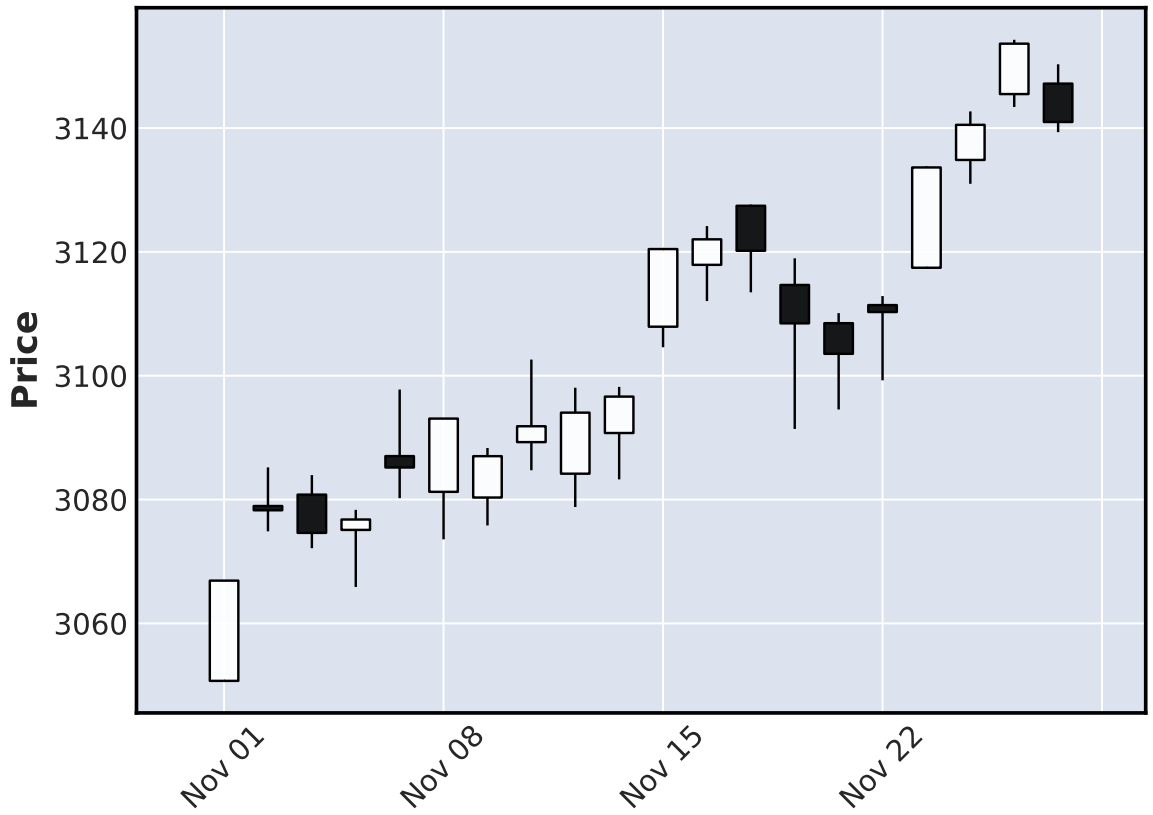
17.6.1 HiLoPlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Mpl_HiLo.py, and the XML code in the file D01_Mpl_HiLo.2D.xml.



17.6.2 CandlePlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Mpl_Candle.py, and the XML code in the file D02_Mpl_Candle.2D.xml.

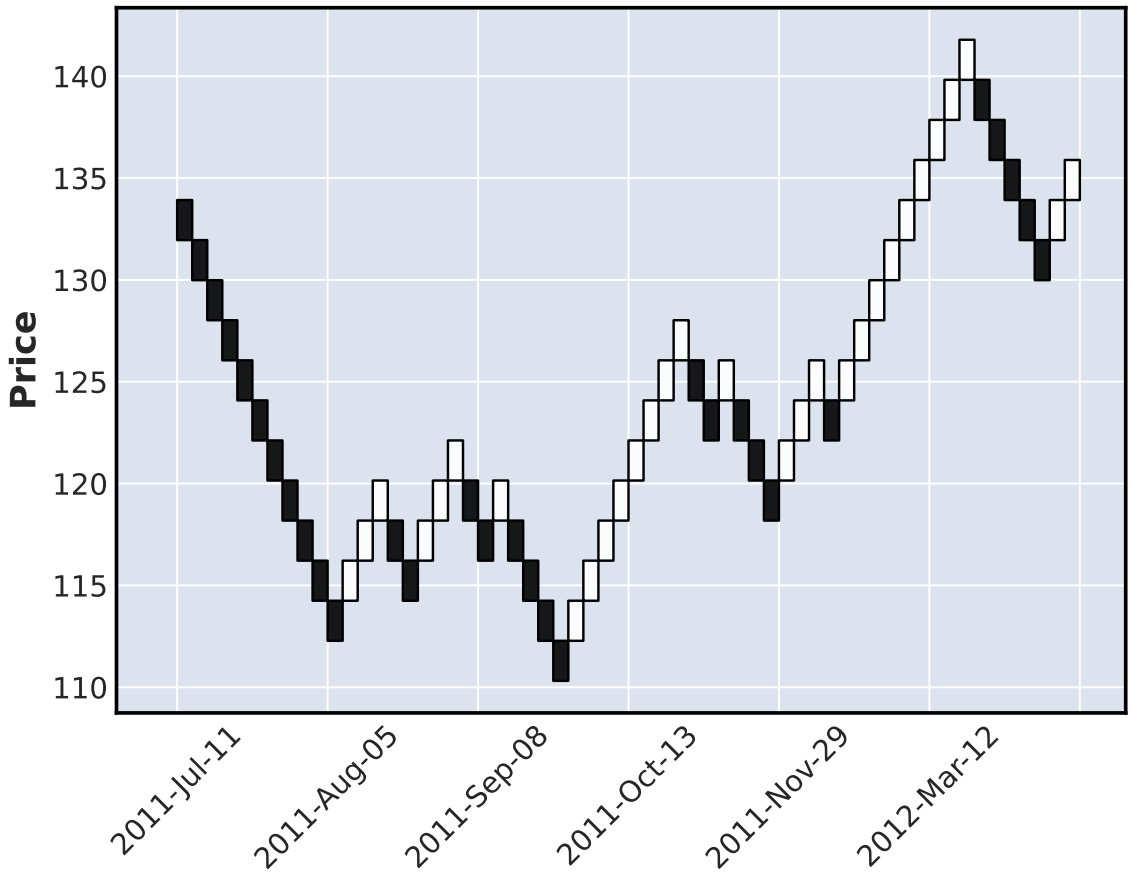


17.6.3 LinePlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Mpl_Line.py, and the XML code in the file D03_Mpl_Line.2D.xml.

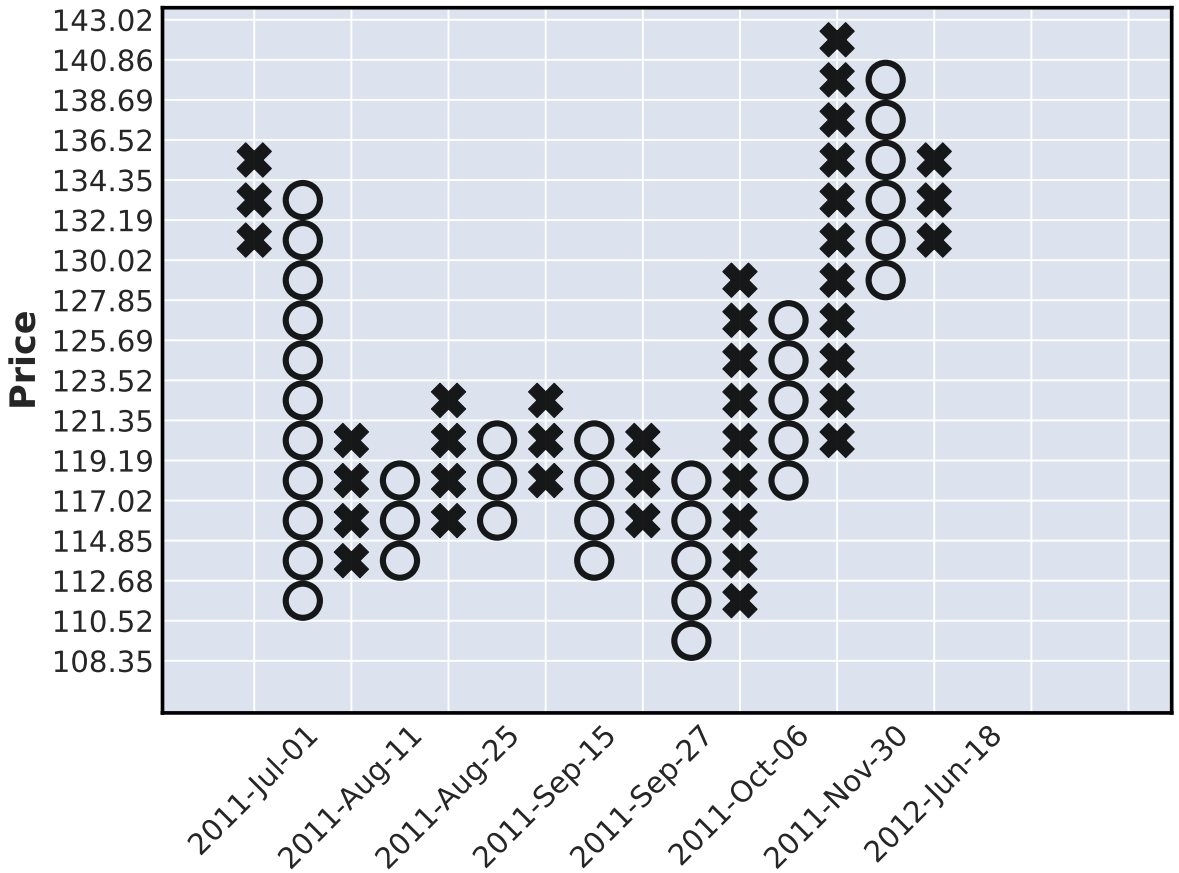
17.6.4 RenkoPlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Mpl_Renko.py, and the XML code in the file D04_Mpl_Renko.2D.xml.



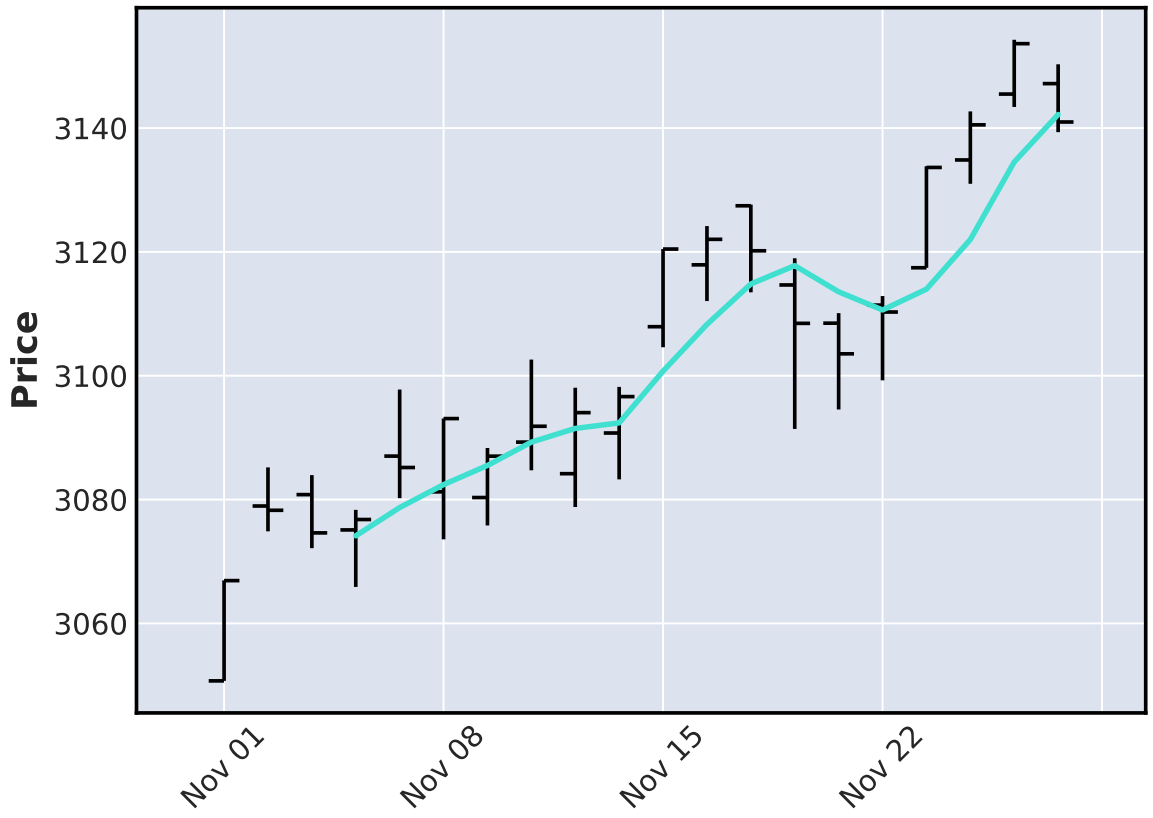
17.6.5 PnfPlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Mpl_Pnf.py, and the XML code in the file D05_Mpl_Pnf.2D.xml.



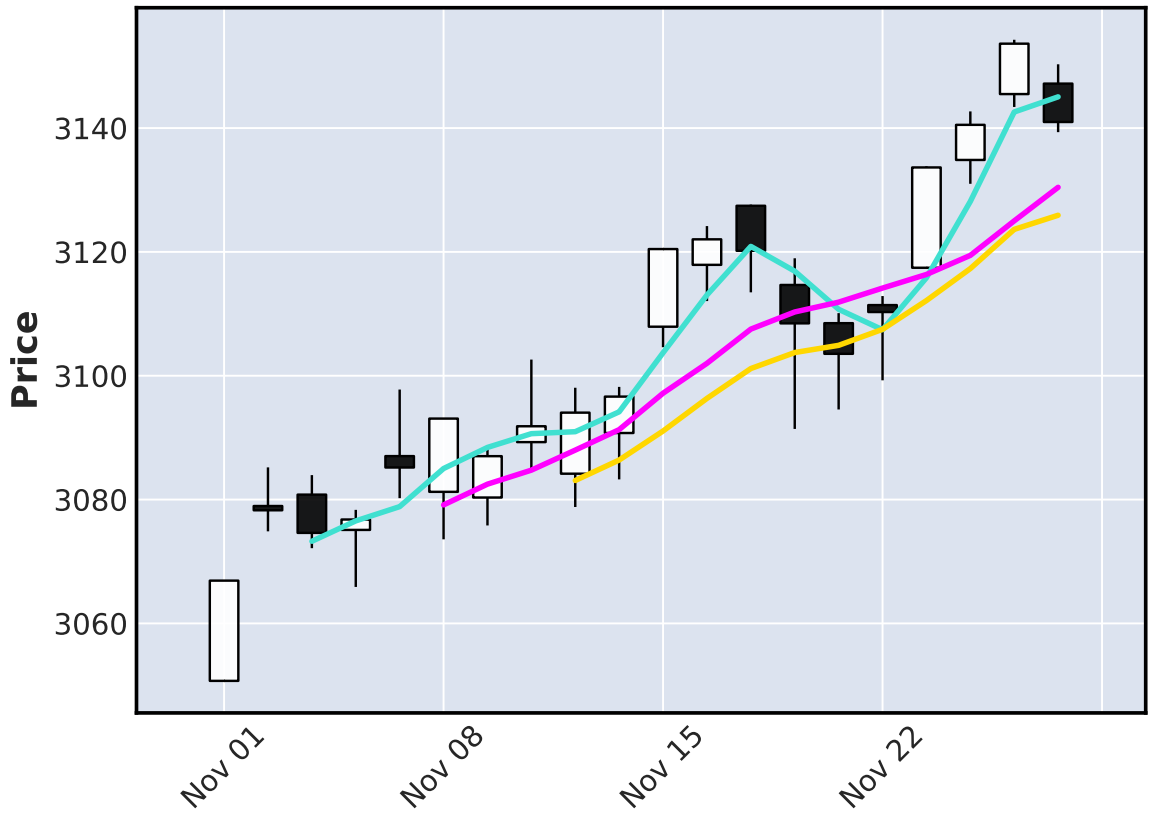
17.6.6 OhlcMav4Plot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Mpl_ohlc_mav.py, and the XML code in the file D06_Mpl_ohlc_mav.2D.xml.



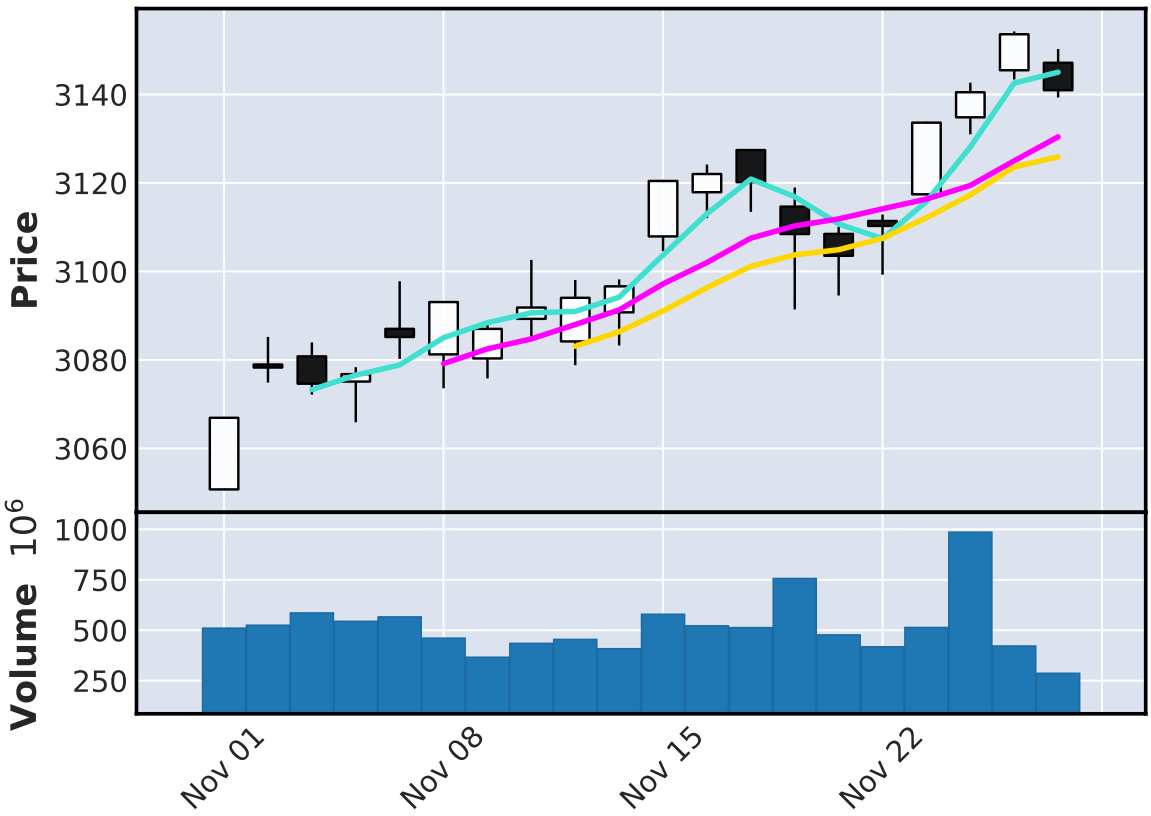
17.6.7 CandleMav369Plot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Mpl_candle_mav369.py, and the XML code in the file D07_Mpl_candle_mav369.2D.xml.



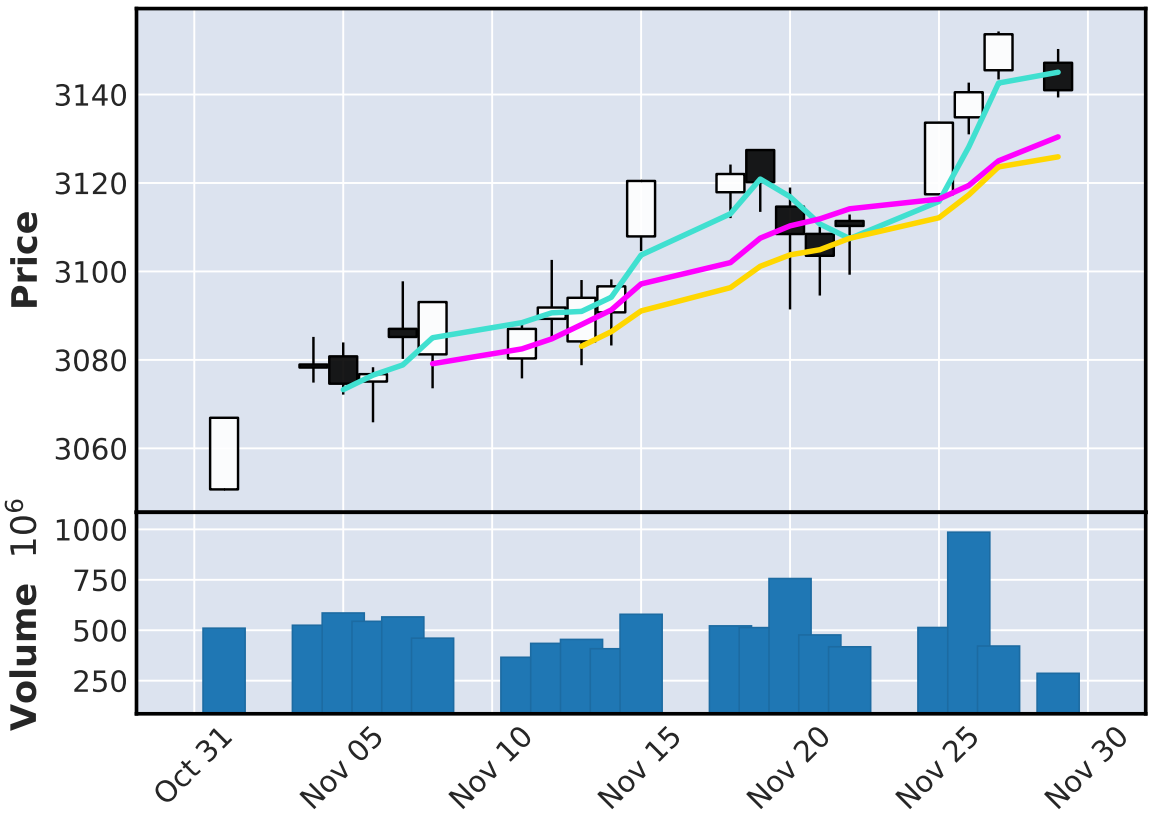
17.6.8 CandleMav369VolPlot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Mpl_candle_mav369_vol.py, and the XML code in the file D08_Mpl_candle_mav369_vol.2D.xml.



17.6.9 CandleMav369VolNonTradPlot

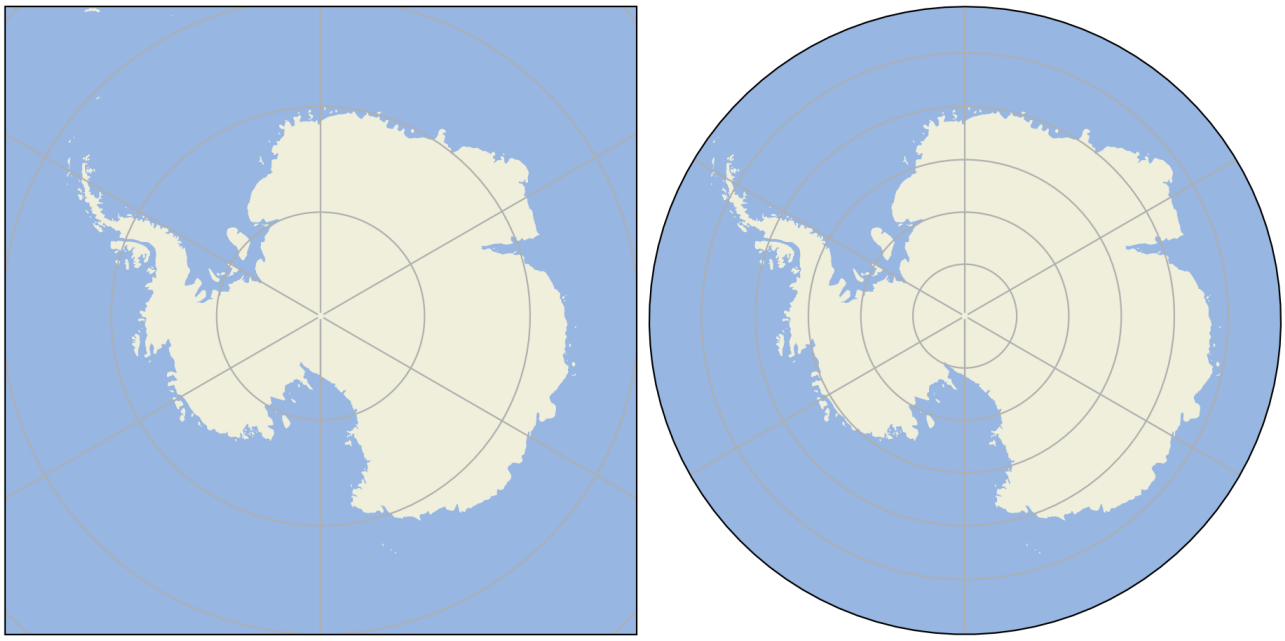
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_Mpl_candle_mav369_vol_nontrad.py, and the XML code in the file D09_Mpl_candle_mav369_vol_nontrad.2D.xml.



17.7 Geographic data (requires cartopy)

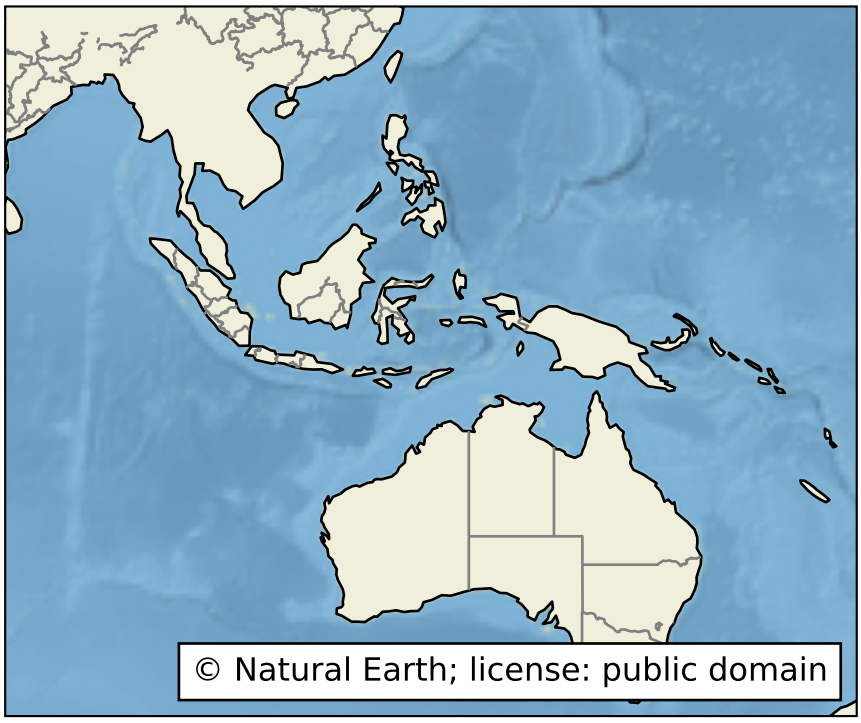
17.7.1 Antarctis

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Antarctis.py, and the XML code in the file D01_Antarctis.2D.xml.



17.7.2 Australia

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Australia.py, and the XML code in the file D02_Australia.2D.xml.

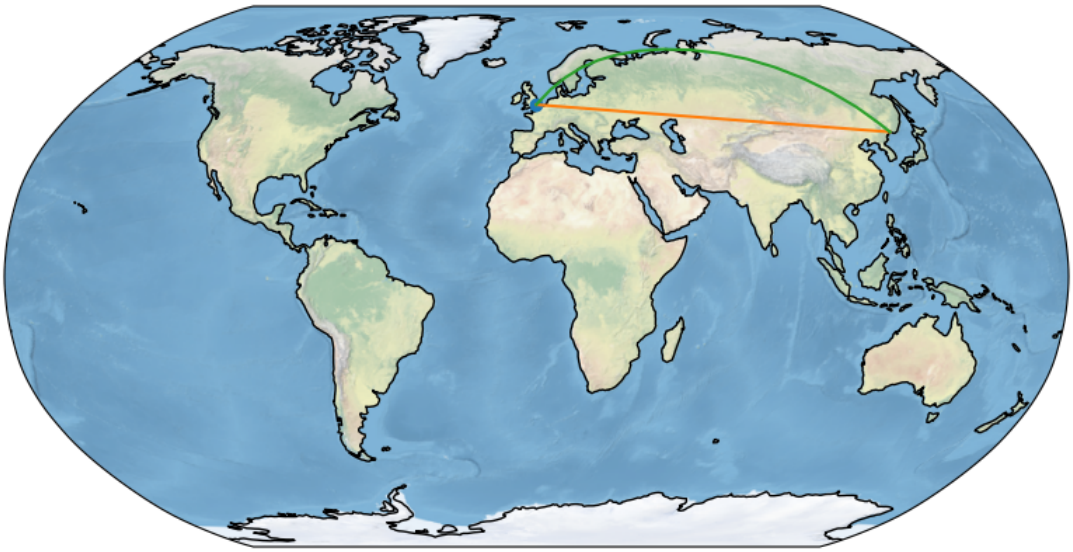


17.7.3 Africa

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Africa.py, and the XML code in the file D03_Africa.2D.xml.

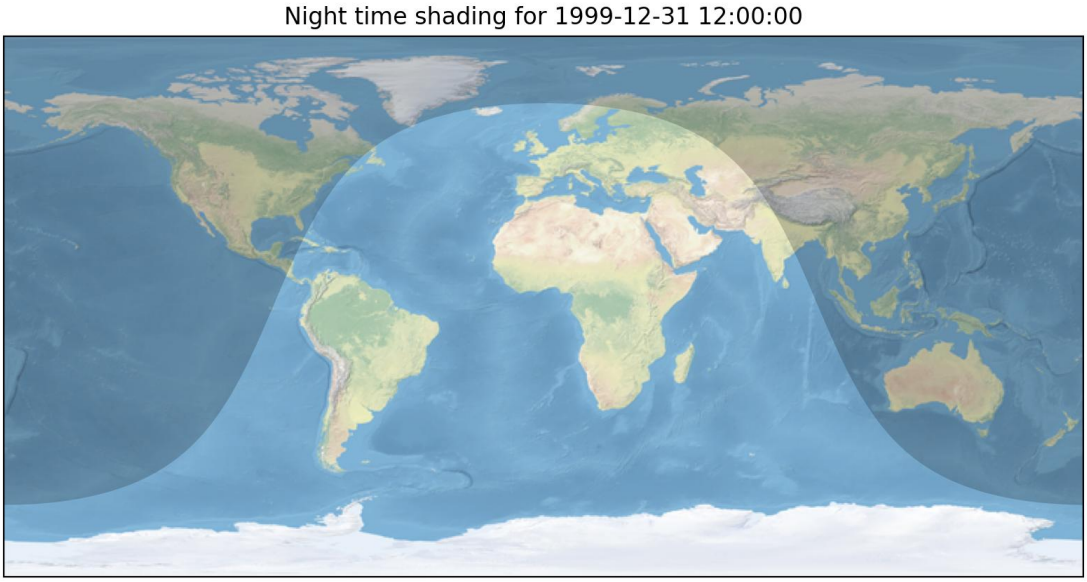
17.7.4 World Flight

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_WorldFlight.py, and the XML code in the file D04_WorldFlight.2D.xml.



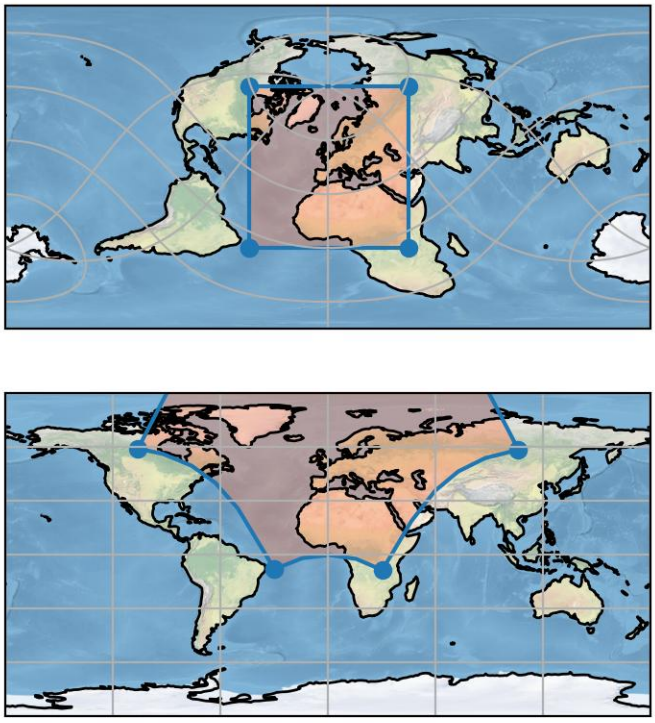
17.7.5 World Night Shading

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_WorldNightShading.py, and the XML code in the file D05_WorldNightShading.2D.xml.



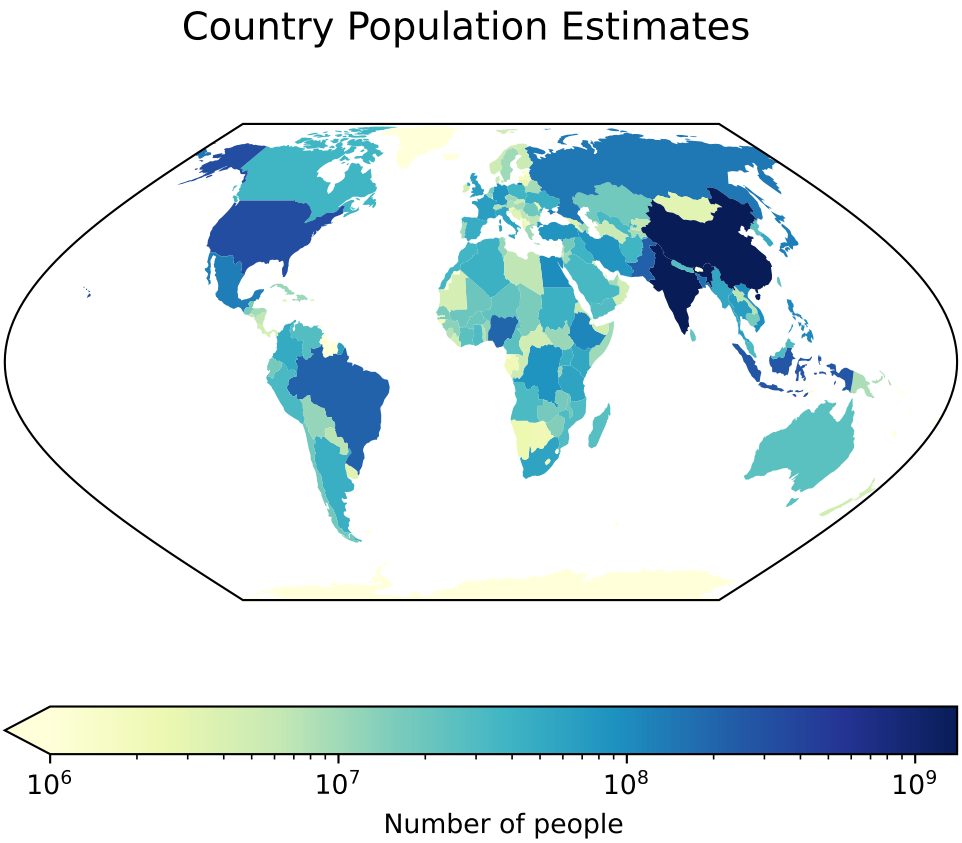
17.7.6 World2projections

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_World2Projections.py, and the XML code in the file D06_World2Projections.2D.xml.



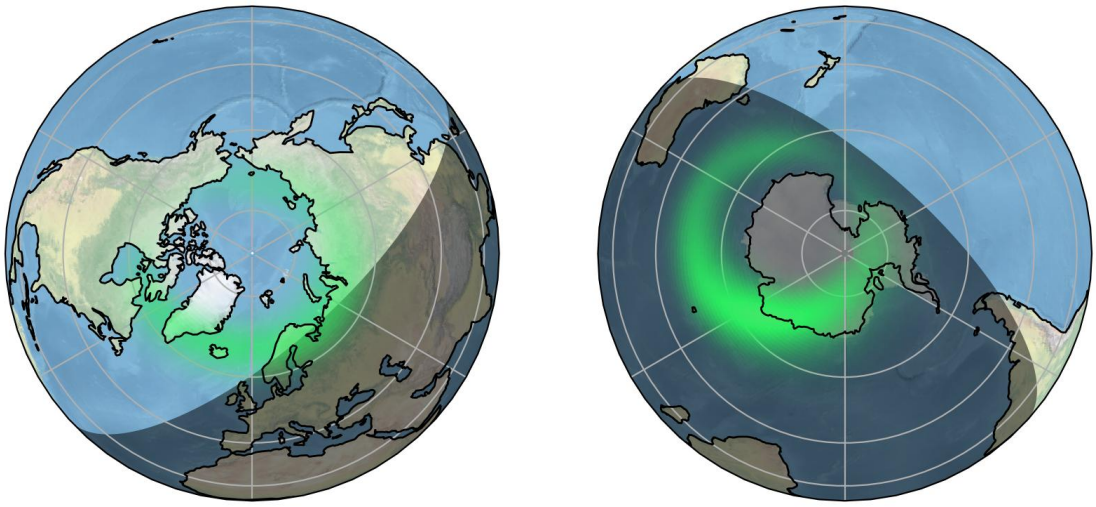
17.7.7 Country population estimates

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_CountryPopulationEstimates.py, and the XML code in the file D07_CountryPopulationEstimates.2D.xml.



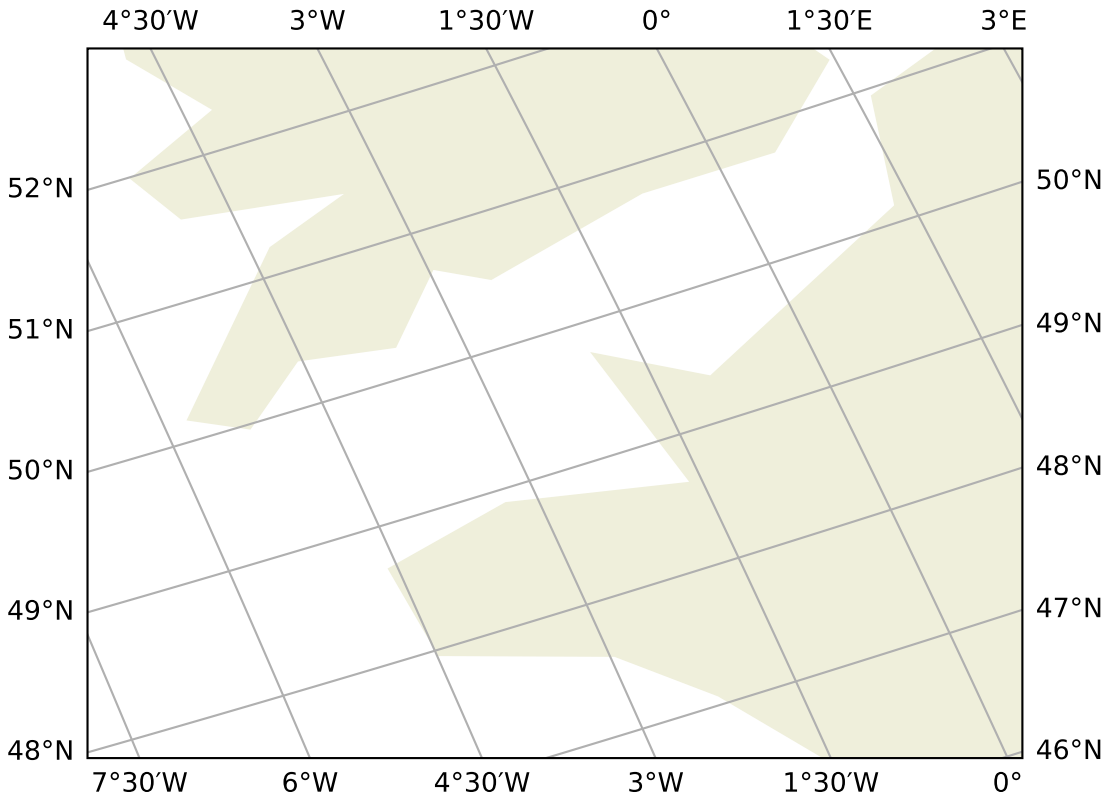
17.7.8 Arctis and Antarctis

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_ArctisAndAntarctis.py, and the XML code in the file D08_ArctisAndAntarctis.2D.xml.



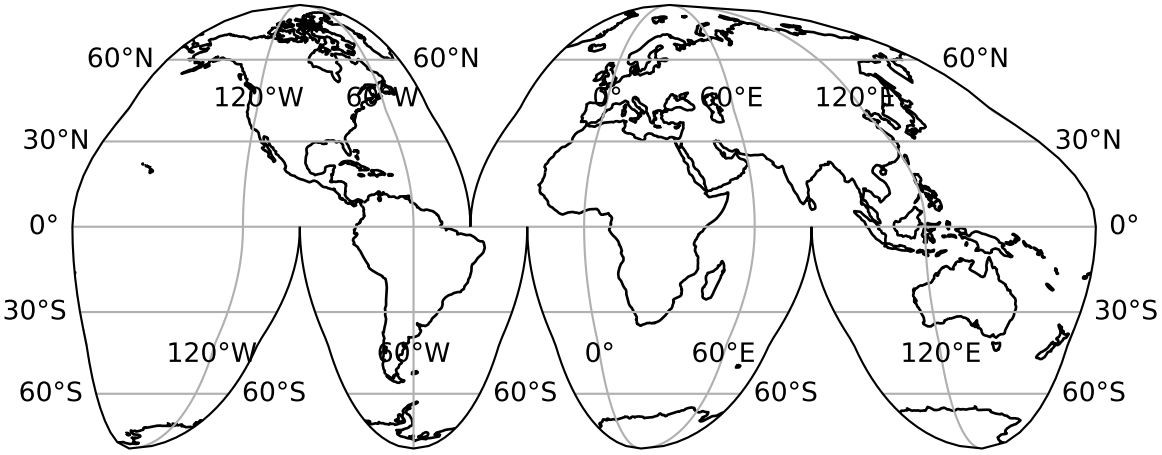
17.7.9 Geographic Mapping, with longitude and altitude on 4 axes crs=ccrs.PlateCarree

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_GeographicMapping1.py, and the XML code in the file D09_GeographicMapping1.2D.xml.



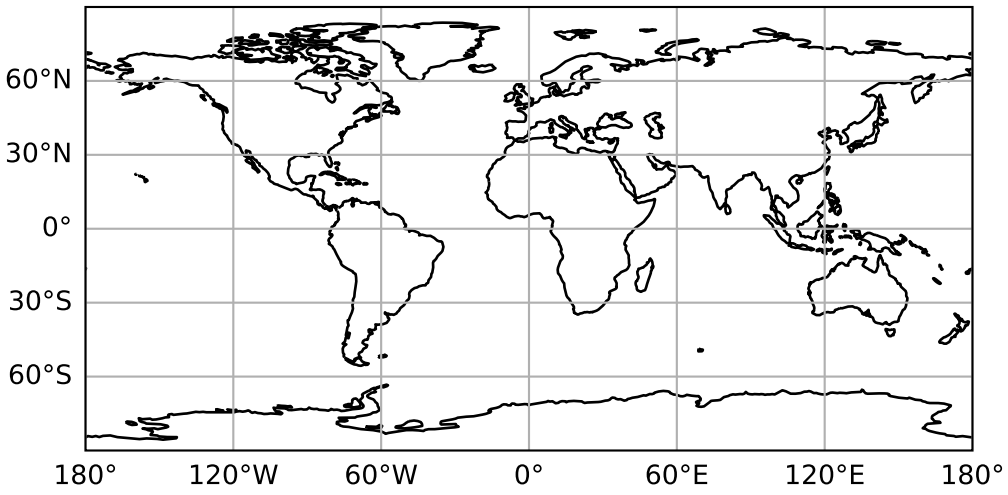
17.7.10 Geographic Mapping, World, projection=ccrs.InterruptedGoodeHomolosine

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_GeographicMapping2.py, and the XML code in the file D10_GeographicMapping2.2D.xml.



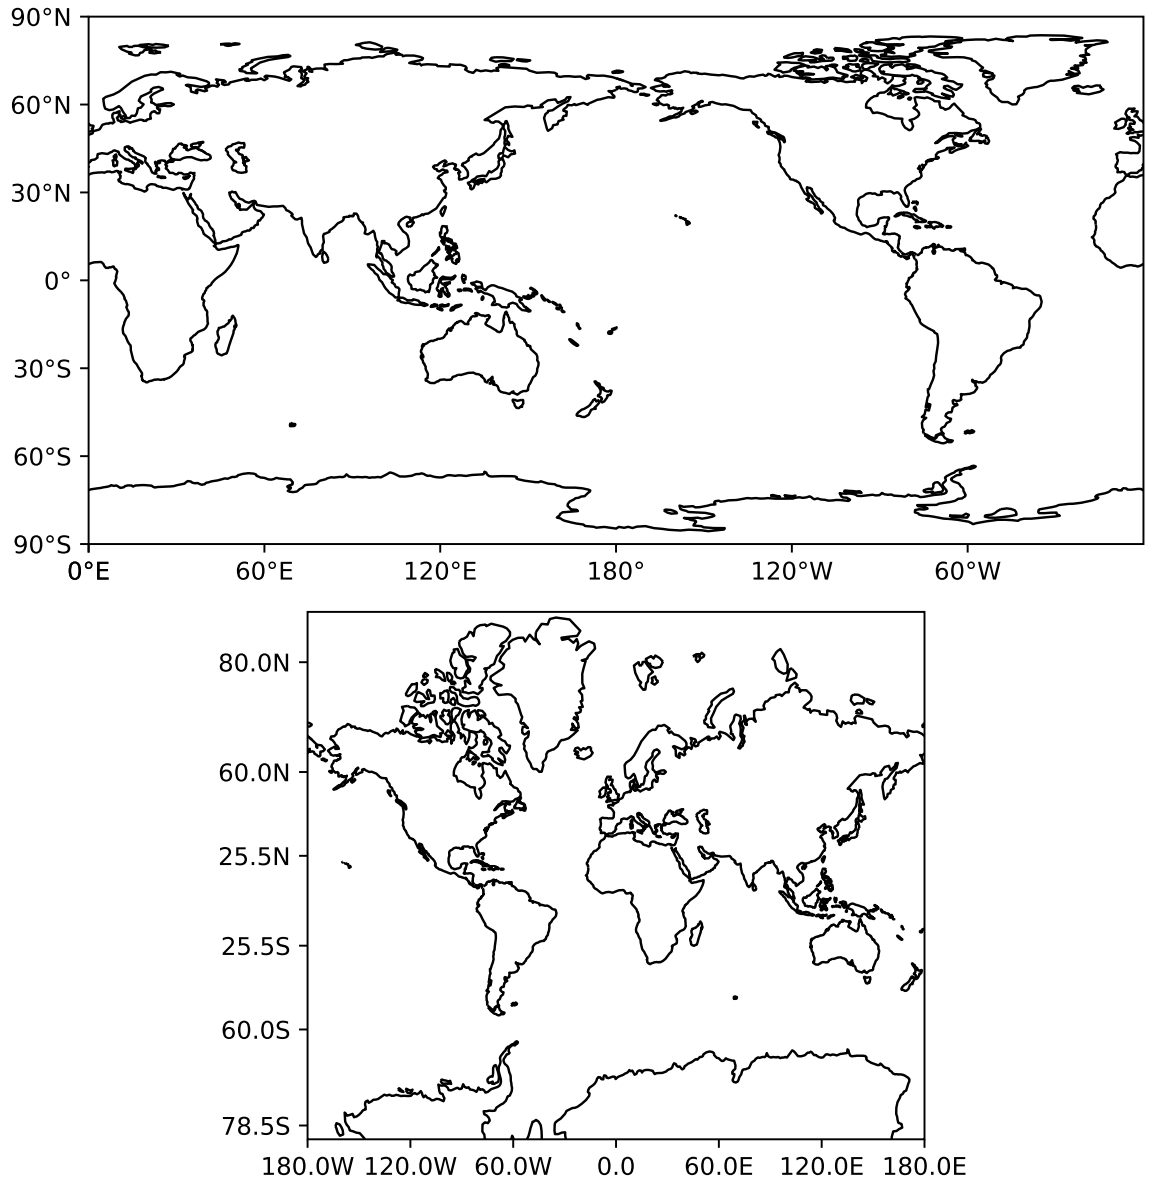
17.7.11 Geographic Mapping, World, projection=ccrs.PlateCarree

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_GeographicMapping3.py, and the XML code in the file D11_GeographicMapping3.2D.xml.



17.7.12 Labelling projection axes: PlateCarree and Mercator

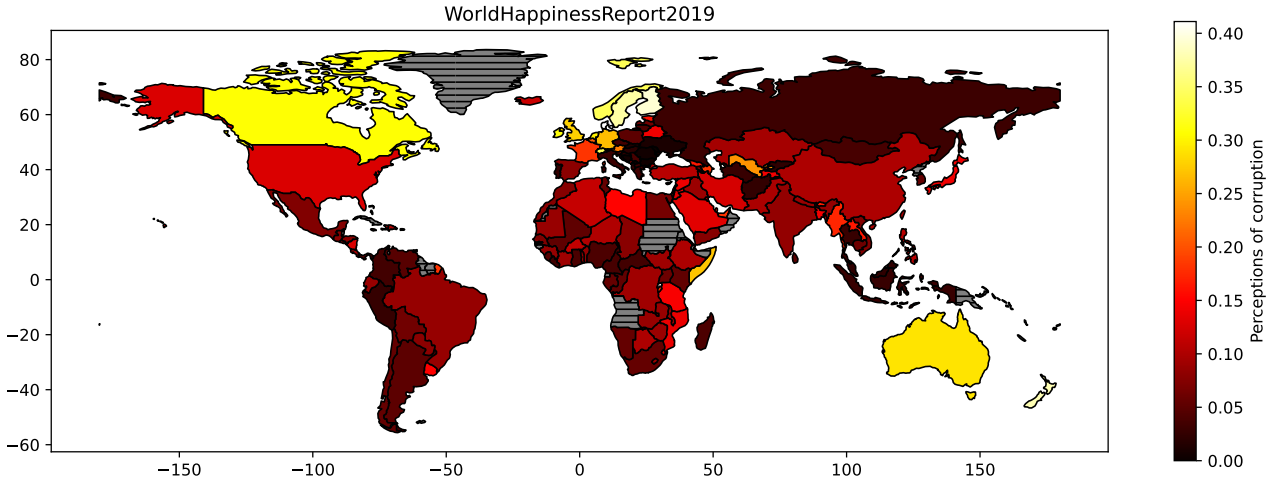
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_LabellingProjectionAxis.py, and the XML code in the file D12_LabellingProjectionAxis.2D.xml.



17.8 Geographic data (requires geopandas)

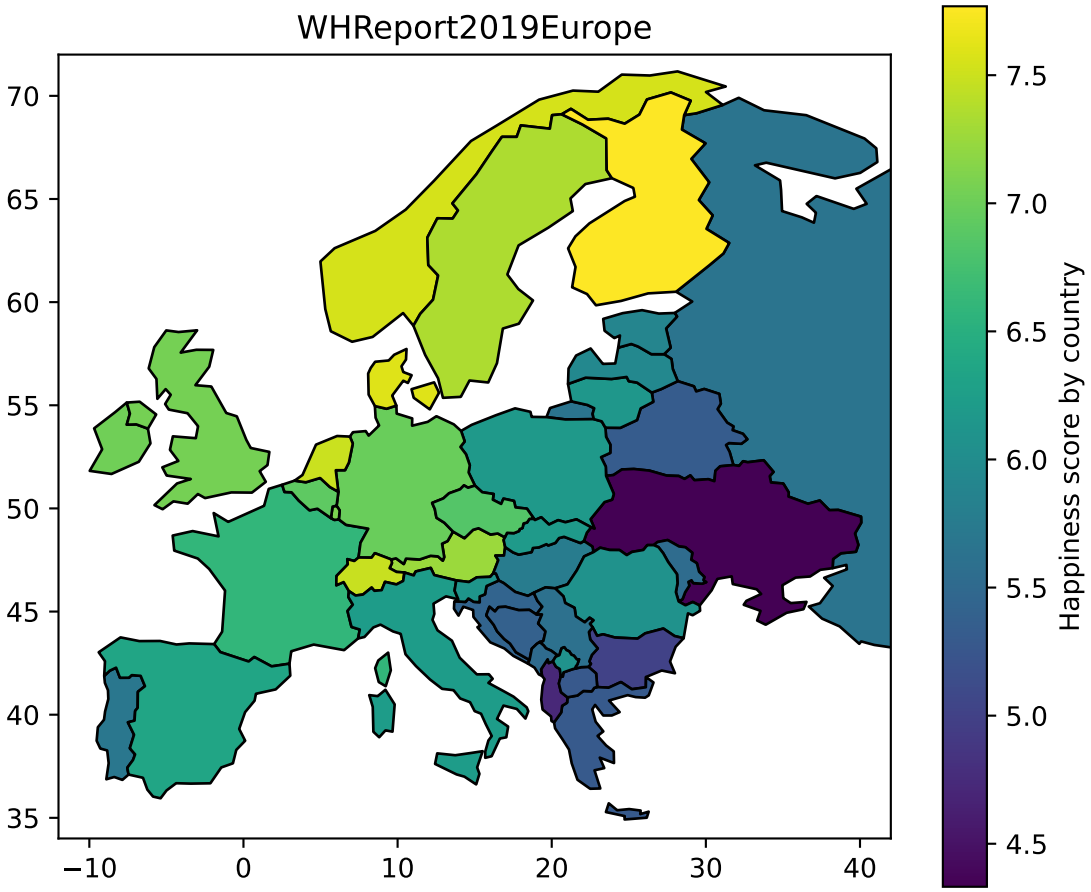
17.8.1 World Happiness Report 2019

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_World.py, and the XML code in the file D01_World.2D.xml.



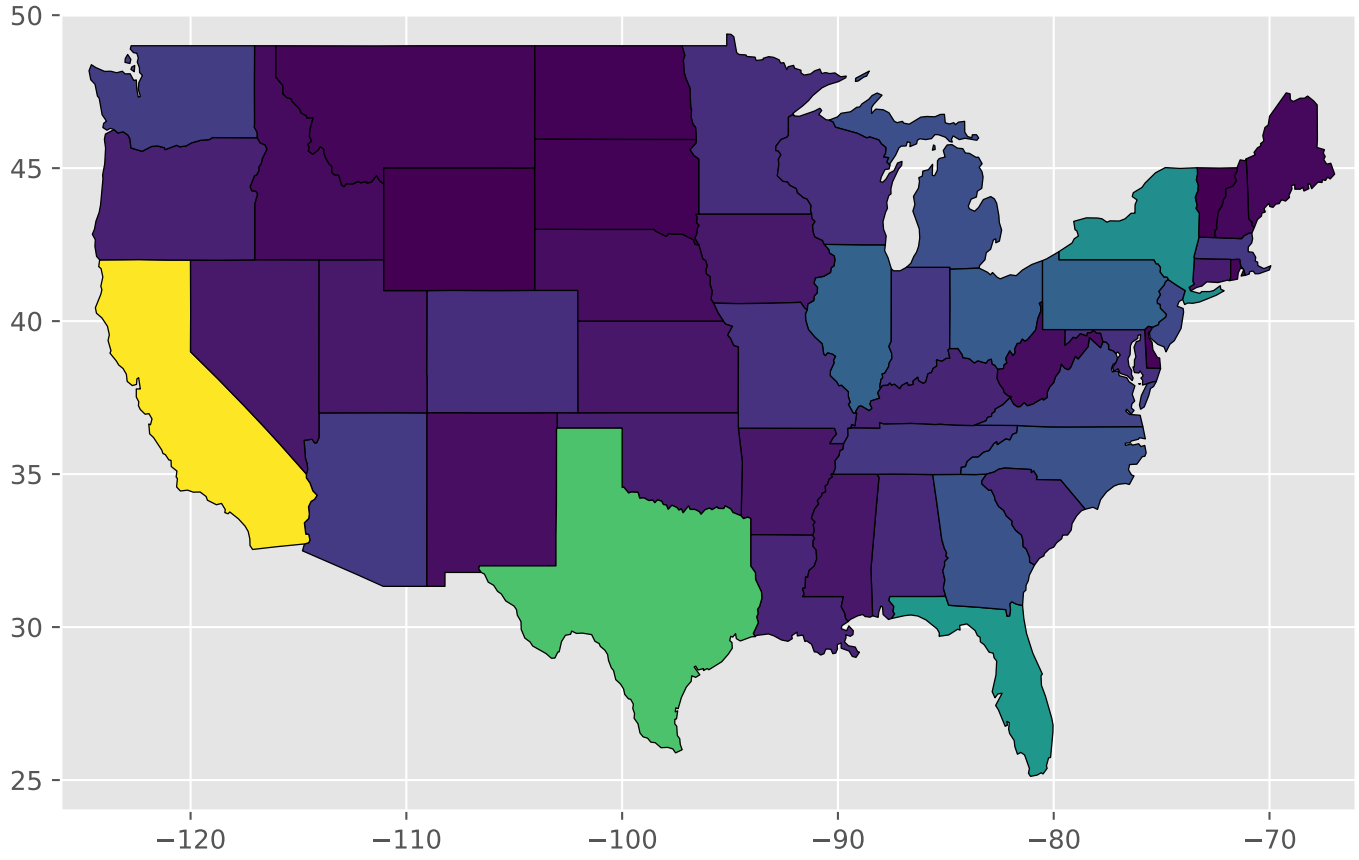
17.8.2 World Happiness Report 2019: Europe

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Europe.py, and the XML code in the file D02_Europe.2D.xml.



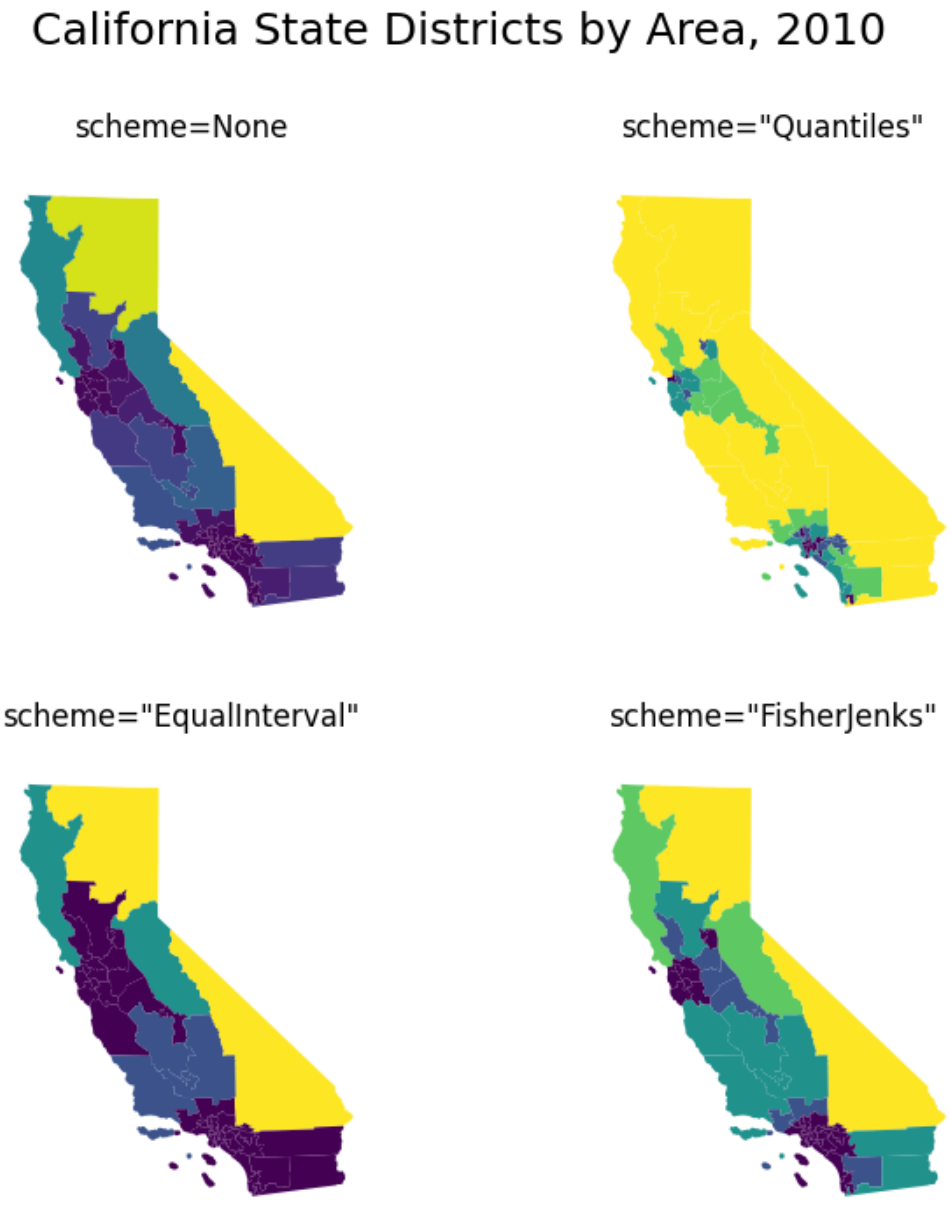
17.8.3 US state populations

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_USPopulation.py, and the XML code in the file D03_USPopulation.2D.xml.



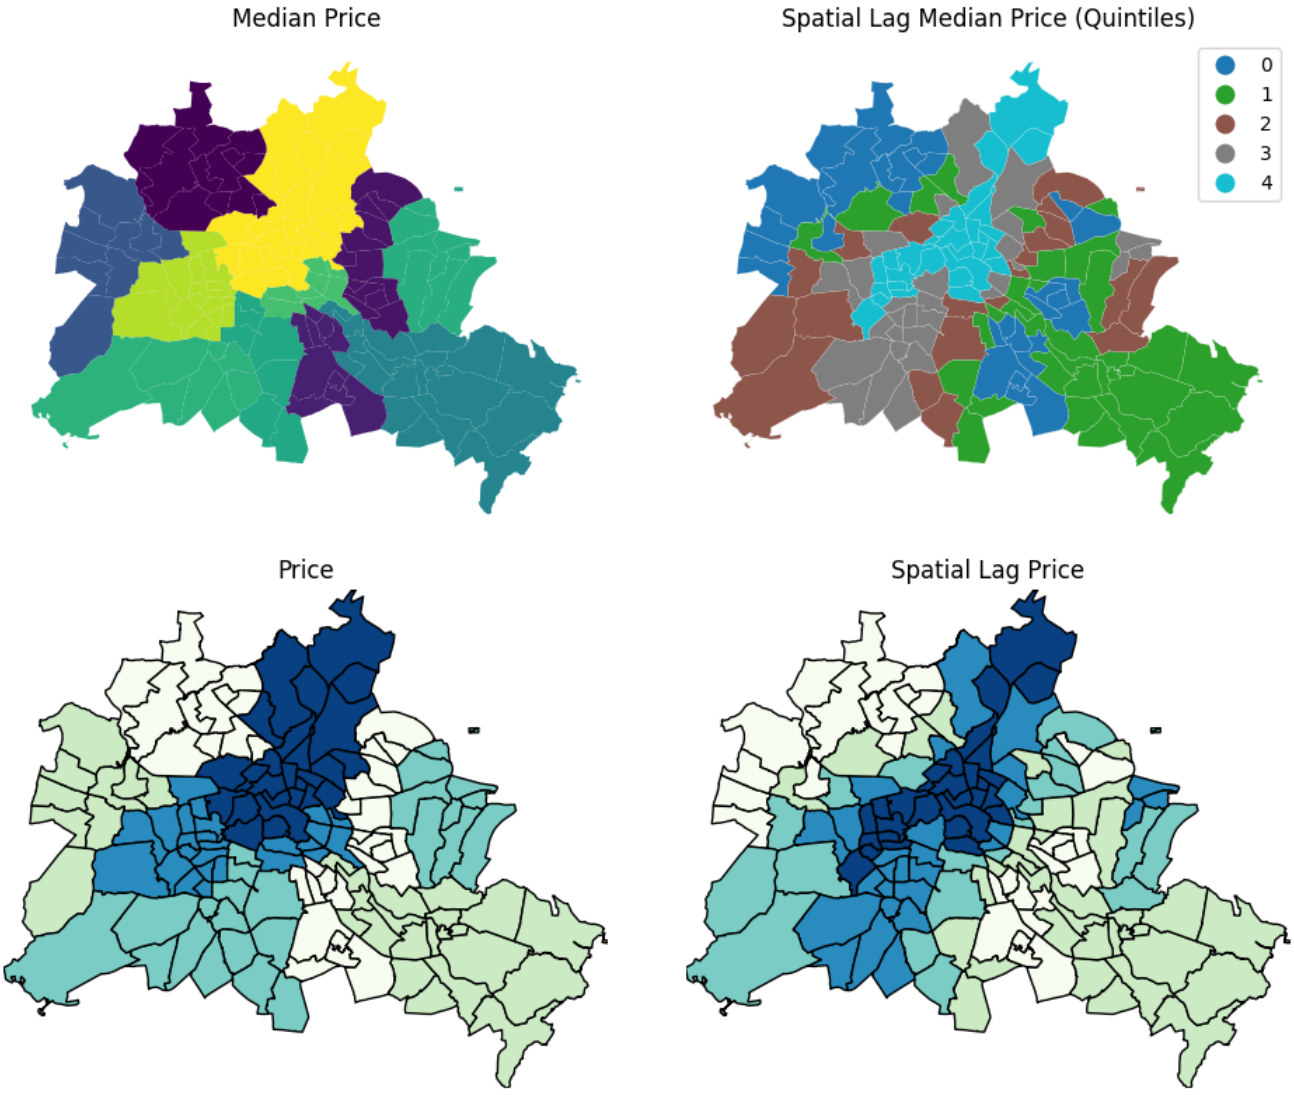
17.8.4 California

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Californa.py, and the XML code in the file D04_Californa.2D.xml.



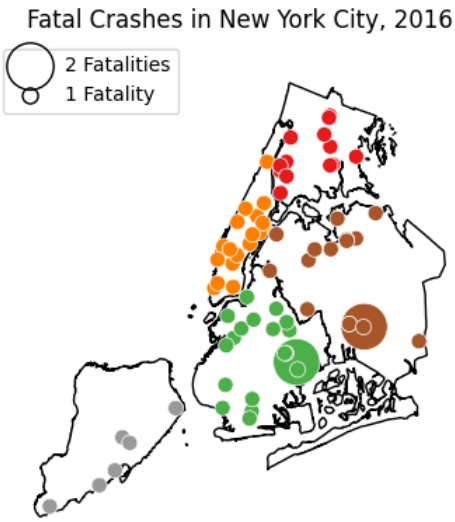
17.8.5 Berlin, Esda

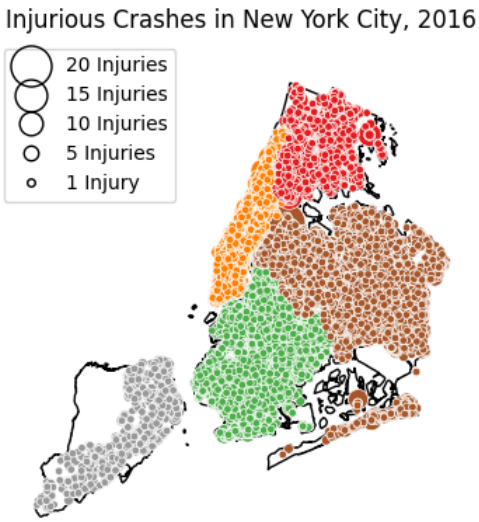
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Berlin.py, and the XML code in the file D05_Berlin.2D.xml.



17.8.6 New York, Collisions

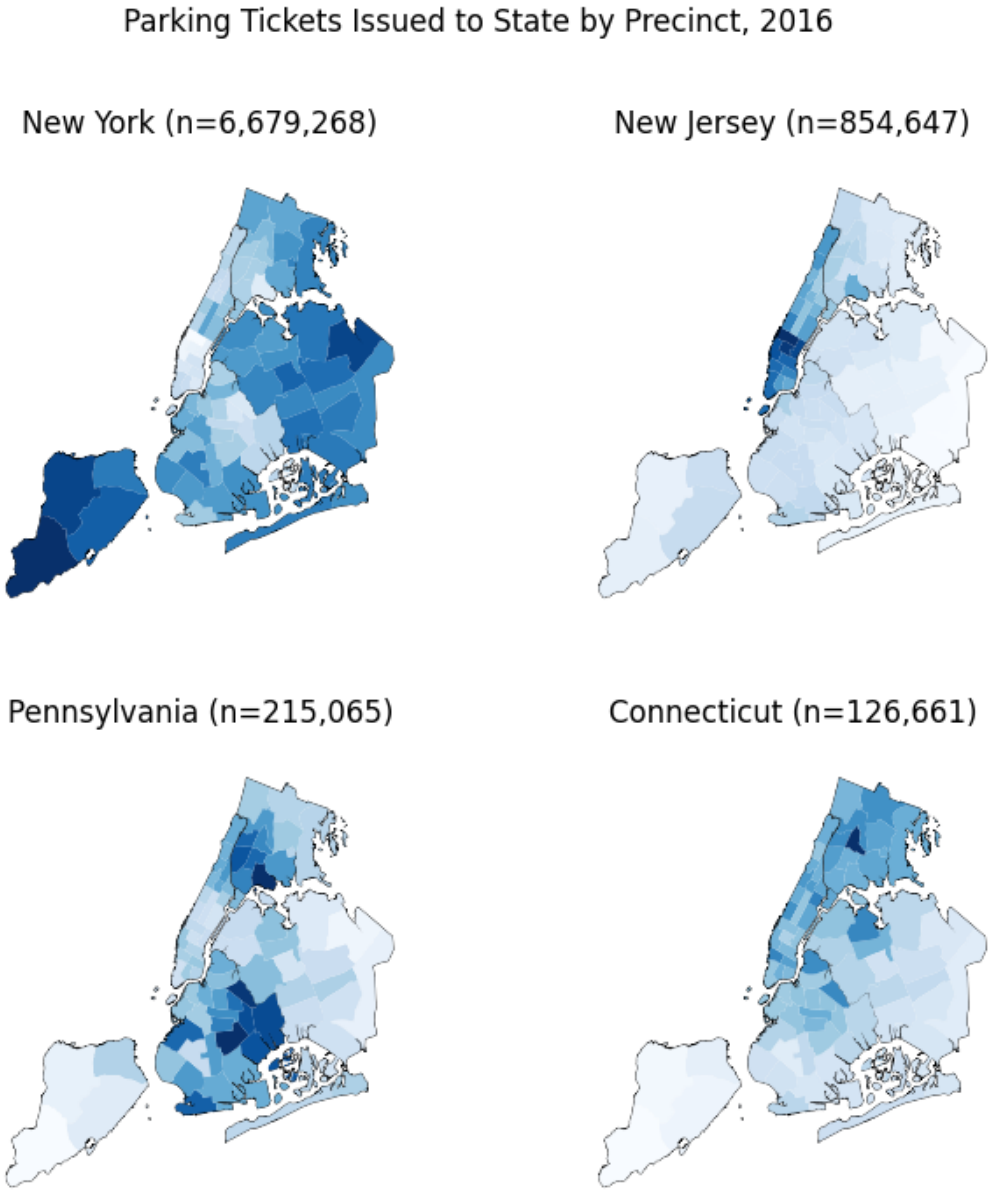
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_NY_Collisions.py, and the XML code in the file D06_NY_Collisions.2D.xml.





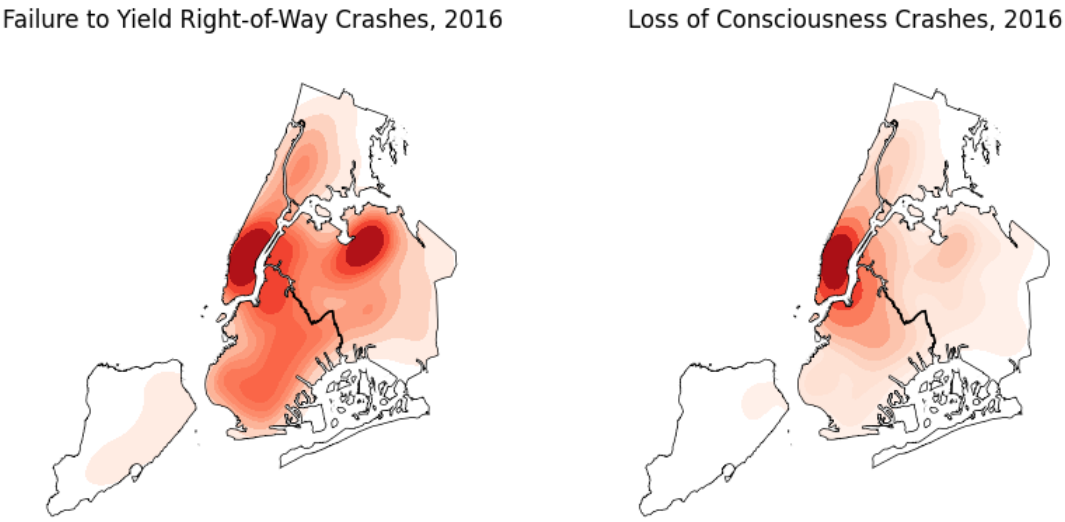
17.8.7 New York, Tickets

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_NY_Tickets.py, and the XML code in the file D07_NY_Tickets.2D.xml.



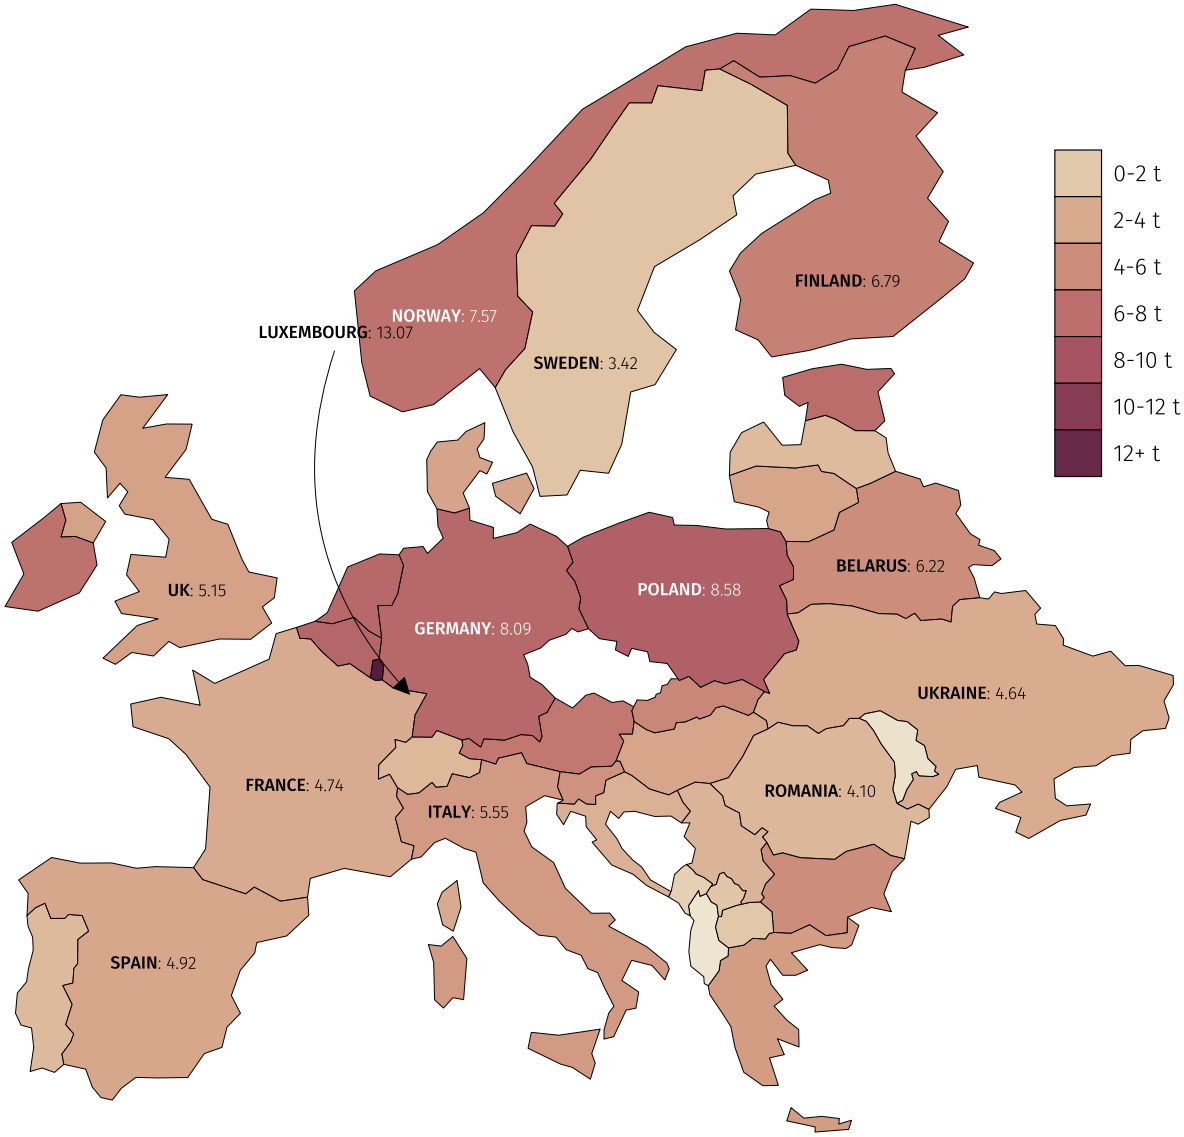
17.8.8 New York, Factors

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_NY_Factors.py, and the XML code in the file D08_NY_Factors.2D.xml.



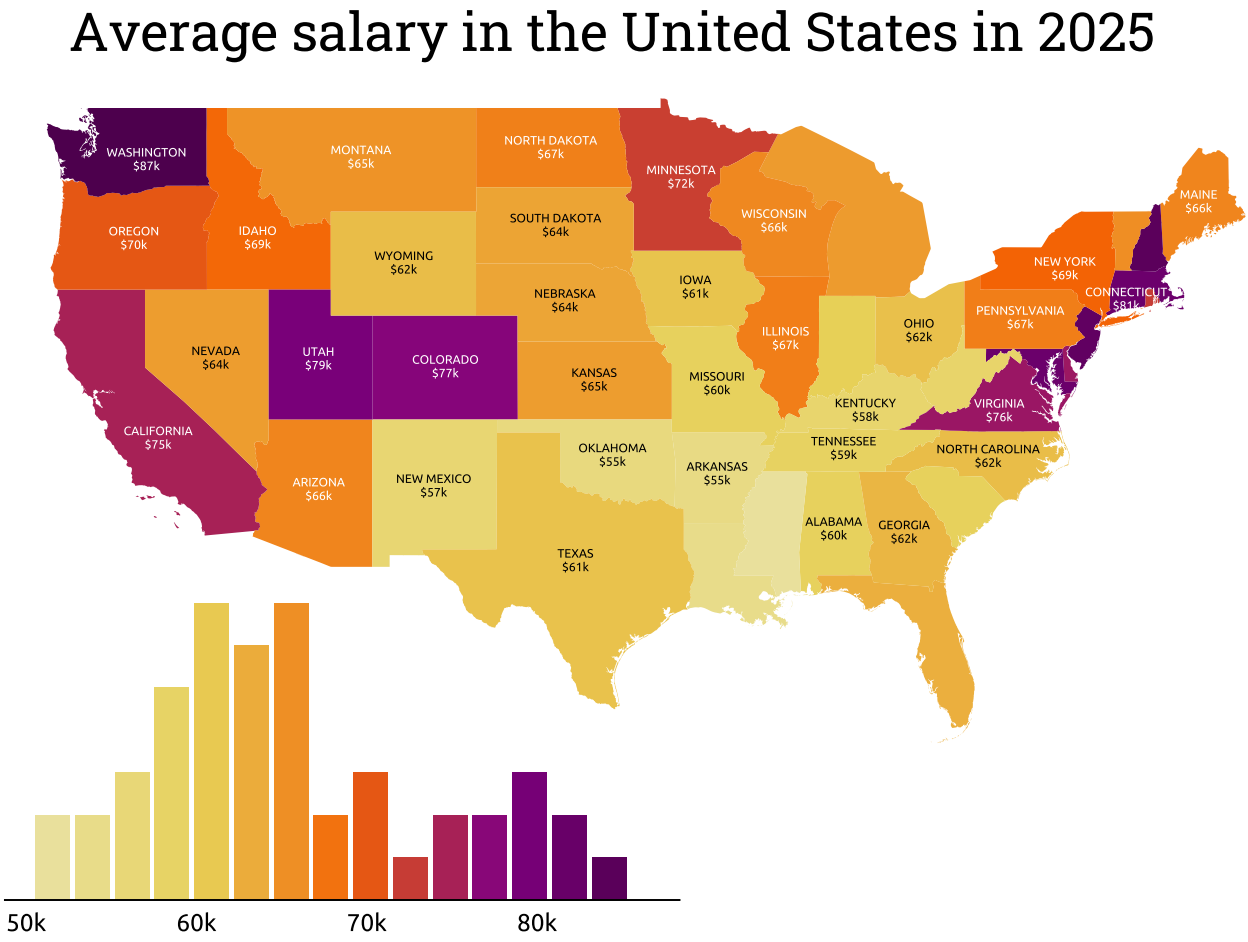
17.8.9 Europe CO2 Emissions

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_EuropeCO2.py, and the XML code in the file D09_EuropeCO2.2D.xml.



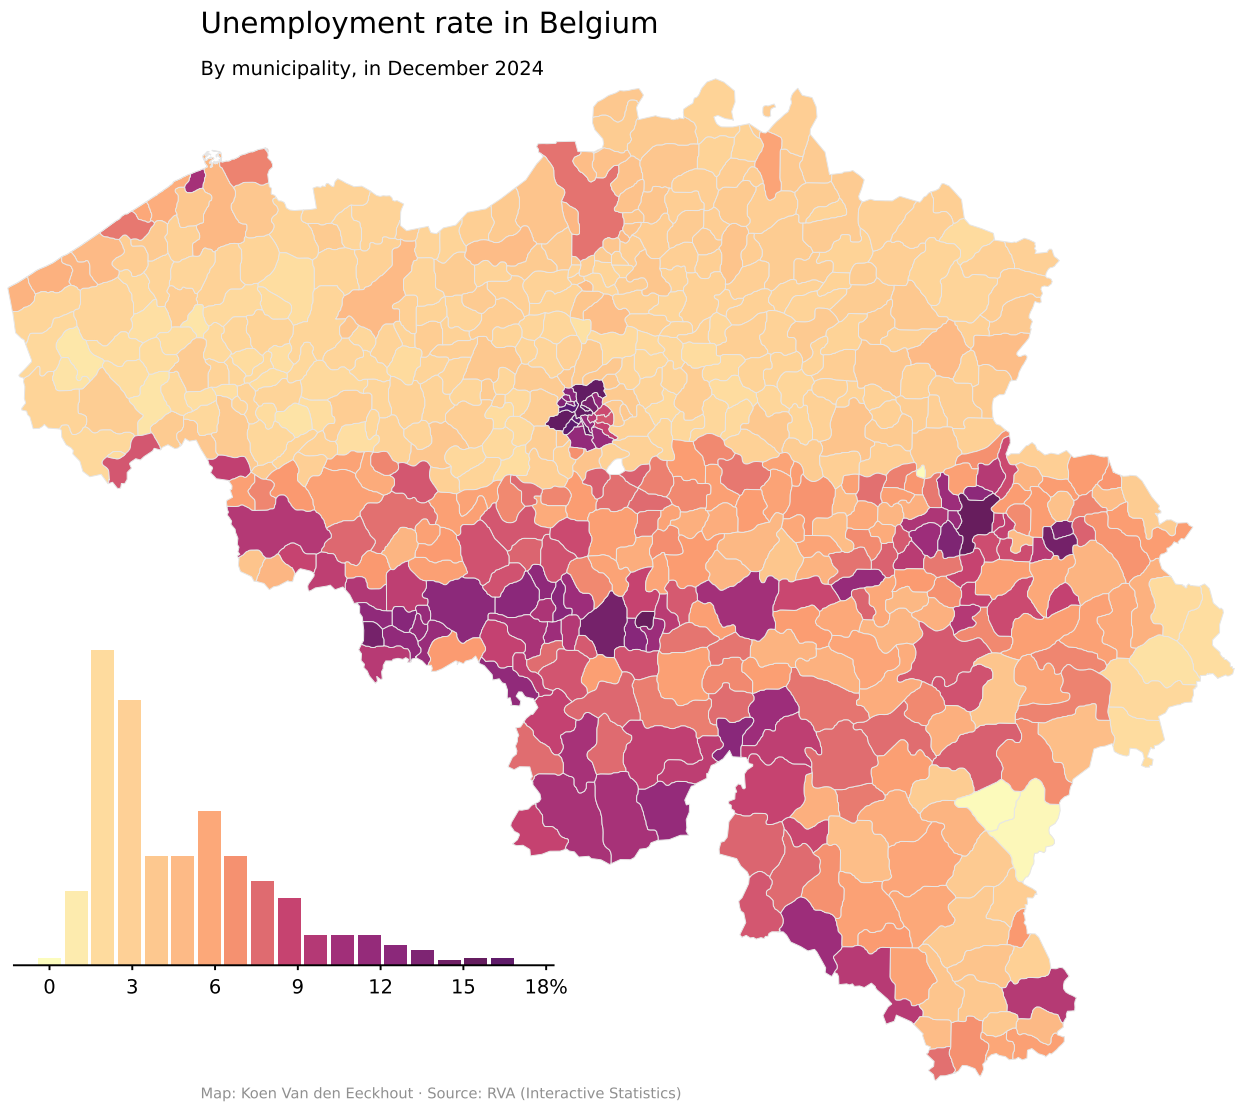
17.8.10 US, Salary

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_USSalary.py, and the XML code in the file D10_USSalary.2D.xml.



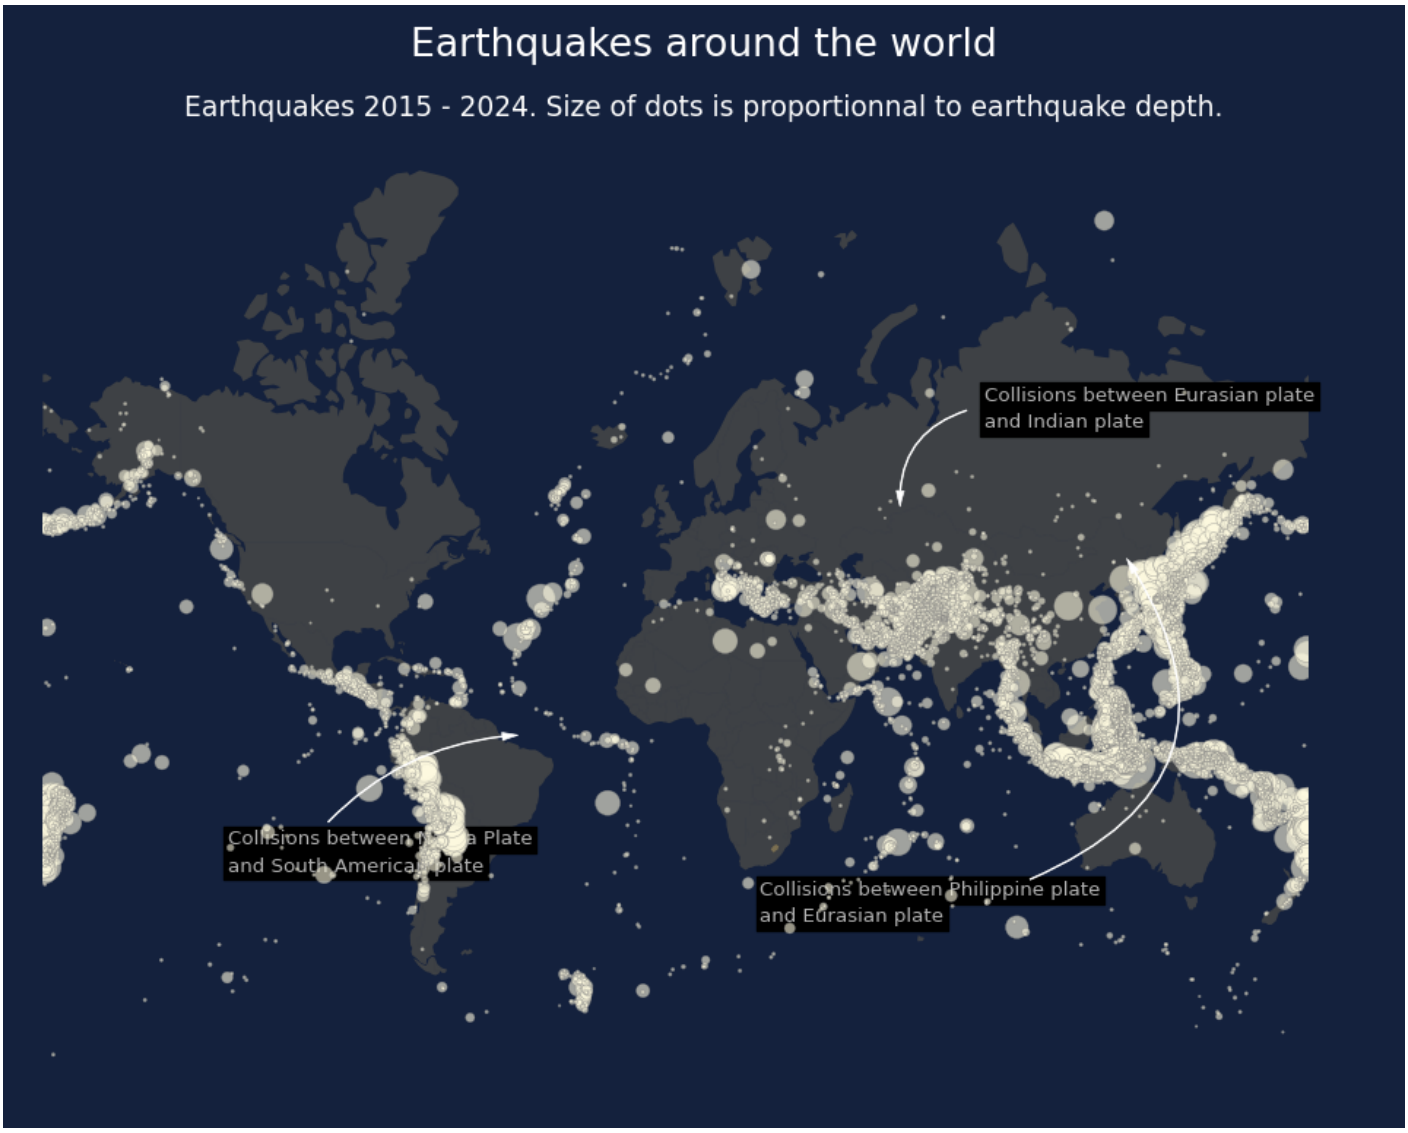
17.8.11 Belgium, unemployment

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_Belgium.py, and the XML code in the file D11_Belgium.2D.xml.



17.8.12 Earthquakes

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_Earthquakes.py, and the XML code in the file D12_Earthquakes.2D.xml.

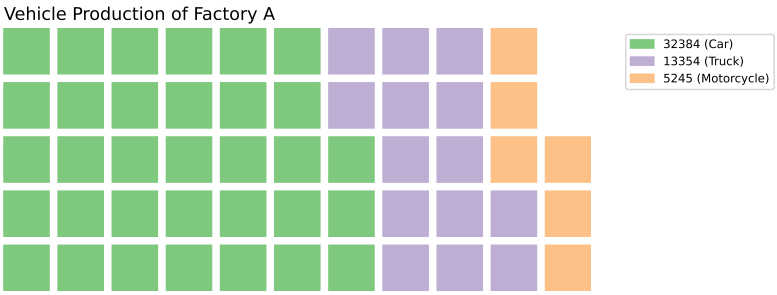


17.9 Parts of a whole

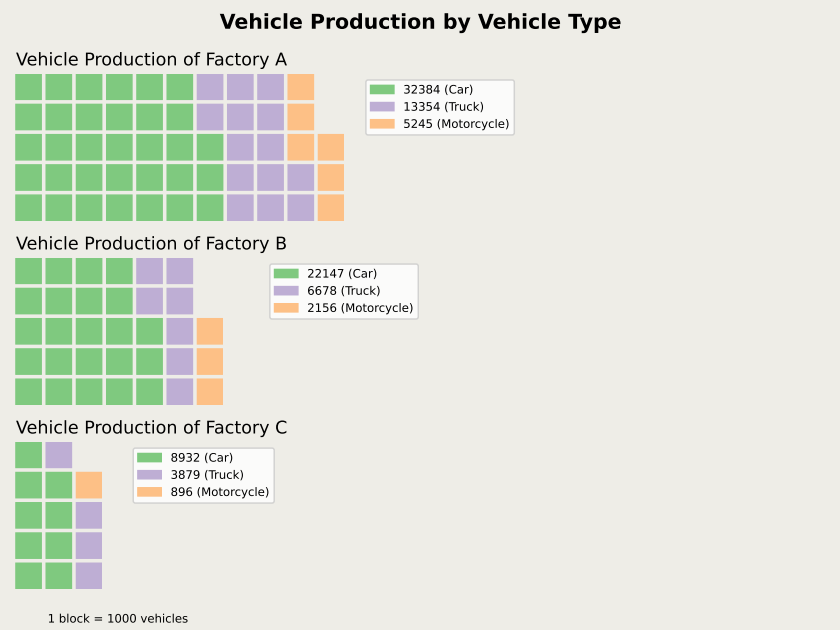
17.9.1 Waffle Chart

The Python code for the first example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_WaffleChart1.py, and the XML code in the file D01a_WaffleChart1.2D.xml.

The Python code for the second example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01b_WaffleChart2.py, and the XML code in the file D01b_WaffleChart2.2D.xml.



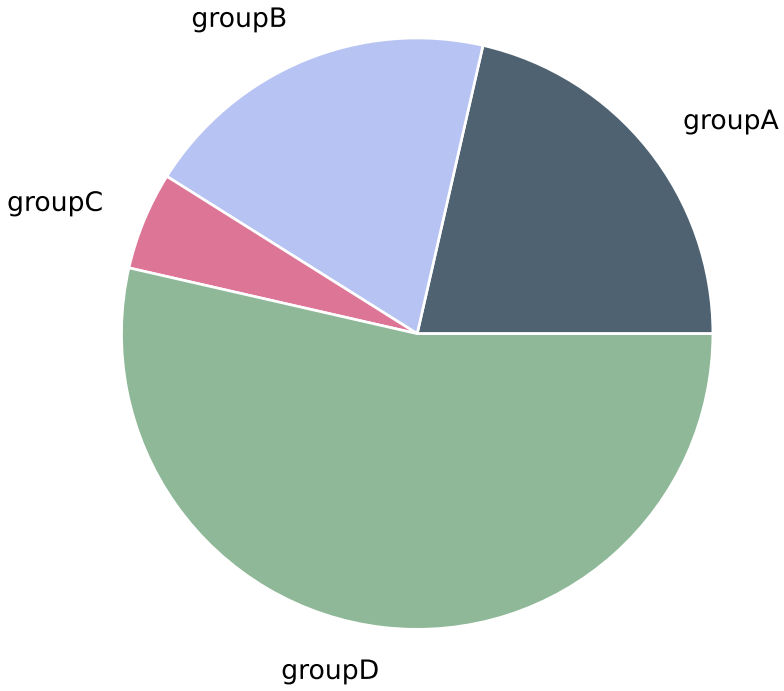
Some text



Some text

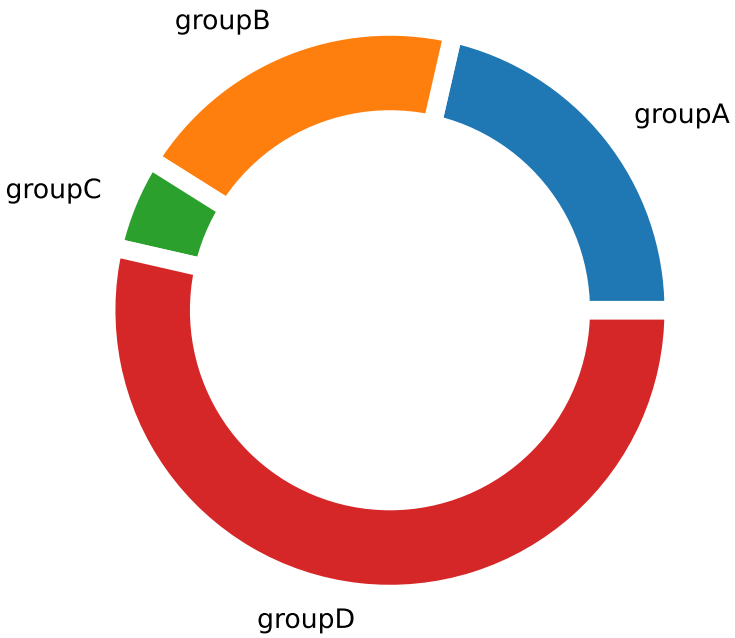
17.9.2 Pie Chart

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_PieChart.py, and the XML code in the file D02_PieChart.2D.xml.



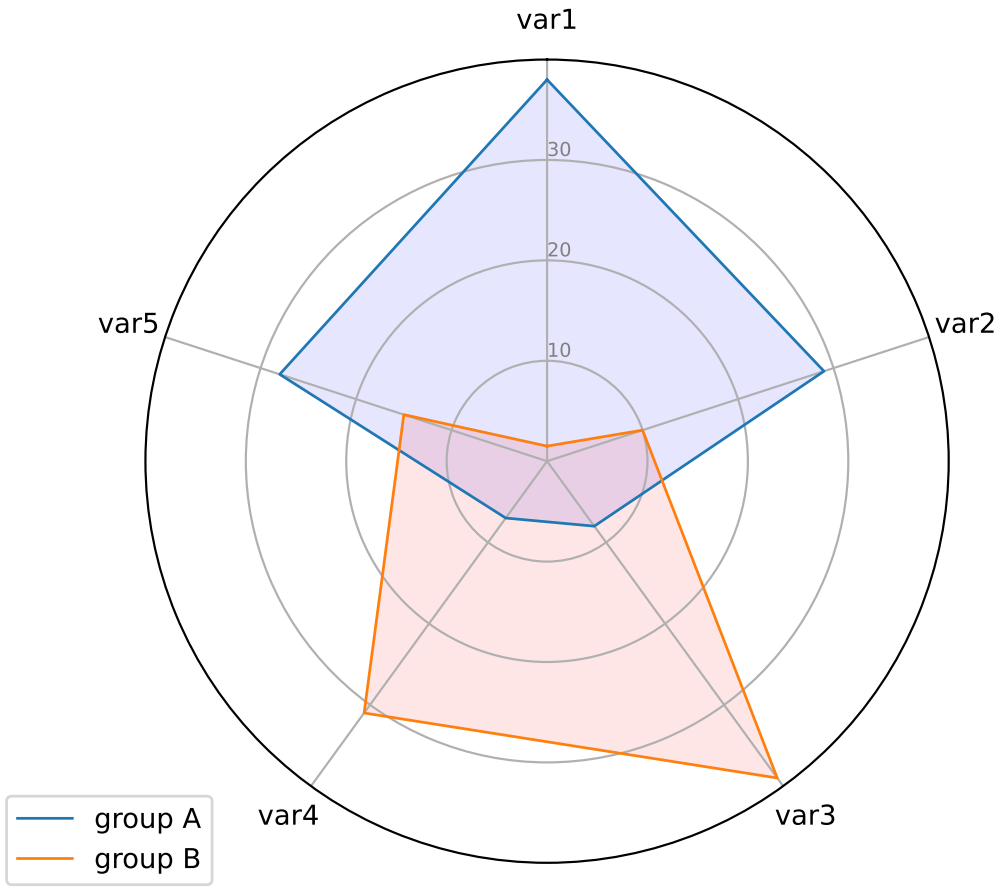
17.9.3 Donut Chart

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_DonutChart.py, and the XML code in the file D03_DonutChart.2D.xml.



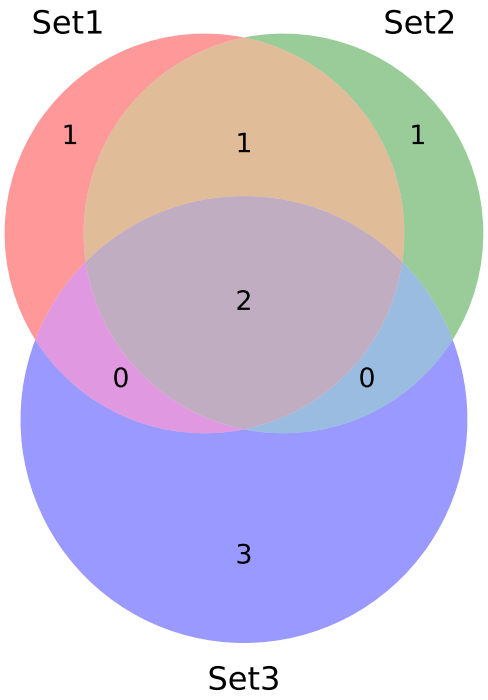
17.9.4 Radar Chart

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_RadarChart.py, and the XML code in the file D04_RadarChart.2D.xml.



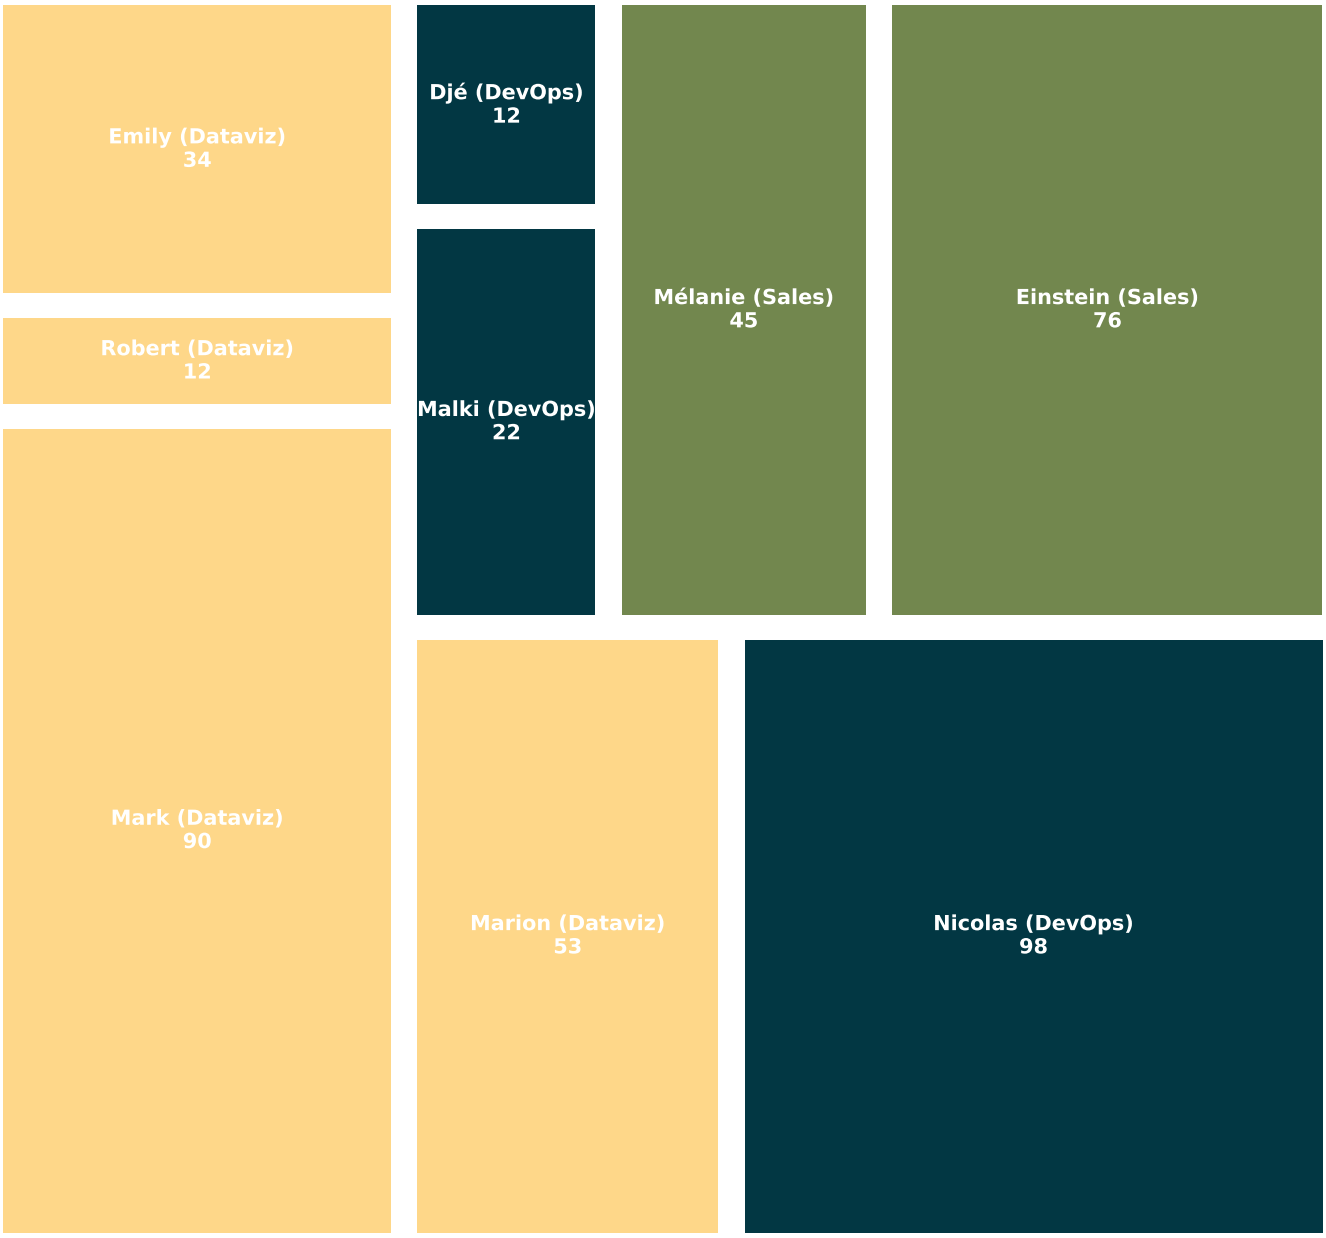
17.9.5 Venn Diagram

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_VennDiagram.py, and the XML code in the file D05_VennDiagram.2D.xml.



17.9.6 Treemap

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Treemap.py, and the XML code in the file D06_Treemap.2D.xml.



17.10 Dendrograms, heatmaps and clustermaps

17.10.1 Dendrogram

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_Dendrogram1.py, and the XML code in the file D01a_Dendrogram1.2D.xml.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01b_Dendrogram2.py, and the XML code in the file D01b_Dendrogram2.2D.xml.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01c_Dendrogram3.py, and the XML code in the file D01c_Dendrogram3.2D.xml.

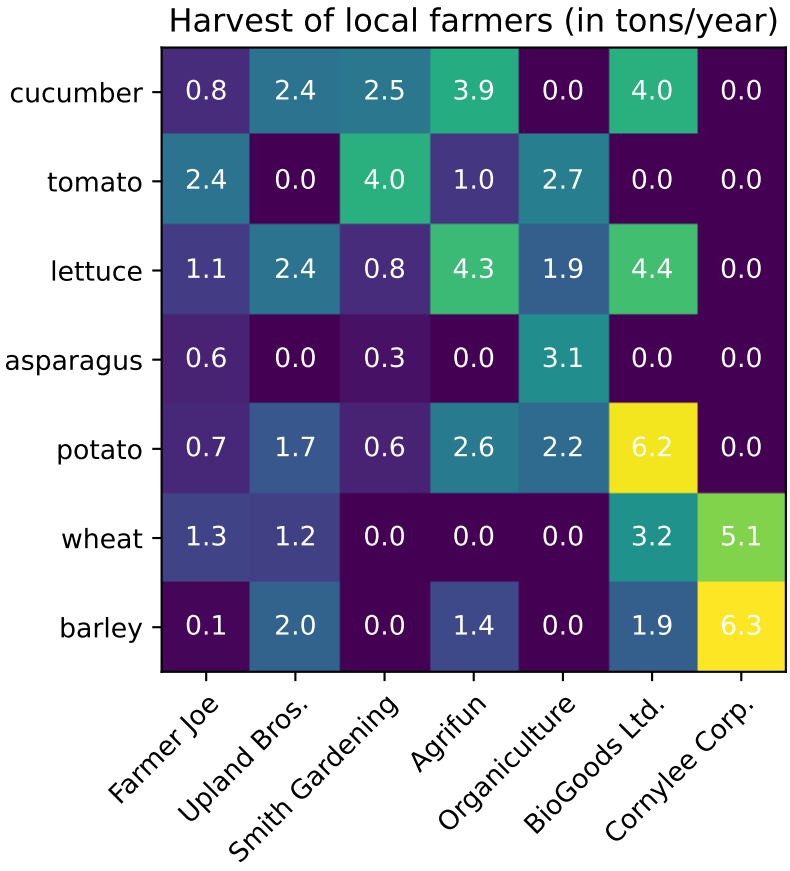
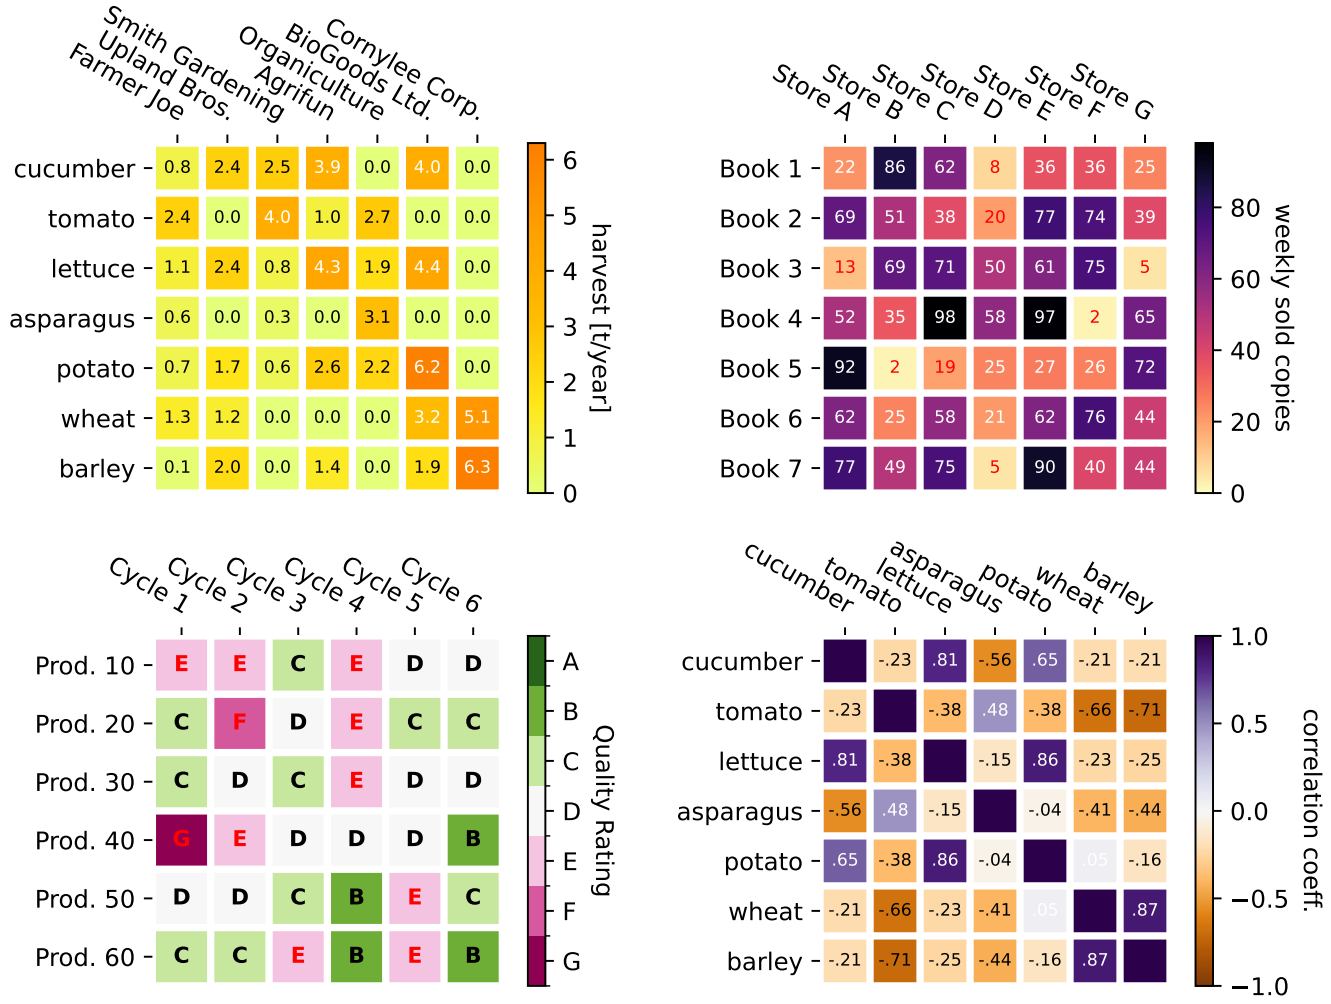
17.10.2 Heatmap, simple

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Heatmap1.py, and the XML code in the file D02_Heatmap1.2D.xml.



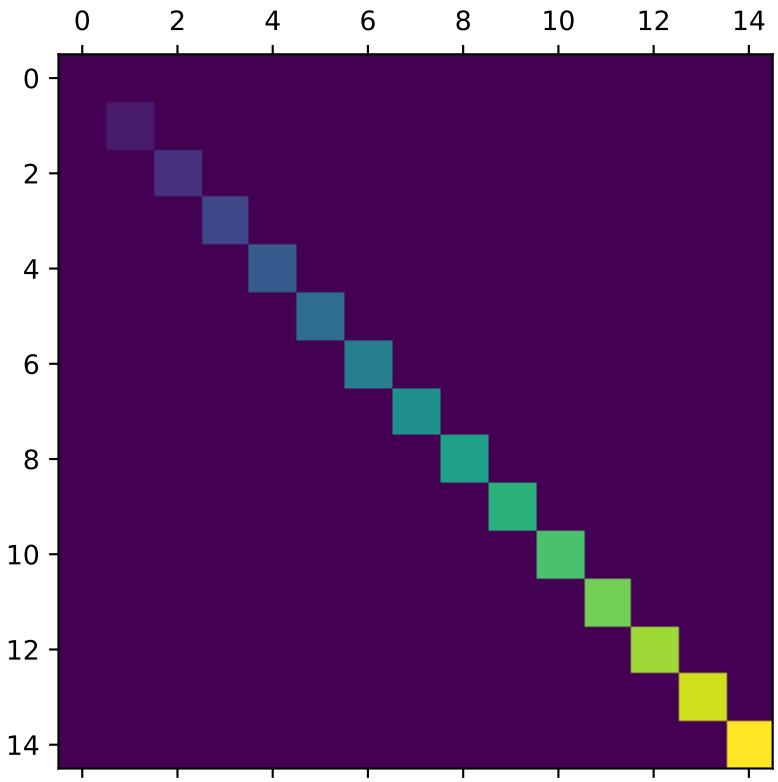
17.10.3 Heatmap, complex

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Heatmap2.py, and the XML code in the file D03_Heatmap2.2D.xml.



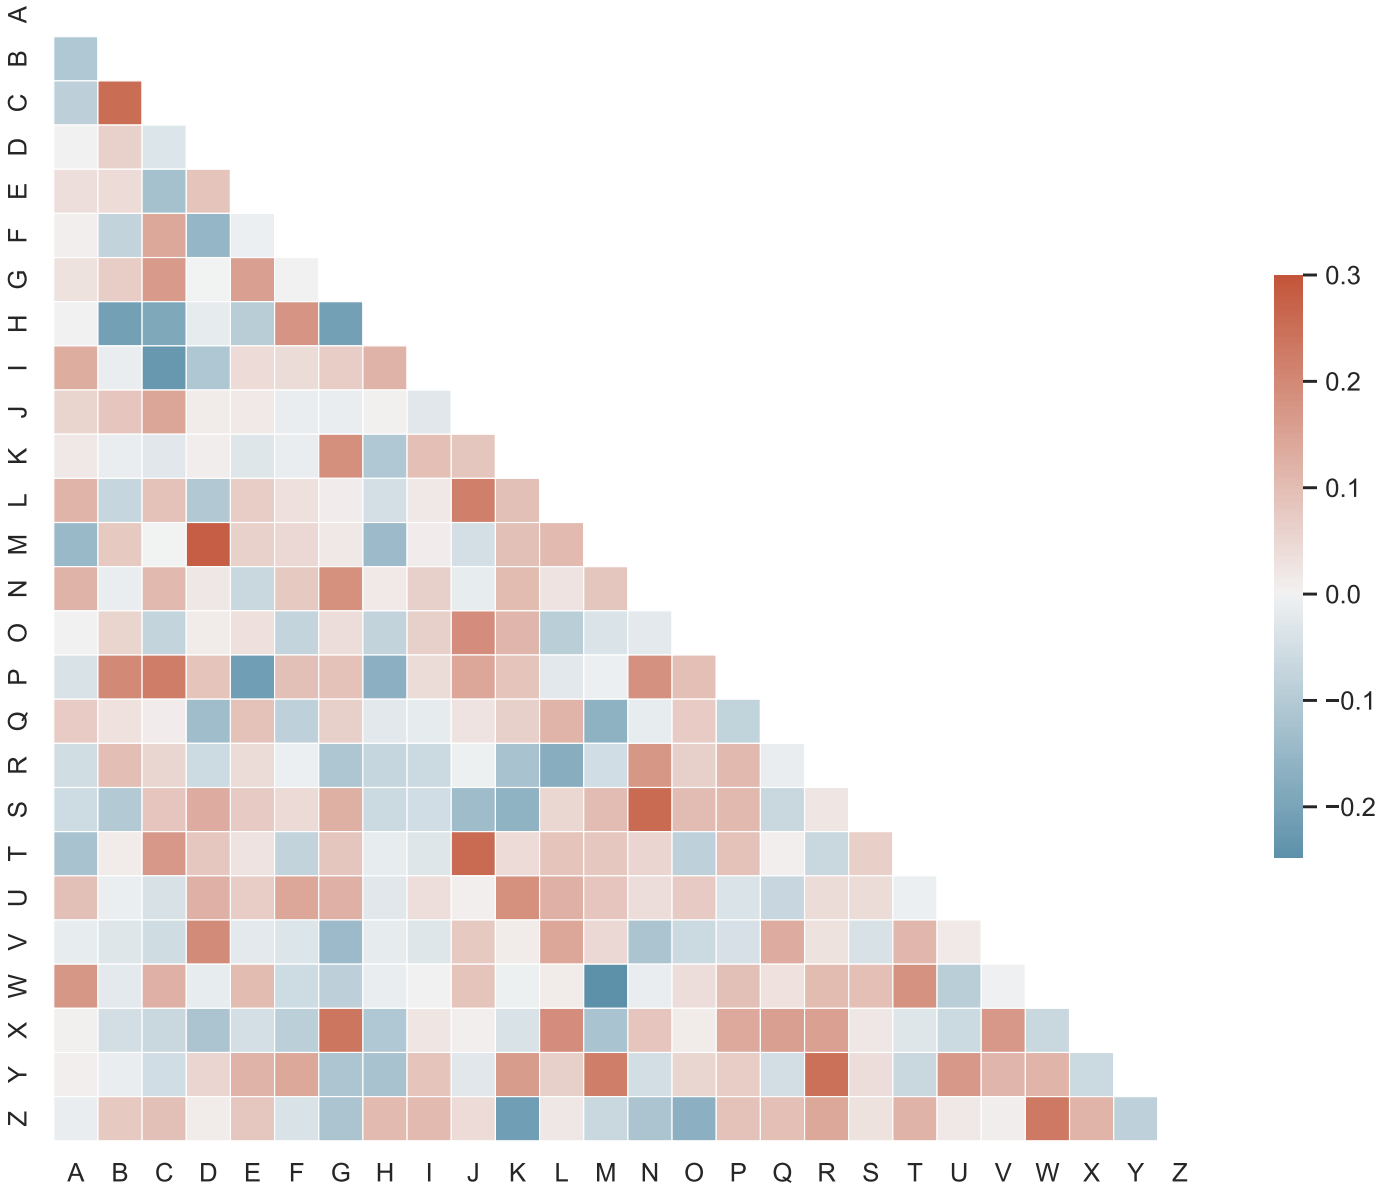
17.10.4 Matshow

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_MatShow.py, and the XML code in the file D04_MatShow.2D.xml.



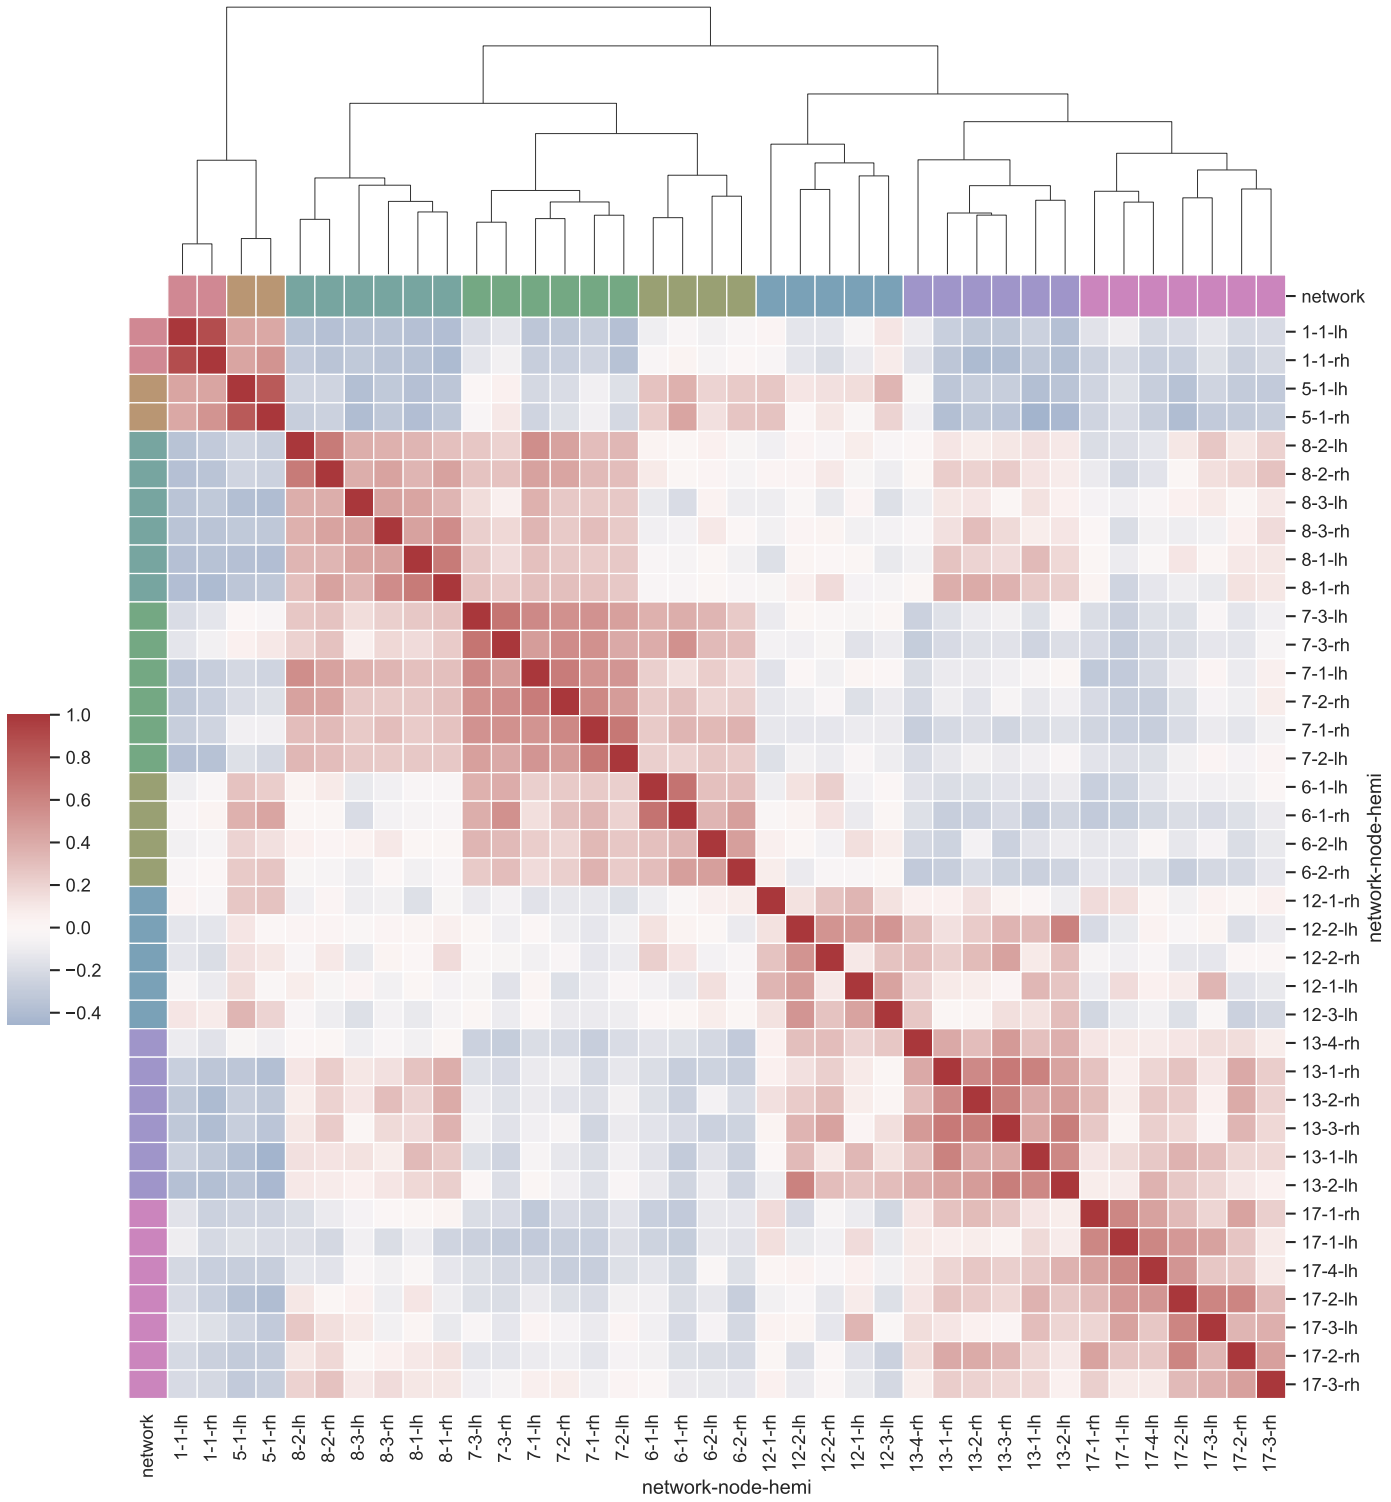
17.10.5 Many pairwise correlations (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_ManyPairwiseCorrelations.py, and the XML code in the file D05_ManyPairwiseCorrelations.2D.xml.



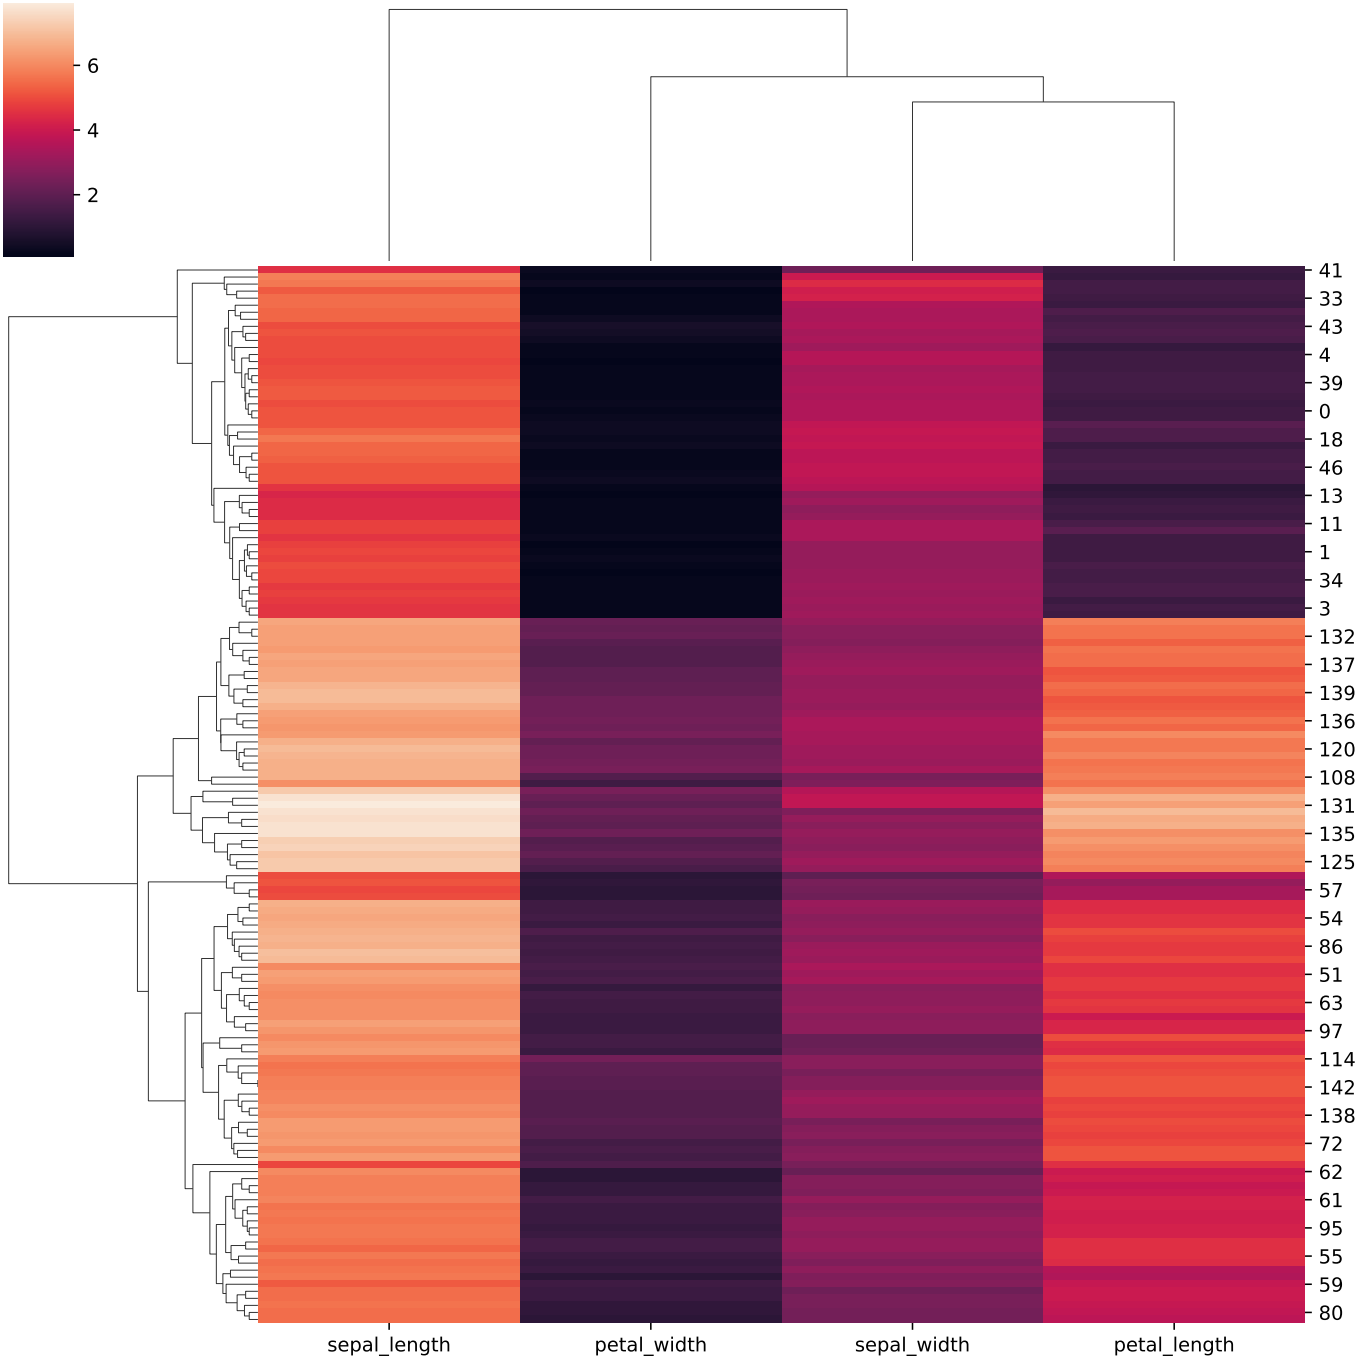
17.10.6 Structured heatmap (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_StructuredHeatmap.py, and the XML code in the file D06_StructuredHeatmap.2D.xml.



17.10.7 Clustermap (Seaborn)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Clustermap.py, and the XML code in the file D07_Clustermap.2D.xml.



see: https://seaborn.pydata.org/generated/seaborn.clustermap.html

17.11 PlotTable

17.11.1 PlotTable1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_PlotTable1.py, and the XML code in the file D01_PlotTable1.2D.xml.

index	A	B	C	D	E
0	0.03	0.23	0.61	0.9	0.08
1	0.16	0.53	0.33	0.62	0.28
2	0.31	0.37	0.01	0.0	0.3
3	0.88	0.43	0.31	0.49	0.58
4	0.57	0.73	0.32	0.89	0.31

17.11.2 PlotTable2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_PlotTable2.py, and the XML code in the file D02_PlotTable2.2D.xml.

		Team Rating			Group Stage Chances			Knockout Stage Chances				
Team	Group	SPI	OFF	DEF	1st Place	2nd Place	3rd Place	Make Rd Of 16	Make Quarters	Make Semis	Make Finals	Win World Cup

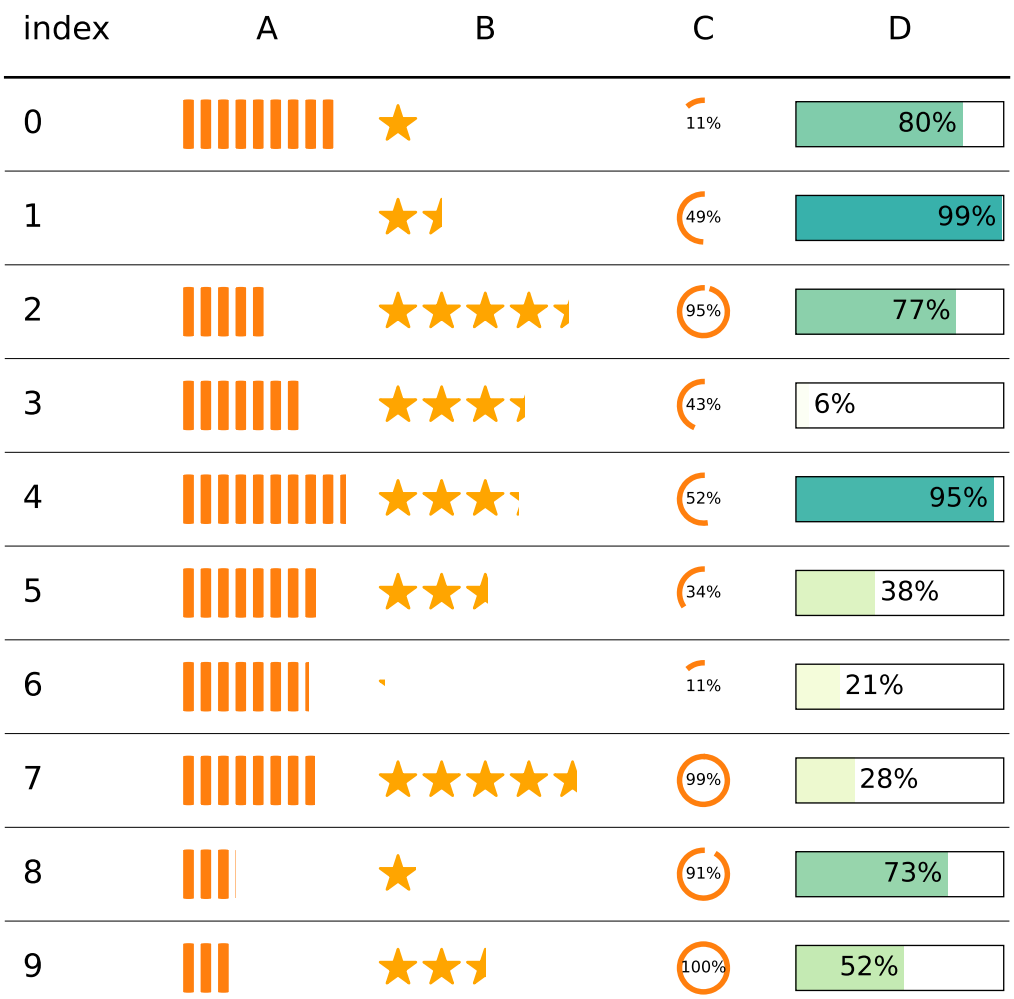
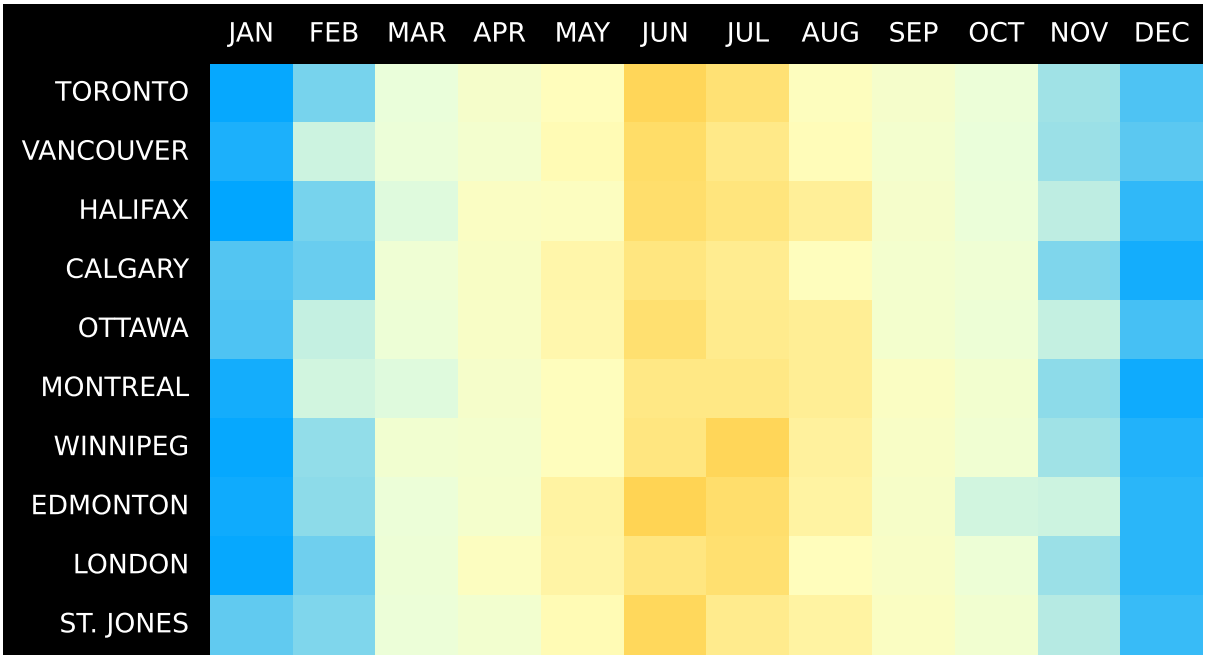
17.11.4 PlotTable4

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_PlotTable4.py, and the XML code in the file D04_PlotTable4.2D.xml.



17.11.5 PlotTable5

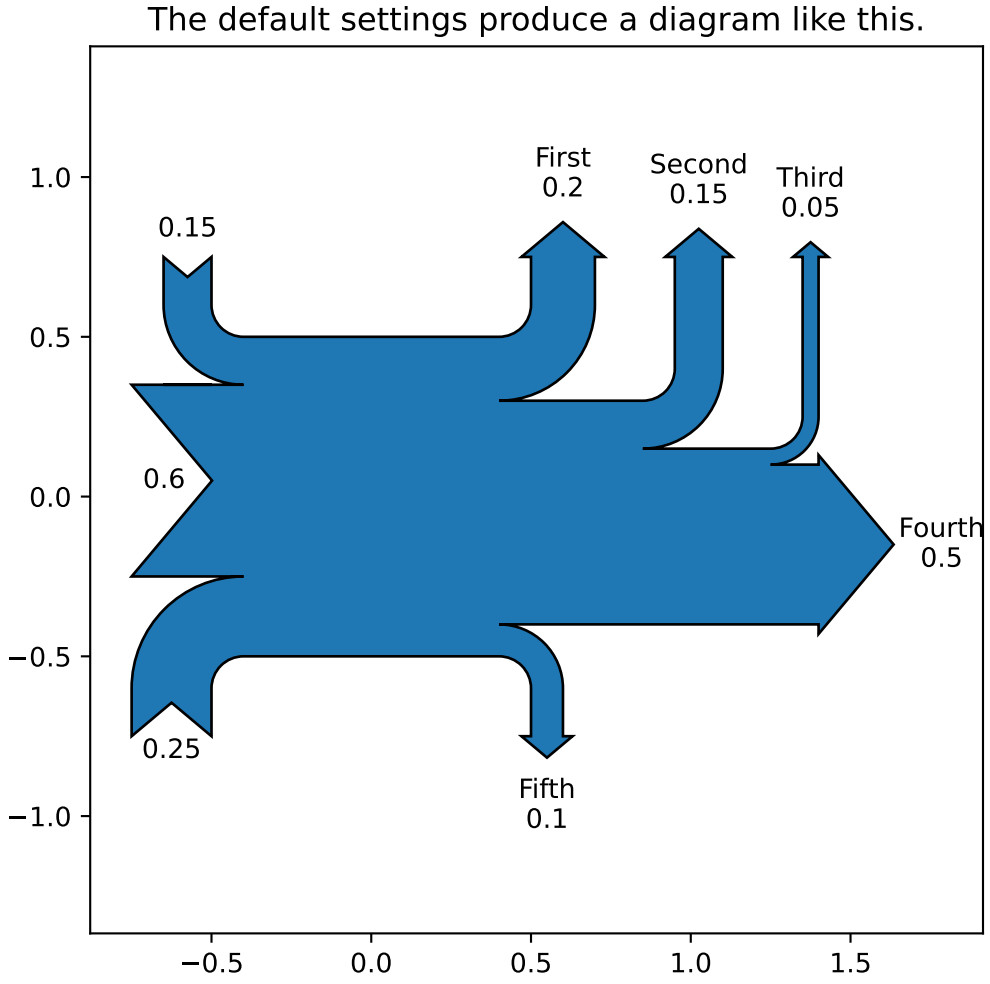
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_PlotTable5.py, and the XML code in the file D05_PlotTable5.2D.xml.



17.12 Flow and connections

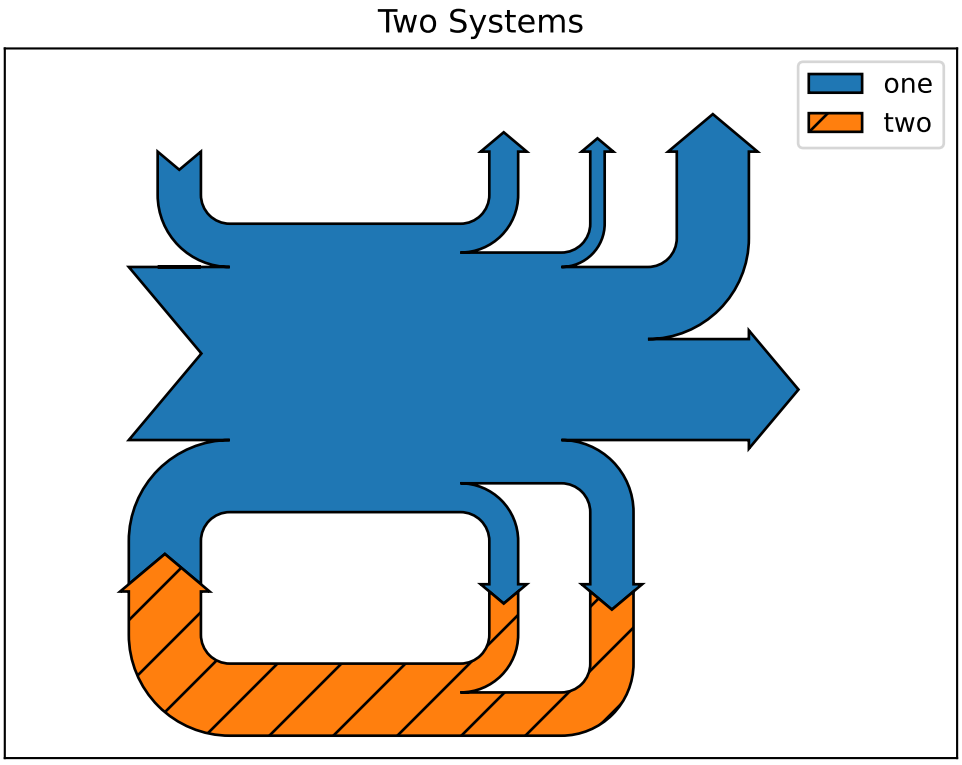
17.12.1 Sankey Default

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Sankey_Default.py, and the XML code in the file D01_Sankey_Default.2D.xml.



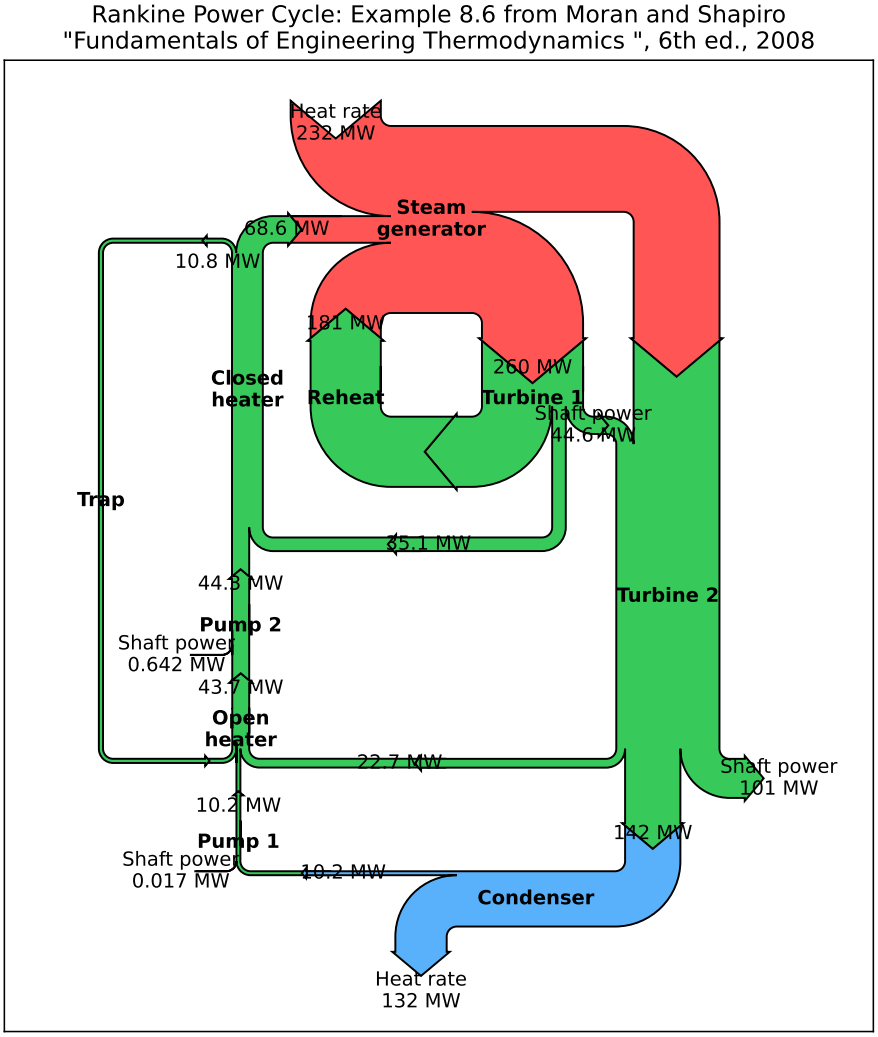
17.12.2 Sankey 2 Systems

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Sankey_TwoSystems.py, and the XML code in the file D02_Sankey_TwoSystems.2D.xml.



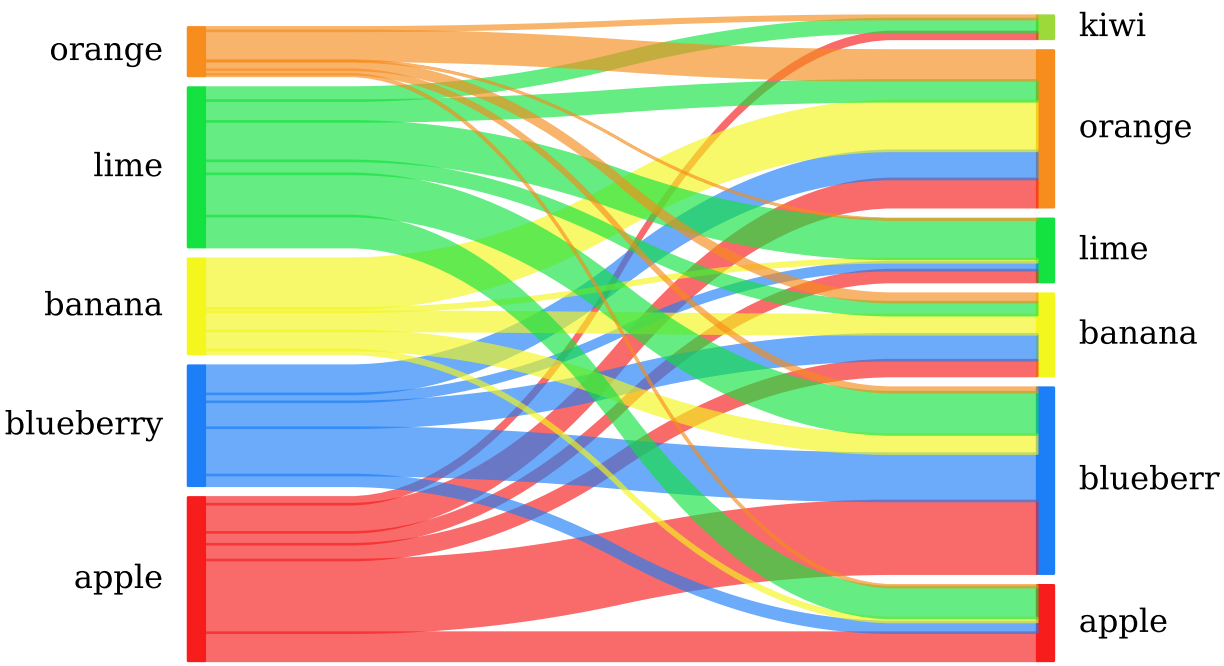
17.12.3 Sankey Rankine

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Sankey_Rankine.py, and the XML code in the file D03_Sankey_Rankine.2D.xml.



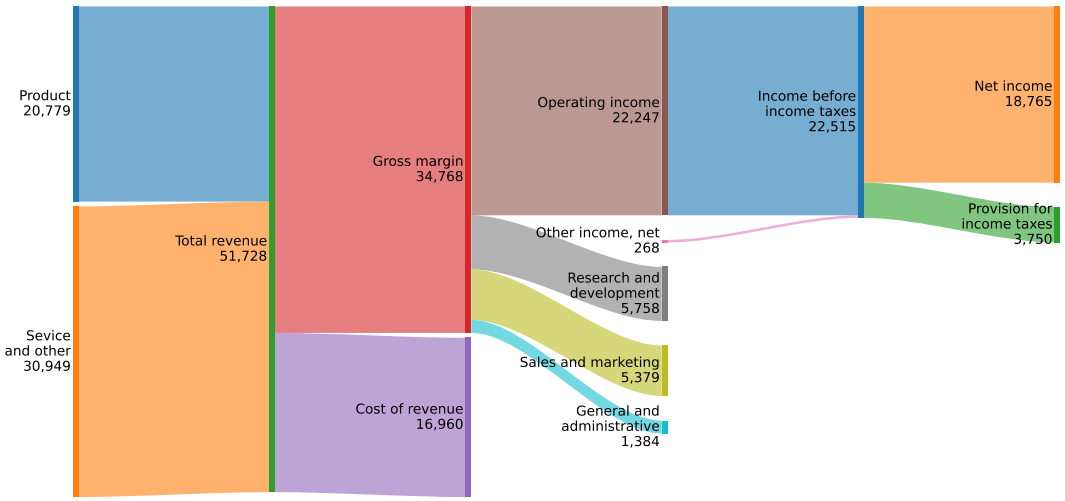
17.12.4 Sankey One 2 one

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Sankey_One2one.py, and the XML code in the file D04_Sankey_One2one.2D.xml.



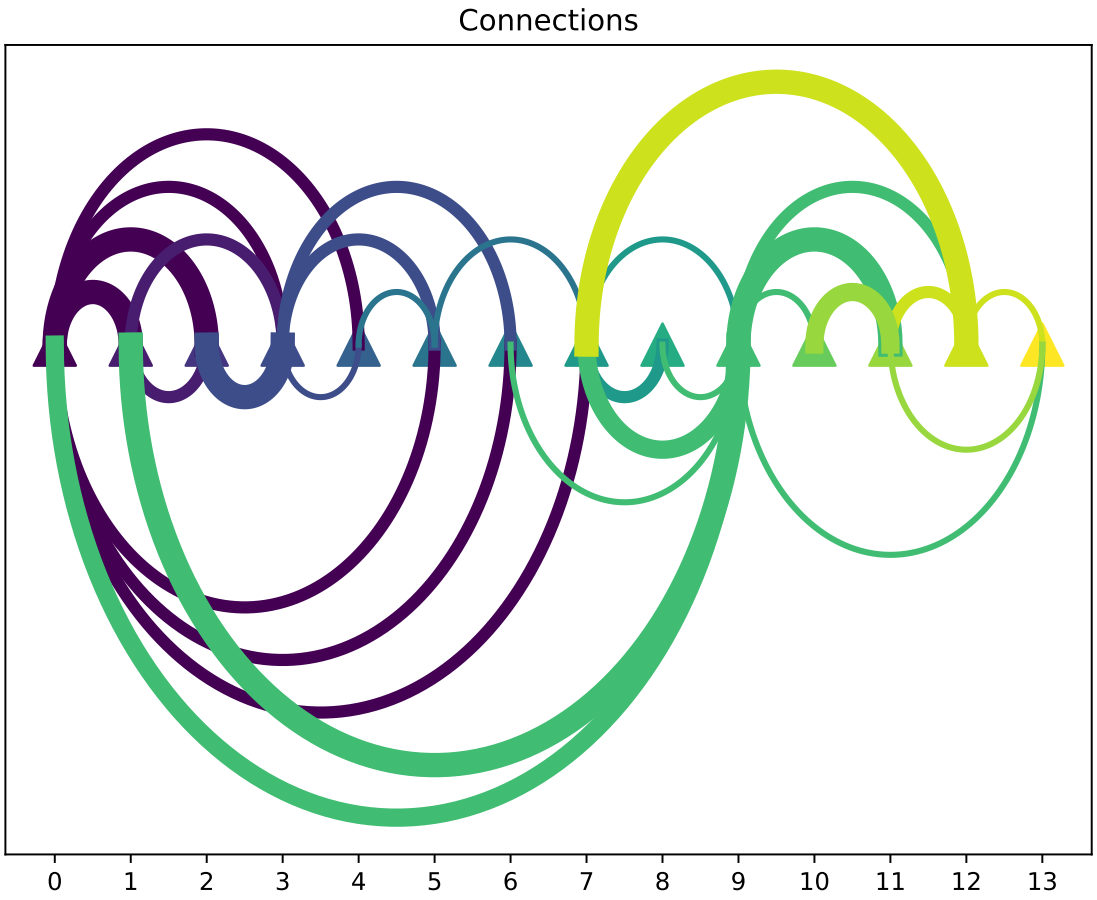
17.12.5 Sankey Flow

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_SankeyFlow.py, and the XML code in the file D05_SankeyFlow.2D.xml.



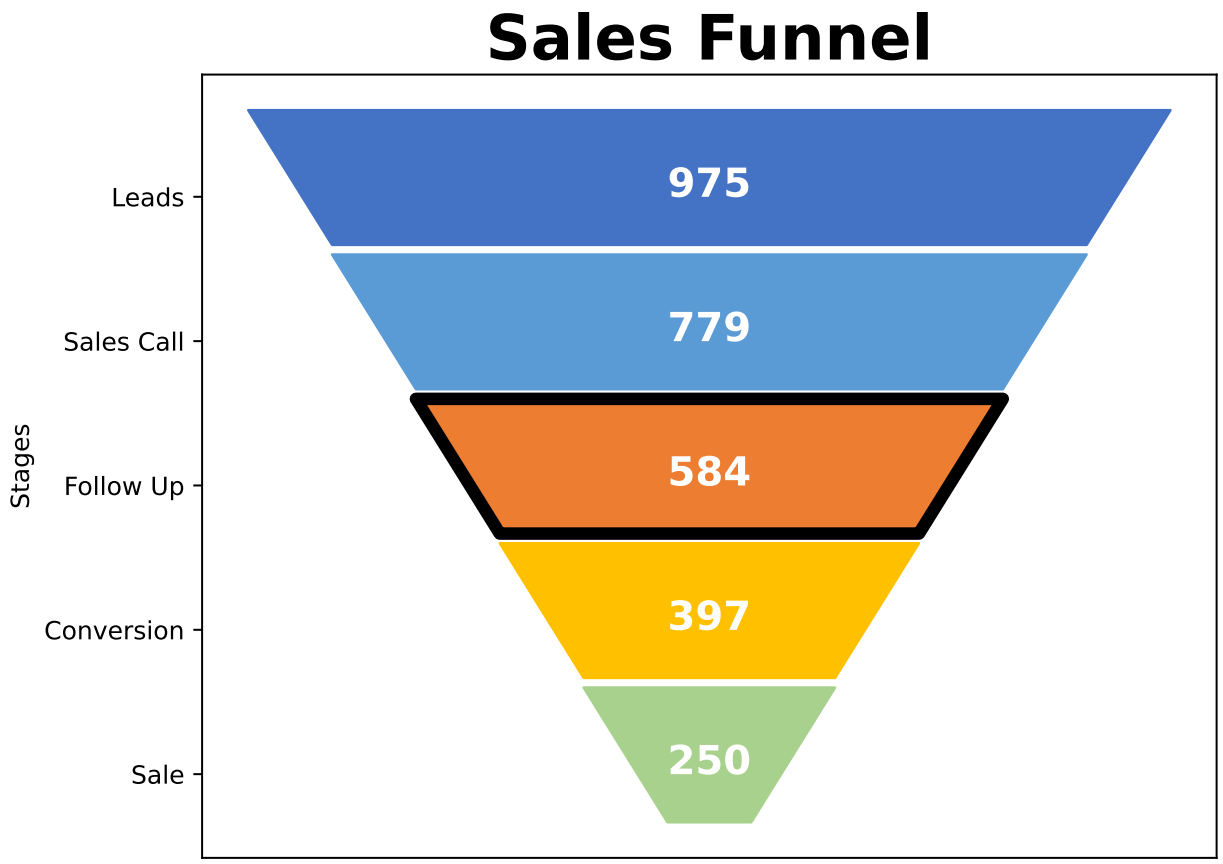
17.12.6 Arcplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_ArcPlot.py, and the XML code in the file D06_ArcPlot.2D.xml.



17.12.7 Funnel Chart

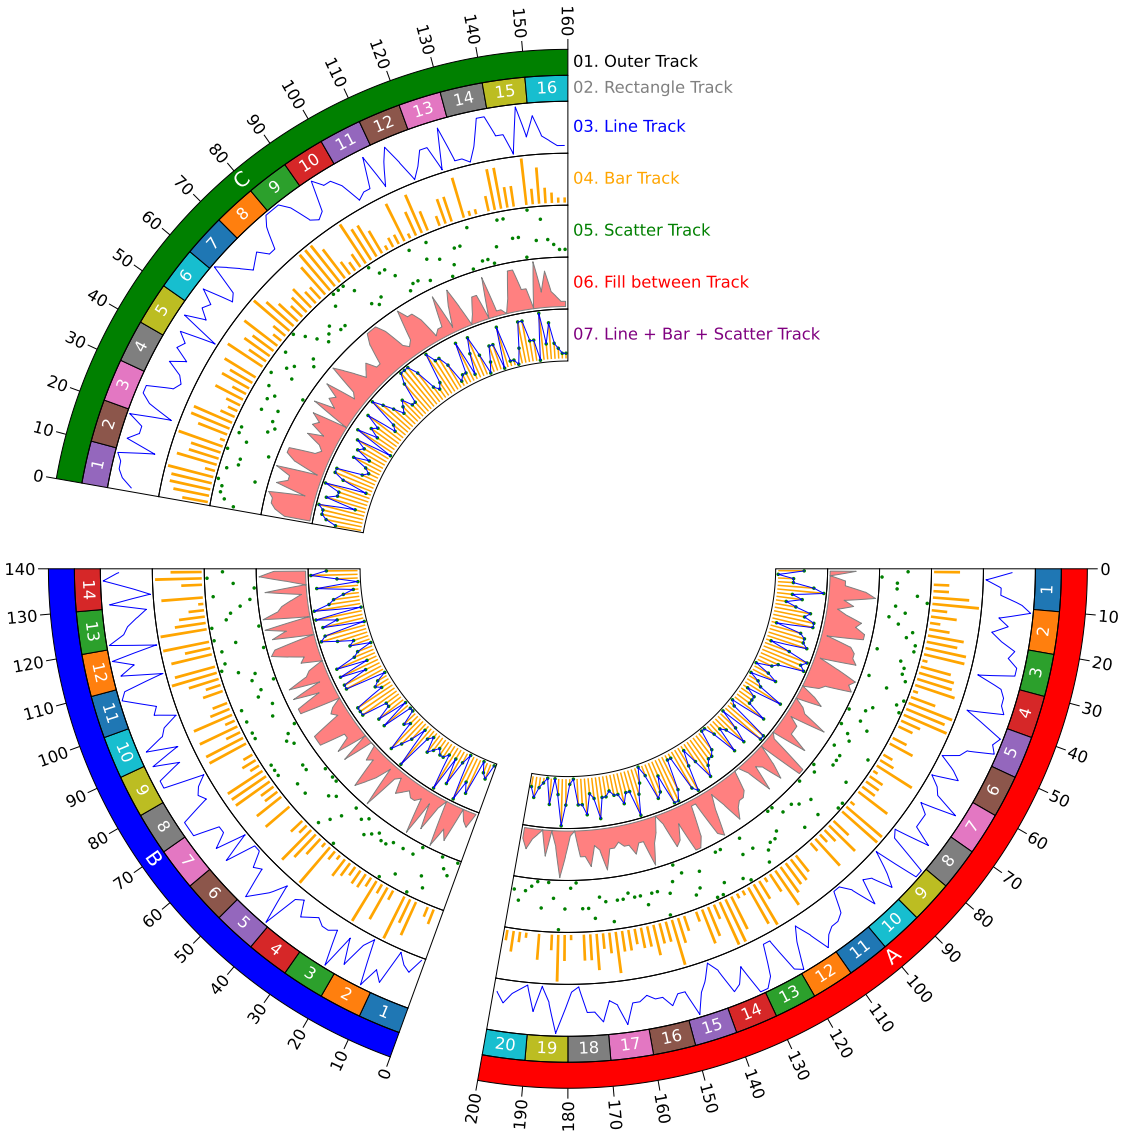
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_FunnelChart.py, and the XML code in the file D07_FunnelChart.2D.xml.



17.13 Circular plots and flows

17.13.1 Circular track plotting

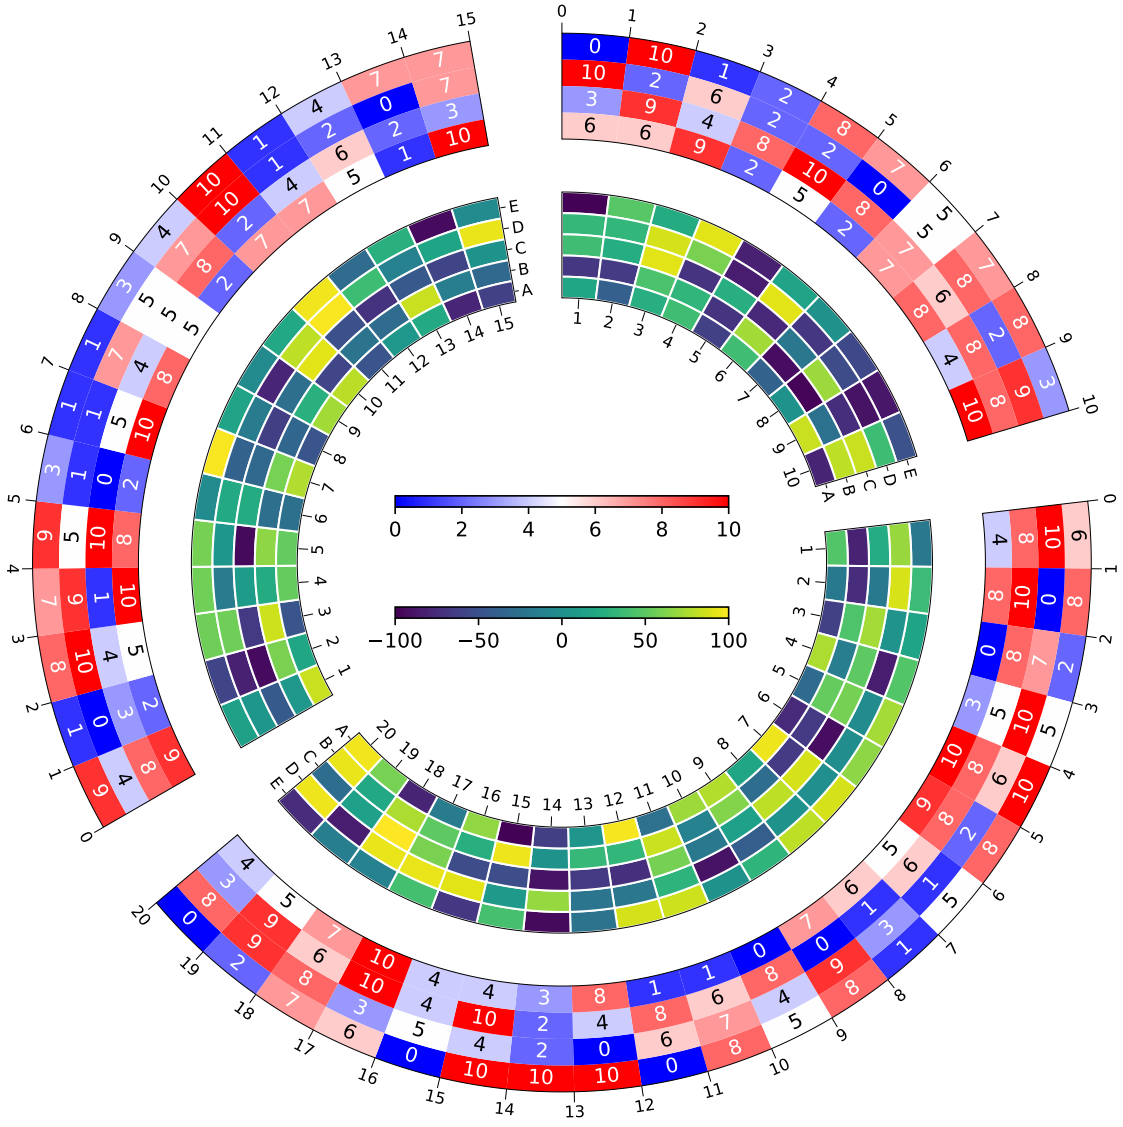
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_CircularTrackplotting.py, and the XML code in the file D01_CircularTrackplotting.2D.xml.



Some text

17.13.2 Circular heatmap

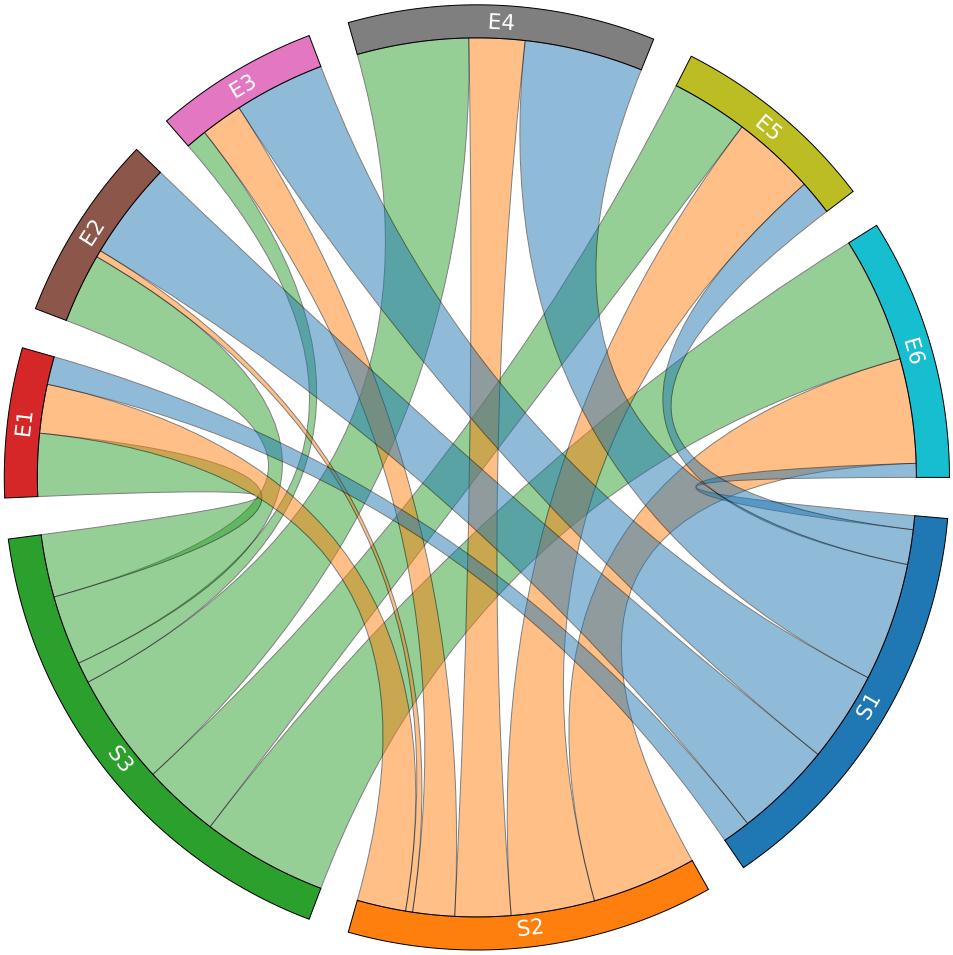
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_CircularHeatmap.py, and the XML code in the file D02_CircularHeatmap.2D.xml.



Some text

17.13.3 Chord diagram (matrix 3x6)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_ChordDiagramMatrix3x6.py, and the XML code in the file D03_ChordDiagramMatrix3x6.2D.xml.



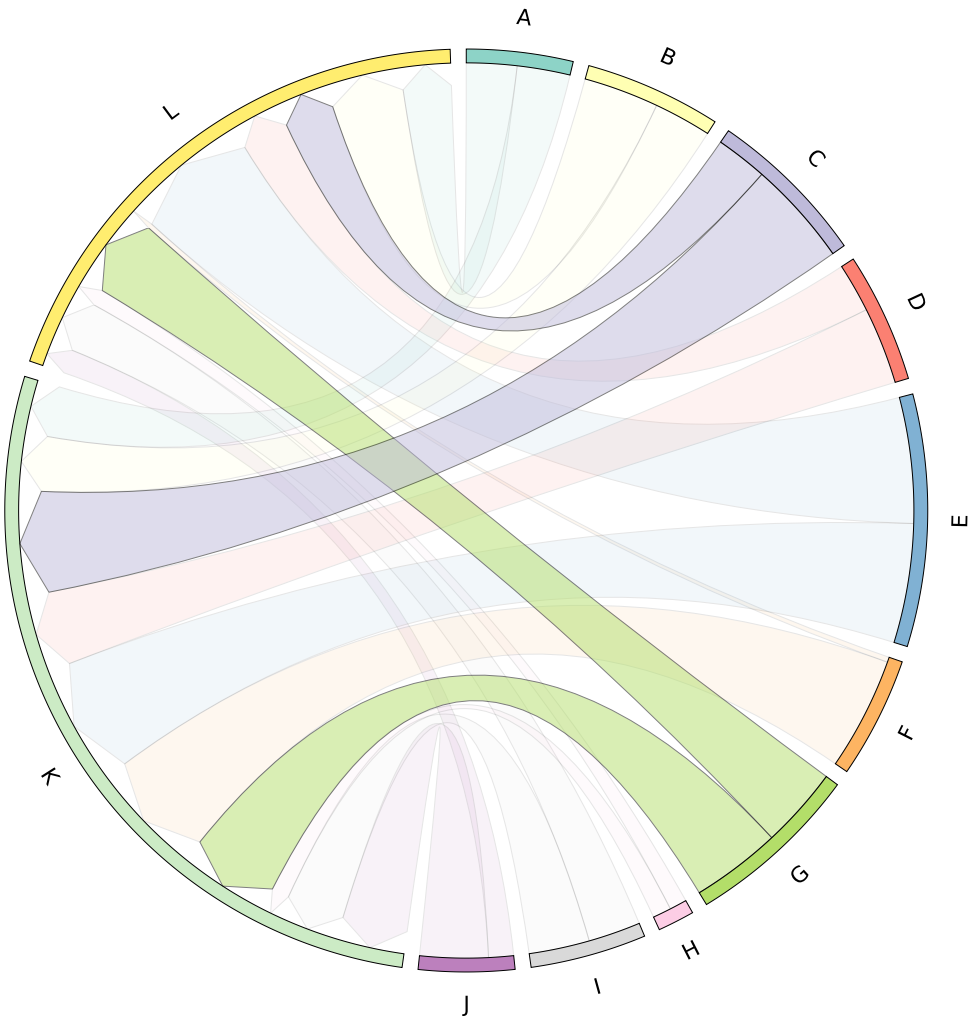
Some text

17.13.4 Chord diagram (matrix10x10)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_ChordDiagramMatrix10x10.py, and the XML code in the file D04_ChordDiagramMatrix10x10.2D.xml.

17.13.5 Chord diagram (from-to table)

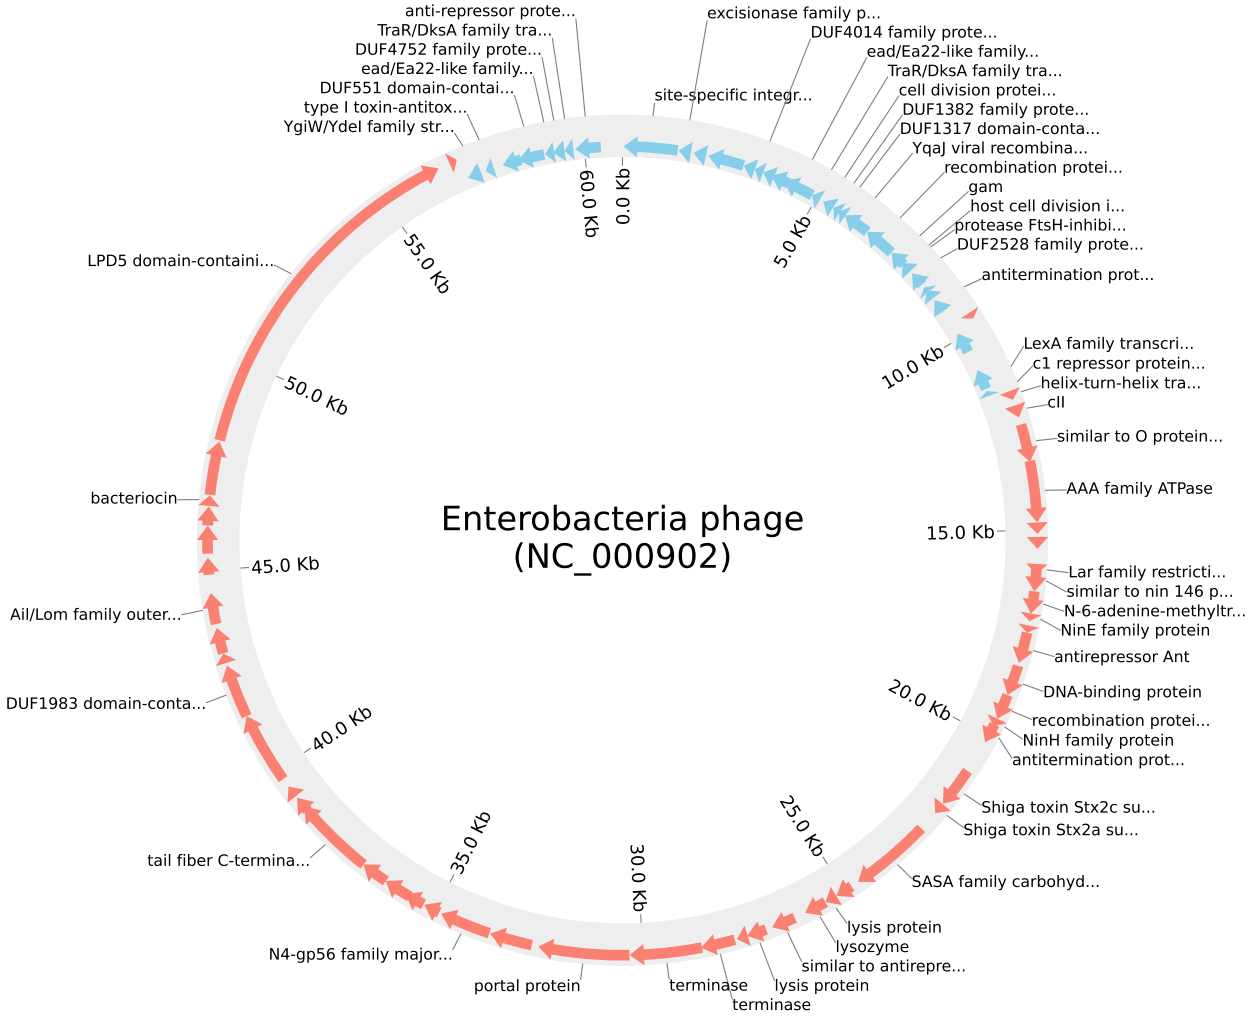
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_ChordDiagramFromTo.py, and the XML code in the file D05_ChordDiagramFromTo.2D.xml.



Some text

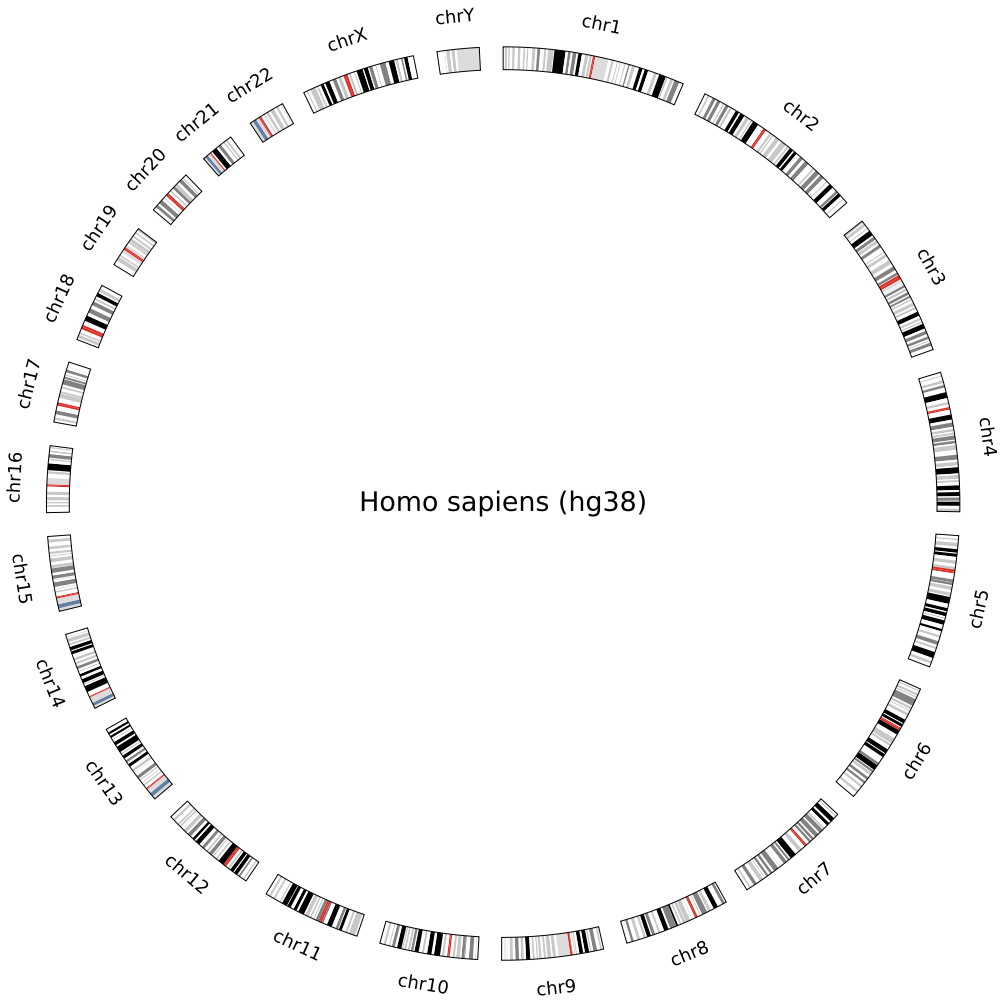
17.13.6 Circos plot: genom of a phage

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_CircosPlotGenomPhage.py, and the XML code in the file D06_CircosPlotGenomPhage.2D.xml.



17.13.7 Circos plot: genom of homo sapiens

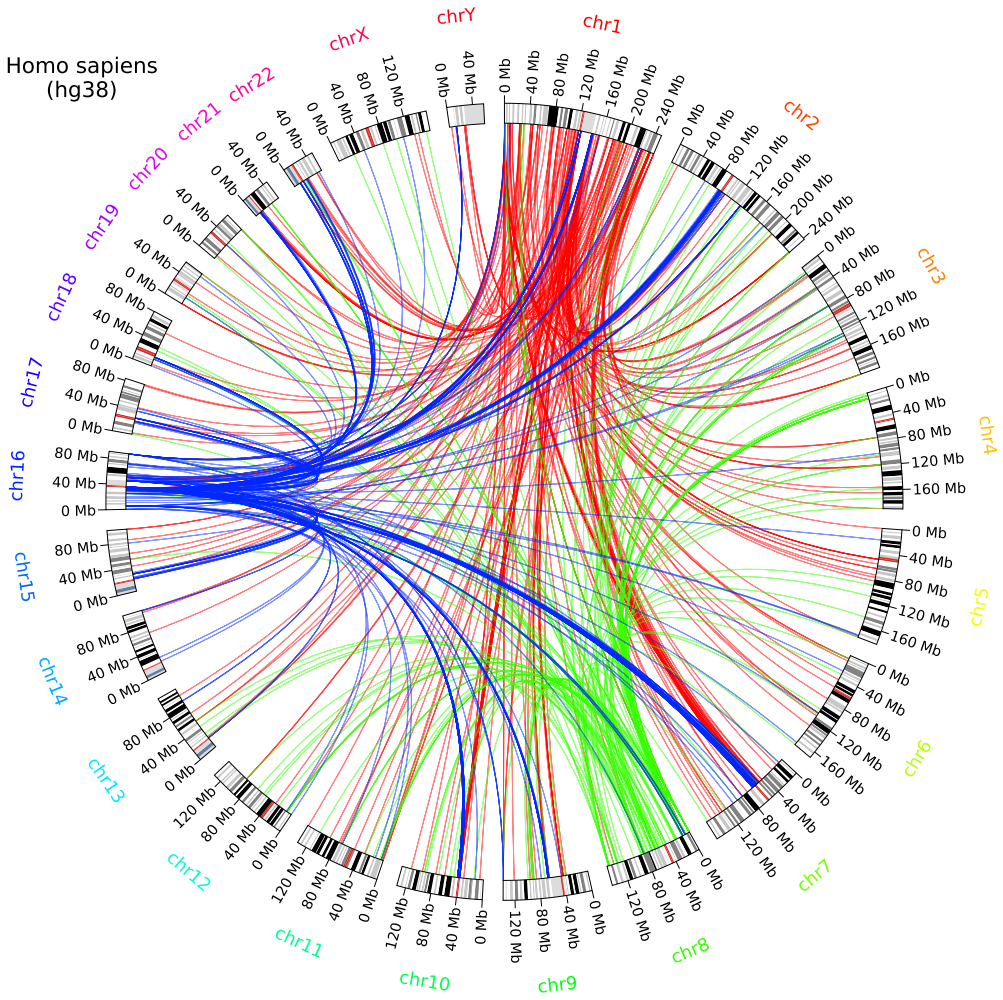
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_CircosPlotGenomHomoSapiens.py, and the XML code in the file D07_CircosPlotGenomHomoSapiens.2D.xml.



Some text

17.13.8 Circos plot: chromosome links

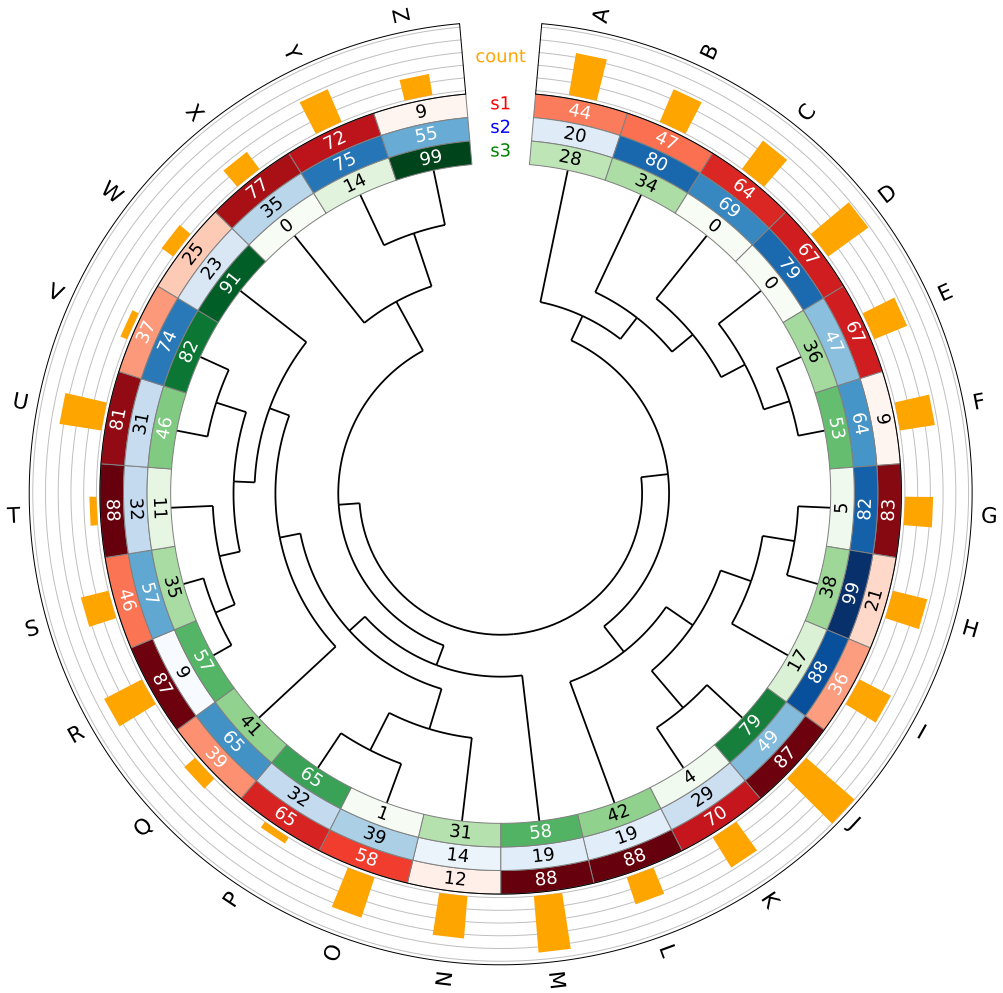
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_CircosPlotChromosomeLinks.py, and the XML code in the file D08_CircosPlotChromosomeLinks.2D.xml.



Some text

17.13.9 Philogenetic tree: bars

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_PhilogeneticTreeBars.py, and the XML code in the file D09_PhilogeneticTreeBars.2D.xml.



Some text

17.13.10 Philogenetic tree: heatmap

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_PhilogeneticTreeHeatmap.py, and the XML code in the file D10_PhilogeneticTreeHeatmap.2D.xml.

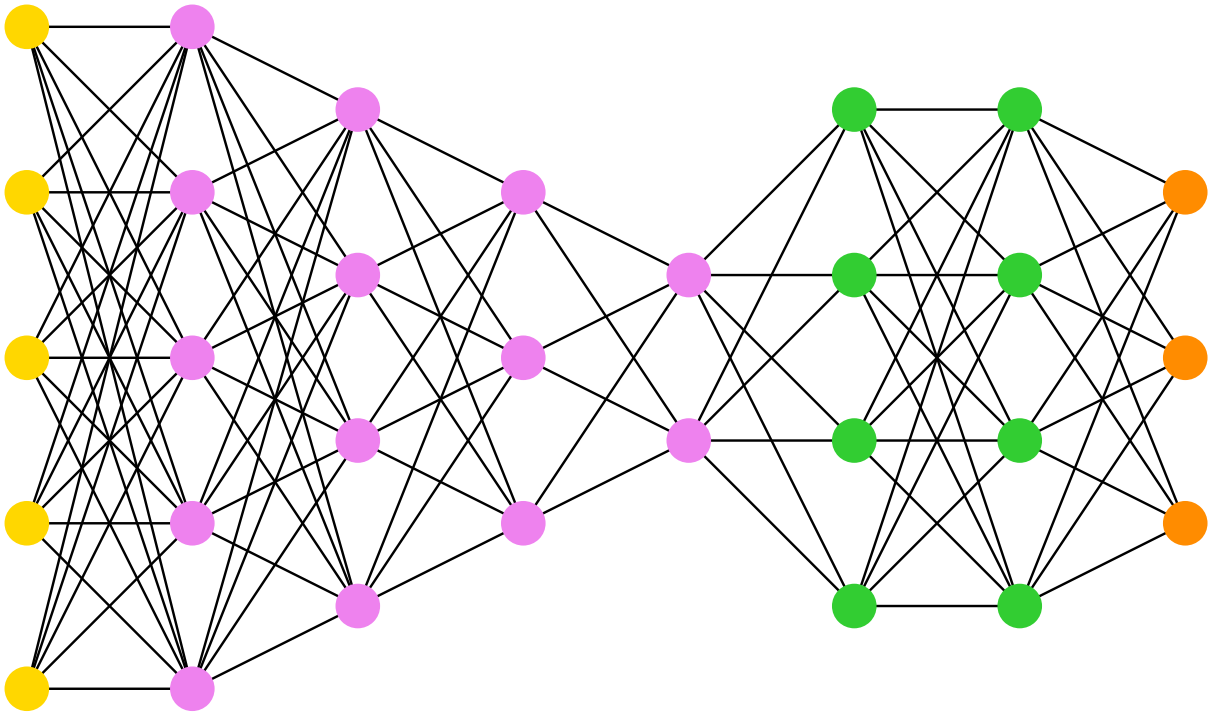
See also: https://networkx.org/documentation/stable/auto_examples/drawing/index.html

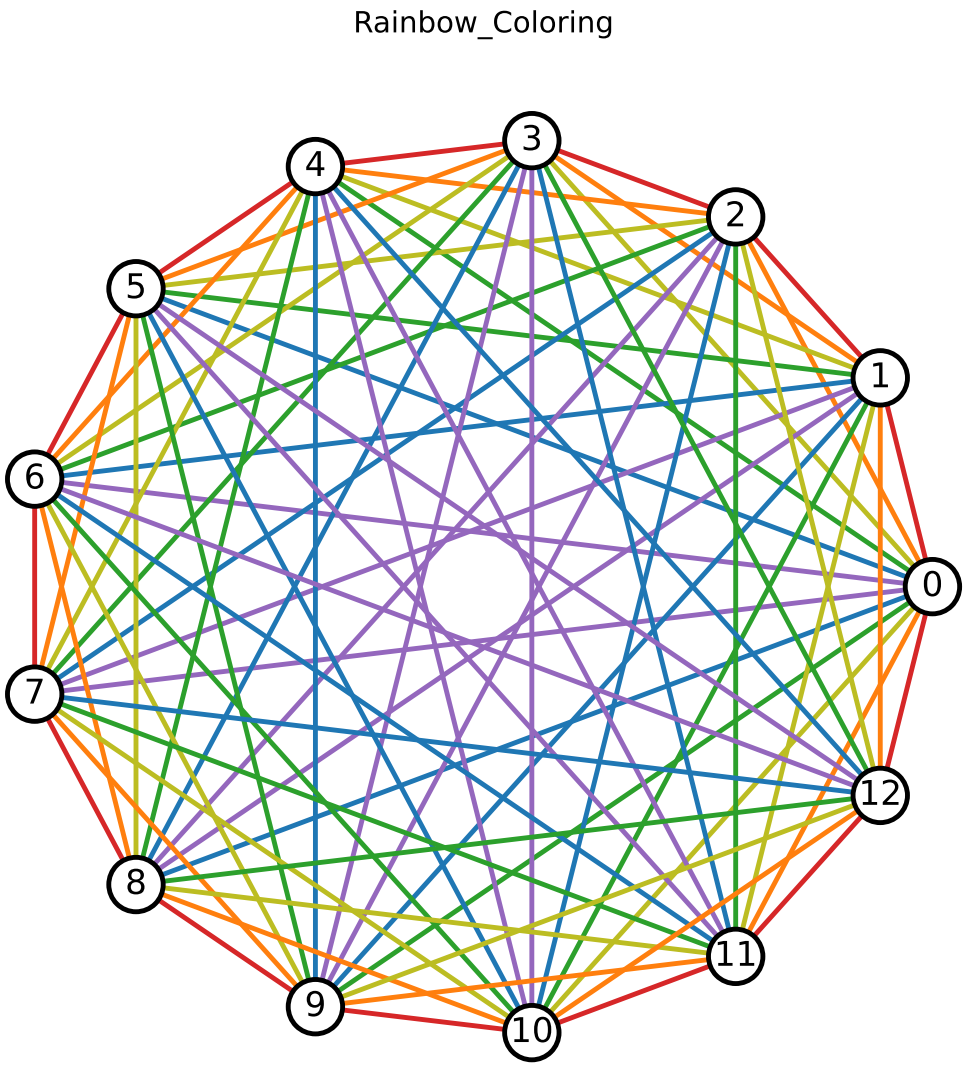
17.14.1 Multipartite_Layout

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_MultipartiteLayout.py, and the XML code in the file D01_Multipartite.2D.xml.



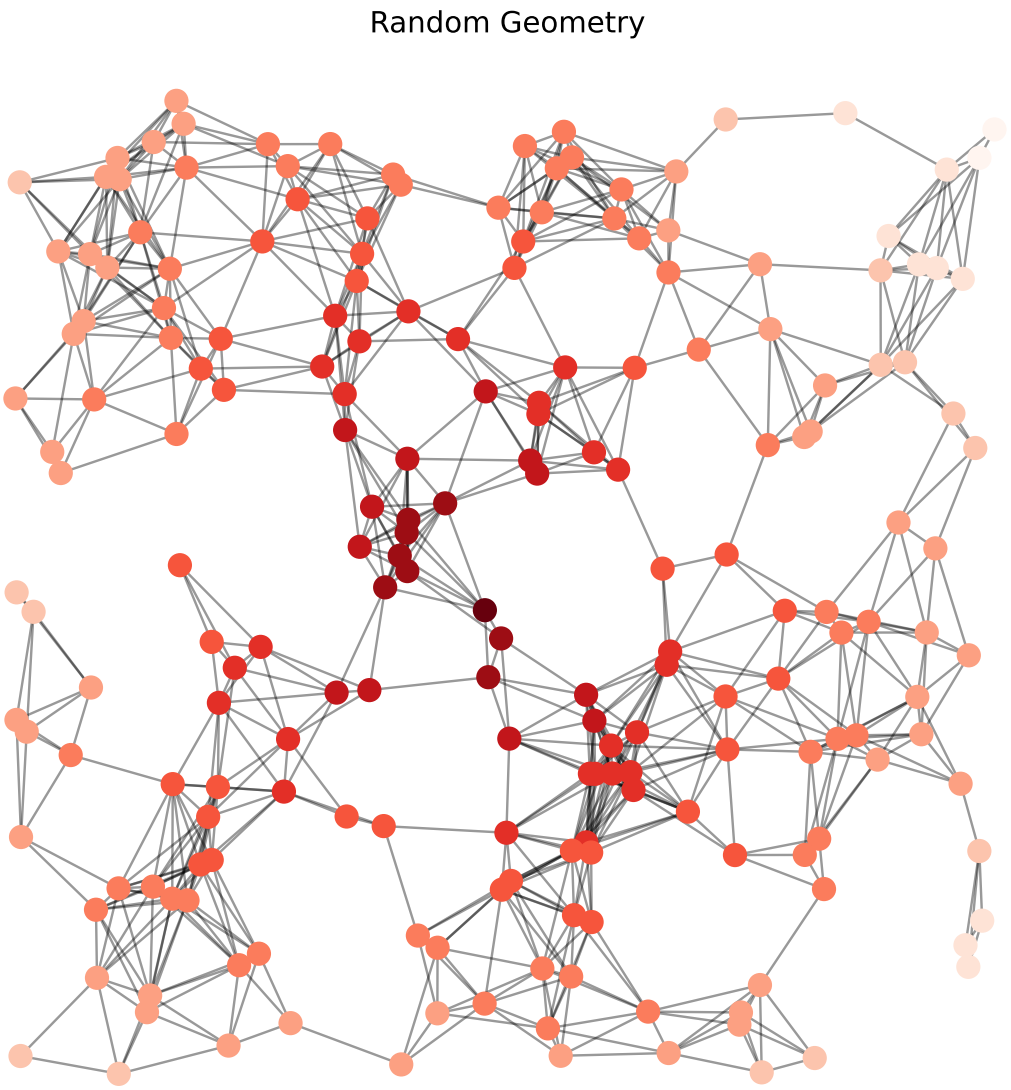
17.14.2 Rainbow_Coloring

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_RainbowColoring.py, and the XML code in the file D02_RainbowColoring.2D.xml.



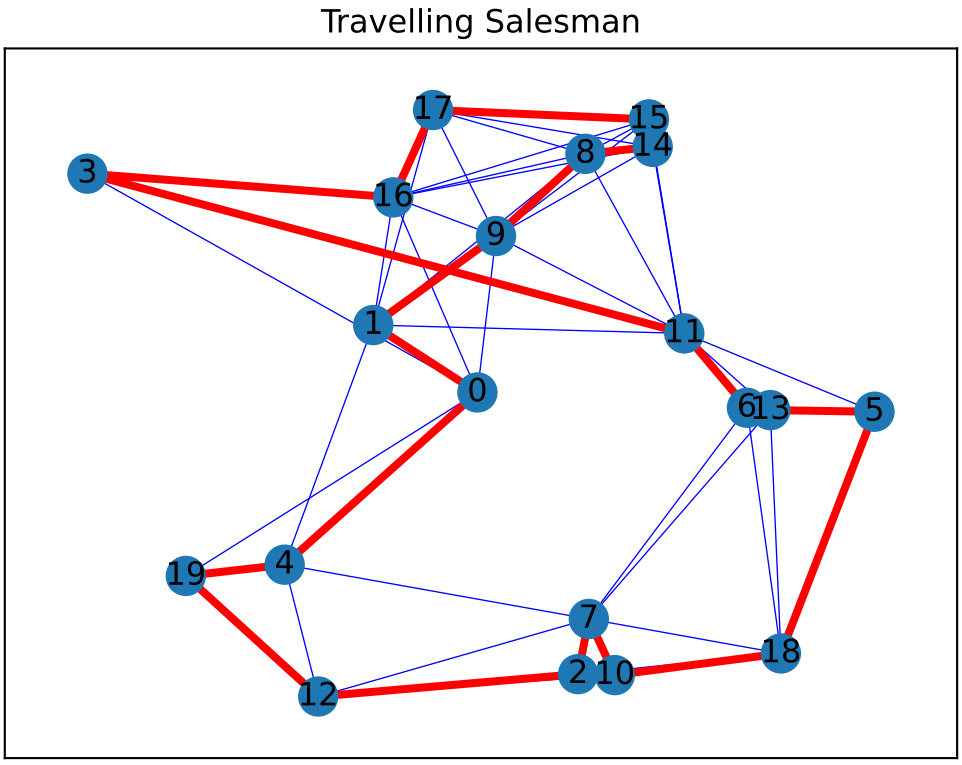
17.14.3 Random_Geometry

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_RandomGeometric.py, and the XML code in the file D03_RandomGeometric.2D.xml.



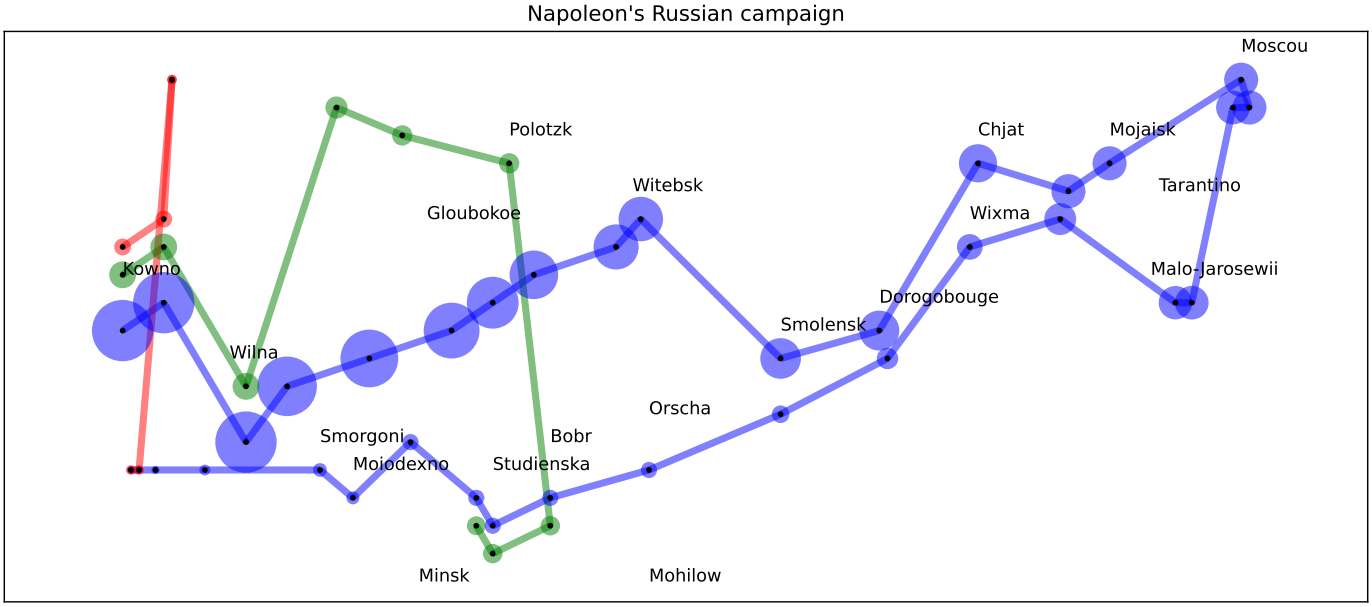
17.14.4 Travelling_Salesman

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_TravellingSalesman.py, and the XML code in the file D04_TravellingSalesman.2D.xml.



17.14.5 NapoleonRussianCampaign

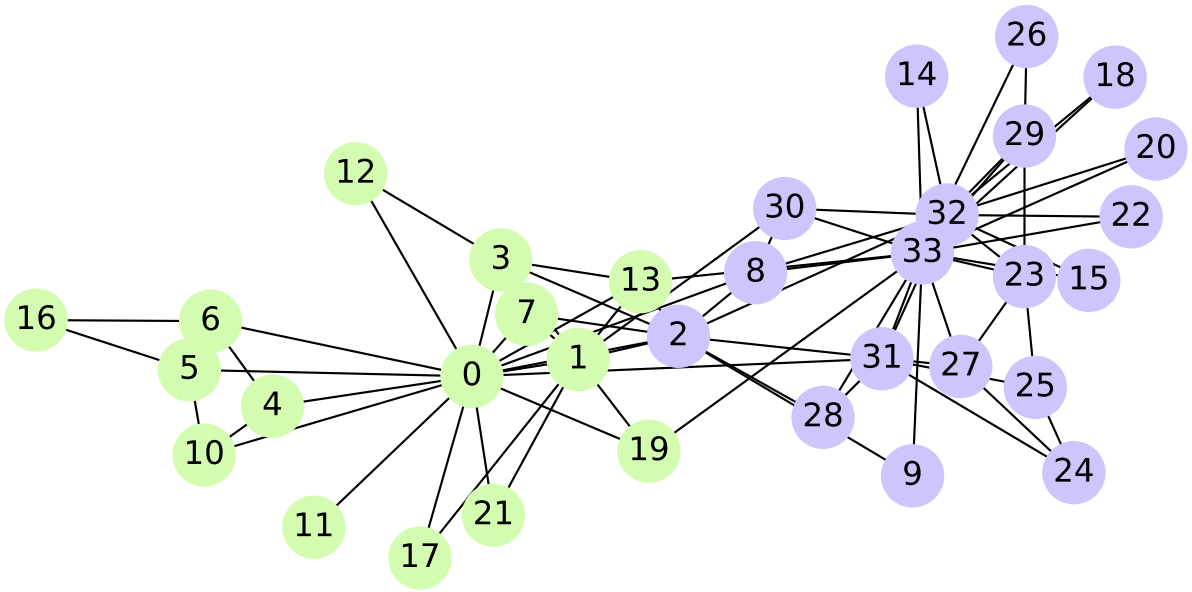
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_NapoleonRussianCampaign.py, and the XML code in the file D05_Napoleon.2D.xml.



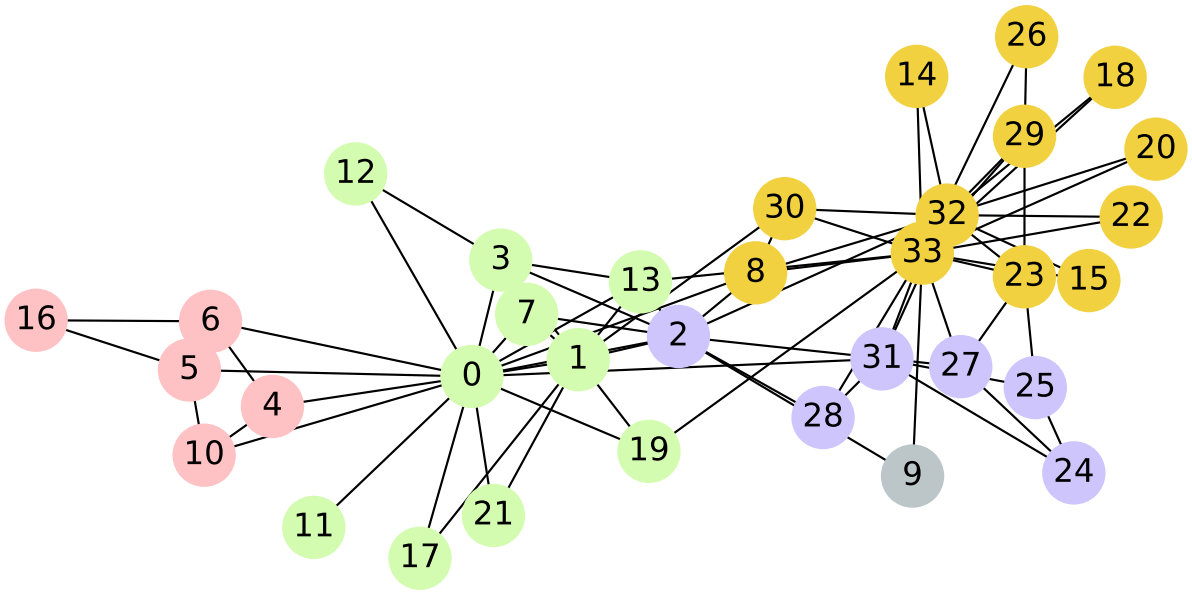
17.14.6 Community Visualisation

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_CommunityVisualisation.py, and the XML code in the file D06_CommunityVisualisation.2D.xml.

Community Visualization of 2 communities with modularity of 0.34766

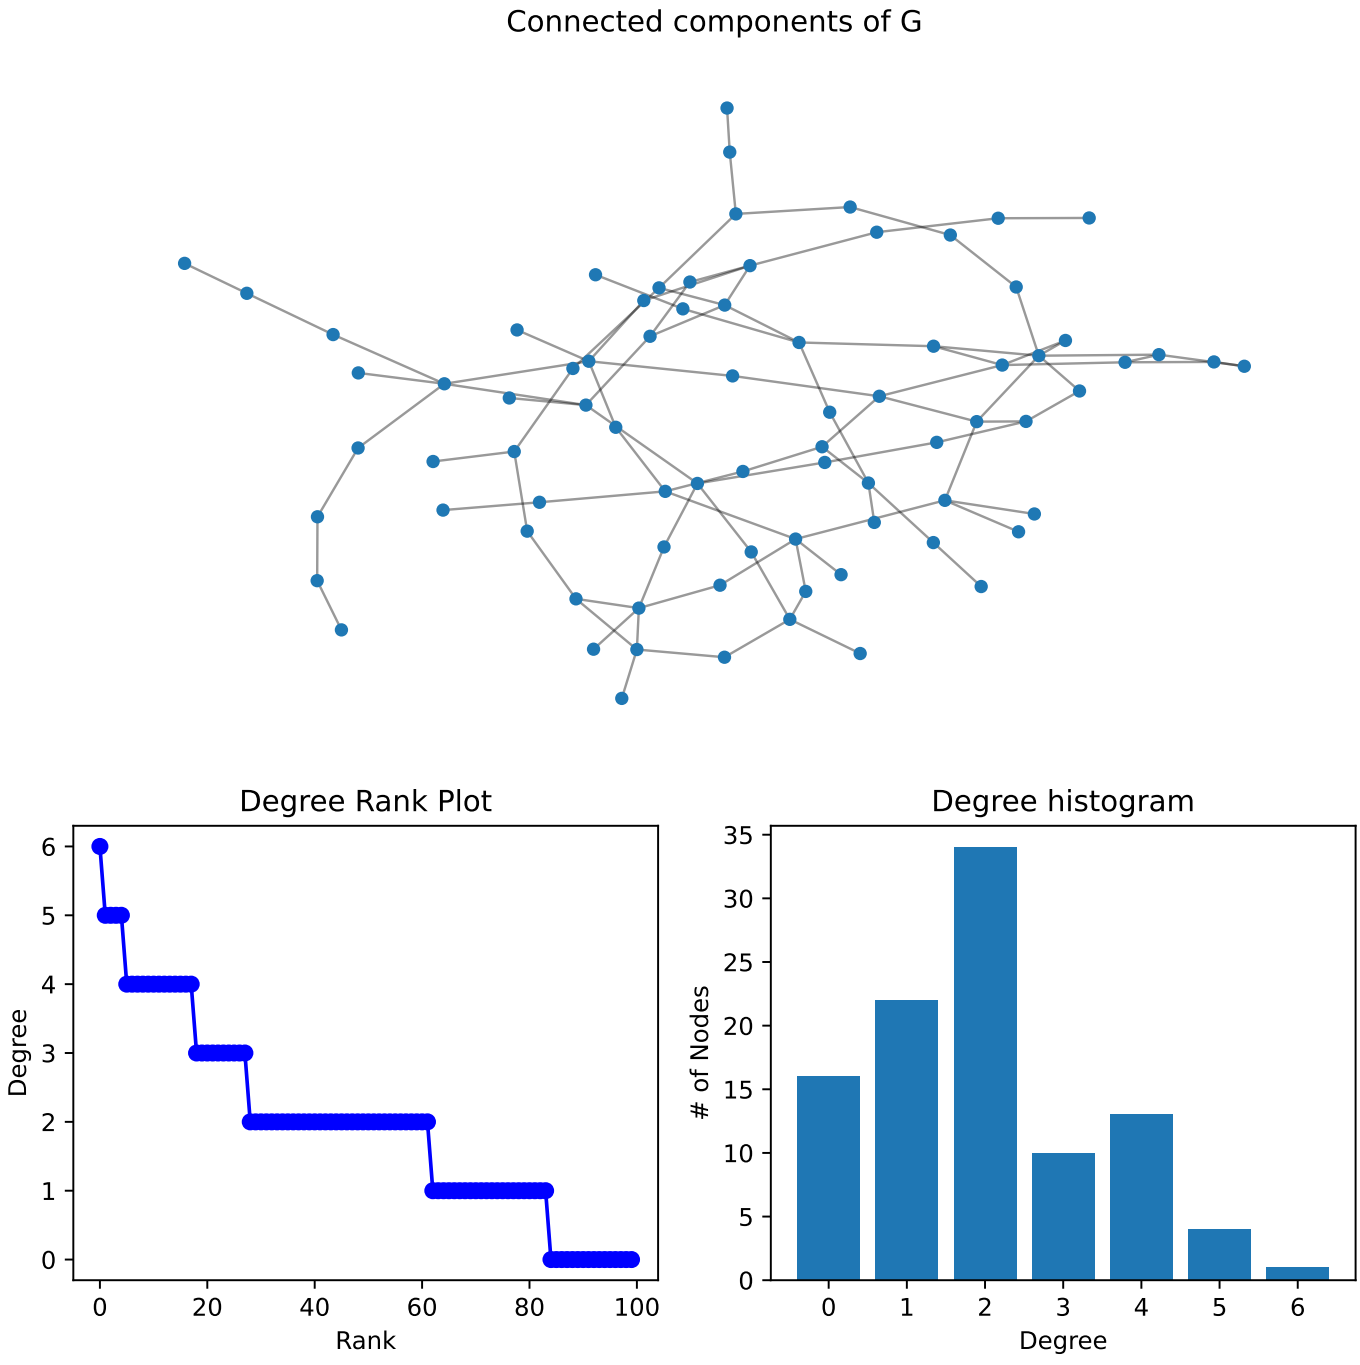


Community Visualization of 5 communities with modularity of 0.384972



17.14.7 Connected Components

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_ConnectedComponents.py, and the XML code in the file D07_ConnectedComponents.2D.xml.



CHAPTER

EIGHTEEN

VISUALISATION OF FUNCTIONS AND CURVES (2D)

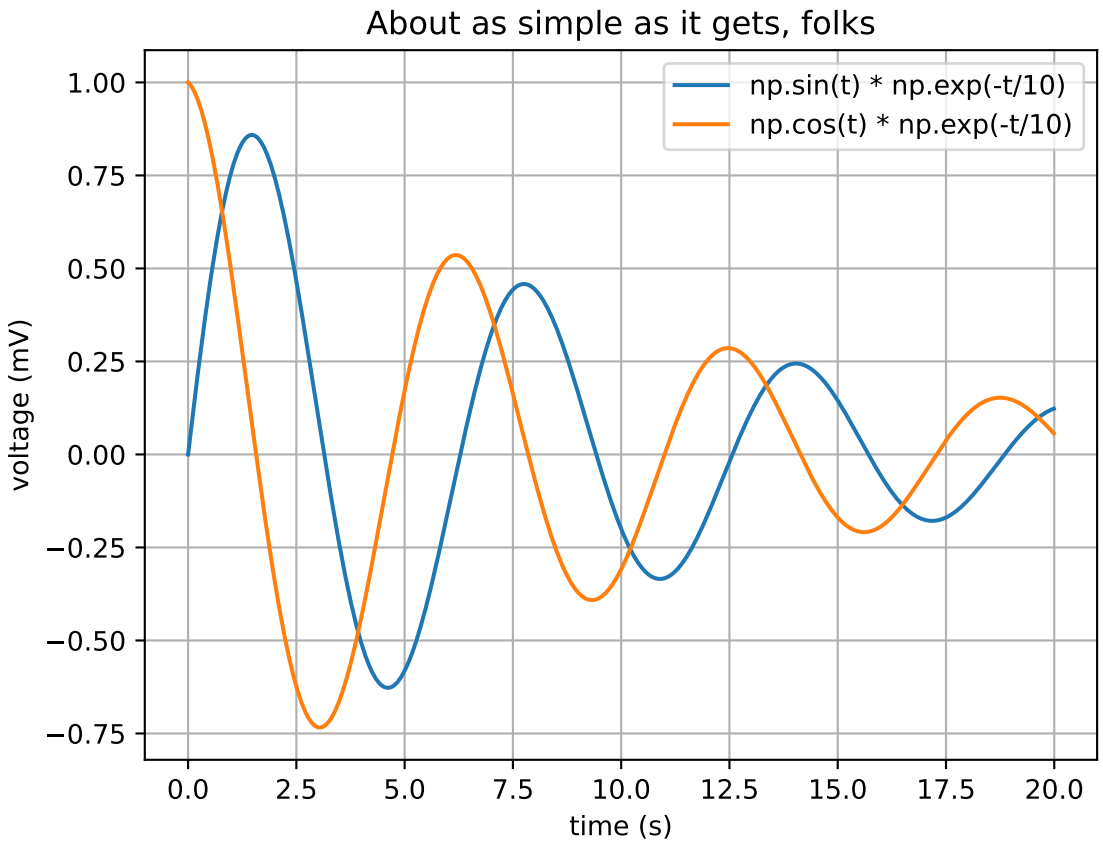
18.1 Introduction to 2D functions plots

18.1.1 Simple plot of (well-behaved) functions in 2D

This is a (slightly modified) example from the Matplotlib tutorials.

See https://matplotlib.org/stable/gallery/lines_bars_and_markers/simple_plot.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Simpleplot.py, and the XML code in the file D01_Simpleplot.2D.xml.

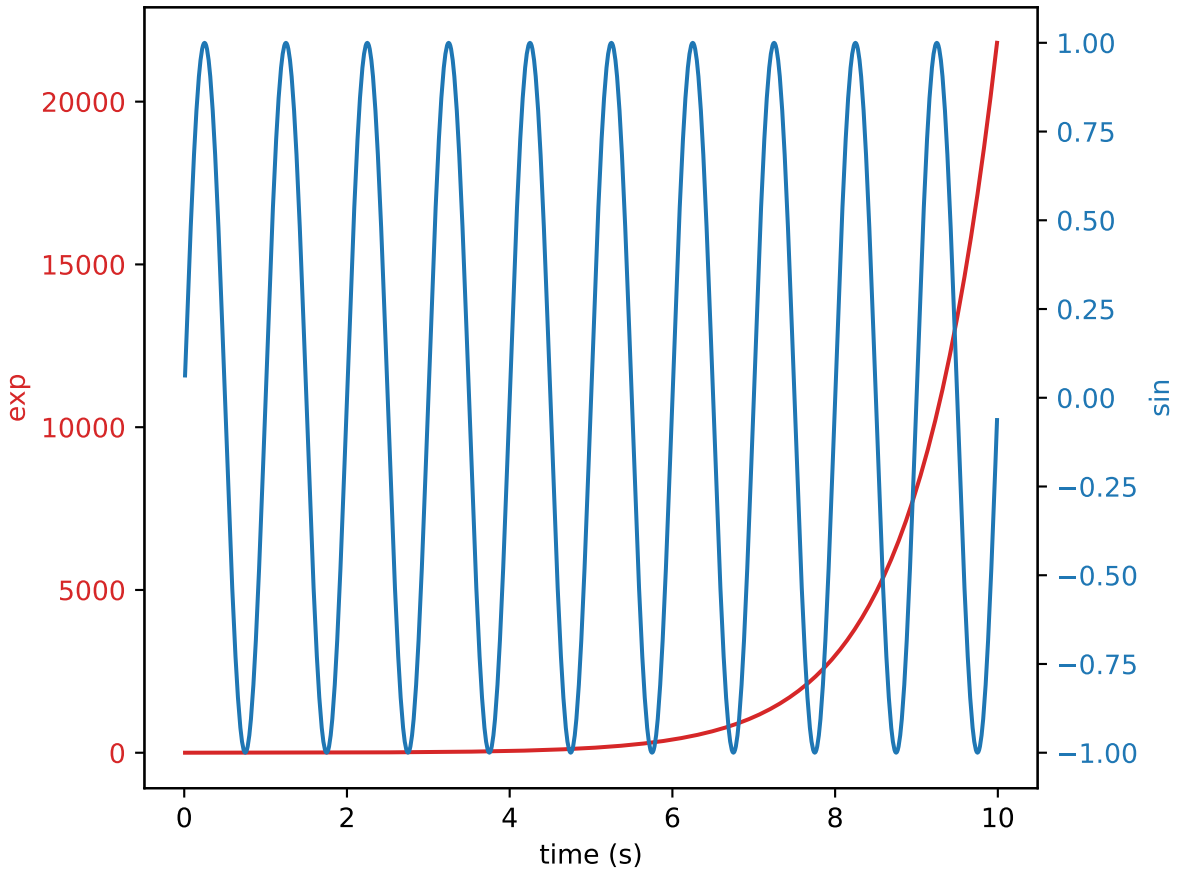


18.1.2 Function plots on different scales

This is an example from the Matplotlib tutorials.

See https://matplotlib.org/stable/gallery/subplots_axes_and_figures/two_scales.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_PlotDiffScales.py, and the XML code in the file D02_PlotDiffScales.2D.xml.

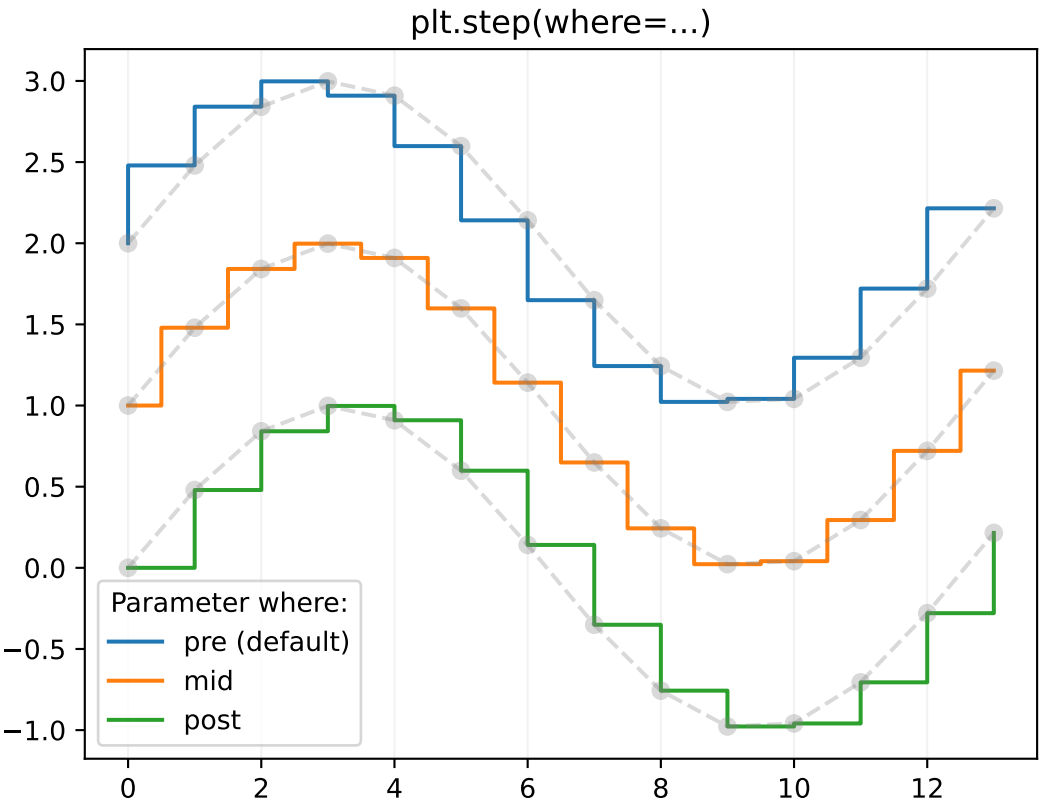


18.1.3 Stepplot

This is an example from the Matplotlib tutorials.

See https://matplotlib.org/stable/gallery/lines_bars_and_markers/step_demo.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Stepplot.py, and the XML code in the file D03_Stepplot.2D.xml.

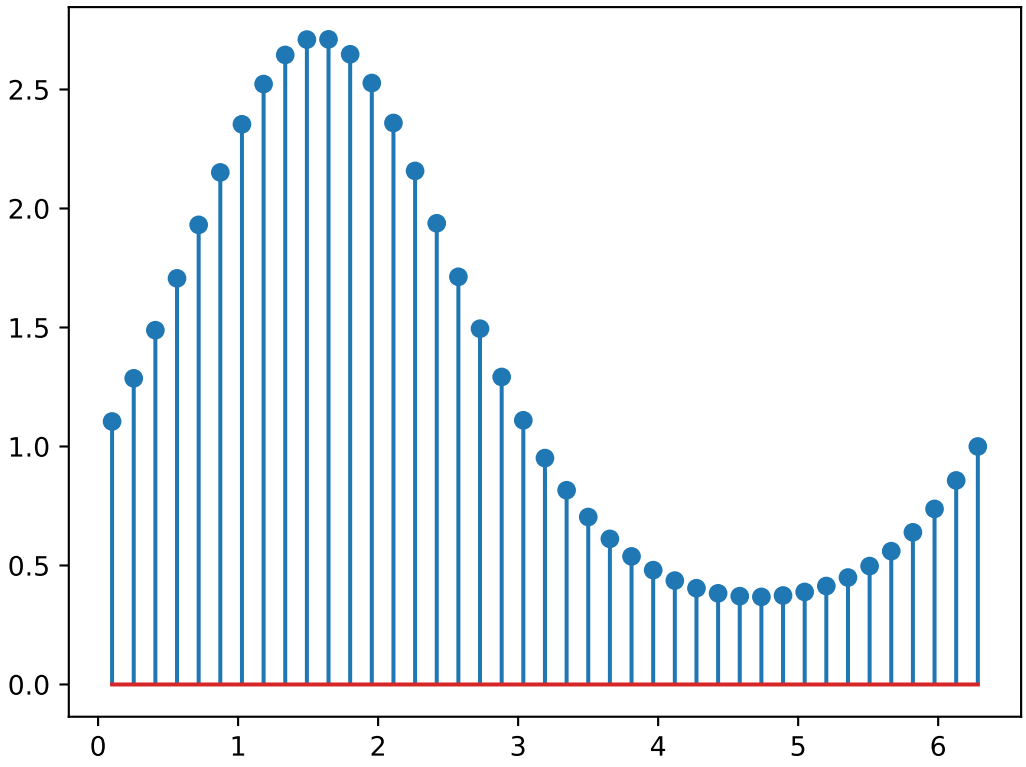


18.1.4 Stemplot

This is an example from the Matplotlib tutorials.

See https://matplotlib.org/stable/gallery/lines_bars_and_markers/stem_plot.html#sphx-glr-gallery-lines-bars-and-markers-stem-plot-py

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Stemplot.py, and the XML code in the file D04_Stemplot.2D.xml.

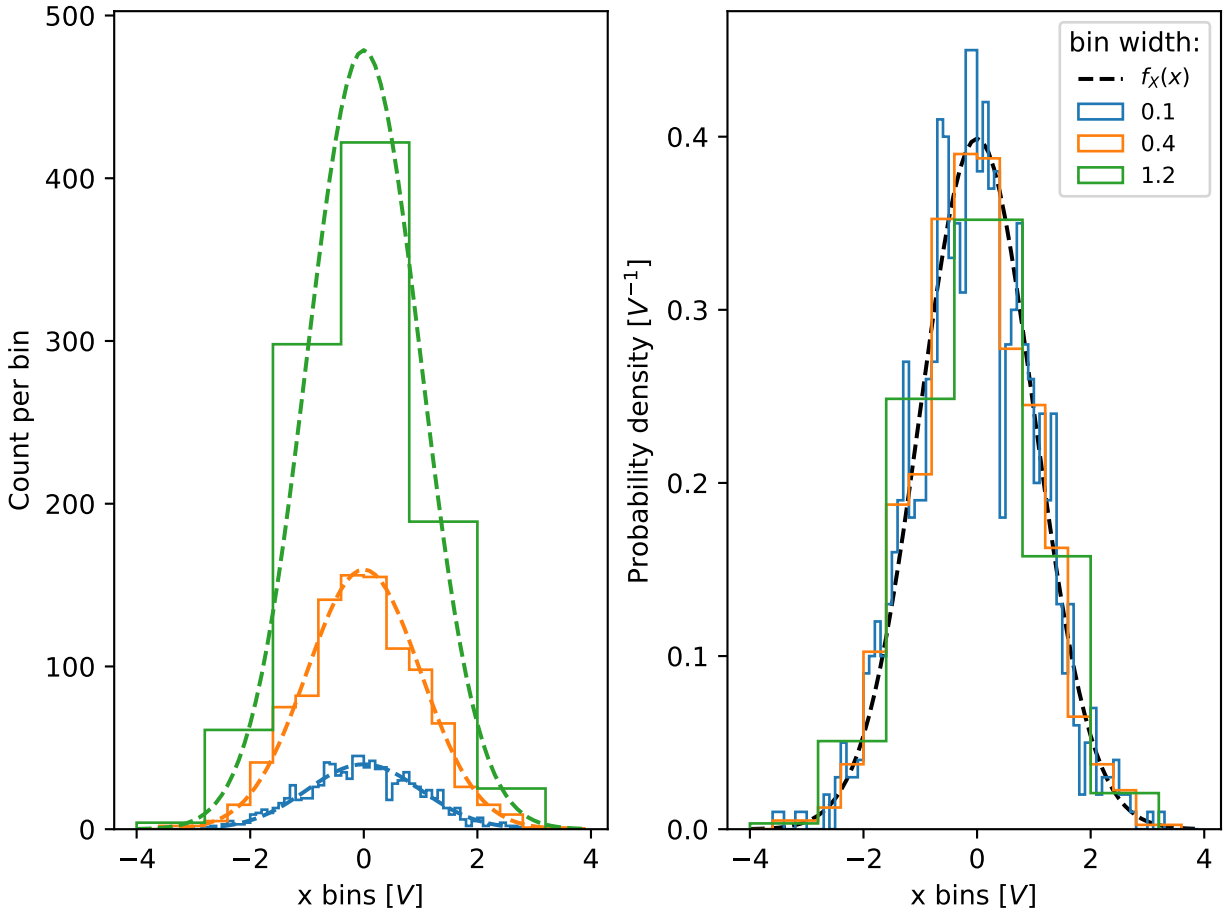


18.1.5 Histograms and densities

This is an example from the Matplotlib tutorials.

See https://matplotlib.org/stable/gallery/statistics/histogram_normalization.html#

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_HistogramsAndDensities.py, and the XML code in the file D05_HistogramsAndDensities.2D.xml.

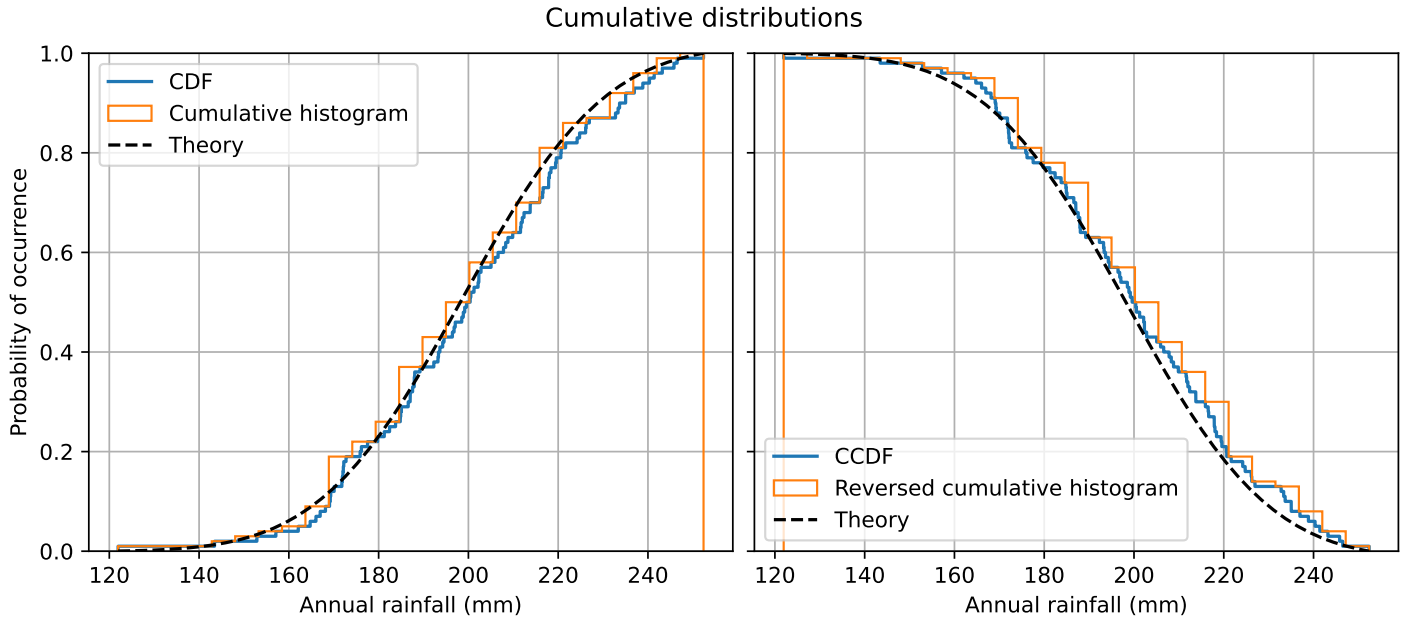


18.1.6 Cumulative histogram and CDF

This is an example from the Matplotlib tutorials.

see https://matplotlib.org/stable/gallery/statistics/histogram_cumulative.html#

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_CumulativeHistogramAndCDF.py, and the XML code in the file D06_CumulativeHistogramAndCDF.2D.xml.



18.1.7 Plots of continuous distribution functions

Some text

18.1.7.1 Probability density function (pdf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

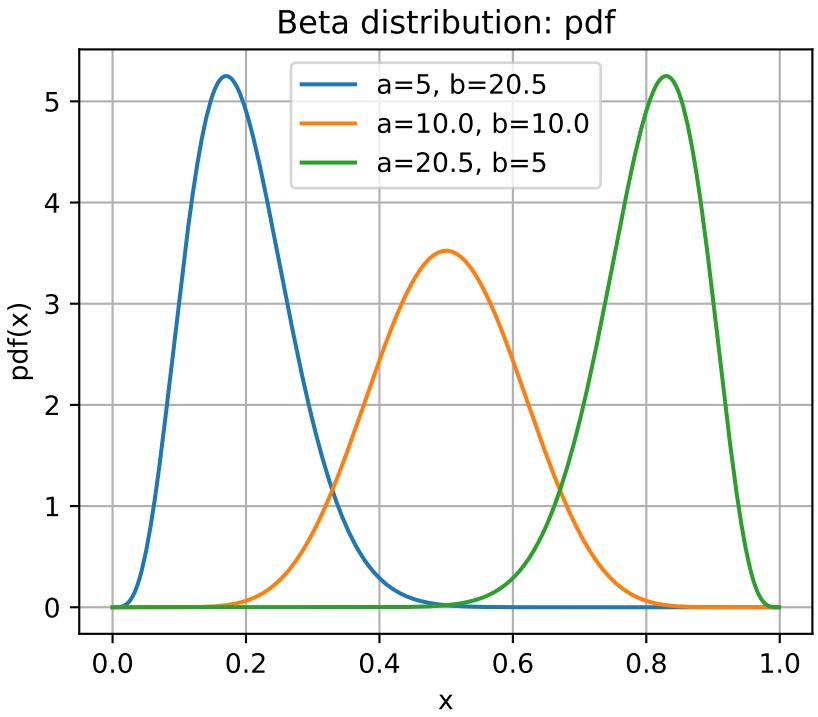
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'pdf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.2 Cumulative distribution function (cdf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

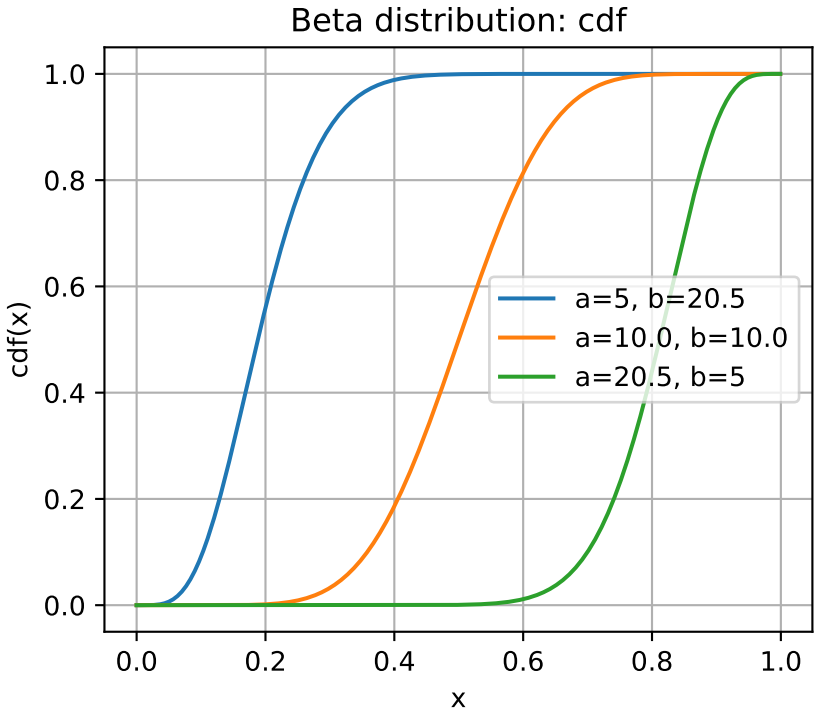
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'cdf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.3 Survival function (sf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

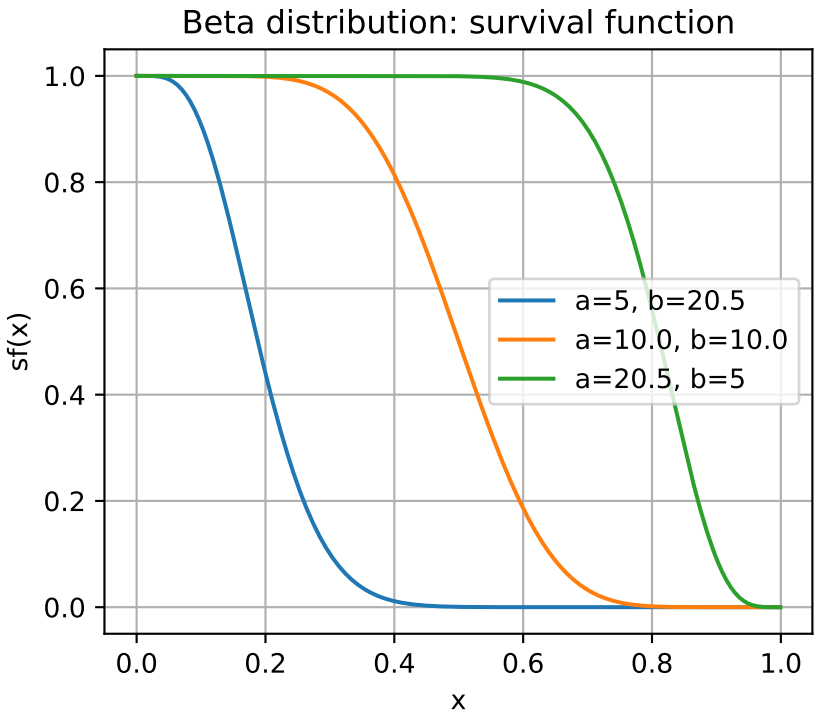
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'sf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.4 Hazard function (hf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

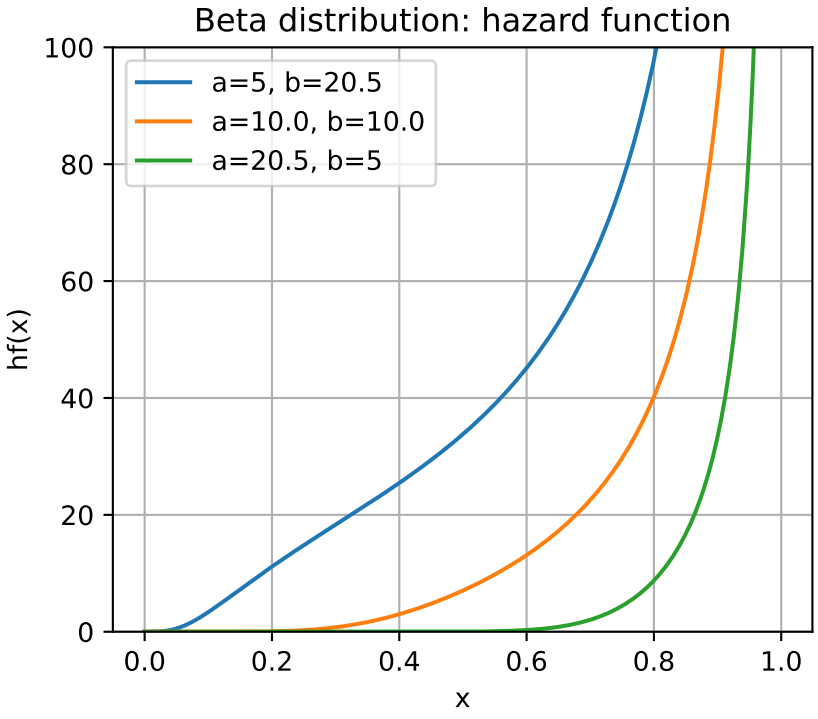
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'hf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.5 Cumulative hazard function (chf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

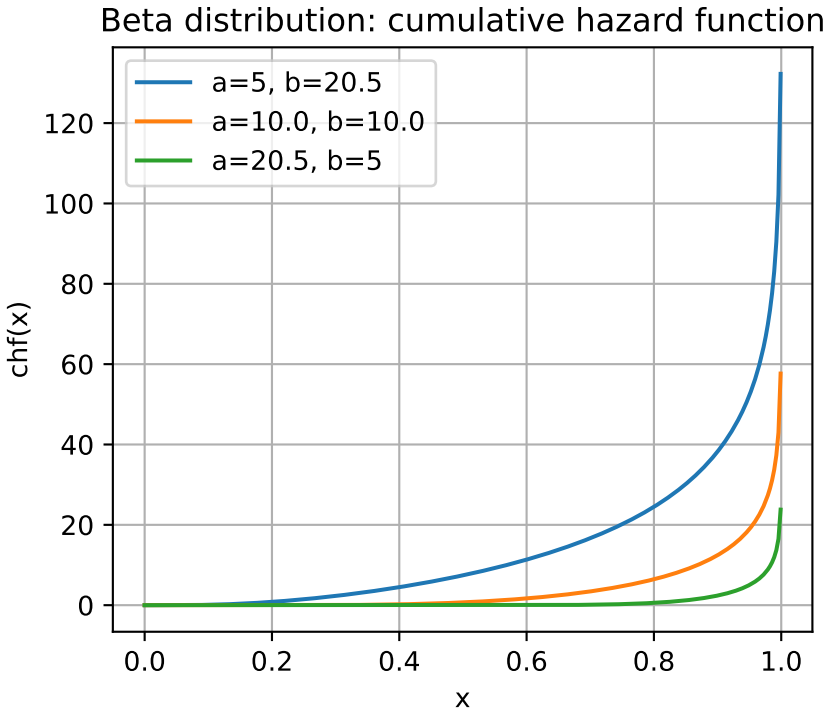
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'chf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.6 Quantile function (qtf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

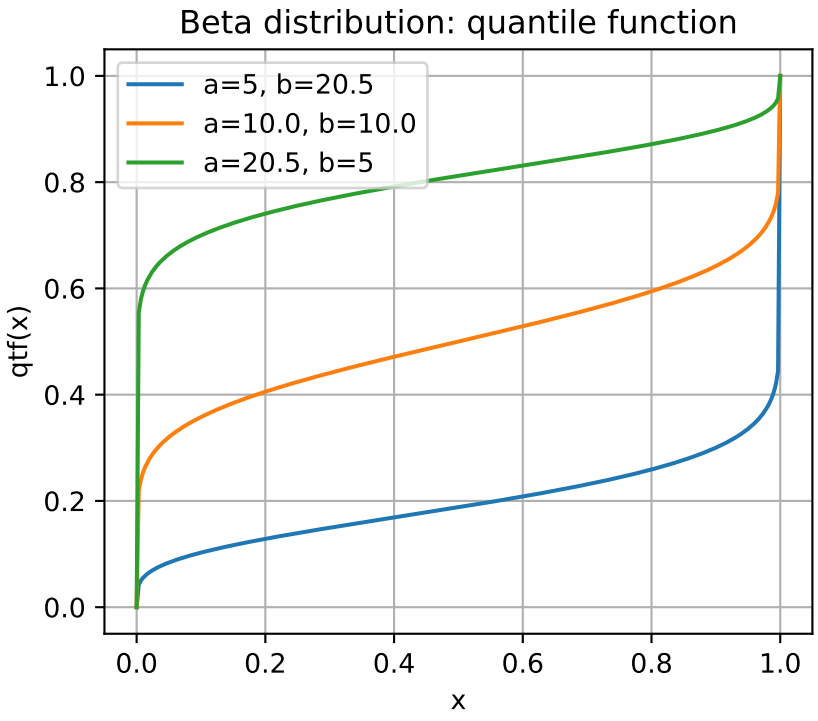
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'qtf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.7.7 Inverse survival function (isf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

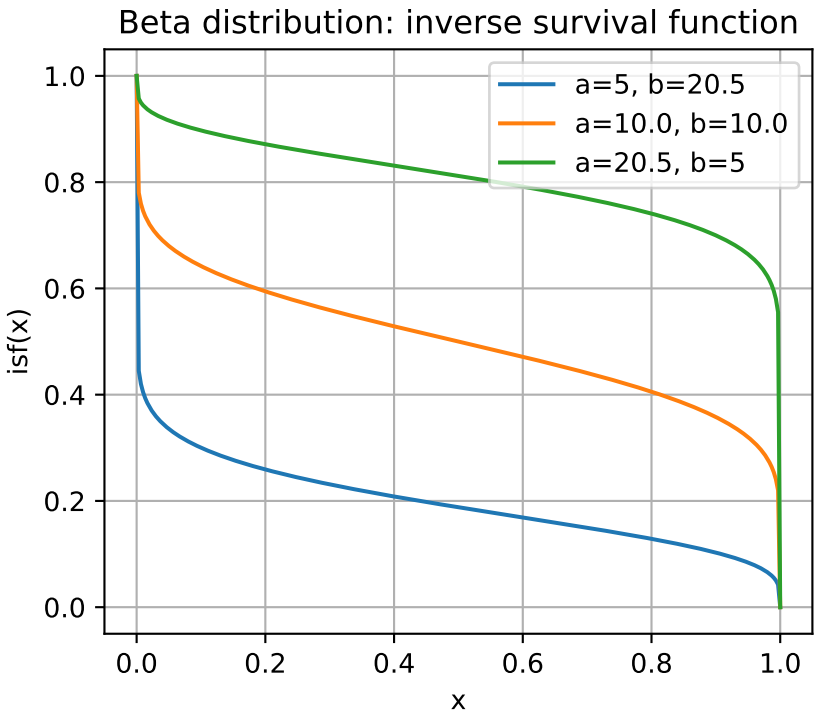
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'qtf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



18.1.8 Plots of discrete distribution functions

18.1.8.1 Probability mass function (pmf)

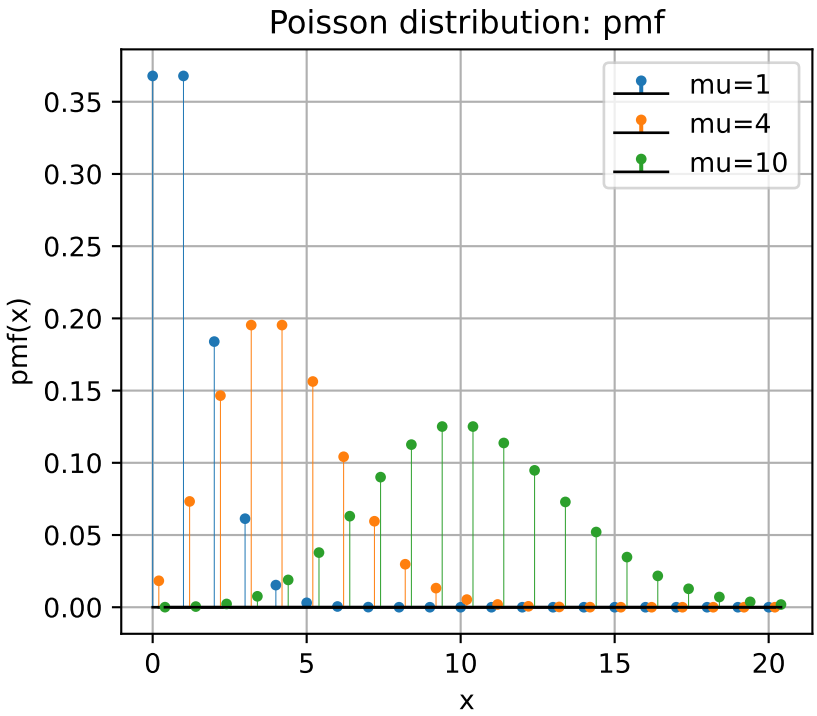
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'pmf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



18.1.8.2 Cumulative distribution function (cdf)

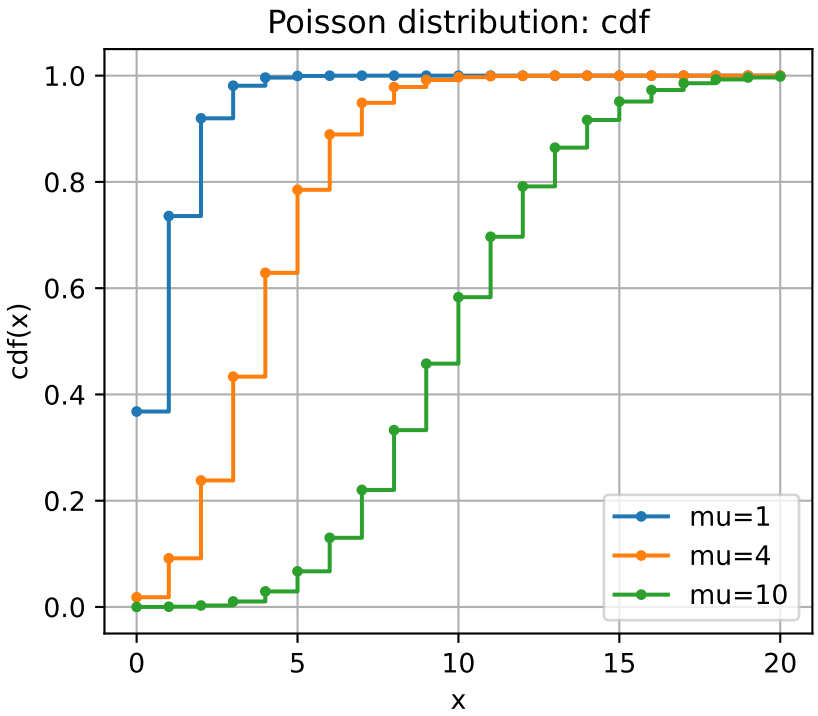
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'cdf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



18.1.8.3 Survival function (sf)

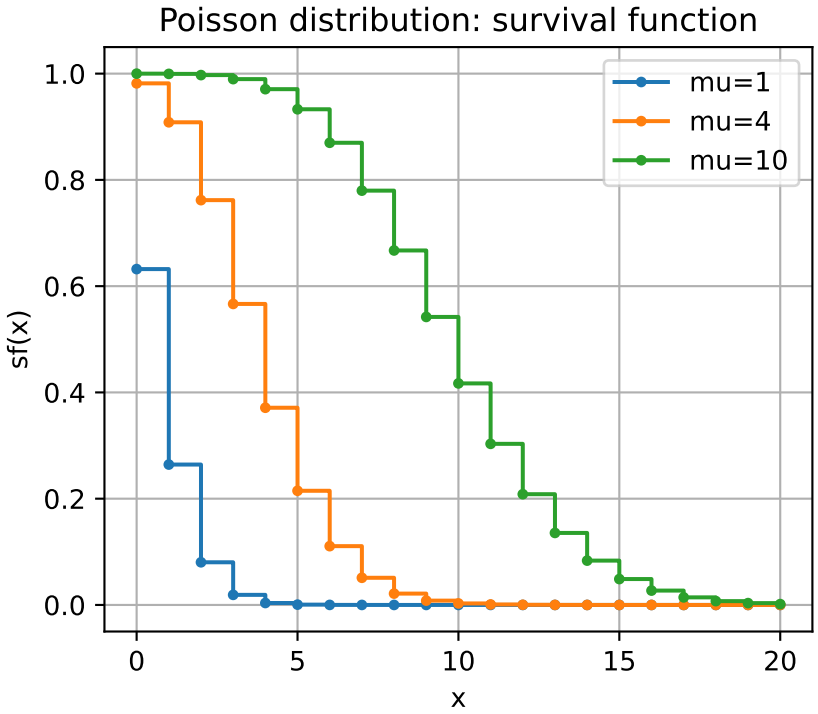
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'sf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



18.1.8.4 Hazard function (hf)

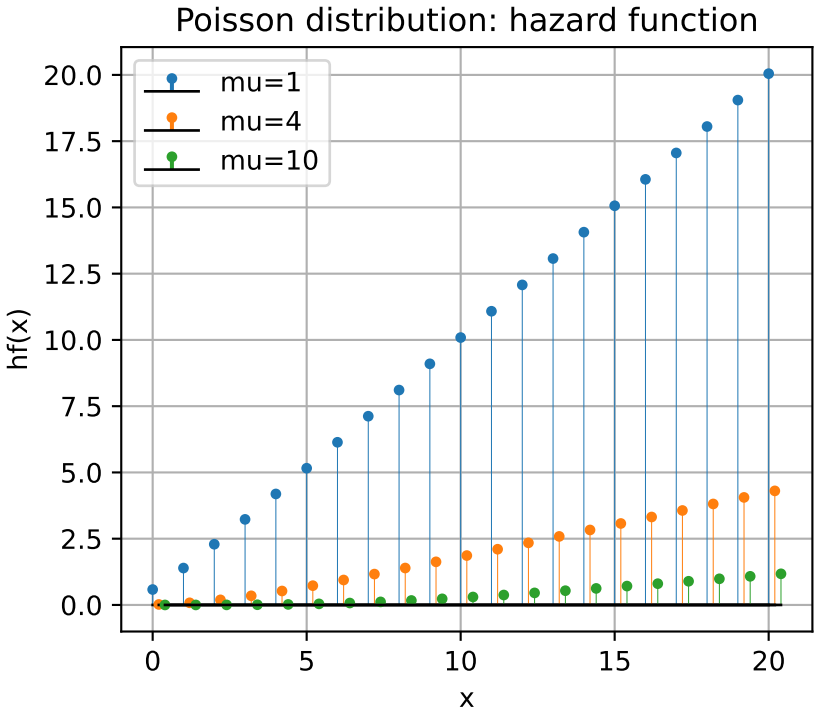
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'hf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



18.1.8.5 Cumulative hazard function (chf)

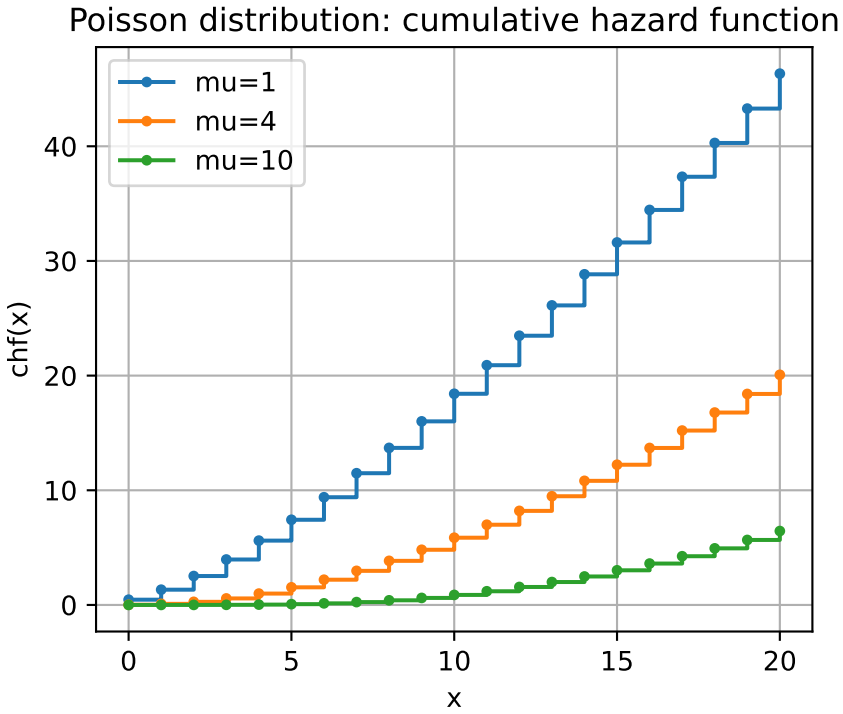
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'chf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



18.1.8.6 Quantile function (qtf)

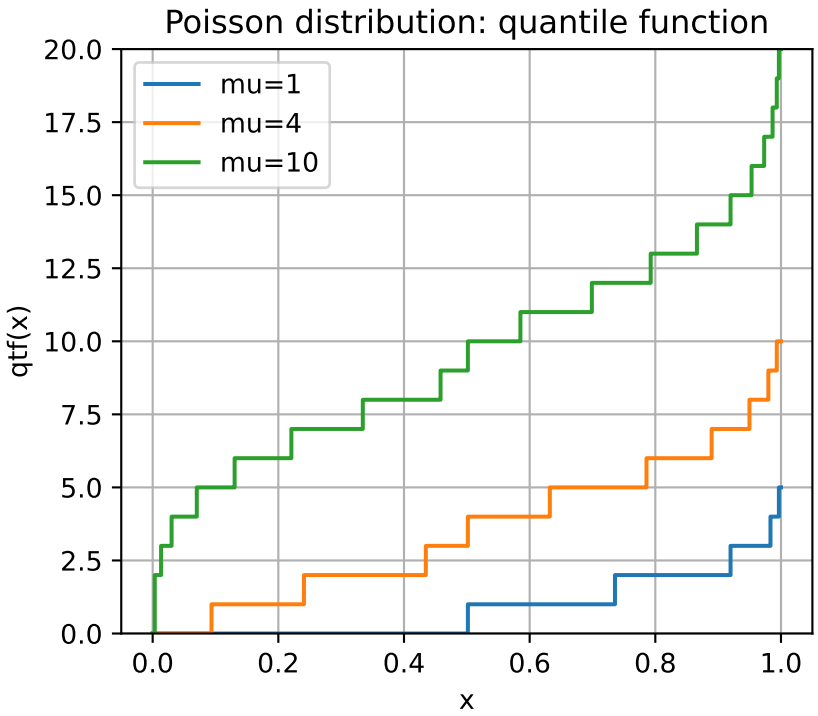
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'qtf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=0, vertical_lines=True)
```



18.1.8.7 Inverse survival function (isf)

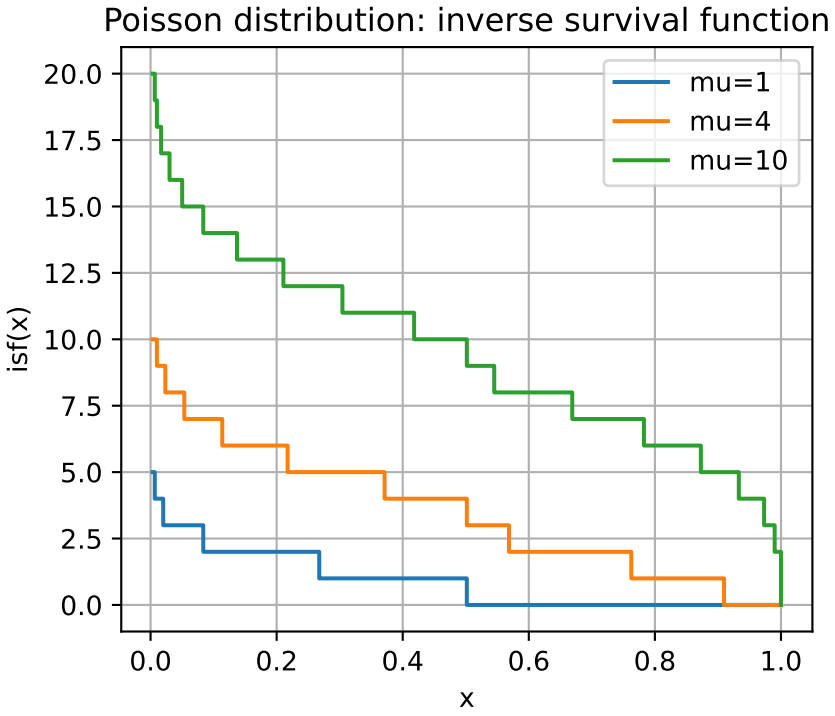
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'isf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=0, vertical_lines=True)
```



18.1.9 Mpmath-inspired functions plots in 2D

The plots discussed here show some possibilities to deal with not-so-well-behaved plots, i.e plots with real input, but (domain-wise) complex output, plots with singularities, and plots which grow very rapidly. The functions which are used here have been modified from Mpmath (see https://mpmath.readthedocs.io/en/stable/plotting.html).

These plots can use both Python-only contexts like `mpm` as well as `FixedPrec` contexts like `math53`, however, results may differ since the `FixedPrec` contexts enforce strict typing, whereas the Python-only contexts do not.

18.1.9.1 Simultaneous plot of sin and cos

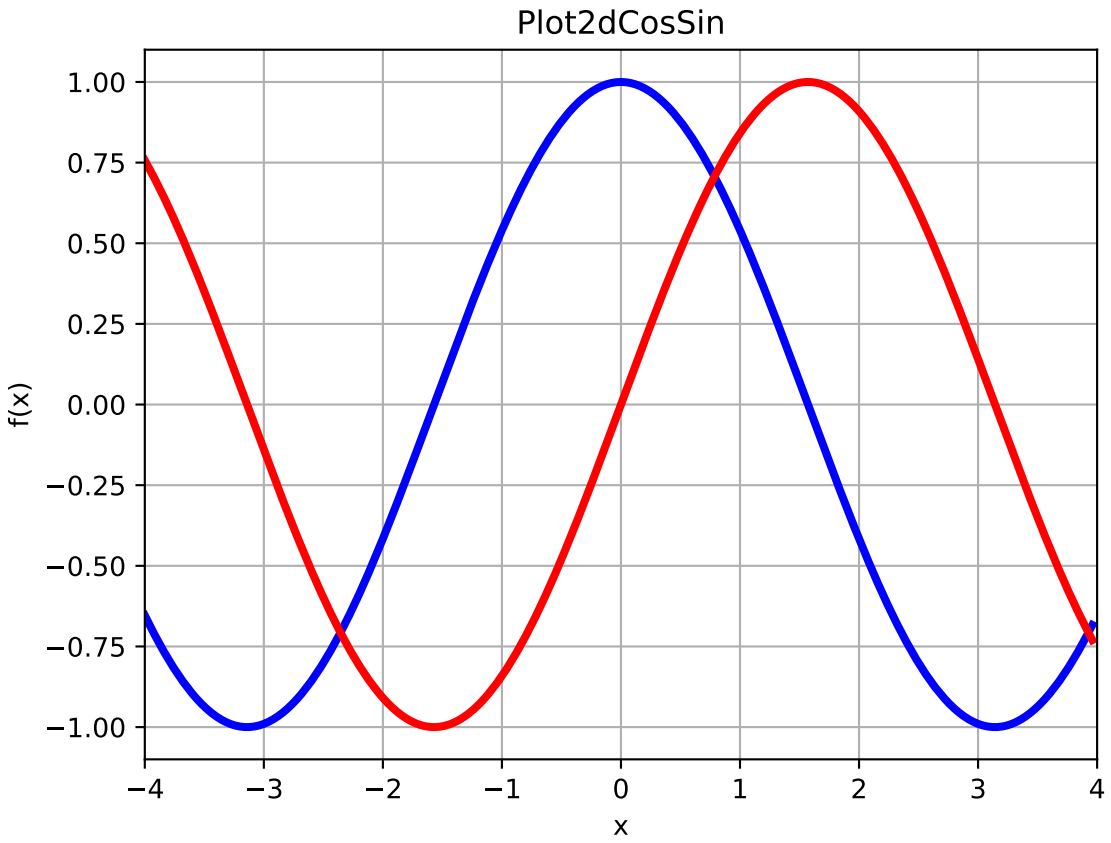
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_FuncPlot2d.py, and the XML code in the file D09_FuncPlot2d.2D.xml.

To produce the figure as shown below, using the `mpm` context, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=mpm, f=[mpm.cos, mpm.sin], xlim=[-4, 4],
            Title = 'Plot2dCosSin')
```

To produce the figure as shown below, using the `math53` context, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=math53, f=[ctx.cos, ctx.sin], xlim=[-4, 4],
            Title = 'Plot2dCosSin')
```

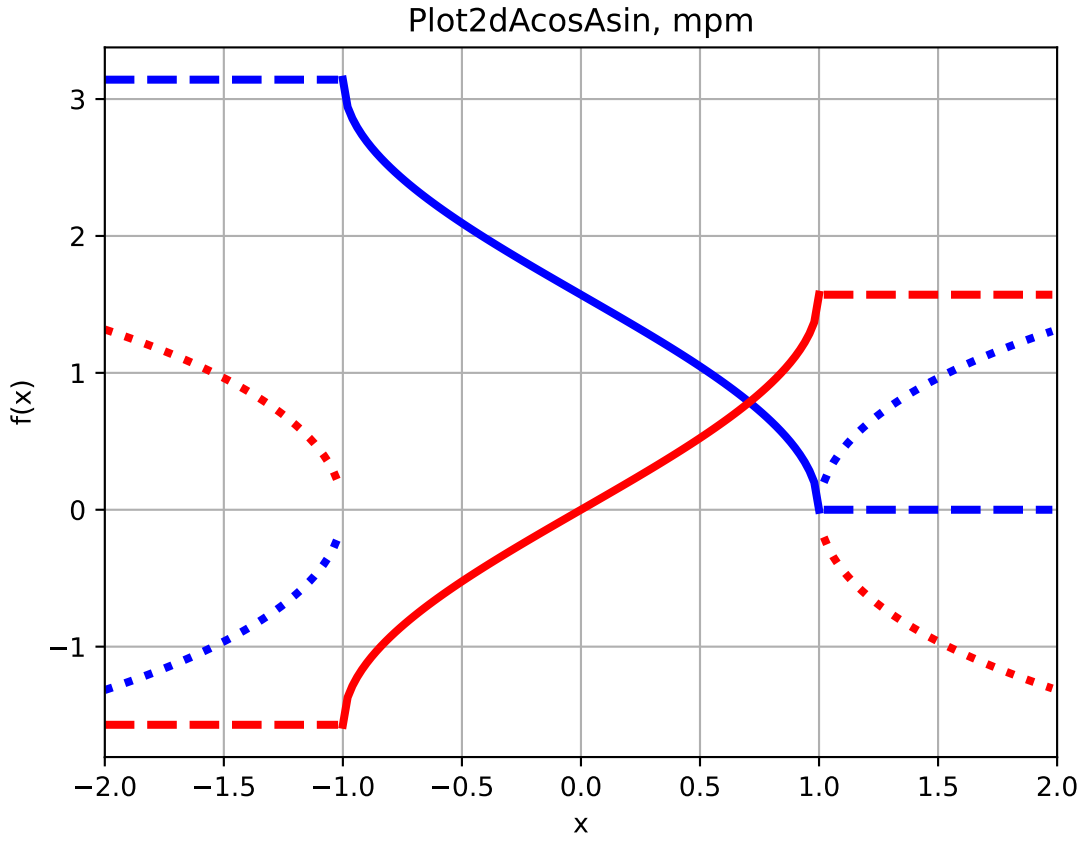


18.1.9.2 Simultaneous plots of asin and acos, for mpm and math53

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_FuncPlot2d.py.

To produce the figure as shown below, using the `mpm` context, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=mpm, f=[mpm.acos, mpm.asin], xlim=[-2, 2],
            Title = 'Simultaneous plot of asin an acos, using mpm')
```



To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=math53, f=[ctx.acos, ctx.asin], xlim=[-2, 2],
            Title = 'Simultaneous plot of asin and acos, using math53')
```

18.1.9.3 Plot of cotangent without singularities specified

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_FuncPlot2d.py.

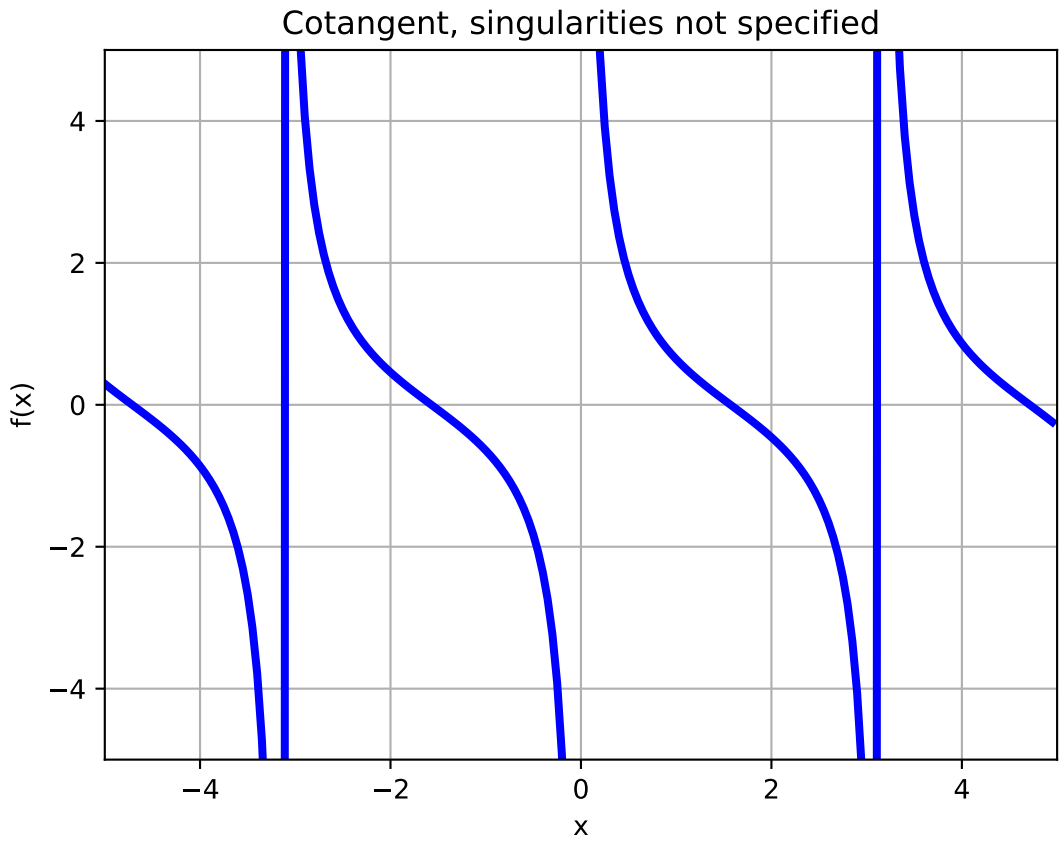
If we plot the `cotangent` without specifying the singularities, we get the results shown below:

To produce the left figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=mpm, f=mpm.cot, xlim=[-5, 5], ylim=[-5, 5],
            Title = 'Cotangent, singularities not specified, Mpm')
```

To produce the right figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=math53, f=ctx.cot, xlim=[-5, 5], ylim=[-5, 5],
            Title = 'Cotangent, singularities not specified, Math53')
```



18.1.9.4 Plot of cotangent with singularities specified

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_FuncPlot2d.py.

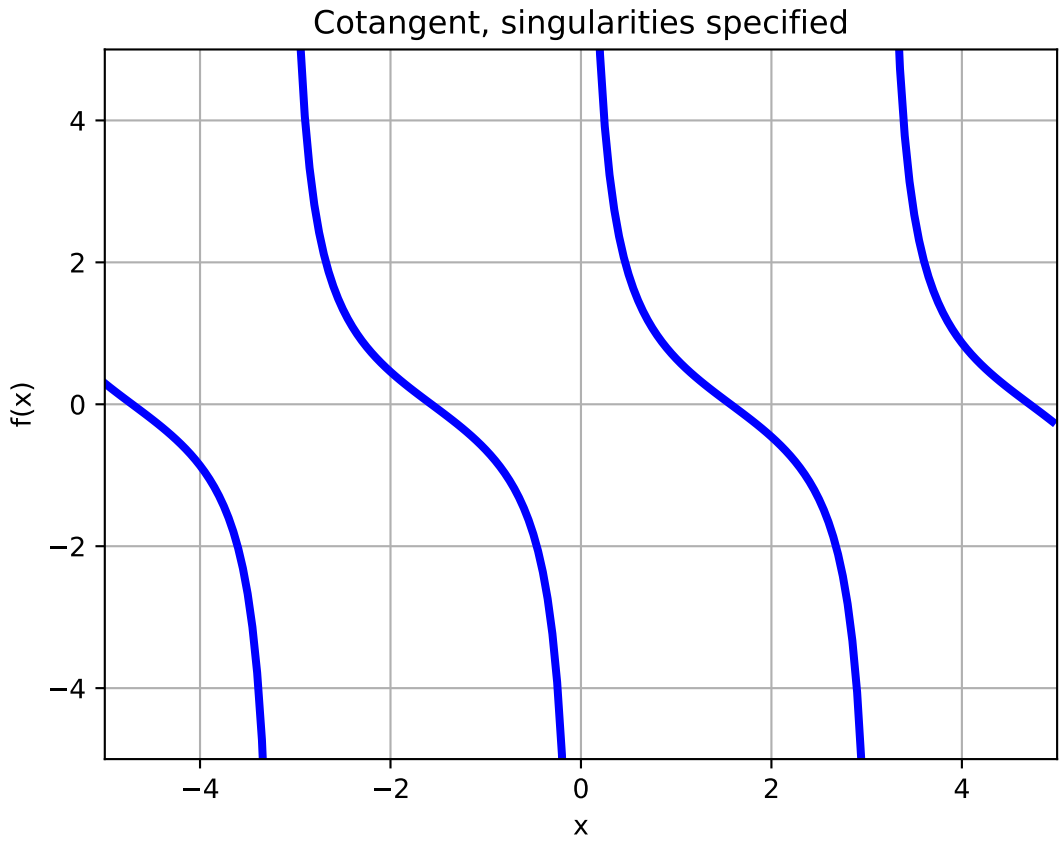
If we plot the `cotangent` and specify the singularities, we get the results shown below:

To produce the left figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=mpm, f=mpm.cot, xlim=[-5, 5], ylim=[-5, 5],
            singularities=[-mpm.pi, 0, mpm.pi],
            Title = 'Cotangent, singularities specified, mpm')
```

To produce the right figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        FuncPlot2d(ctx=math53, f=ctx.cot, xlim=[-5, 5], ylim=[-5, 5],
            singularities=[-ctx.pi(), 0, ctx.pi()],
            Title = 'Cotangent, singularities specified, math53')
```



18.2 Basic curves

18.2.1 Regular convex polygon

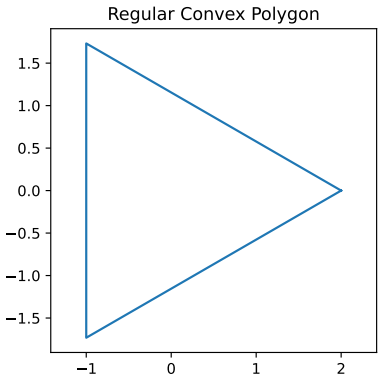
A regular polygon is a polygon that is direct equiangular (all angles are equal in measure) and equilateral (all sides have the same length). Regular polygons may be either convex, star or skew. In the limit, a sequence of regular polygons with an increasing number of sides approximates a circle.

$$r = \frac{a}{\cos\left(t - \alpha/2 - \alpha \left\lfloor \theta/\alpha \right\rfloor\right)}, \quad \text{where } \alpha = \frac{2\pi}{n}.$$

$$x(t) = r\cos(t)),$$

$$y(t) = r\sin(t).$$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_RegularConvexPolygon.py, and the XML code in the file D01_RegularConvexPolygon.2D.xml.



See also: https://en.wikipedia.org/wiki/Star_polygon

See also: https://mathcurve.com/polyedres/regulier/polygoneregulier.shtml

See also: https://mathcurve.com/courbes2d/goursat/goursat.shtml

See also: https://mathcurve.com/courbes3d.gb/polygramme/polygramme.shtml

See also: https://mathcurve.com/courbes3d.gb/billardcylindrique/billardcylindrique.shtml

18.2.2 Circle

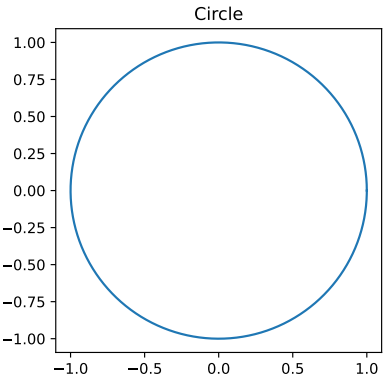
A circle is the set of points in a plane that are equidistant from a given point O. The parametric equations for a circle of radius a can be given by

$$x(t) = a\cos(t)),$$

$$y(t) = a\sin(t).$$

See also Wikipedia [1368], MathWorld [1042], MathCurve [305].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Circle.py, and the XML code in the file D02_Circle.2D.xml.



18.2.3 Ellipse

An ellipse is a plane curve surrounding two focal points, such that for all points on the curve, the sum of the two distances to the focal points is a constant. The parametric equations of a standard ellipse centered at the origin with width $2a$ and height $2b$ can be given by (with $0 \leq t < 2\pi$):

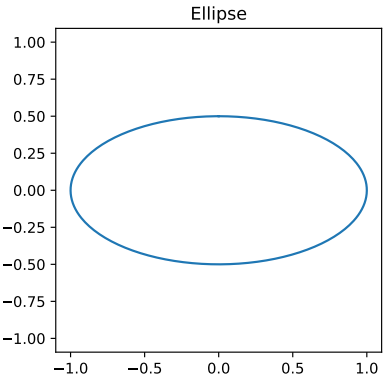
$$x(t) = a\cos(t)),$$

$$y(t) = b\sin(t).$$

Assuming $a \geq b$, the focal points are $(\pm\sqrt{a^2 - b^2}, 0)$.

See also Wikipedia [1373], MathWorld [1044], MathCurve [307].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Ellipse.py, and the XML code in the file D03_Ellipse.2D.xml.



18.2.4 Parabola

A parabola is a plane curve which is mirror-symmetrical and is approximately U-shaped. It fits several superficially different mathematical descriptions, which can all be proved to define exactly the same curves.

The graph of a quadratic function $y = ax^2 + bx + c$ (with $a \neq 0$) is a parabola with its axis parallel to the y-axis. Conversely, every such parabola is the graph of a quadratic function.

The surface of revolution obtained by rotating a parabola about its axis of symmetry is called a paraboloid.

See also: https://mathworld.wolfram.com/Parabola.html

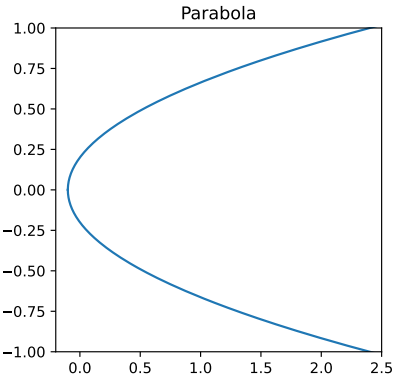
See also: https://en.wikipedia.org/wiki/Parabola

In polar coordinates, the equation of a parabola with parameter a and center (0, 0) is given by $r(t) = -\frac{2a}{1 + \cos(t)}$. It can also be written parametrically as

$$x(t) = at^2,$$

$$y(t) = 2at.$$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Parabola.py, and the XML code in the file D04_Parabola.2D.xml.



18.2.5 Hyperbola

In polar coordinates, the equation of a hyperbola centered at the origin (i.e., with $x_0 = y_0 = 0$) is $r2(t) = \dfrac{a^2 b^2}{b^2 \cos^2(t) - a^2 \sin^2(t)}$.

Parametric equations for the right branch of a hyperbola are given by

$$x(t) = a \cosh(t),$$

$$y(t) = b \sinh(t),$$

which ranges over the right branch of the hyperbola.

A parametric representation which ranges over both branches of the hyperbola is

$$x(t) = a \sec(t),$$

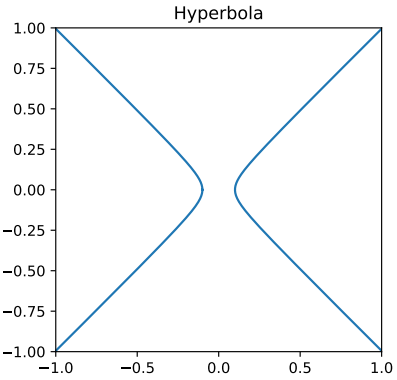
$$y(t) = b \tan(t),$$

with $t \in (-\pi, \pi)$ and discontinuities at $\pm\pi/2$.

See also: https://mathworld.wolfram.com/Hyperbola.html

See also: https://mathworld.wolfram.com/ConicSection.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Hyperbola.py, and the XML code in the file D05_Hyperbola.2D.xml.



18.2.6 Cycloid

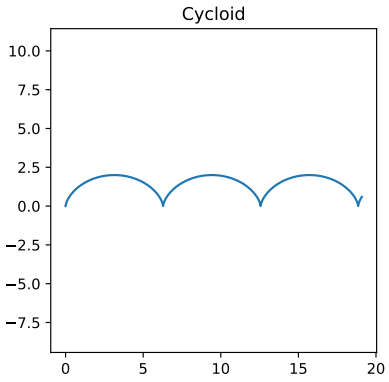
The cycloid is the locus of a point on the rim of a circle of radius a rolling along a straight line. If the cycloid has a cusp at the origin and its humps are oriented upward, its parametric equation is

$$x(t) = a(t - \sin(t)),$$

$$y(t) = a(t - \cos(t)).$$

See also Wikipedia [1372], MathWorld [1043], MathCurve [306].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Cycloid.py, and the XML code in the file D06_Cycloid.2D.xml.



18.2.7 Trochoid

A trochoid is the locus of a point at a distance b from the center of a circle of radius a rolling on a fixed line. A trochoid has parametric equations

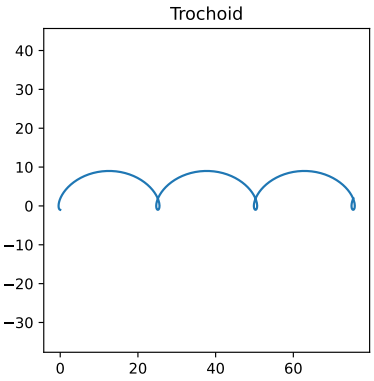
$$x(t) = at - b\sin(t),$$

$$y(t) = at - b\cos(t)).$$

If $b < a$, the trochoid is known as a curtate cycloid; if $b = a$, it is a cycloid; and if $b > a$, the curve is a prolate cycloid.

See also Wikipedia [1396], MathWorld [1055], MathCurve [326].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Trochoid.py, and the XML code in the file D07_Trochoid.2D.xml.



18.2.8 Cardioid

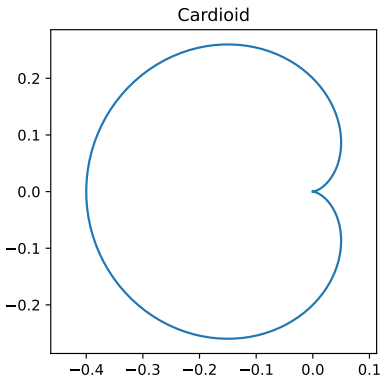
In geometry, a cardioid is a plane curve traced by a point on the perimeter of a circle that is rolling around a fixed circle of the same radius.

The polar equation is given by

$$r = a(1 - \cos(\theta)).$$

See also: Wikipedia [1401], MathWorld [1058]

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Cardioid.py, and the XML code in the file D08_Cardioid.2D.xml.



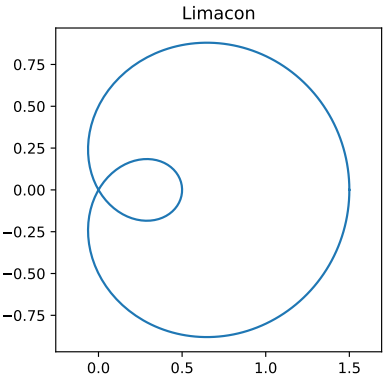
18.2.9 Limaçon curve

Returns the curve given by the polar equation

$$r = b + a\cos(\theta).$$

See also: see also Wikipedia [1415], MathWorld [1065]

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_LimaconCurve.py, and the XML code in the file D09_LimaconCurve.2D.xml.



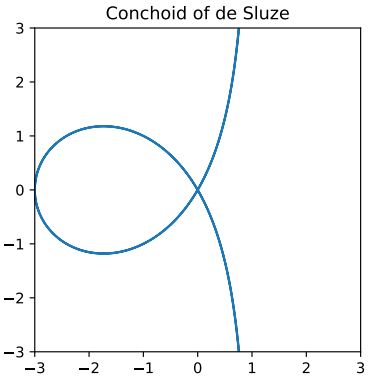
18.2.10 Conchoid of de Sluze

Returns the curve given by the polar equation

$$r = \sec(\theta) + a\cos(\theta).$$

See also: see also Wikipedia [1403], MathWorld [1059]

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_ConchoidOfDeSluze.py, and the XML code in the file D10_ConchoidOfDeSluze.2D.xml.



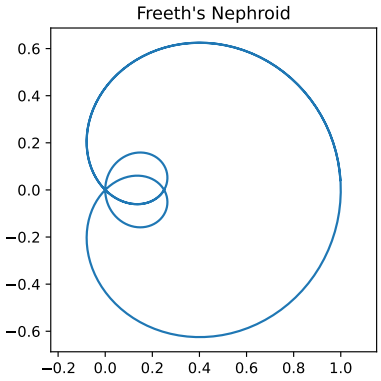
18.2.11 Freeth's Nephroid

The curve has the polar equation

$$r = a\left[1 + 2\sin\left(\tfrac{1}{2}\theta\right)\right]$$

See also: Wikipedia [1410], MathWorld [1063]

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_FreethNephroid.py, and the XML code in the file D11_FreethNephroid.2D.xml.



18.2.12 Strophoid

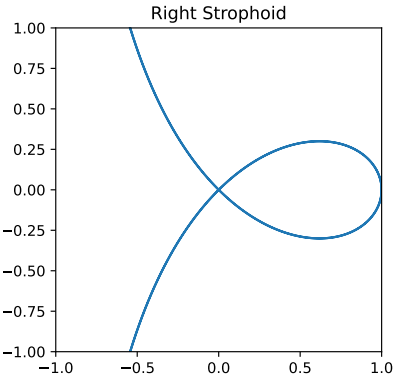
The name strophoid means "belt with a twist". The polar form for a general strophoid is

$$r = \frac{b \sin(a - 2\theta)}{\sin(a - \theta)}$$

See also: Wikipedia [1421], MathWorld [1069]

A special cases is the right strophoid with $a = \pi/2$.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_Strophoid.py, and the XML code in the file D12_Strophoid.2D.xml.



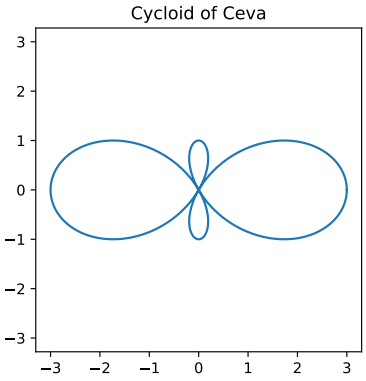
18.2.13 Cycloid of Ceva

A curve with the polar form

$$r = 1 + 2\cos(2\theta).$$

See also: Wikipedia [1404], MathWorld [1060]

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13_CycloidOfCeva.py, and the XML code in the file D13_CycloidOfCeva.2D.xml.



18.2.14 Lemniscate of Gerono

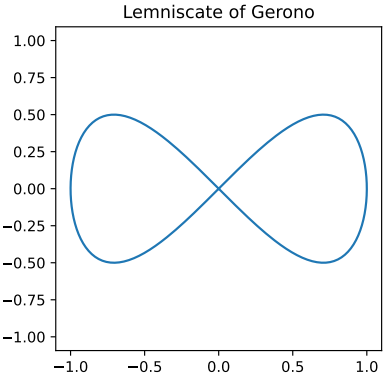
This curve is also known as Eight curve. It has parametric equations

$$x(t) = a \sin(t),$$

$$y(t) = x(t) \cos(t)).$$

See also Wikipedia [1387], MathWorld [1052], MathCurve [318].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14_LemniscateOfGerono.py, and the XML code in the file D14_LemniscateOfGerono.2D.xml.



18.2.15 Lemniscate of Bernoulli

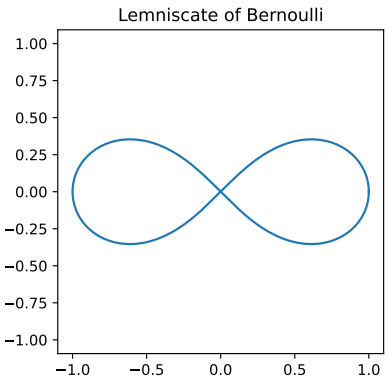
The lemniscate of Bernoulli is a polar curve defined as the locus of points such that the the product of distances from two fixed points $(-a, 0)$ and $(a, 0)$ is a constant a^2. It has parametric equations

$$x(t) = \frac{a\cos(t)}{1 + \sin^2(t)},$$

$$y(t) = x(t)\sin(t)).$$

See also Wikipedia [1386], MathWorld [1051], MathCurve [317].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D15_LemniscateOfBernoulli.py, and the XML code in the file D15_LemniscateOfBernoulli.2D.xml.



18.3 Spirals

18.3.1 Archimedes' spiral

The parametric equations of Archimedes' Spiral are

$$r(t) = at,$$

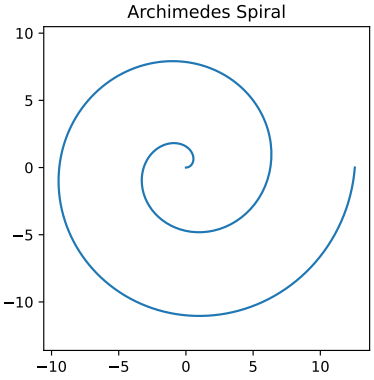
$$x(t) = r\cos(t),$$

$$y(t) = r\sin(t).$$

Changing the parameter a controls the distance between loops.

See also Wikipedia [1399], MathWorld [1056], MathCurve [302].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_ArchimedesSpiral.py, and the XML code in the file D01_ArchimedesSpiral.2D.xml.



18.3.2 Fermat's spiral

The parametric equations of Fermat' spiral are

$$r(t) = \pm a\sqrt{t},$$

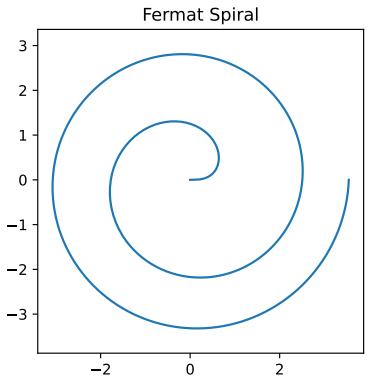
$$x(t) = r\cos(t),$$

$$y(t) = r\sin(t).$$

Changing the parameter a controls the distance between loops.

See also Wikipedia [1409], MathWorld [1062], MathCurve [1409].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_FermatSpiral.py, and the XML code in the file D02_FermatSpiral.2D.xml.



18.3.3 Hyperbolic Spiral

The parametric equations of the hyperbolic spiral are

$$r(t) = \frac{a}{t},$$

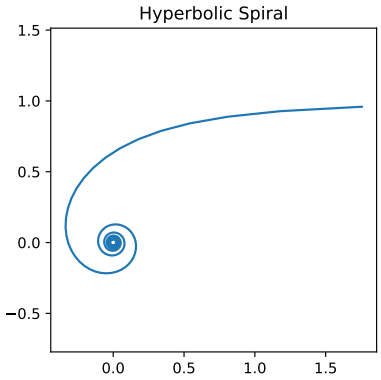
$$x(t) = r\cos(t),$$

$$y(t) = r\sin(t).$$

Changing the parameter a controls the distance between loops.

See also Wikipedia [1413], MathWorld [1064], MathCurve [313].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_HyperbolicSpiral.py, and the XML code in the file D03_HyperbolicSpiral.2D.xml.



18.3.4 Lituus

The parametric equations of the Lituus are

$$r(t) = \frac{a}{\sqrt{t}},$$

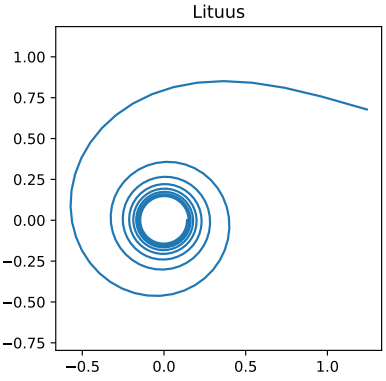
$$x(t) = r\cos(t),$$

$$y(t) = r\sin(t).$$

Changing the parameter a controls the distance between loops.

See also Wikipedia [1416], MathWorld [1066], MathCurve [321].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Lituus.py, and the XML code in the file D04_Lituus.2D.xml.



18.3.5 Logarithmic Spiral

The parametric equations of the logarithmic spiral are

$$r(t) = a\exp(kt),$$

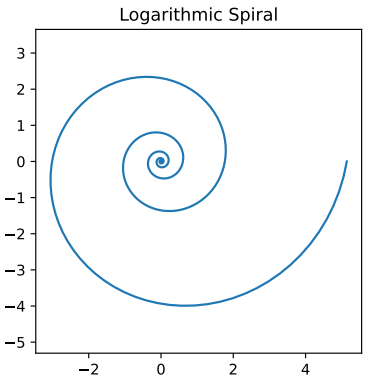
$$x(t) = r\cos(t),$$

$$y(t) = r\sin(t).$$

where $a > 0$ and $k \neq 0$ are real constants.

See also Wikipedia [1417], MathWorld [1067], MathCurve [322].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_LogarithmicSpiral.py, and the XML code in the file D05_LogarithmicSpiral.2D.xml.



18.3.6 Poinsot's Spiral

The parametric equations of the Poinsot spiral are

$$r(t) = \frac{a}{\alpha \cosh(kt) + \beta \sinh(kt)}, \quad \text{with } \alpha^2 + \beta^2 \neq 0.$$

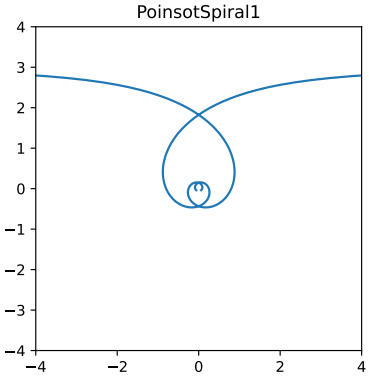
$$x(t) = r \cos(t),$$

$$y(t) = r \sin(t).$$

where $a > 0$ and $k \neq 0$ are real constants.

See also Wikipedia [1450], MathWorld [1079], MathCurve [332].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_PoinsotSpiral.py, and the XML code in the file D06_PoinsotSpiral.2D.xml.



18.3.7 Cotes's spiral

The shape of spirals in the family depends on the parameters. The curves in polar coordinates, $(r, \theta), r > 0$ are defined by one of the following five equations:

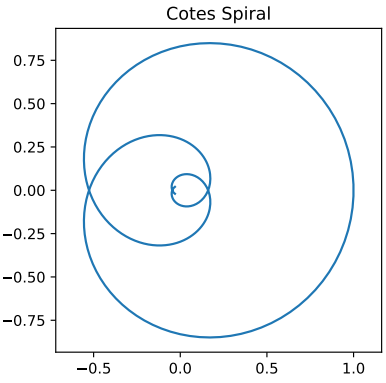
$$\frac{1}{r} = \begin{cases} A\cosh(k\theta + \varepsilon) \\ A\exp(k\theta + \varepsilon) \\ A\sinh(k\theta + \varepsilon) \\ A(k\theta + \varepsilon) \\ A\cos(k\theta + \varepsilon) \end{cases}$$

$A > 0$, $k > 0$ and ε are arbitrary real constants. A determines the size, k determines the shape, and ε determines the angular position of the spiral.

The first and third forms are Poinsot's spirals; the second is the logarithmic spiral; the fourth is the hyperbolic spiral; the fifth is the epispiral.

See also Wikipedia [1445], MathWorld [1074].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_CotesSpiral.py, and the XML code in the file D07_CotesSpiral.2D.xml.



18.3.8 Tanh Spiral

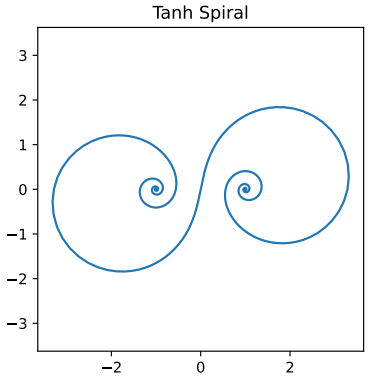
This is a spiral proposed by Bourke [34], and also discussed by Meier [413]. It has the following parametric equations:

$$x(t) = \frac{\sinh(2t)}{\cos(2at) + \cosh(2t)},$$

$$y(t) = \frac{\sin(2at)}{\cos(2at) + \cosh(2t)},$$

with $-\pi/2 \leq t \leq \pi/2$ and $a > 0$ (eg:2).

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_TanhSpiral.py, and the XML code in the file D08_TanhSpiral.2D.xml.



18.3.9 Nielsens Spiral

Nielsen's spiral, also called the sici spiral is the spiral with parametric equations

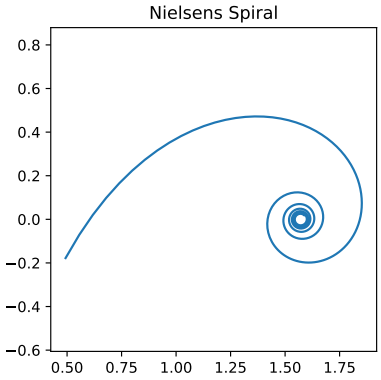
$$x(t) = a \cdot \mathrm{ci}(t),$$

$$y(t) = a \cdot \mathrm{si}(t),$$

where $\mathrm{ci}(t)$ is the cosine integral and $\mathrm{si}(t)$ is the sine integral.

See also Wikipedia [1449], MathWorld [1078], MathCurve [335].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_NielsenSpiral.py, and the XML code in the file D09_NielsenSpiral.2D.xml.



18.3.10 Cornu Spiral

The Cornu spiral, also known as a Euler spiral or clothoid, is the curve generated by a parametric plot of S(t) against C(t). A Cornu spiral has the property that its curvature at any point is proportional to the distance along the spiral, measured from the origin.

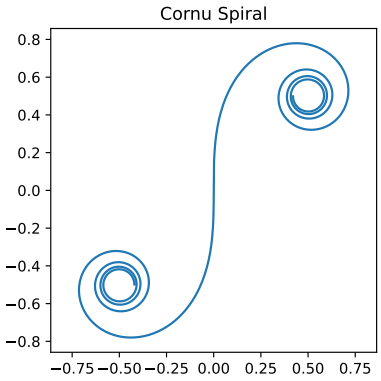
$$x(t) = a \cdot C(t),$$

$$y(t) = a \cdot S(t),$$

where $C(t)$ and $S(t)$ are the Fresnel integrals.

See also Wikipedia [1448], MathWorld [1073], MathCurve [328].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_CornuSpiral.py, and the XML code in the file D10_CornuSpiral.2D.xml.



18.4 Decorative curves

18.4.1 Fish curve

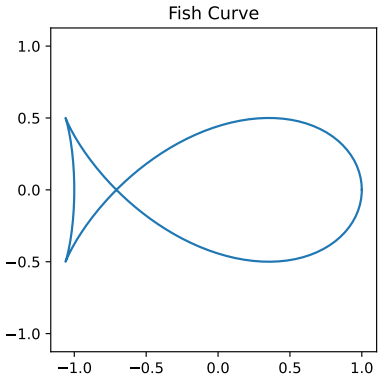
The fish curve has the parametric equation

$$x(t) = a\cos(t) - \frac{a\sin^2(t)}{\sqrt{2}},$$

$$y(t) = a\cos(t)\sin(t).$$

See also Wikipedia [1377], MathWorld [1047], MathCurve [311].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_FishCurve.py, and the XML code in the file D01_FishCurve.2D.xml.



18.4.2 Heart curve

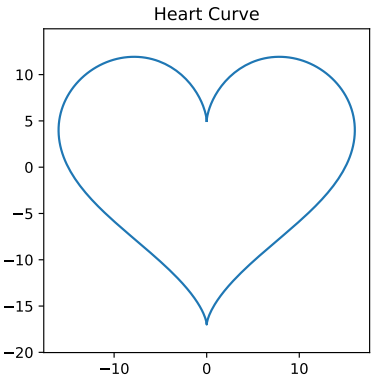
The heart curve has the parametric equation

$$x(t) = 16\sin^3(t),$$

$$y(t) = 13\cos(t) - 5\cos(2t) - 2\cos(3t) - \cos(4t)$$

See also Wikipedia [1379], MathWorld [1048].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_HeartCurve.py, and the XML code in the file D02_HeartCurve.2D.xml.



18.4.3 Chrysanthemum curve

The chrysanthemum curve (see Bourke [33]) is given in polar coordinates by the following

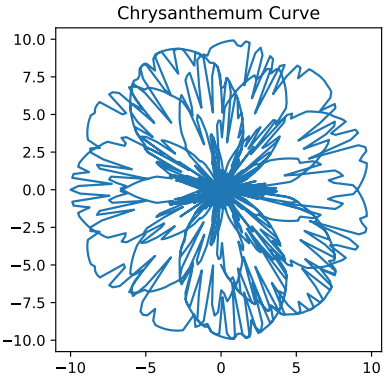
$$r = 5(1 + \sin(11t/5)) - 4\sin^4(17t/3)\sin^8(2\cos(3t) - 28t) \quad \text{where } 0 \leq t \leq 21\pi$$

and in Cartesian coordinates

$$x = r\cos(t)$$

$$y = r\sin(t)$$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_ChrysanthemumCurve.py, and the XML code in the file D03_ChrysanthemumCurve.2D.xml.



18.4.4 Butterfly curve

The butterfly curve is given in polar coordinates by the following

$$r = \exp(\cos(t)) - 2\cos(4t) - \sin^5(t/12)$$

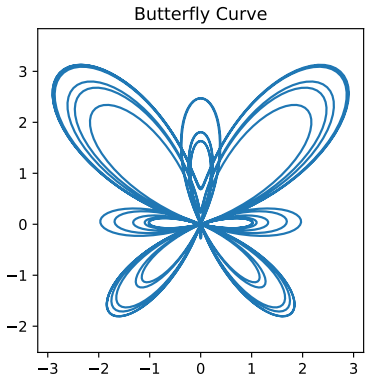
and in Cartesian coordinates

$$x = r\cos(t)$$

$$y = r\sin(t)$$

See also Wikipedia [1400], MathWorld [1057].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_ButterflyCurve.py, and the XML code in the file D04_ButterflyCurve.2D.xml.



18.5 General curve families

18.5.1 Regular star polygon

There exist infinitely many regular star polytopes in two dimensions, whose Schläfli symbols consist of rational numbers $\{n/m\}$. They are called star polygons and share the same vertex arrangements of the convex regular polygons.

$$r = \frac{a}{\cos\left(t - \alpha/2 - \alpha \left\lfloor \theta/\alpha \right\rfloor\right)}, \quad \text{where } \alpha = \frac{2m\pi}{n}.$$

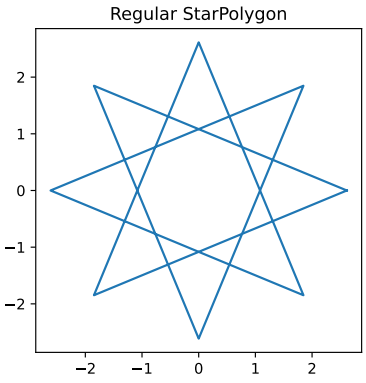
$$x(t) = r\cos(t)),$$

$$y(t) = r\sin(t).$$

See also: https://en.wikipedia.org/wiki/Star_polygon

See also: https://mathworld.wolfram.com/StarPolygon.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_RegularStarPolygon.py, and the XML code in the file D01_RegularStarPolygon.2D.xml.



18.5.2 Regular compound polygon (polygram)

The n vertices of the regular polygon being determined, all the associated regular polygons are obtained by joining the vertices from m to m, where m is coprime with n and between 1 and $n/2$. The case $m = 1$ gives the only uncrossed polygon, which is convex.

$$r = \frac{a}{\cos\left(t - \alpha/2 - \alpha\,\lfloor\theta/\alpha\rfloor\right)}, \quad \text{where } \alpha = \frac{2m\pi}{n}.$$

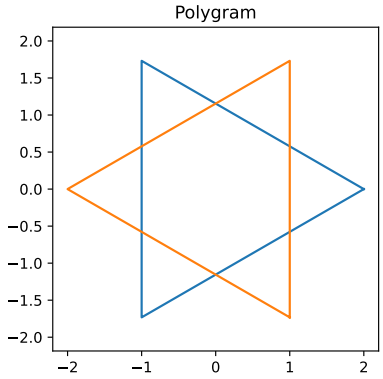
$$x(t) = r\cos(t)),$$

$$y(t) = r\sin(t).$$

See also: https://en.wikipedia.org/wiki/Polygram_(geometry)#Regular_compound_polygons

See also: https://mathworld.wolfram.com/Polygram.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Polygram.py, and the XML code in the file D02_Polygram.2D.xml.



18.5.3 Epicycloid

The epicycloids are the curves described by a point on a circle (C) rolling without slipping on a base circle (C_0), the open disks with boundaries (C) and (C_0) being disjoint. Therefore, they are special cases of epitrochoids. An epicycloid has parametric equations

$$qx(t) = a\left((q+1)\cos(t) - \cos\left((q+1)t\right)\right),$$

$$qy(t) = a\left((q+1)\sin(t) - \sin\left((q+1)t\right)\right).$$

See also Wikipedia [1374], MathWorld [1045], MathCurve [308].

The epicycloids are curves composed of isometric arcs (the arches) joining at cuspidal points (obtained for $t = \dfrac{2\pi}{q}$) in a finite number equal to the numerator of q if q is rational, or in an infinite number otherwise.

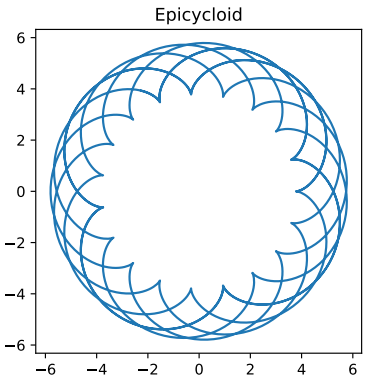
When q is rational, $q = \dfrac{n}{m}$, the curve is algebraic and rational (take $u = \tan\left(\dfrac{t}{2m}\right)$ as a parameter).

Its looks like a regular polygon, crossed if $m \geq 2$, with n vertices joined by m points by the curves located outside the circle (C_0).

The notation of simple epicycloid with n cusps (E_n) refers to the case $q = n$, i.e. when there are no crossovers.

Special cases are the cardioid $(q = 1)$, the nephroid $(q = 2)$, and the double cardioid $(q = 1/2)$,

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Epicycloid.py, and the XML code in the file D03_Epicycloid.2D.xml.



18.5.4 Hypocycloid

The hypocycloids are the curves described by a point on a circle (C) rolling without slipping on, and inside, a base circle (C_0), when the rolling circle is smaller than the fixed one. Therefore, they are special cases of hypotrochoids. A hypocycloid has parametric equations

$$qx(t) = a\left((q-1)\cos(t) - \cos\left((q-1)t\right)\right),$$

$$qy(t) = a\left((q-1)\sin(t) - \sin\left((q-1)t\right)\right).$$

See also Wikipedia [1380], MathWorld [1049], MathCurve [314].

The hypocycloids are curves composed of isometric arcs (the arches) connecting at cuspidal points (obtained for $t = \dfrac{2\pi}{q}$) in a finite number equal to the numerator of q if q is rational, or in an infinite number otherwise.

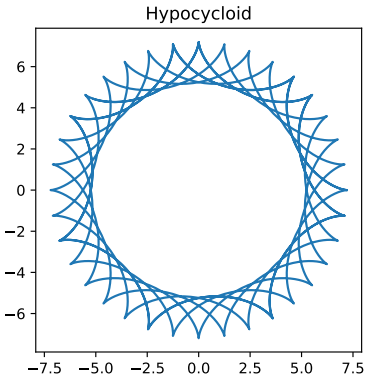
When q is rational, $q = \dfrac{n}{m}$, the curve is algebraic and rational (take $u = \tan\left(\dfrac{t}{2m}\right)$ as a parameter).

It has the same structure as a regular polygon, crossed if $m \geq 2$, with n vertices linked from m to m by curves located inside the circle (C_0).

The notation of simple hypocycloid with n cusps (E_n) refers to the case $q = n$, i.e. when there are no crossings.

Special cases are the point $(q = 1)$, the La Hire line $(q = 2)$, the deltoid $(q = 3)$, and the astroid $(q = 4)$.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Hypocycloid.py, and the XML code in the file D04_Hypocycloid.2D.xml.



18.5.5 Epitrochoid

The epitrochoids are the curves described by a point linked to a circle (C) rolling without slipping on a base circle (C_0), the open disks with boundaries (C) and (C_0) being disjoint. An epitrochoid has parametric equations

$$qx(t) = a\left((q+1)\cos(t) - k\cos\left((q+1)t\right)\right),$$

$$qy(t) = a\left((q+1)\sin(t) - k\sin\left((q+1)t\right)\right).$$

See also Wikipedia [1375], MathWorld [1046], MathCurve [310].

For $d = a + b$, we get the roses.

For $k < 1$, the curve is also called shortened epicycloid.

For $k > 1$, the curve is also called elongated epicycloid.

The limit case is $k = \dfrac{1}{q+1}$; there is then a flat point.

For $\dfrac{1}{q+1} < k < 1$, the curve undulates, with points of inflection.

For $k = 1$, we obtain the epicycloid, with cusps.

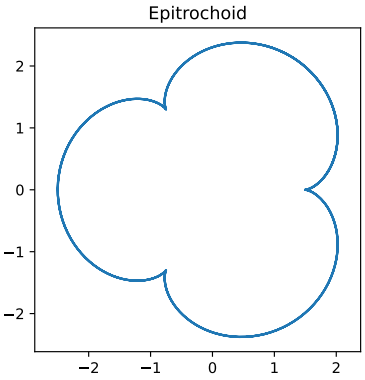
For $1 < k < q + 1$, the curve makes loops, with concave and convex portions, (positive angular speed, then negative alternately).

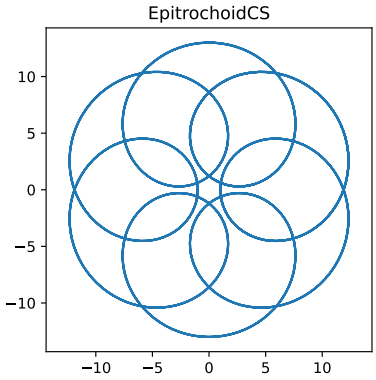
For $k = q + 1$, we get a rose with index $n < 1$, of polar equation $\rho = 2d\cos\dfrac{q}{q+2}\theta$.

The case $k > q - 1$ leads to a more complicated pattern.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Epitrochoids.py, and the XML code in the file D05_Epitrochoids.2D.xml.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_EpitrochoidCS.py, and the XML code in the file D05_EpitrochoidCS.2D.xml.





18.5.6 Hypotrochoid

The hypotrochoids are the curves described by a point linked to a circle (C) rolling without slipping internally on a base circle $(C0)$. A hypocycloid has parametric equations

$$qx(t) = a\left((q-1)\cos(t) - k\cos\left((q-1)t\right)\right),$$

$$qy(t) = a\left((q-1)\sin(t) - k\sin\left((q-1)t\right)\right).$$

See also Wikipedia [1381], MathWorld [1050], MathCurve [315].

For $k = 1$, we get the hypocycloids.

If a is fixed but q is changed into $\dfrac{q}{q-1}$ and k into $\dfrac{1}{k}$, then the hypotrochoid obtained is the homothetic image of the initial one with ratio k. Therefore, we get all the hypotrochoids by considering only the case $q \geq 2$.

For $q = 2$, we get the ellipses.

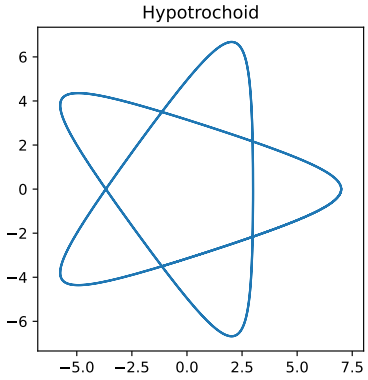
For $q > 2$, the curve is also called curtate hypocycloid if $k < 1$, and prolate hypocycloid if $k > 1$.

However, according to the preceding paragraph, in the case $1 < q < 2$, the curtate hypocycloids are paradoxically obtained for $k > 1$ and the prolate ones for $k < 1$.

For $k = q - 1$, we get a rose of index $n > 1$.

The hypocycloid with parameter $q = n/m$ constitutes a "rounded" approximation of the regular polygon of type (n, m); for the portions between two vertices to be as linear as possible, we can consider the limit case where this portion does not have an inflexion point, which corresponds to the case $k = 1/(q-1)$.

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Hypotrochoid.py, and the XML code in the file D06_Hypotrochoid.2D.xml.



18.5.7 Rose curve

A rose curve, also called Grandi's rose or the multifolium, is a curve which has the shape of a petalled flower. The polar equation of the rose is generally given as $r = a\cos(nt)$ or by the version rotated by 90 degrees, $r = a\sin(nt)$. The sine version has the advantage that roses with odd n have a petal oriented vertically (up or down depending on n), whereas the cosine orientation gives a petal oriented to the right.

See also Wikipedia [1419], MathWorld [1068], MathCurve [323].

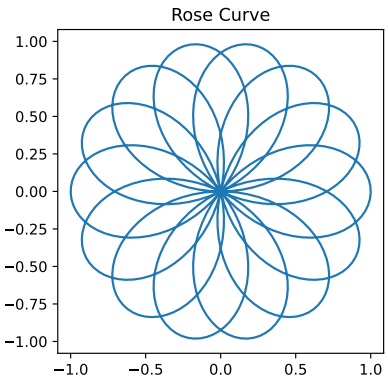
If n is odd, the rose is n-petalled. If n is even, the rose is $2n$-petalled.

The curve is algrebraic iff $n = p/q$ is rational, with degree $p + q$ when pq is odd and $2(p + q)$ when pq is even.

If $n = p/q$ is a rational number, then the curve closes at a polar angle of $\theta = \pi qm$, where $m = 1$ if pq is odd and $m = 2$ if pq is even. If n is irrational, then there are an infinite number of petals. For $n > 1$ the curve is a hypotrochoid, and for $0 < n < 1$ it is an epitrochoid. The roses are views from above of the clelias.

Special cases are the limaçon trisectrix ($n = 1/3$), the Dürer folium ($n = 1/2$), the circle ($n = 1$), the quadrifolium ($n = 2$) and the trifolium ($n = 3$).

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_RoseCurve.py, and the XML code in the file D07_RoseCurve.2D.xml.



18.5.8 Lissajous curves

Lissajous curves are the family of curves described by the parametric equations

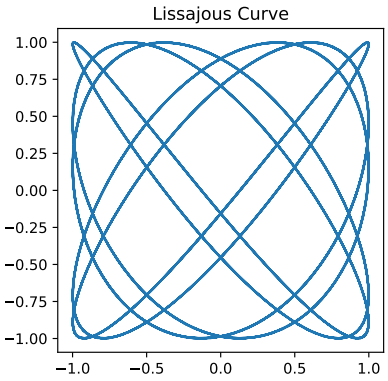
$$x(t) = a\sin(\omega t + \delta),$$

$$y(t) = b\sin(t).$$

See also Wikipedia [1388], MathWorld [1053], MathCurve [320].

Special cases are the line ($\omega = 1, \delta = 0$), the circle ($a = b, \omega = 1, \delta = \pi/2$), the ellipse ($a = b, \omega = 1, \delta = \pi/2$), the section of a parabola ($\omega = 2, \delta = \pi/2$).

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_LissajousCurve.py, and the XML code in the file D08_LissajousCurve.2D.xml.



18.5.9 Superellipses (Lamé curves)

Superellipses are the family of curves described by the parametric equations

$$x(t) = |\cos(t)|^{2/r} \cdot a \cdot \mathrm{sgn}(\cos(t)),$$

$$y(t) = |\sin(t)|^{2/r} \cdot b \cdot \mathrm{sgn}(\sin(t)),$$

with $0 \leq t \leq \pi/2$.

See also Wikipedia [1394], MathWorld [1054], MathCurve [316].

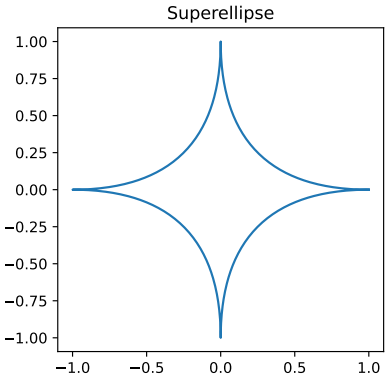
> The restriction to r>2 is sometimes made.

The generalization to a three-dimensional surface is known as a superellipsoid.

Superellipses with a=b are also known as Lamé curves or Lamé ovals, and the case $a = b$ with $r = 4$ is sometimes known as the squircle.

Special cases are the astroid ($r = 2/3$), the diamond ($r = 1$), the ellipse ($r = 2$).

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_Superellipses.py, and the XML code in the file D09_Superellipses.2D.xml.



18.5.10 Epispirals

The epispirals are solutions of the problem that consists in determining the trajectories in space of a massive point subject to a force centred on O proportional to $\frac{1}{\rho^3}$ (this force is, thanks to the Binet formula, proportional to $u^2(u+u'')$ which is here $(1+n^2)u^2$, with $u=\frac{1}{\rho}$); the other solutions are the Poinsot spirals, with intermediary case the hyperbolic spiral.

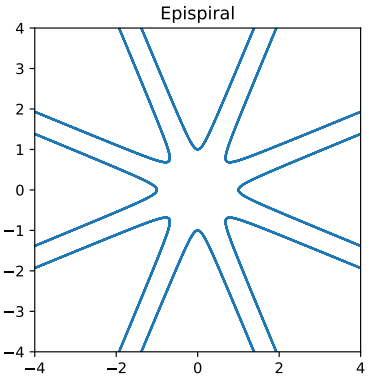
The curve is composed of an infinite branch obtained for $-\frac{\pi}{2n} < 0 < \frac{\pi}{2n}$, and of all its images by rotations by angle $k\left(\pi+\frac{\pi}{n}\right)$ for integer values of k. When n is a rational number with numerator p, and denominator q, the curve is symmetrical about O iff p or q is even.

In this case, the curve is composed of $2p$ branches derived from the initial branch by rotations by angles $\frac{2k\pi}{n}$ and $\frac{2k\pi}{n}+\pi$.

Special cases are the line ($n=1$), the crosscurve ($n=2$), the rectangukar trefoil ($n=3$), the Delanges trisectrix ($n=1/2$), the MacLaurin trisectrix ($n=1/3$).

See also Wikipedia [1408], MathWorld [1061], MathCurve [309].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_Epispirals.py, and the XML code in the file D10_Epispirals.2D.xml.



18.5.11 Nodal curves (stereographic projections of the clelia)

Polar equation: $\rho = a\tan(n\theta)$.

The nodal curves are the Brocard transforms of the Kappa, when the pole is at the centre of the Kappa. Each curve is composed of an infinite branch, the base, obtained for $-\frac{\pi}{2n} < 0 < \frac{\pi}{2n}$, and all its images by the rotations of angle $k\frac{\pi}{n}$ when k is an integer.

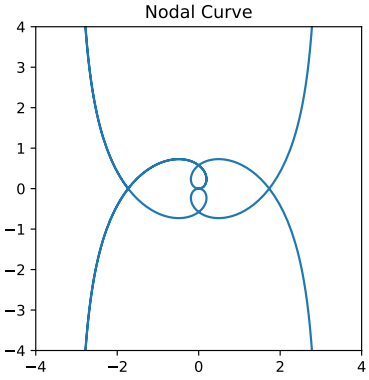
If n is rational and its numerator is p and its denominator q, then the curve is composed of 2p branches, images of the base branch by rotation when q is odd, and p branches when it is even.

Special cases are the Kappa ($n = 1$), the windmill ($n = 2$),the right strophoid ($n = 1/2$).

All nodal curves are stereographic projections of the clelia. The inverse (with centre O and radius a^2) of a nodal curve is the same curve turned by $\frac{\pi}{2n}$.

See also: MathCurve [331].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_NodalCurves.py, and the XML code in the file D11_NodalCurves.2D.xml.



18.5.12 Cyclic-harmonic curves

Polar equation: $\rho = a(1 + e\cos(n\theta))$.

The cyclic-harmonic curves are the conchoids of roses with respect to their centre. The curve is composed of a base pattern, symmetrical about Ox, obtained for $-\frac{\pi}{n} \leq 0 \leq \frac{\pi}{n}$, transformed by all the rotations of $2k\frac{\pi}{n}$ for integer values of k. When n is a rational number and p is its numerator, p rotations give the whole curve.

Case $e < 1$: For $n = p/q$, the cyclic-harmonic curve of parameter n is one of the possible projections of the Turk's head knot of type (p, q); its p external summits and its p internal vertices form a regular polygon, and it has $p(q - 1)$ double points.

Special cases are the trefoil knot ($n = 3/2$), the projection of the 5.1 knot ($n = 5/2$) the projection of the figure-eight knot ($n = 2/3$).

Case $e = 1$:

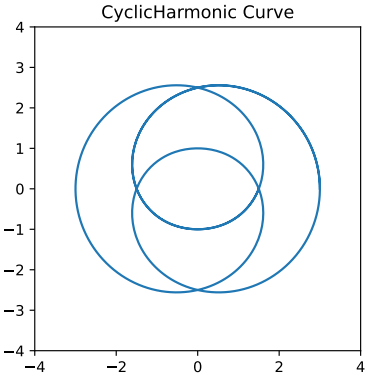
Special cases are the cardioid for $n = 1$ (see also Wikipedia [1401], MathWorld [1058], MathCurve [303]), the double egg ($n = 2$)

Case $e > 1$:

Special cases are the limaçon of Pascal for $n = 1$ (see also Wikipedia [1415], MathWorld [1065], MathCurve [319]), the cycloid (or trisectrix) of Ceva for $n = 2$ (see also Wikipedia [1404], MathWorld [1060], MathCurve [304]), and Freeth's nephroid for $n = 1/2$ (see also Wikipedia [1410], MathWorld [1063], MathCurve [312]).

See also: MathCurve [329].

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_CyclicHarmonicCurves.py, and the XML code in the file D12_CyclicHarmonicCurves.2D.xml.



18.5.13 Rational circular cubics

The rational circular cubics have the following parametrization (see MathCurve [333]):

$$x(t) = \frac{dt^2 + 2bt + 2a + d}{1 + t^2}$$

$$y(t) = \frac{dt^3 + 2bt^2 + 2at + dt}{1 + t^2} = tx(t).$$

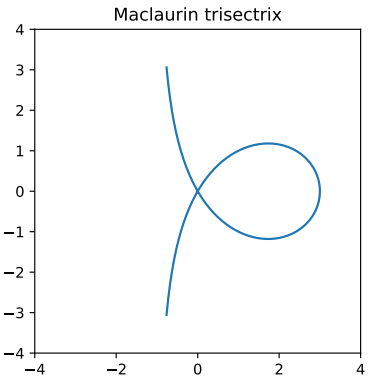
They have a real singularity (see Wikipedia [1451]), which is necessarily unique.

- For $\sqrt{a^2 + b^2} > |a+d|$, the cubic is called crunodal, i.e. this singularity is a double point with different tangents (see Wikipedia [1446], MathWorld [1075]).
- For $\sqrt{a^2 + b^2} = |a+d|$, the cubic is called cuspidal, i.e. this singularity is a cuspidal point (see Wikipedia [1447], MathWorld [1076]).
- For $\sqrt{a^2 + b^2} < |a+d|$, the cubic is called acnodal, i.e. this singularity is an isolated point (see Wikipedia [1443], MathWorld [1071]).

Many other parametric curves can be obtained as special cases:

- For $b = 0$, we get the right rational circular cubics (see also: MathCurve [334]).
- For $\sqrt{a^2 + b^2} = |a + d|$, we get the cissoids (see Wikipedia [1444], MathWorld [1072], MathCurve [327]).
- For $d = -a$, we get the strophoids (see Wikipedia [1421], MathWorld [1069], MathCurve [325]).
- For $a = -2d, b = 0$, we get the Maclaurin trisectrix (see Wikipedia [1452], MathWorld [1077], MathCurve [330]).
- In the right and acnodal case (i.e. b = 0, d > 0), we get the cubic (or conchoid) of de Sluze (see Wikipedia [1403], MathWorld [1059], MathCurve [324]).

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13_RationalCircularCubics.py, and the XML code in the file D13_RationalCircularCubics.2D.xml.



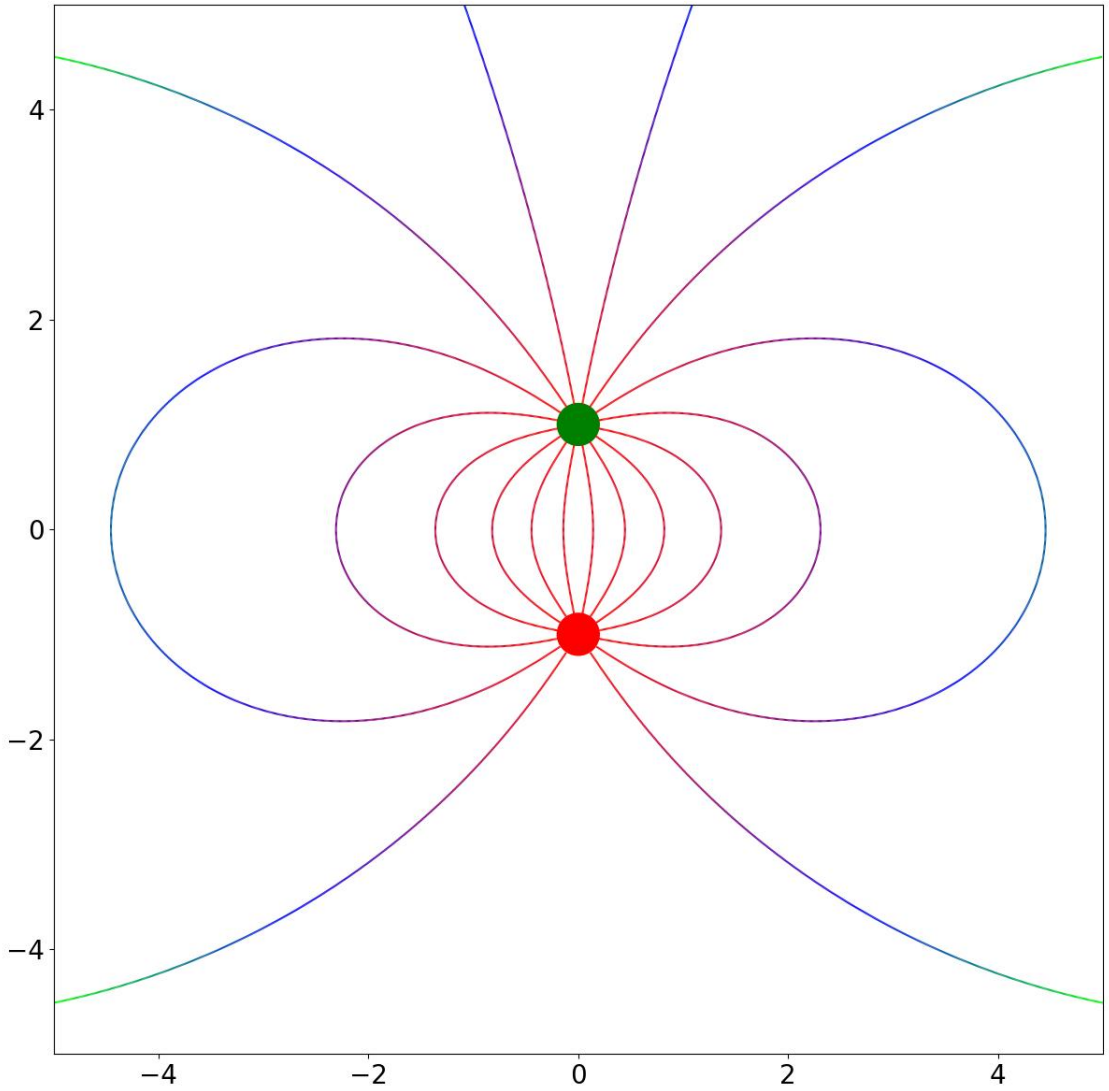
18.6 Field lines

18.6.1 Colored electric field lines: 1 positive vs 1 negative charge

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_4_ColoredFieldLines.py, and the XML code in the file D01_4_ColoredFieldLines.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        UseColors_ = True
        Model_ = 1  # 1, 2, 3, 4
        ColoredFieldLines(UseColors=UseColors_, Model=Model_)
```

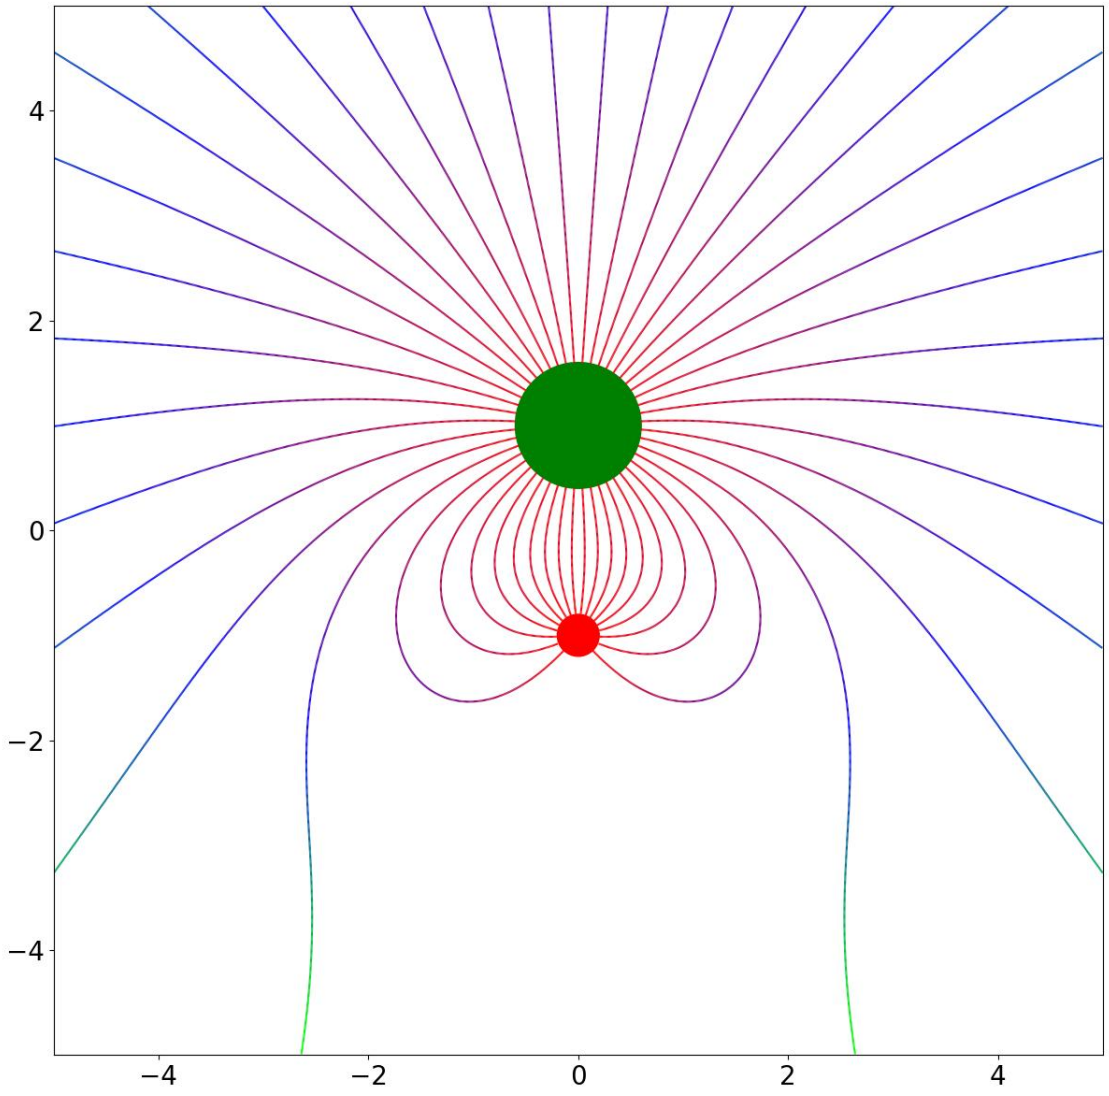


18.6.2 Colored electric field lines: 3 positive vs 1 negative charge(s)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_4_ColoredFieldLines.py, and the XML code in the file D01_4_ColoredFieldLines.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        UseColors_ = True
        Model_ = 2  # 1, 2, 3, 4
        ColoredFieldLines(UseColors=UseColors_, Model=Model_)
```

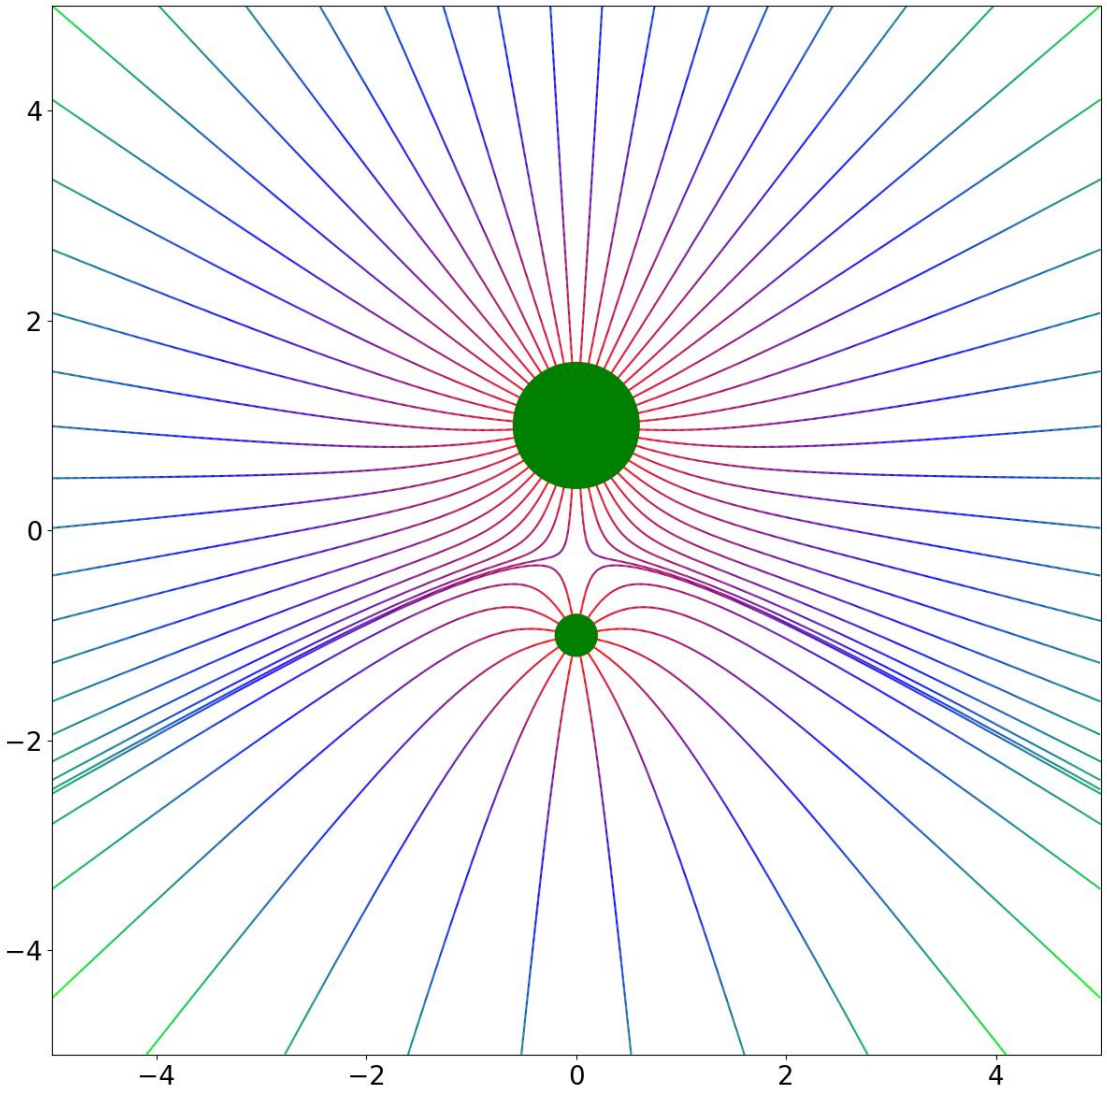


18.6.3 Colored electric field lines: 3 positive vs 1 positive charge(s)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_4_ColoredFieldLines.py, and the XML code in the file D01_4_ColoredFieldLines.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        UseColors_ = True
        Model_ = 3  # 1, 2, 3, 4
        ColoredFieldLines(UseColors=UseColors_, Model=Model_)
```

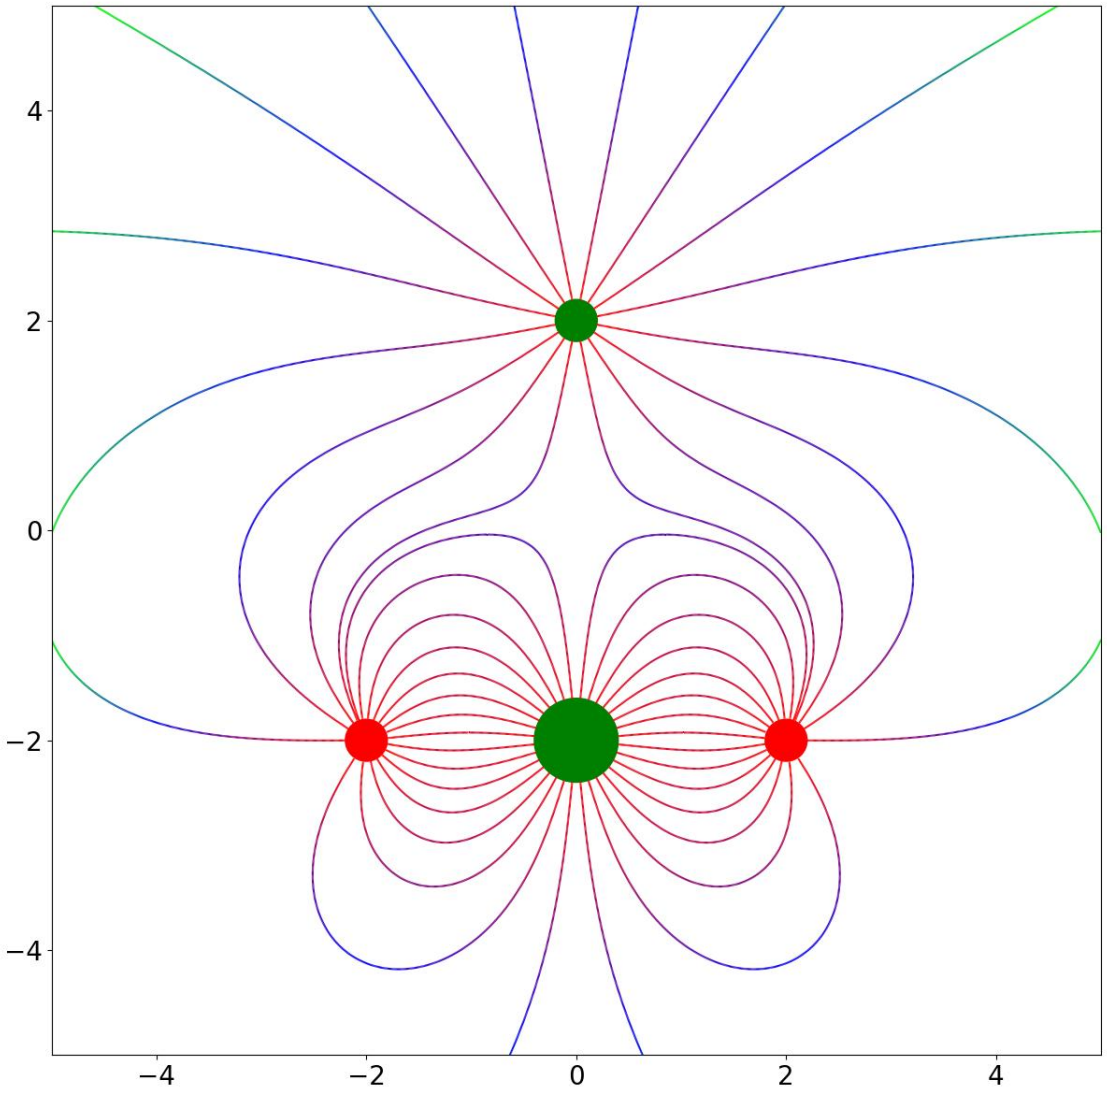


18.6.4 Colored electric field lines: 3 positive and 2 negative vs 1 positive charge(s)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_4_ColoredFieldLines.py, and the XML code in the file D01_4_ColoredFieldLines.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

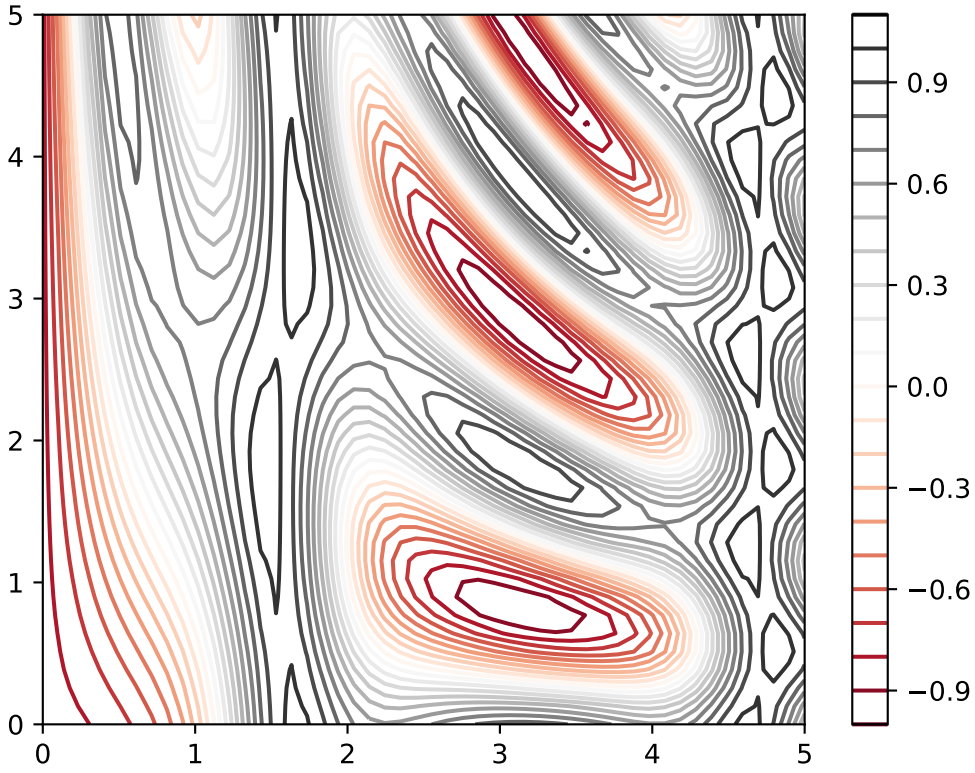
```
try:
    if __name__ == '__main__':
        UseColors_ = True
        Model_ = 4  # 1, 2, 3, 4
        ColoredFieldLines(UseColors=UseColors_, Model=Model_)
```



18.7 Contours

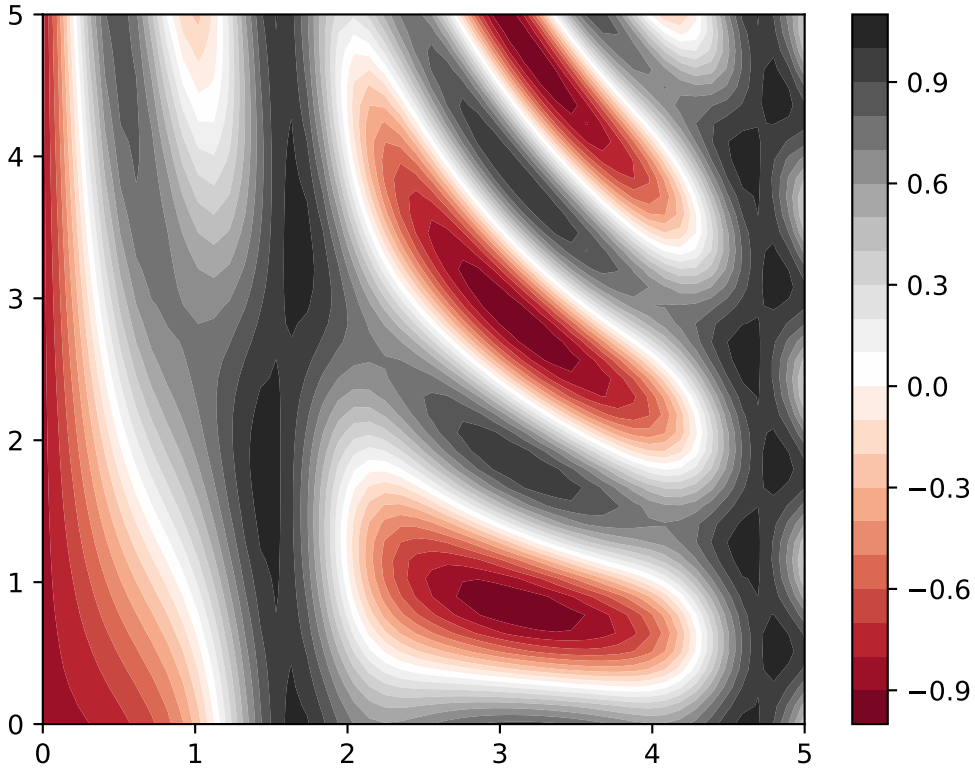
18.7.1 Open Contourplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_ContourOpen.py, and the XML code in the file D01_ContourOpen.2D.xml.



18.7.2 Filled Contourplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_ContourFilled.py, and the XML code in the file D02_ContourFilled.2D.xml.

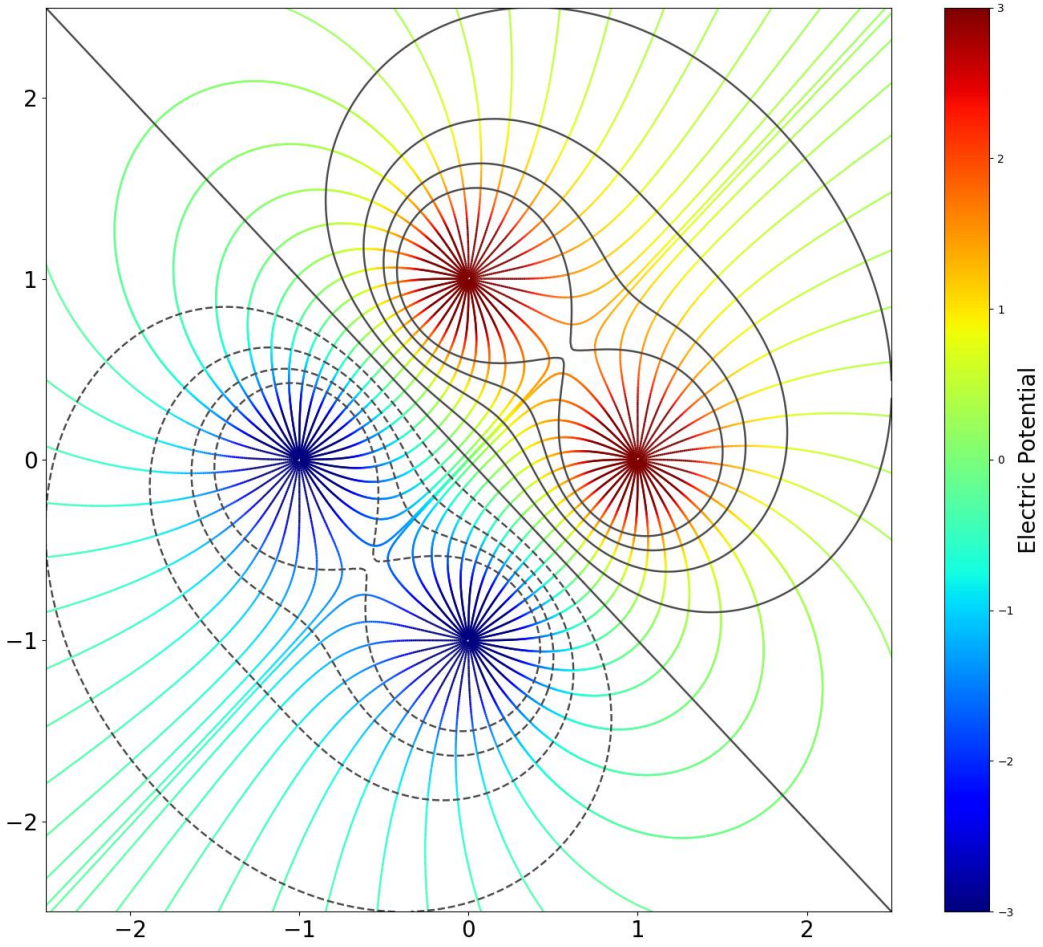


18.7.3 Electric dipole: field lines and open contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = False
        Model_ = 1  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```

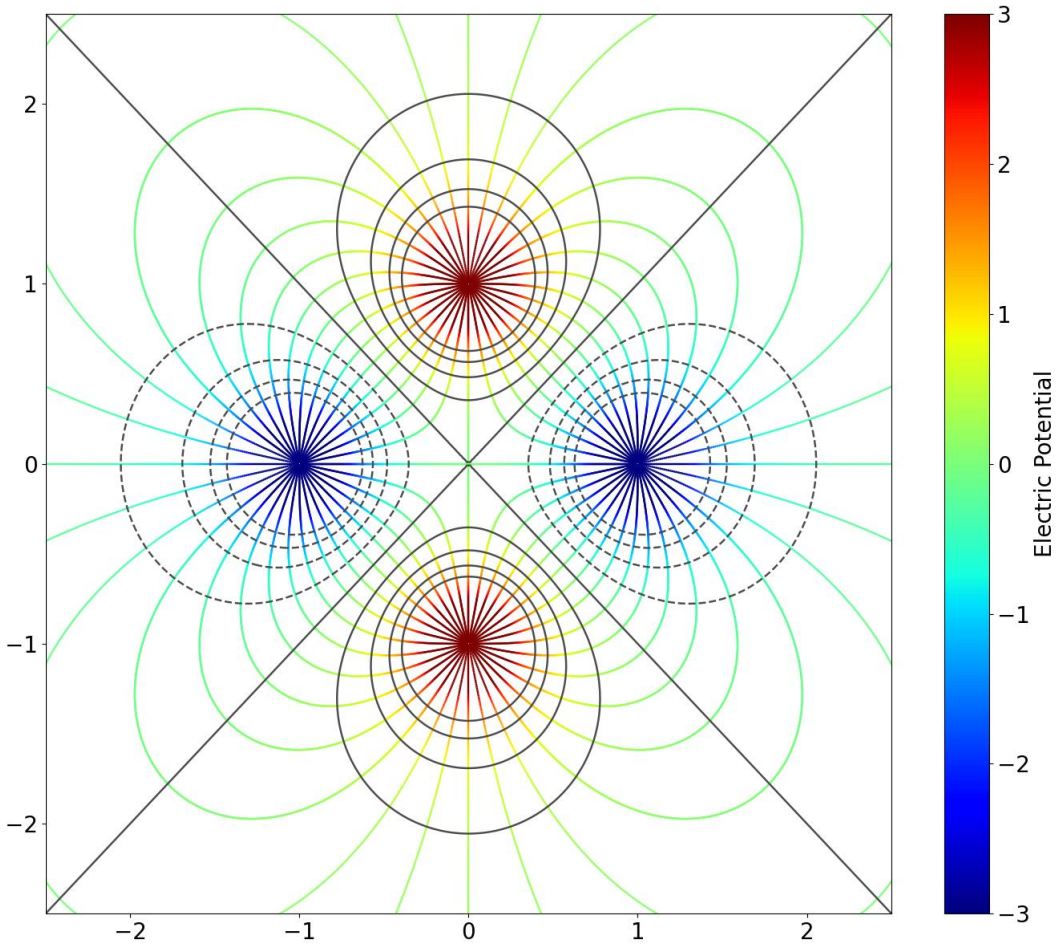


18.7.4 Electric quadrupole: field lines and open contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = False
        Model_ = 2  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```

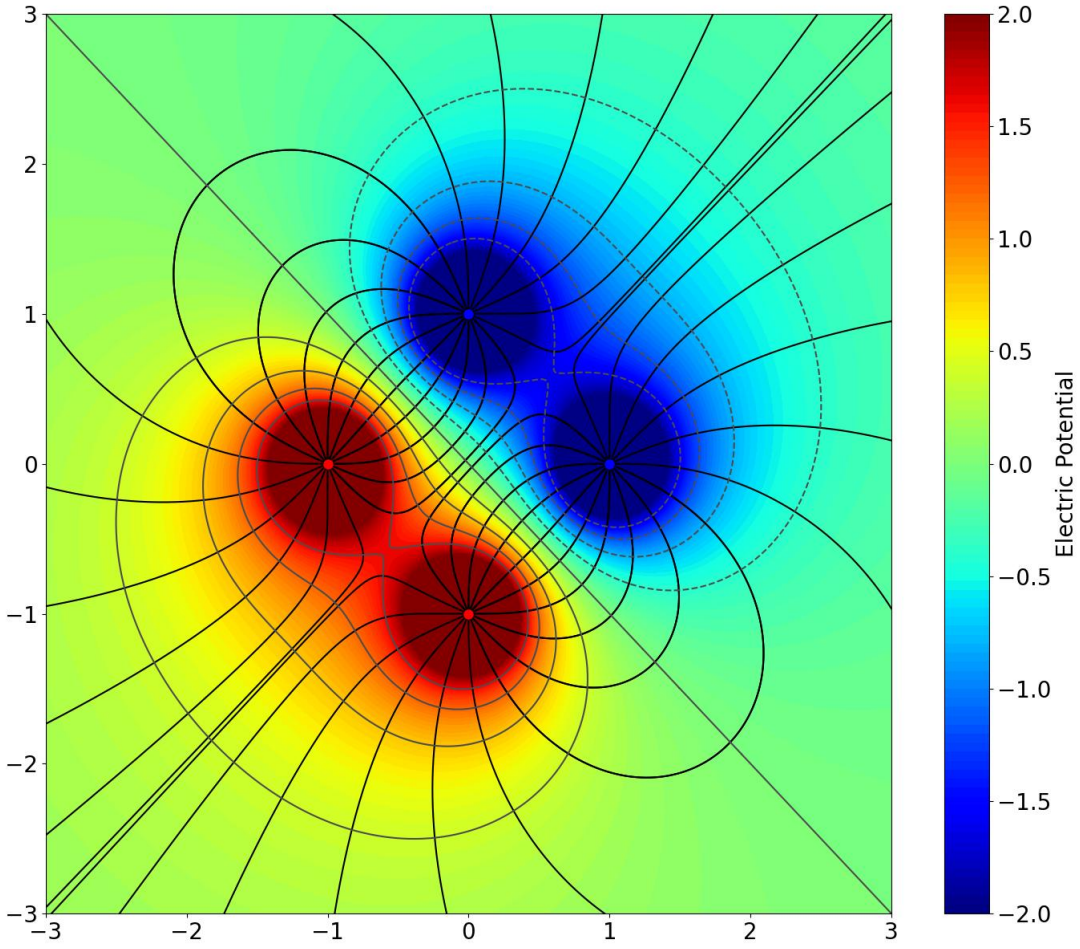


18.7.5 Electric dipoles: field lines and filled contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = True
        Model_ = 1  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```

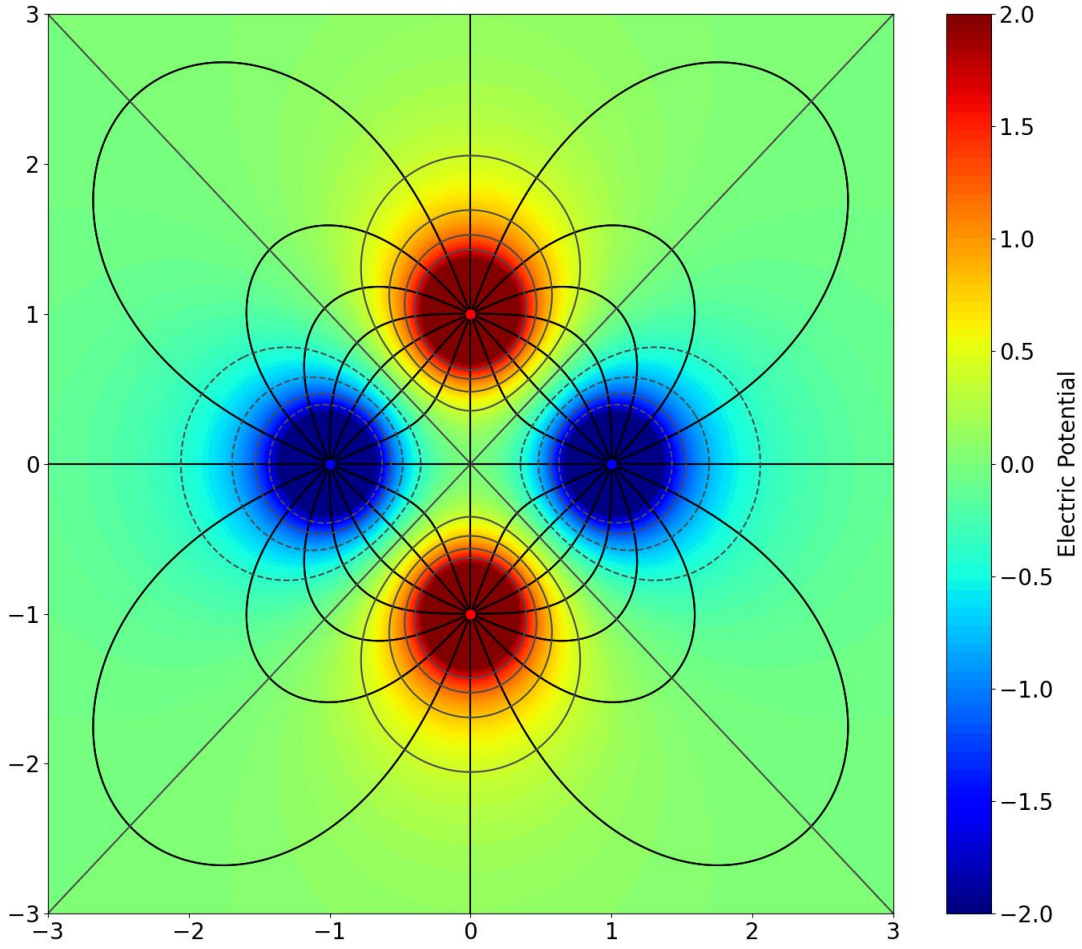


18.7.6 Electric quadrupole: field lines and filled contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = True
        Model_ = 2  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```

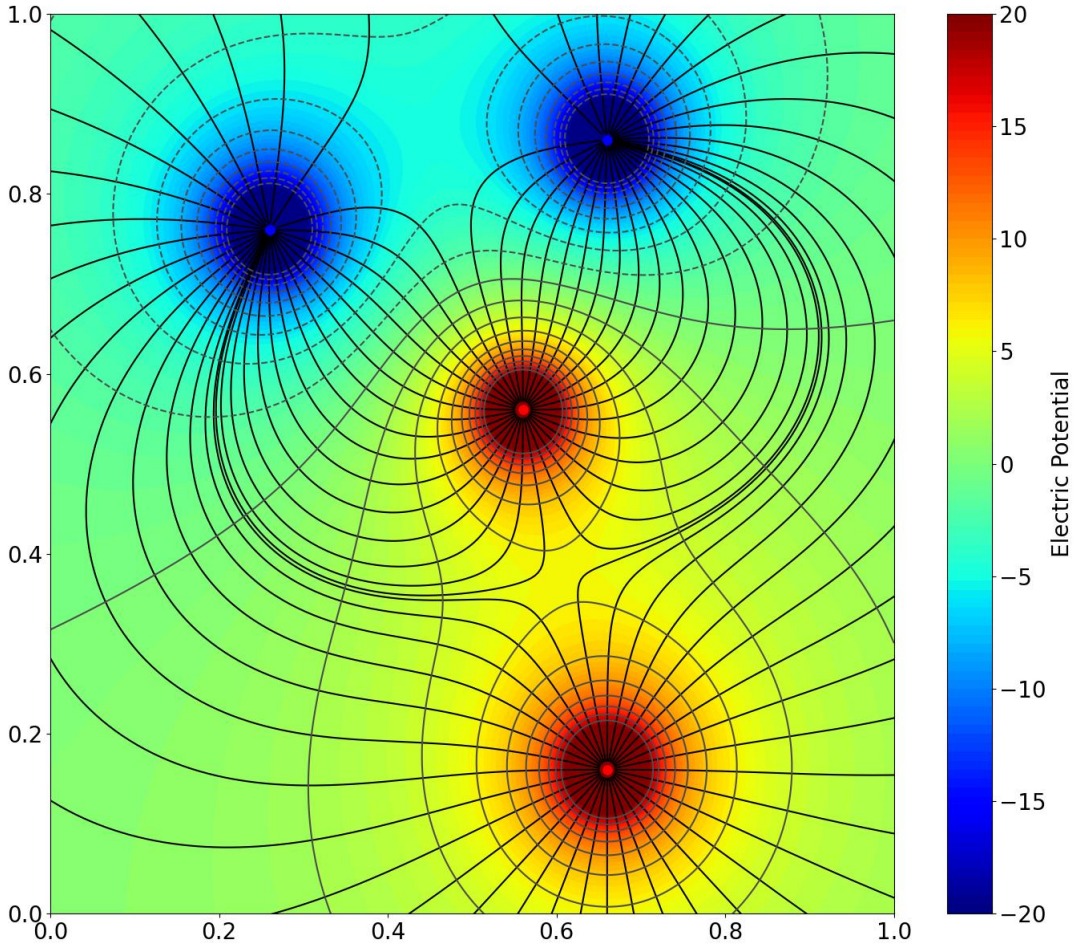


18.7.7 Orthogonal electric dipoles: field lines and filled contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = True
        Model_ = 3  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```

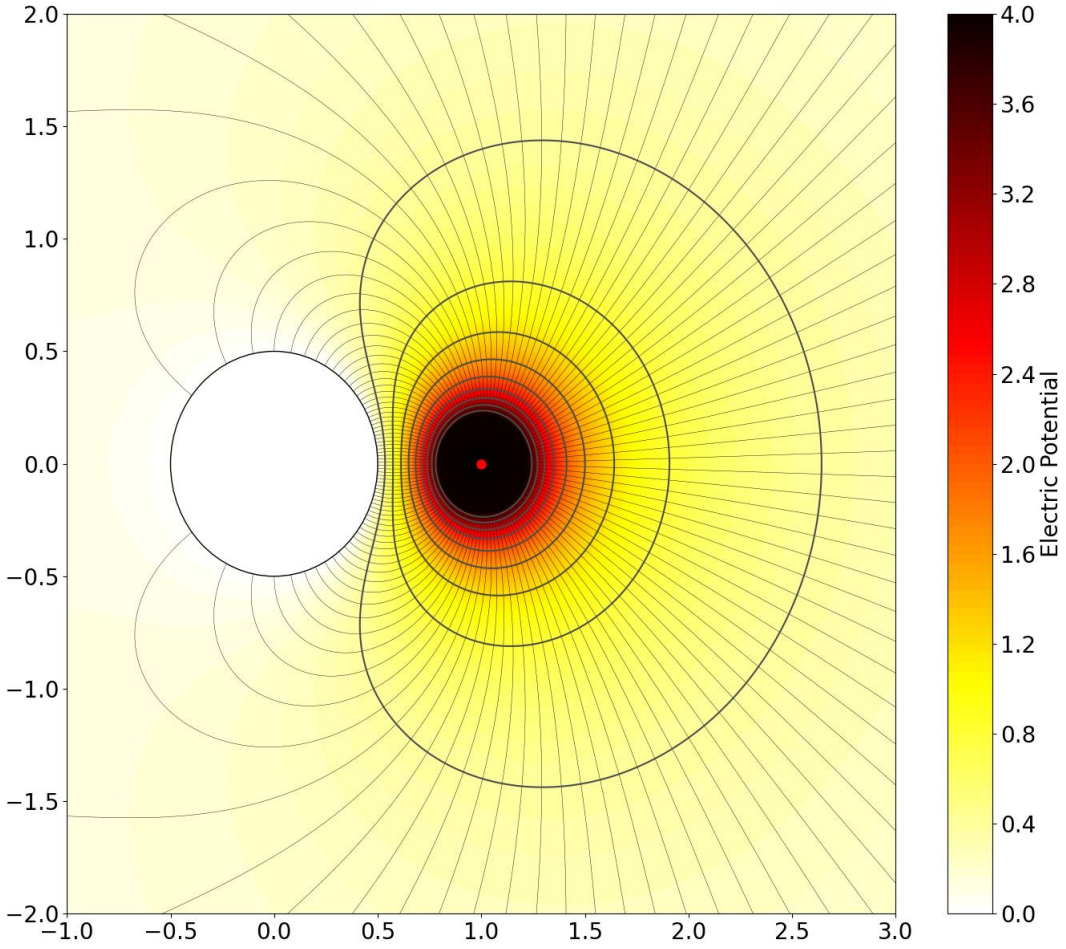


18.7.8 Electric field lines around a point charge with grounded sphere

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_08_FieldLinesContours.py, and the XML code in the file D03_08_FieldLinesContours.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ContourFilled_ = True
        Model_ = 4  # 1, 2, 3, 4
        FieldLinesContours(ContourFilled=ContourFilled_, Model=Model_)
```



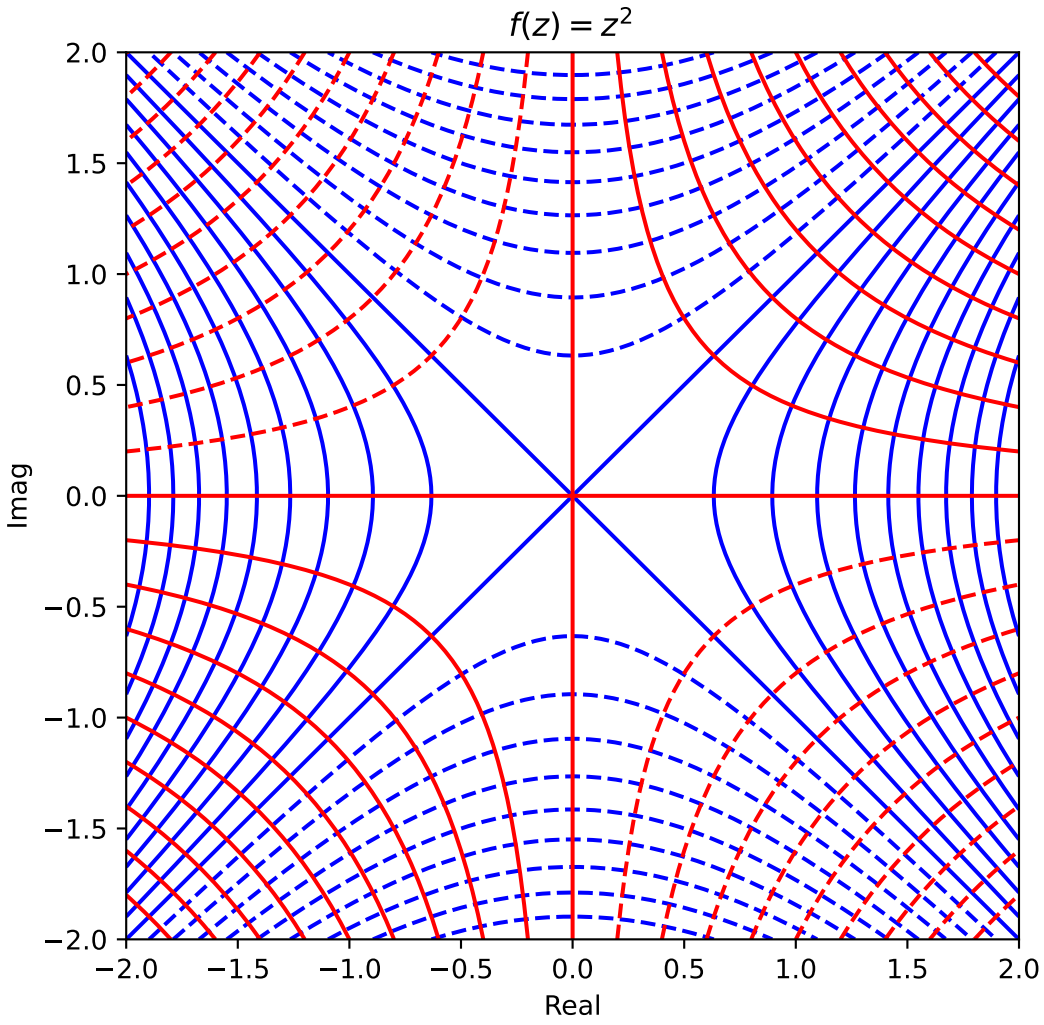
18.8 Complex functions rendered as contours

18.8.1 Complex square function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=lambda z:z*z, wclip=20.0,
            showlevels=True, Title=r'$f(z)=z^2$')
```

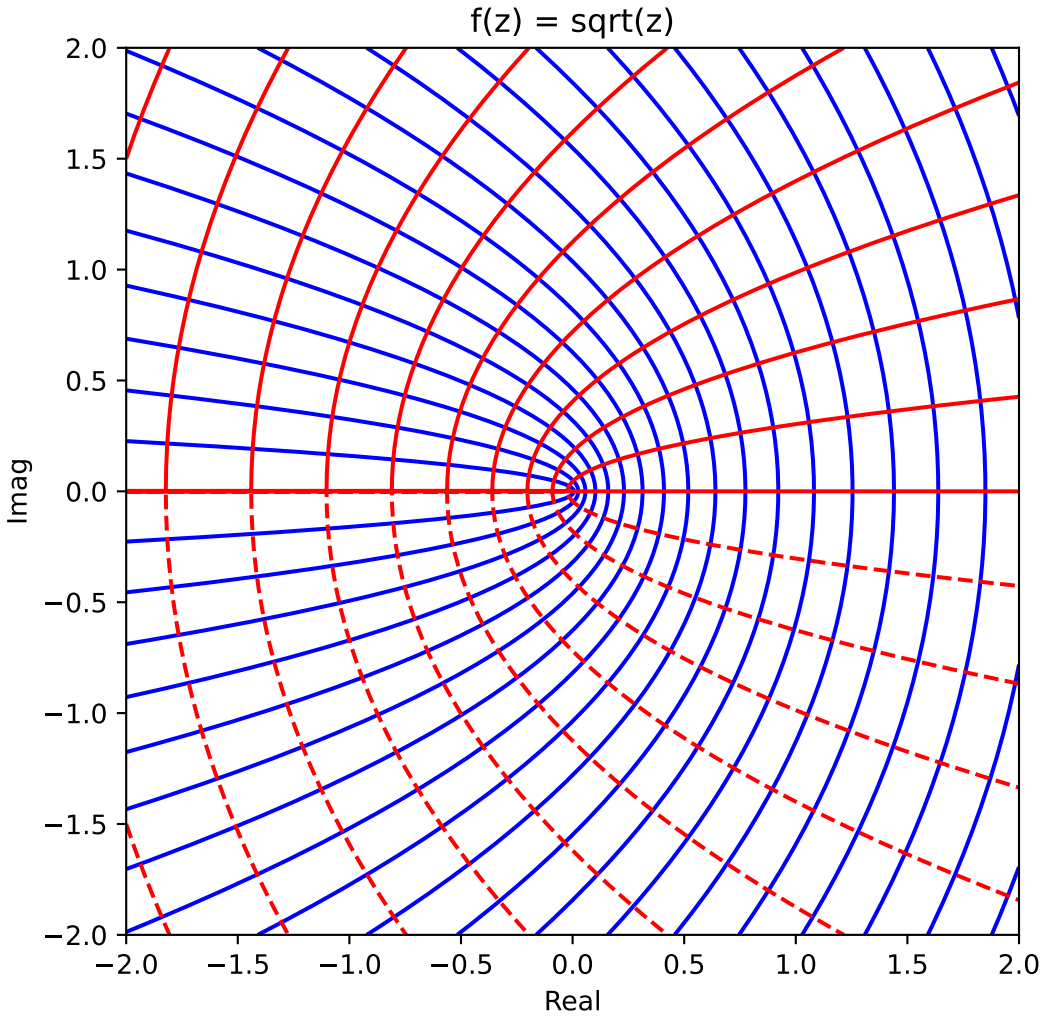


18.8.2 Complex sqrt function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.sqrt, wclip=20.0, Title='f(z)=sqrt(z)')
```

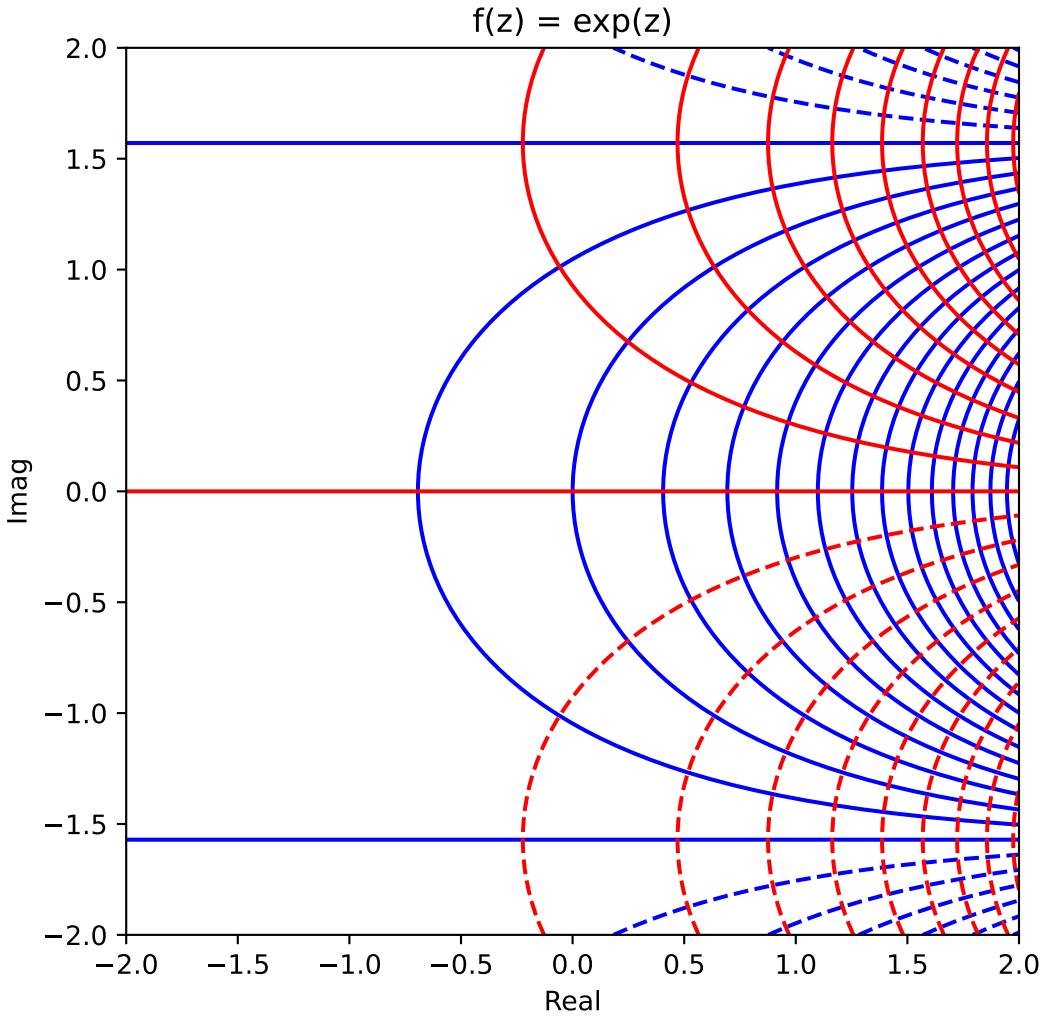


18.8.3 Complex exp function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.exp, wclip=20.0, Title='f(z)=exp(z)')
```

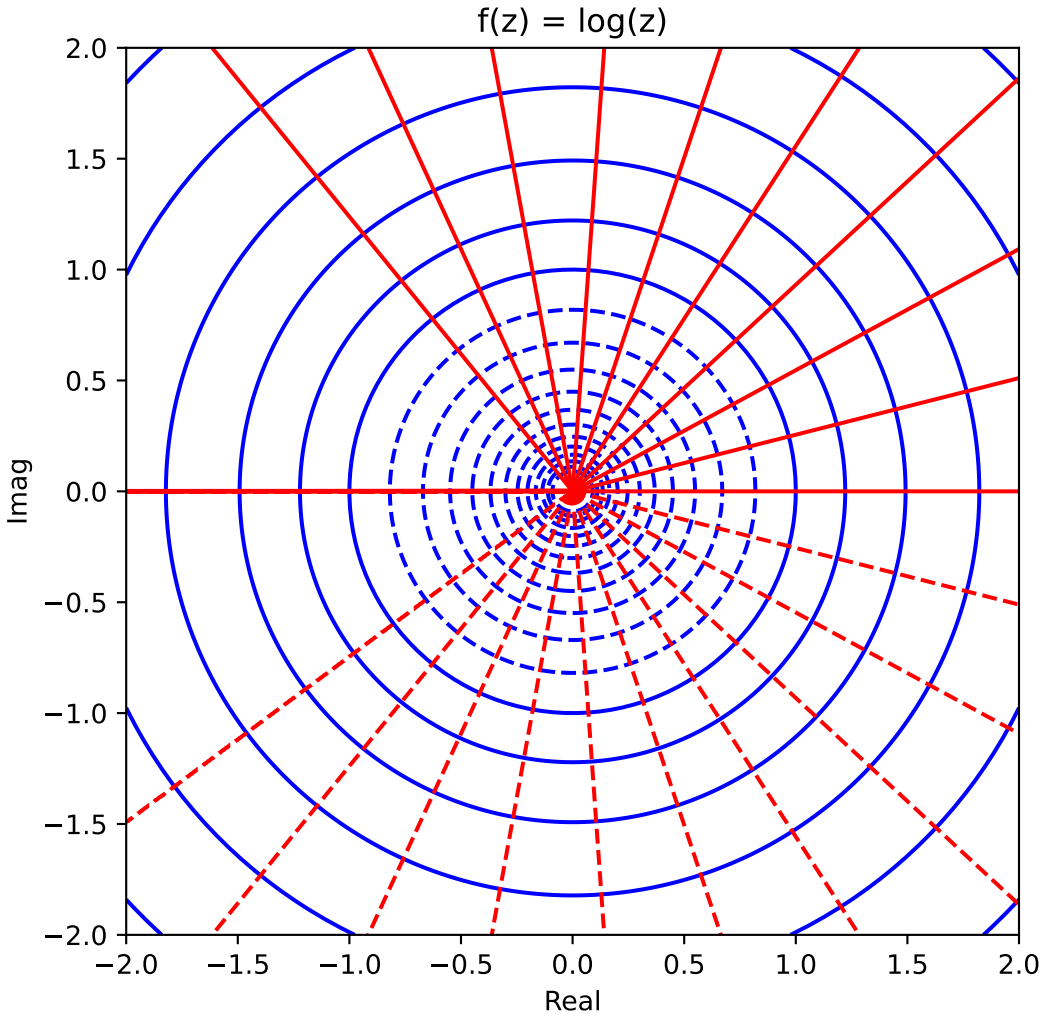


18.8.4 Complex log function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.log, wclip=2.5, Title='f(z)=log(z)')
```

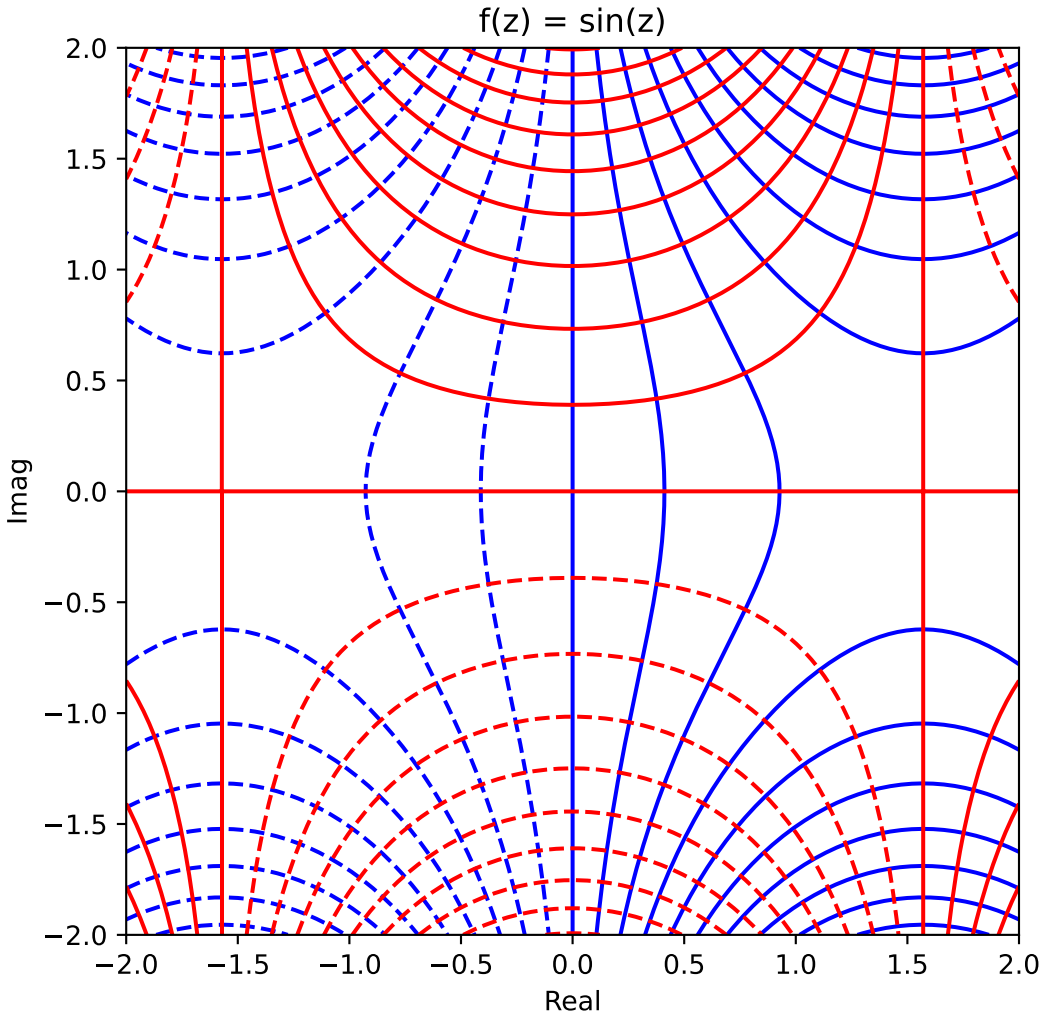


18.8.5 Complex sine function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.sin, wclip=20.0, Title='f(z)=sin(z)')
```

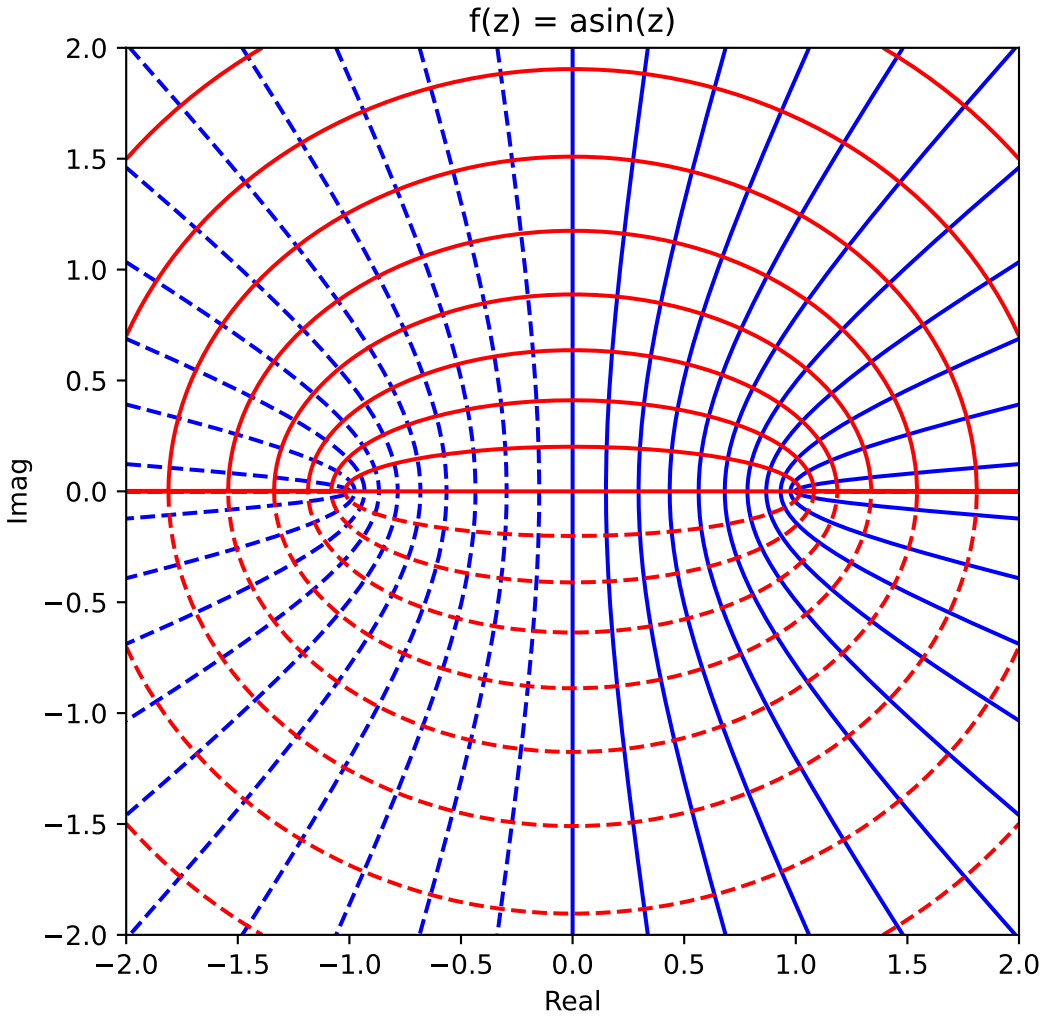


18.8.6 Complex asin function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.asin, wclip=20.0, Title='f(z)=asin(z)')
```

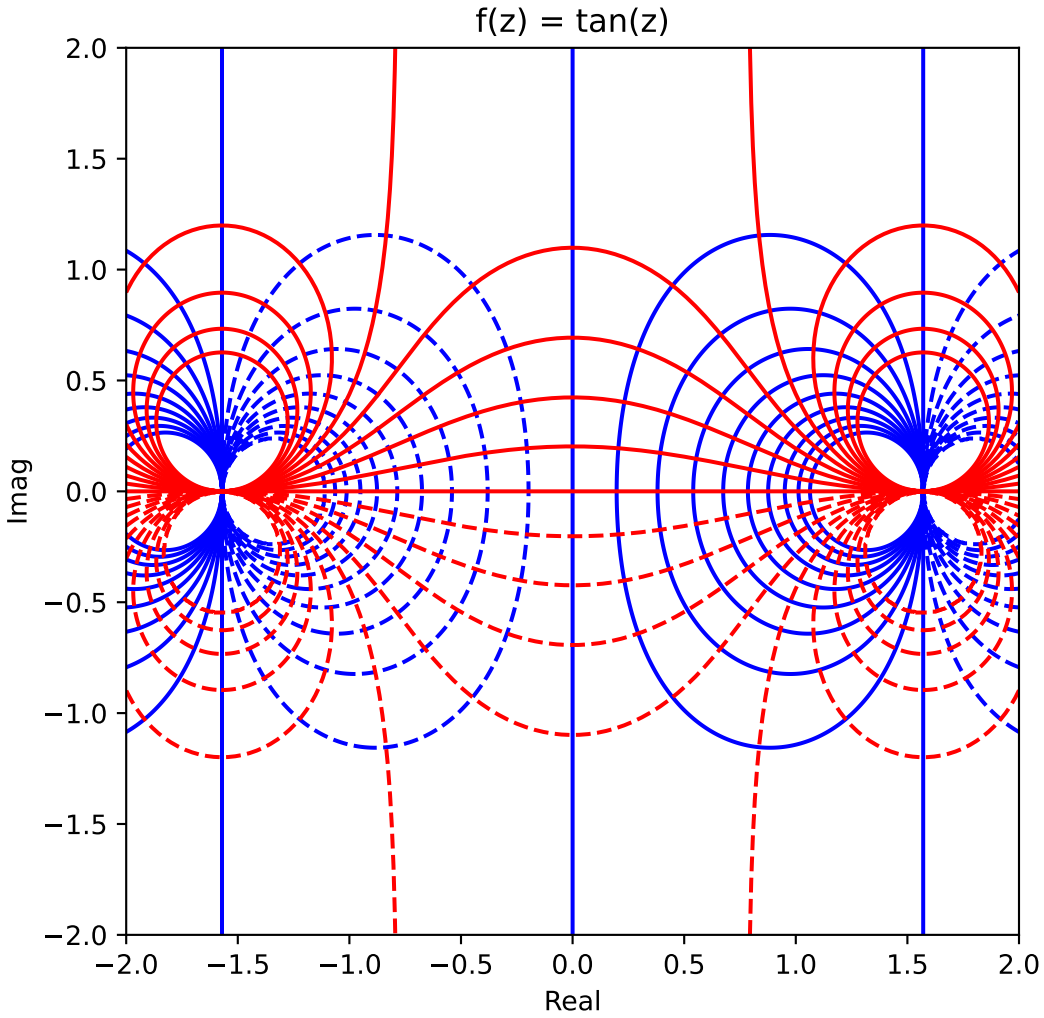


18.8.7 Complex tan function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.tan, wclip=2.0, Title='f(z)=tan(z)')
```

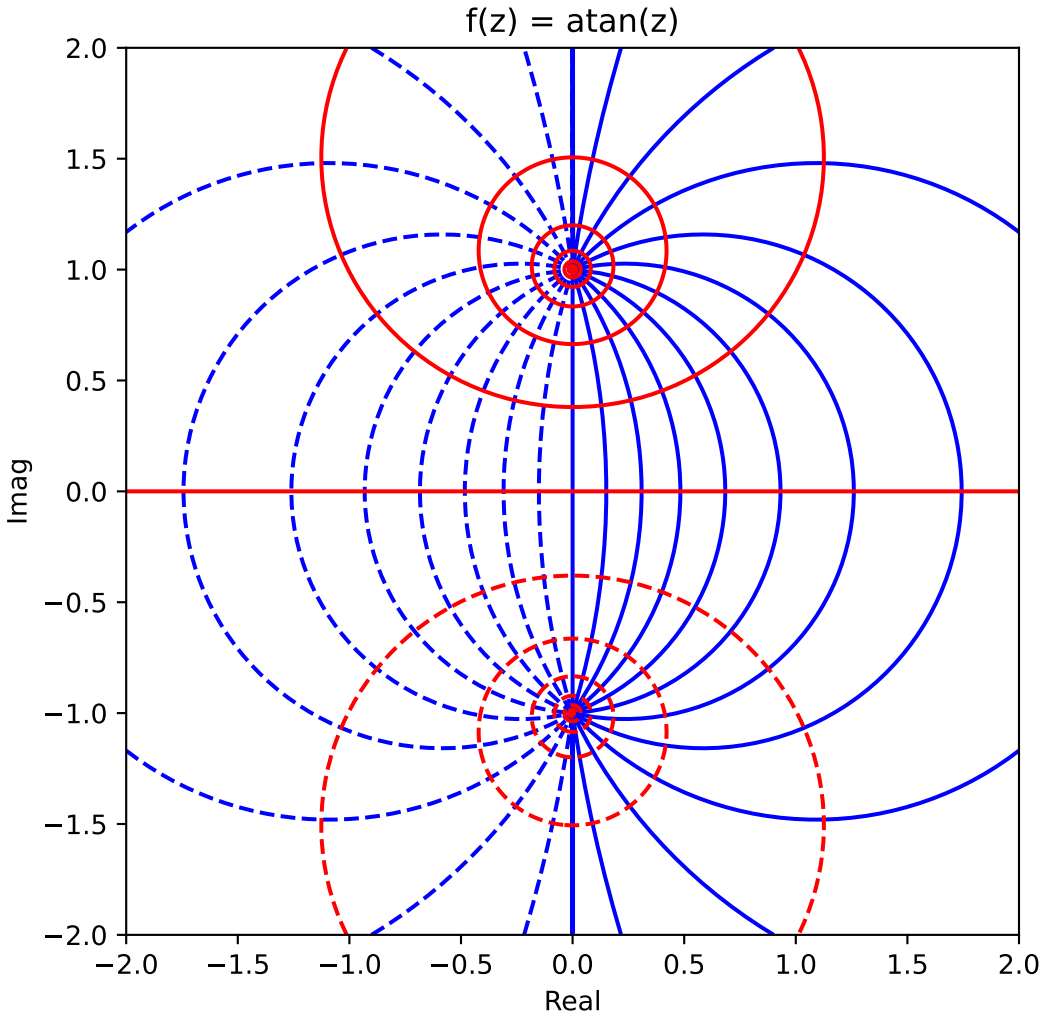


18.8.8 Complex atan function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_8_ContourComplex.py, and the XML code in the file D01_8_ContourComplex.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        Contour2dComplex(func=np.atan, wclip=20.0, Title='f(z)=atan(z)')
```



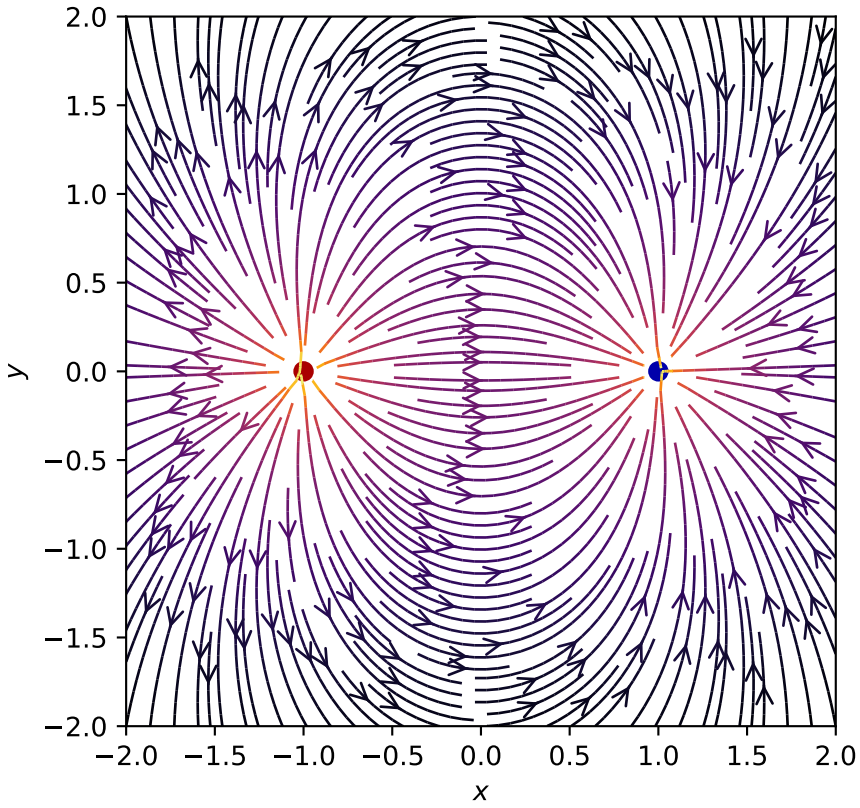
18.9 Streams, barbs and quivers (some require cartopy)

18.9.1 Streams, Electric Dipole: vector field

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_04_VectorFieldMultipole.py, and the XML code in the file D01_04_VectorFieldMultipole.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        nq_ = 2**1
        VectorFieldMultipole(nq=nq_)
```

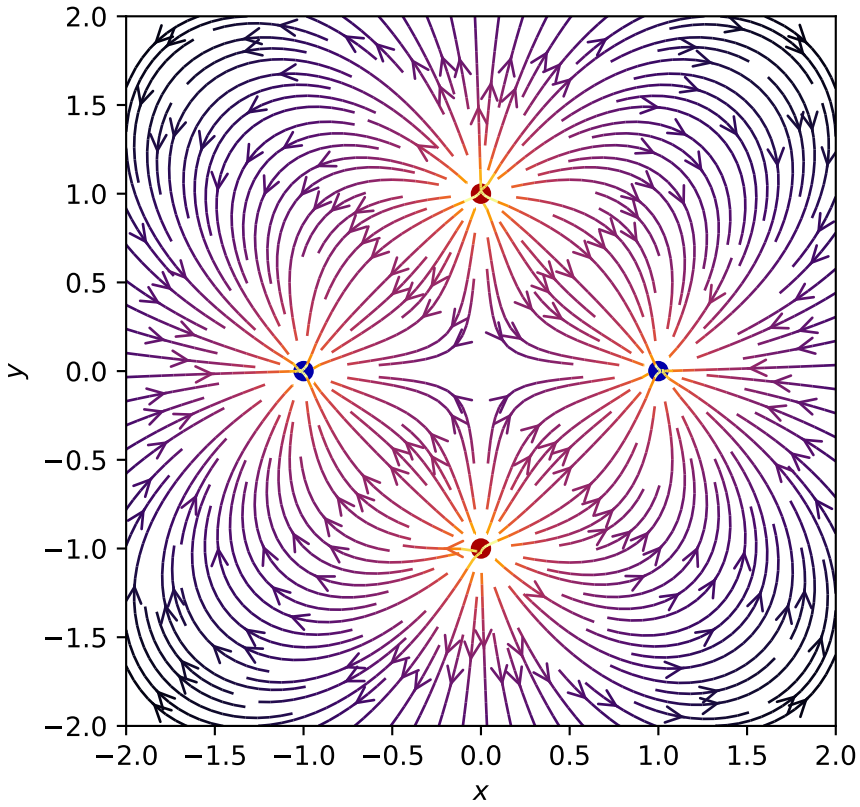


18.9.2 Streams, Electric Quadrupole: vector field

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_04_VectorFieldMultipole.py, and the XML code in the file D01_04_VectorFieldMultipole.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        nq_ = 2**2
        VectorFieldMultipole(nq=nq_)
```

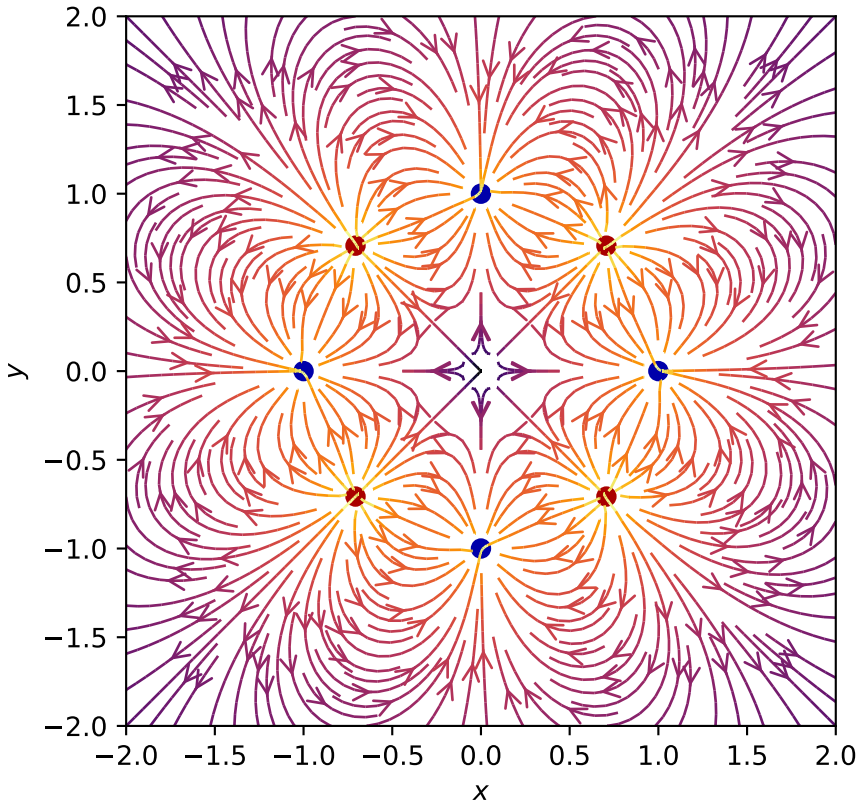


18.9.3 Streams, Electric Octopole: vector field

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_04_VectorFieldMultipole.py, and the XML code in the file D01_04_VectorFieldMultipole.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        nq_ = 2**3
        VectorFieldMultipole(nq=nq_)
```

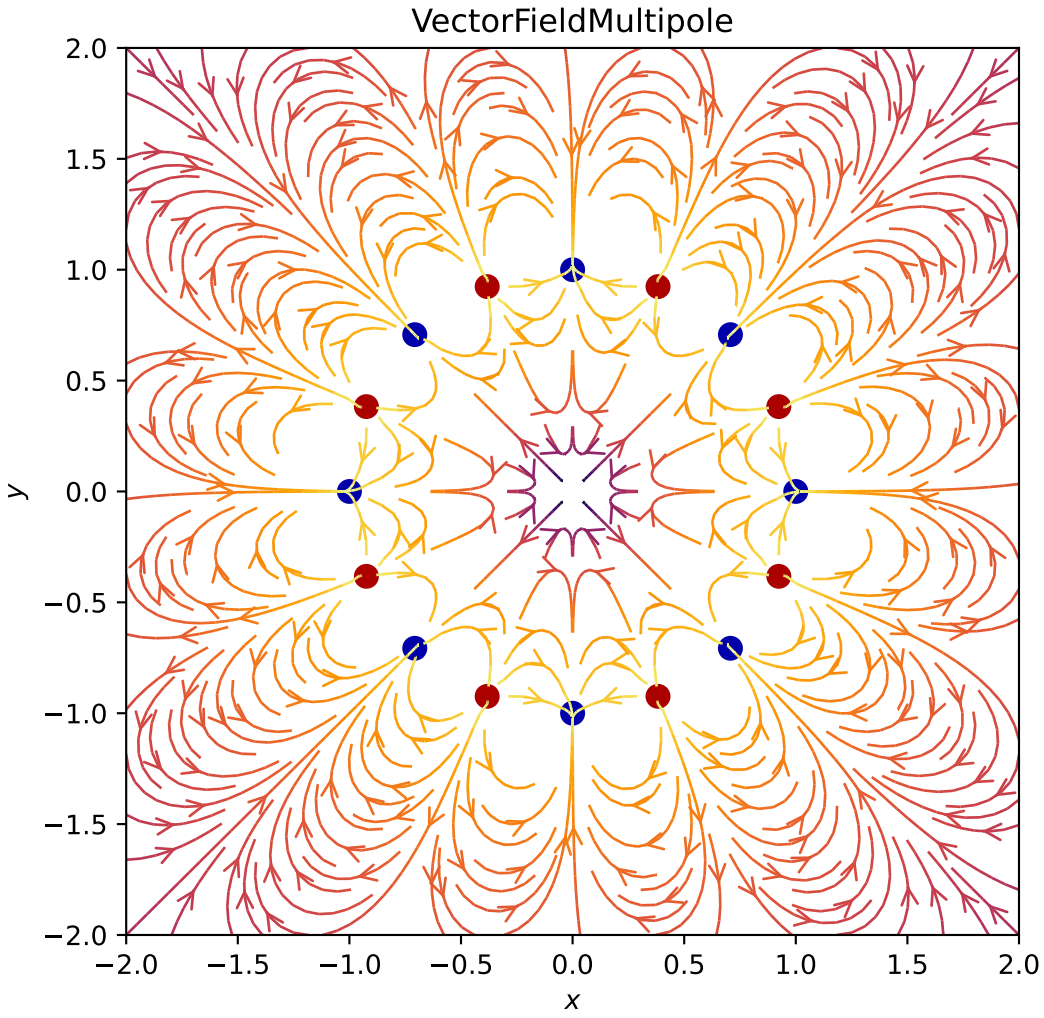


18.9.4 Streams, Electric Hexapole: vector field

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_04_VectorFieldMultipole.py, and the XML code in the file D01_04_VectorFieldMultipole.2D.xml.

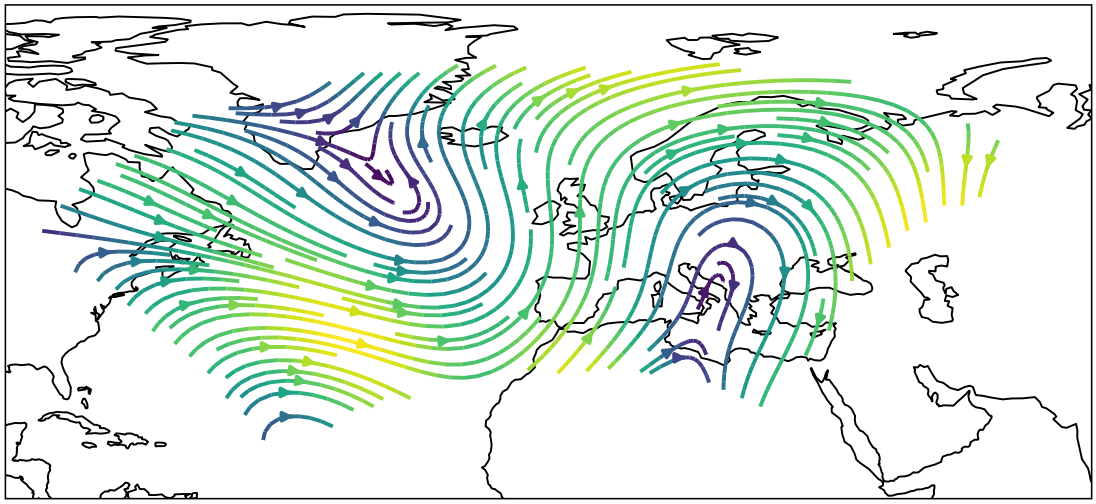
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        nq_ = 2**4
        VectorFieldMultipole(nq=nq_)
```



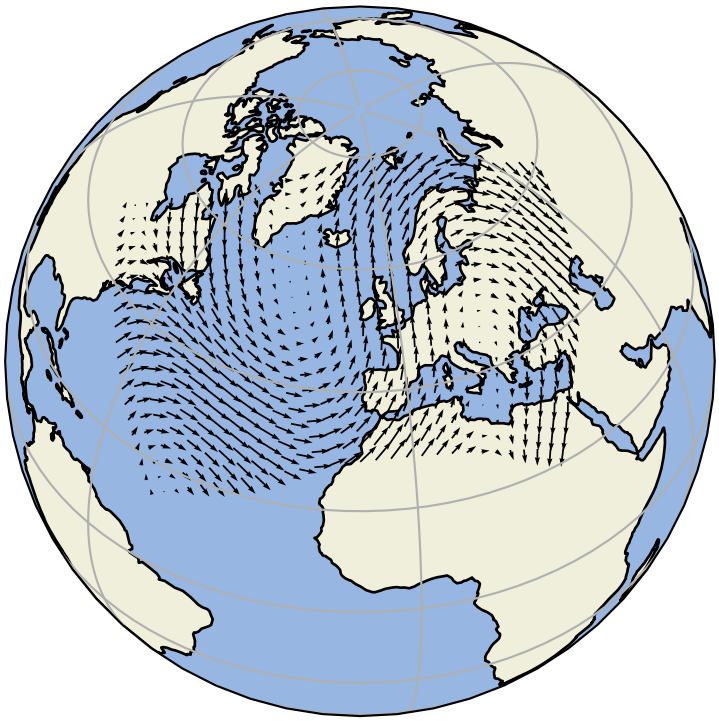
18.9.5 Streams, North Atlantic Ocean and Europe (requires cartopy)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_StreamsNorthAtlantic.py, and the XML code in the file D05_StreamsNorthAtlantic.2D.xml.



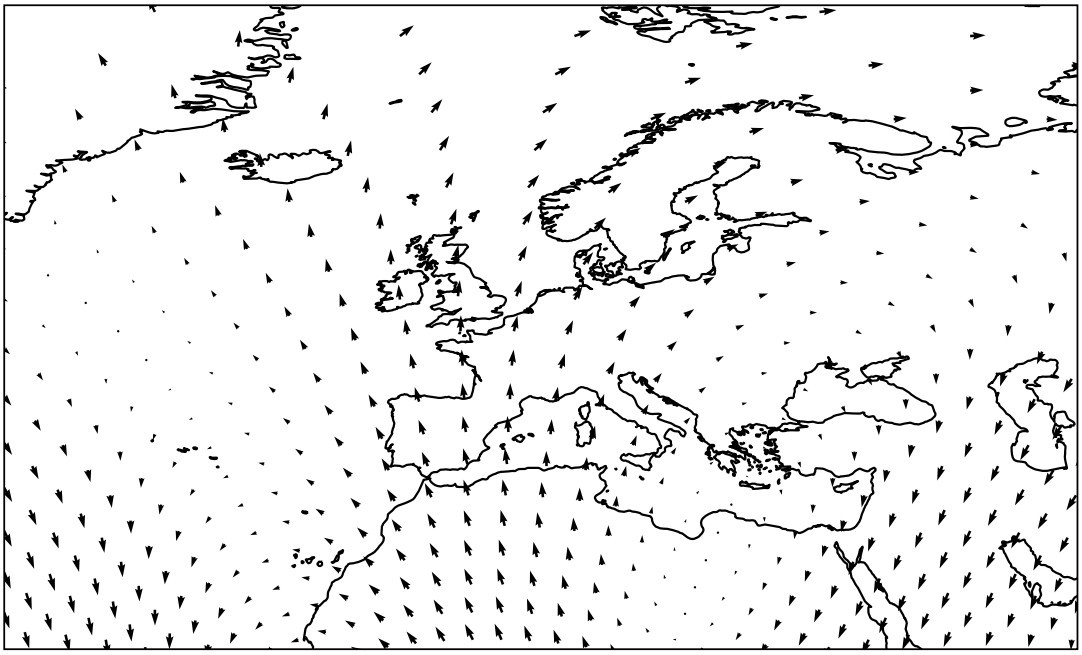
18.9.6 Quivers, North Atlantic Ocean and Europe (requires cartopy)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_QuiversNorthAtlantic.py, and the XML code in the file D06_QuiversNorthAtlantic.2D.xml.

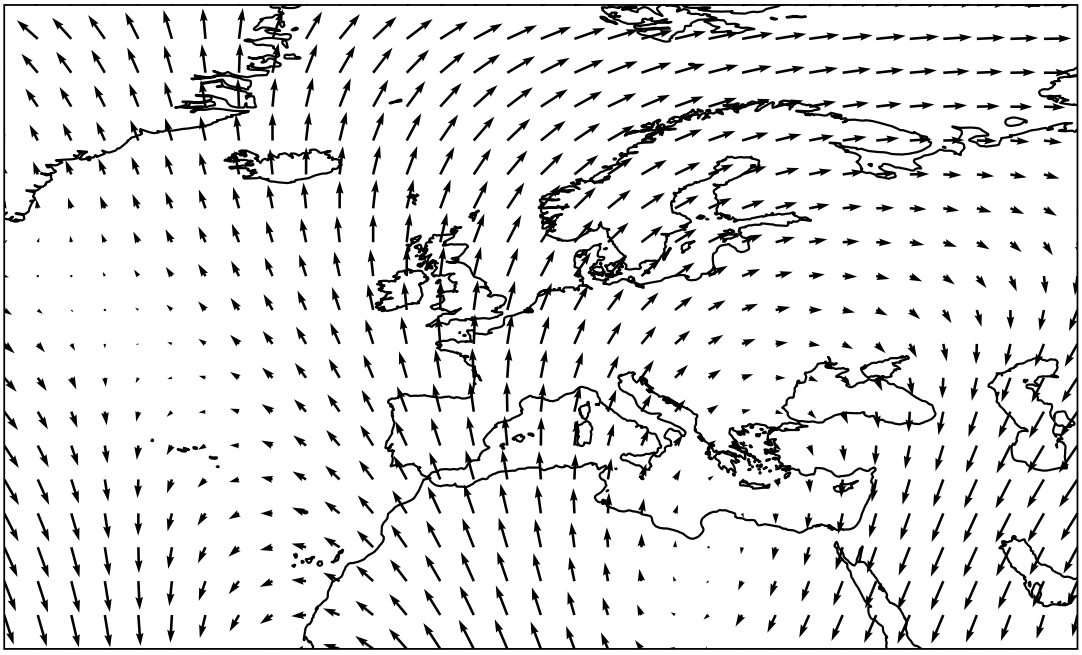


18.9.7 Quivers, plain and regridded (requires cartopy)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_QuiversPlainAndRegridded.py, and the XML code in the file D07_QuiversPlainAndRegridded.2D.xml.



The same vector field regridded



18.9.8 Barbs, North Atlantic Ocean and Europe (requires cartopy)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_BarbsNorthAtlantic.py, and the XML code in the file D08_BarbsNorthAtlantic.2D.xml.

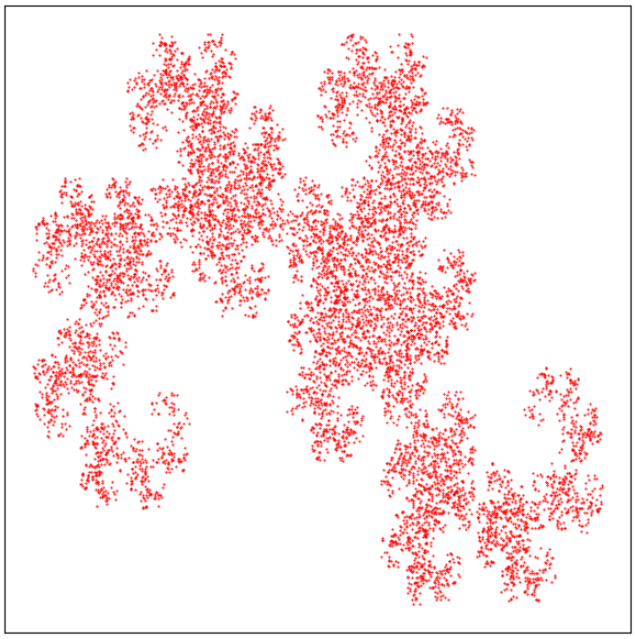
Right figure: Barnsley's Fern, 100000 points

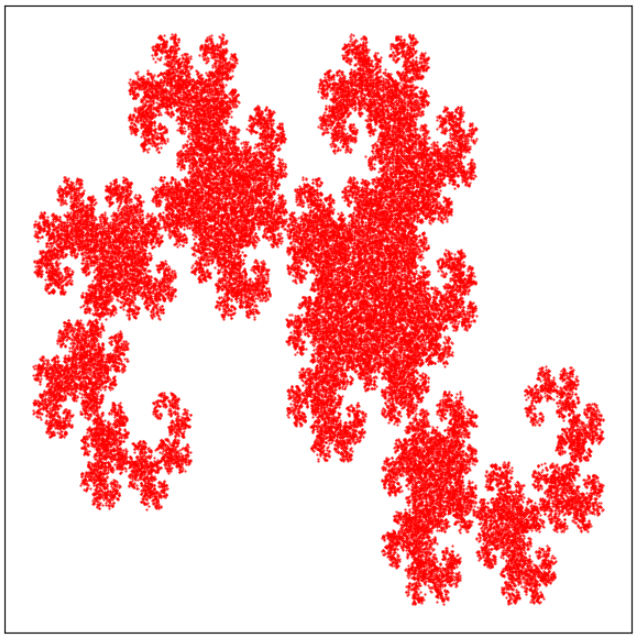
19.1.2 Dragon curve

https://en.wikipedia.org/wiki/Dragon_curve

https://mathworld.wolfram.com/DragonCurve.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_DragonCurve.py, and the XML code in the file D02_DragonCurve.2D.xml.





Left figure: Dragon Curve, 10000 points

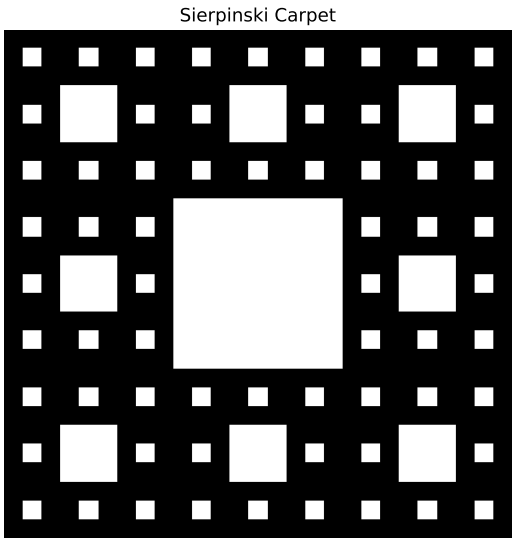
Right figure: Dragon Curve, 50000 points

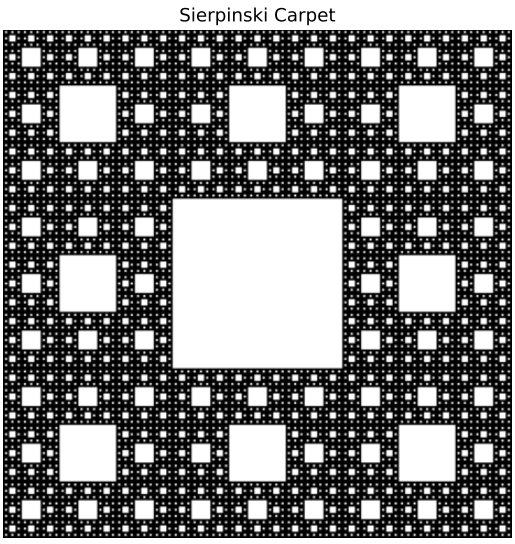
19.1.3 Sierpiński carpet

https://en.wikipedia.org/wiki/Sierpi%C5%84ski_carpet

https://mathworld.wolfram.com/SierpinskiCarpet.html

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_SierpinskiCarpet.py, and the XML code in the file D03_SierpinskiCarpet.2D.xml.





Left figure: Sierpiński carpet, $n = 3$.

Right figure: Sierpiński carpet, $n = 5$.

19.2 Fractals related to the Mandelbrot set

See also: http://www.juliasets.dk/Pictures_of_Julia_and_Mandelbrot_sets.htm

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

See also: http://www.dhushara.com/DarkHeart/quasif/quasi.htm (includes Kleinian fractals)

See also: https://en.wikipedia.org/wiki/Mandelbrot_set

Difference Method: https://en.wikibooks.org/wiki/Fractals/Iterations_in_the_complex_plane/demm

MandelbrotSetExterior: https://en.wikibooks.org/wiki/Fractals/Iterations_in_the_complex_plane/MandelbrotSetExterior#Real_Escape_Time

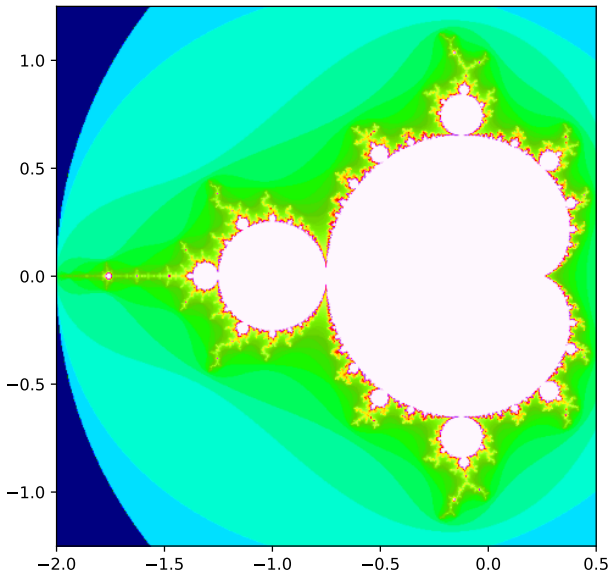
Fractals/fractalzoomer: https://en.wikibooks.org/wiki/Fractals/fractalzoomer

19.2.1 Mandelbrot set, example 1, classical set: $z_{n+1} = z_n^2 + c$

Classical formula: $z_{n+1} = z_n^2 + c$.

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_Mandelbrot1.py, and the XML code in the file D01a_Mandelbrot1.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01b_Mandelbrot1.py, and the XML code in the file D01b_Mandelbrot1.2D.xml.



19.2.2 Mandelbrot set, example 2: higher powers

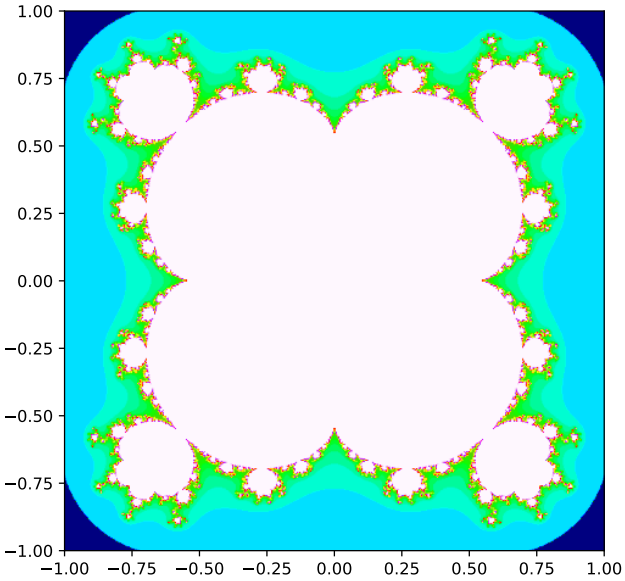
Recursion formula: $z_{n+1} = z_n^5 + c$.

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02a_Mandelbrot2.py, and the XML code in the file D02a_Mandelbrot2.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02b_Mandelbrot2.py, and the XML code in the file D02b_Mandelbrot2.2D.xml.

See also: https://paulbourke.net/fractals/mandelpower/

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen



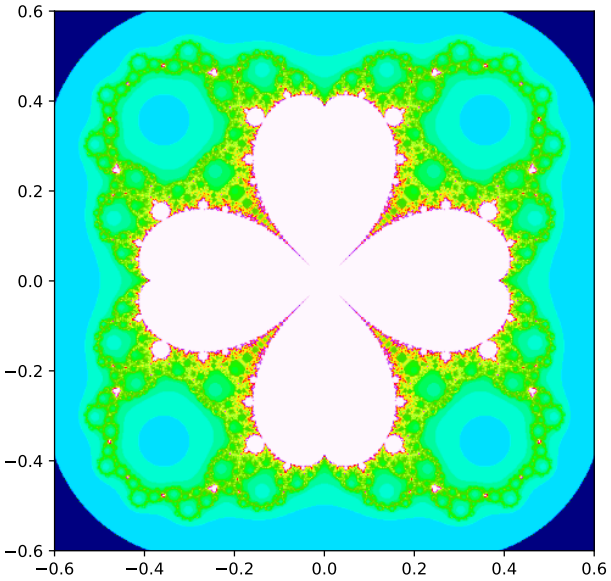
19.2.3 Mandelbrot set, example 3: $z_{n+1} = z_n^5 + \frac{c}{z_n}$

Recursion formula: $z_{n+1} = z_n^5 + \frac{c}{z_n}$.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03a_Mandelbrot3.py, and the XML code in the file D03a_Mandelbrot3.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03b_Mandelbrot3.py, and the XML code in the file D03b_Mandelbrot3.2D.xml.



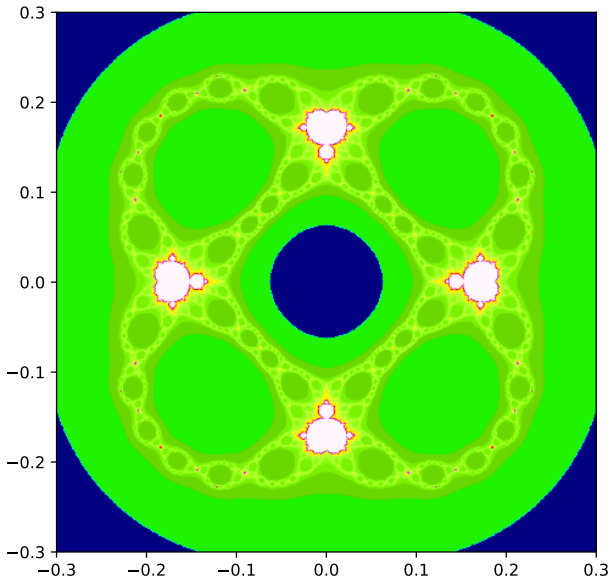
19.2.4 Mandelbrot set, example 4: $z_{n+1} = z_n^5 + \frac{c}{z_n^5}$

Recursion formula: $z_{n+1} = z_n^5 + \frac{c}{z_n^5}$.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04a_Mandelbrot4.py, and the XML code in the file D04a_Mandelbrot4.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04b_Mandelbrot4.py, and the XML code in the file D04b_Mandelbrot4.2D.xml.



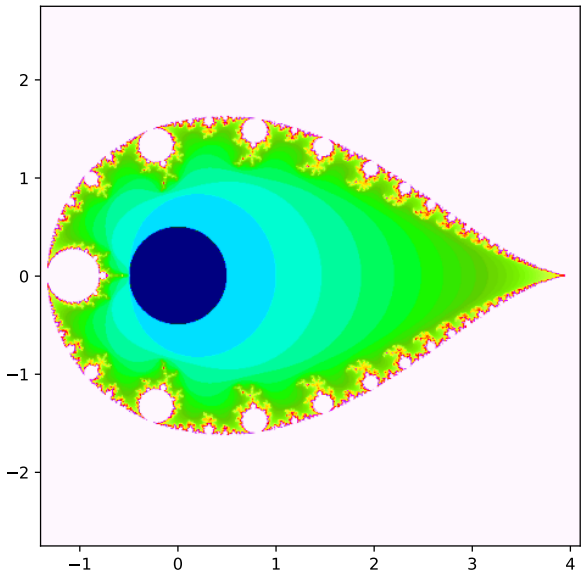
19.2.5 Mandelbrot set, example 5, "Inverse Mandelbrot"

Recursion formula: $z_{n+1} = z_n^2 + \frac{1}{c}$.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05a_Mandelbrot5.py, and the XML code in the file D05a_Mandelbrot5.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05b_Mandelbrot5.py, and the XML code in the file D05b_Mandelbrot5.2D.xml.



19.2.6 Mandelbrot set, example 6, "Marek Dragon Fractal":

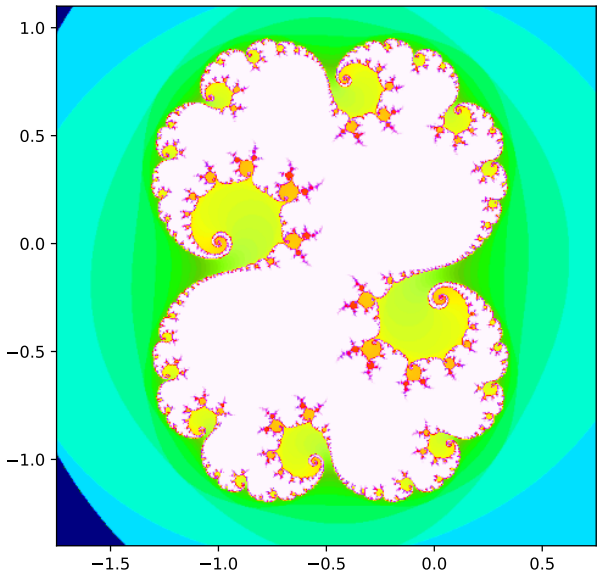
Compare this with "Phoenix Julia fractals"

Recursion formula: $z_{n+1} = \exp(2\pi ir)z_n + z_n^2$ where r is an irrational number, in this example it is $1 - (\sqrt{2} - \sqrt{3} + \sqrt{5})/2$.

See also: https://paulbourke.net/fractals/marek/

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06a_Mandelbrot6.py, and the XML code in the file D06a_Mandelbrot6.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06b_Mandelbrot6.py, and the XML code in the file D06b_Mandelbrot6.2D.xml.



19.2.7 Mandelbrot set, example 7, "Burning Ship Fractal"

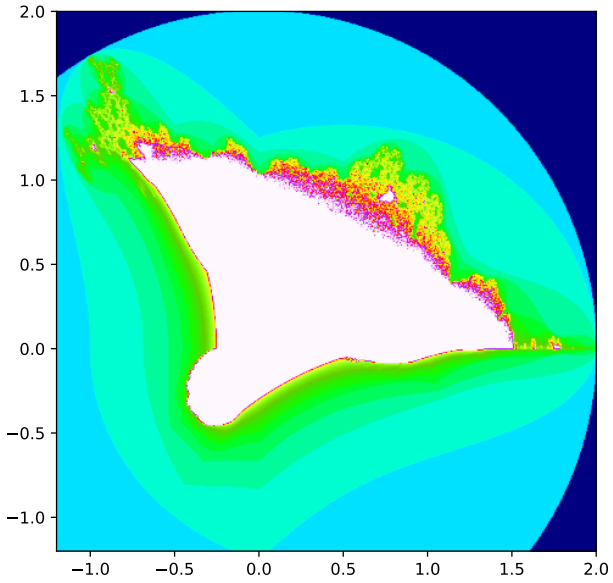
Recursion formula: $z_{n+1} = (|\Re(z_n)| + i|\Im(z_n)|)^2 + c$.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

See also: https://paulbourke.net/fractals/burnship/

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_Mandelbrot7.py, and the XML code in the file D07a_Mandelbrot7.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_Mandelbrot7.py, and the XML code in the file D07b_Mandelbrot7.2D.xml.



19.3 Fractals related to the Julia set

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

See also: https://en.wikipedia.org/wiki/Julia_set

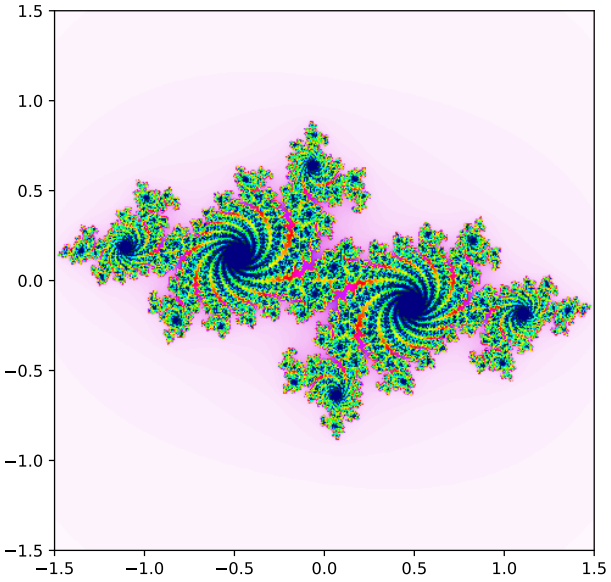
19.3.1 Julia sets, example 1: Classical set

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_Julia01.py, and the XML code in the file D01a_Julia01.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01b_Julia01.py, and the XML code in the file D01b_Julia01.2D.xml.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

See also: https://paulbourke.net/fractals/sinjulia/julia_set.py (contains suggestions for c.) in the section "QUADRATIC JULIA ITERATION AND BAILOUT".

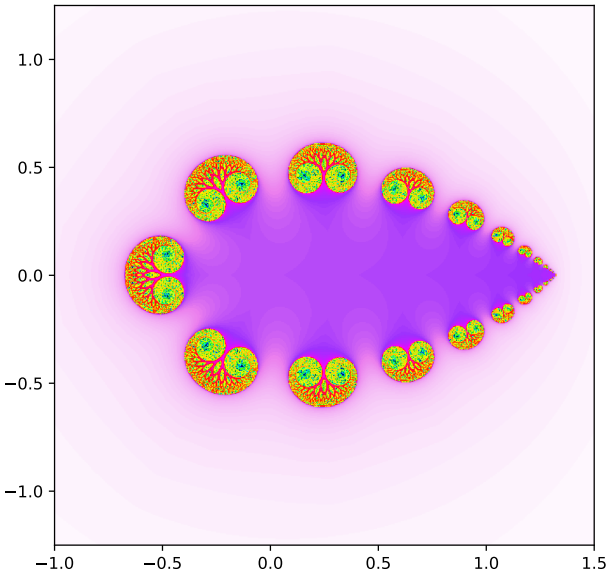


19.3.2 Julia sets, example 2: Glynn fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02a_Julia02.py, and the XML code in the file D02a_Julia02.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02b_Julia02.py, and the XML code in the file D02b_Julia02.2D.xml.

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

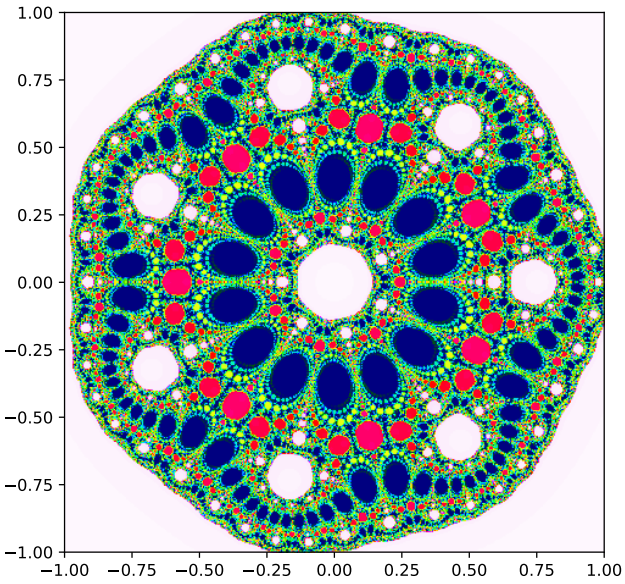


19.3.3 Julia sets, example 3: Spiral Septagon fractal

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03a_Julia03.py, and the XML code in the file D03a_Julia03.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03b_Julia03.py, and the XML code in the file D03b_Julia03.2D.xml.

See also: https://paulbourke.net/fractals/septagon/

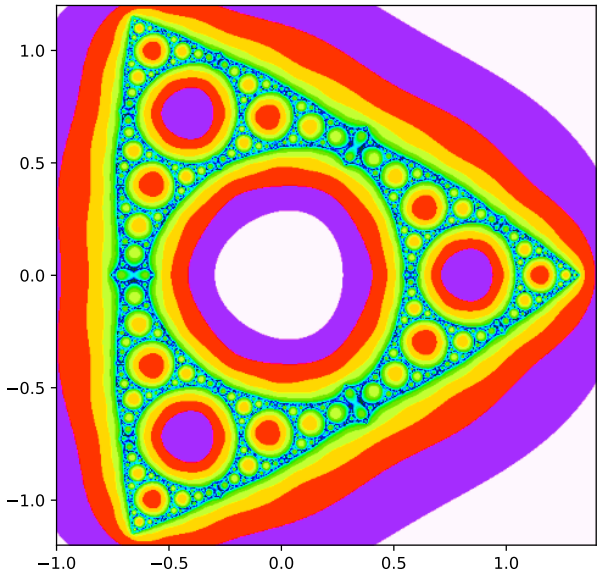


19.3.4 Julia sets, example 4: Reuleaux Triangle fractal

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04a_Julia04.py, and the XML code in the file D04a_Julia04.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04b_Julia04.py, and the XML code in the file D04b_Julia04.2D.xml.

See also: https://paulbourke.net/fractals/triangle/



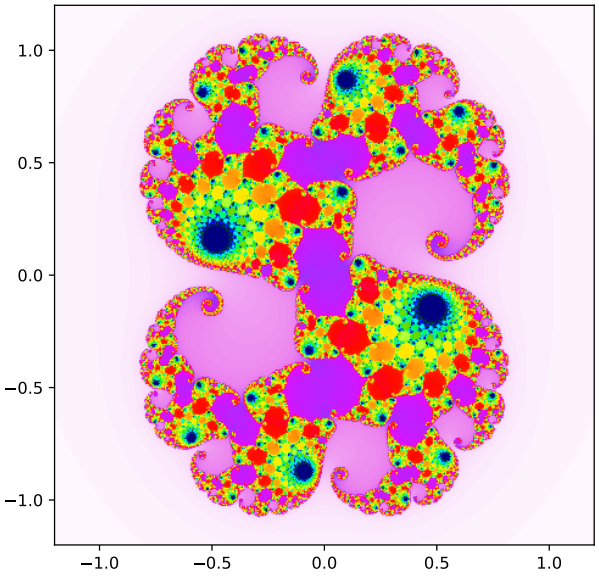
19.3.5 Julia sets, example 5: Phoenix Julia fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05a_Julia05.py, and the XML code in the file D05a_Julia05.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05b_Julia05.py, and the XML code in the file D05b_Julia05.2D.xml.

Compare this with "Marek Dragon"

See also: https://paulbourke.net/fractals/phoenix_julia/

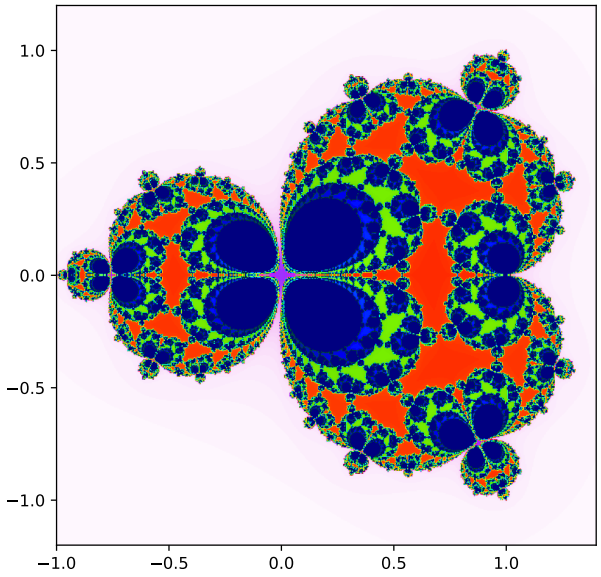


19.3.6 Julia sets, example 6: Cubic Julia fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06a_Julia06.py, and the XML code in the file D06a_Julia06.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06b_Julia06.py, and the XML code in the file D06b_Julia06.2D.xml.

See also: https://paulbourke.net/fractals/cubicjulia/

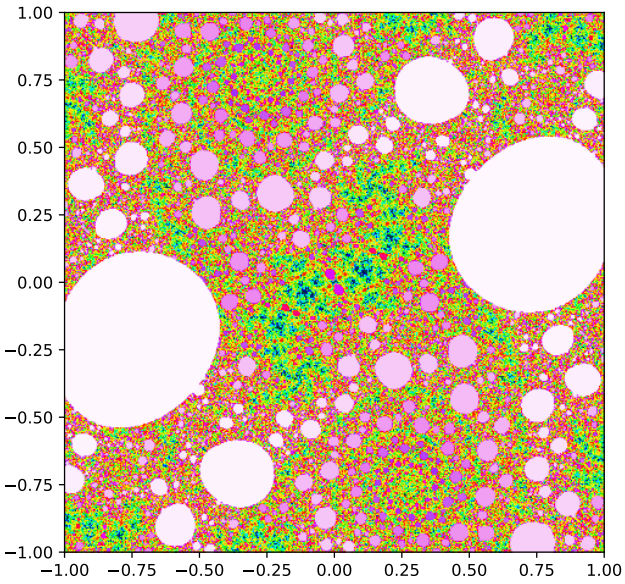


19.3.7 Julia sets, example 7: Spiral Julia fractal (uses $z_{n+1} = \tan(z_n^2 + c)$)

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_Julia07.py, and the XML code in the file D07a_Julia07.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_Julia07.py, and the XML code in the file D07b_Julia07.2D.xml.

See also: https://paulbourke.net/fractals/spiraljulia/



19.3.8 Julia sets, example 8: Julia set of $\sin(z)$

To do this we form the series $zk + 1 = csin(zk)$, starting with some initial $z0$.

See also: https://paulbourke.net/fractals/sinjulia/julia_set.py

See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen, 4.7. zn+1 = c sin(zn)

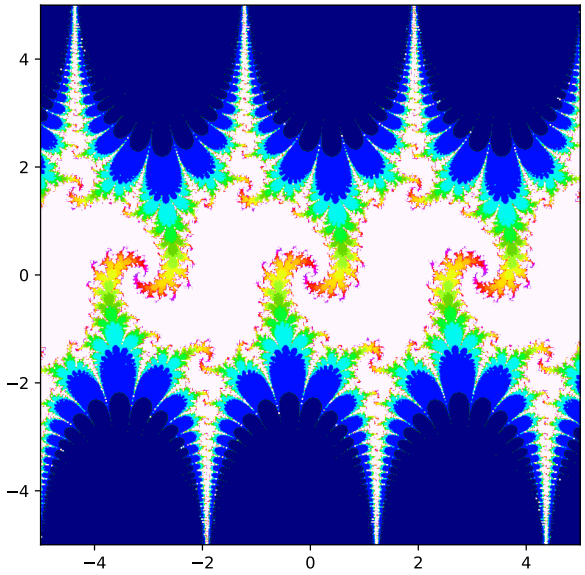
The behaviour of this series determines whether or not the initial z0 is part of the julia set or not. More precisely, if the series tends to infinity then z0 is part of the Julia set, otherwise it isn't. In the examples shown on the right the white regions are in the Julia set, black points are outside the Julia set.

To create images of the Julia set we map pixels in the image onto values of z0 and colour the pixel dependent on the behaviour of the series. In the examples on the right the image is mapped onto the range +-2pi in both the real and imaginary axes. The series is tested after 50 terms, it is decided that it tends to infinity if the absolute value of the imaginary part of zk is greater than 50.

See also: https://paulbourke.net/fractals/sinjulia/

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08a_Julia08.py, and the XML code in the file D08a_Julia08.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08b_Julia08.py, and the XML code in the file D08b_Julia08.2D.xml.

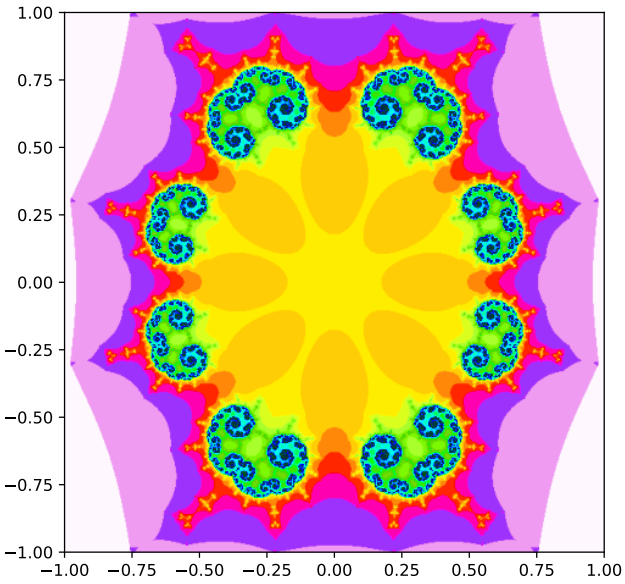


19.3.9 Julia sets, example 9: Julia09 fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09a_Julia09.py, and the XML code in the file D09a_Julia09.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09b_Julia09.py, and the XML code in the file D09b_Julia09.2D.xml.

See also: https://paulbourke.net/fractals/cubicjulia/

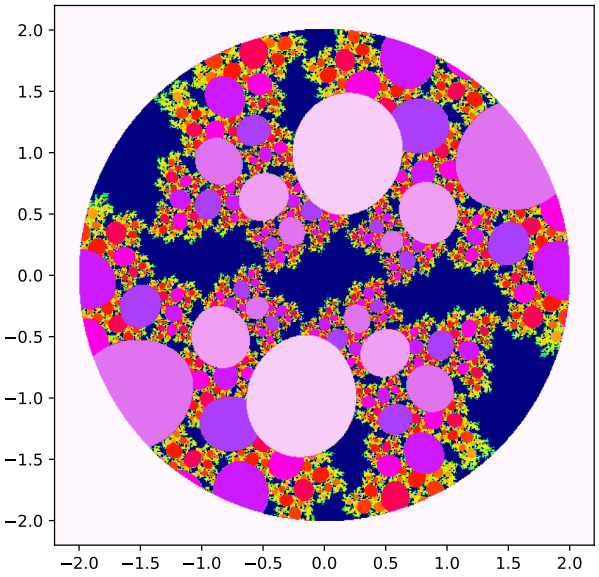


19.3.10 Julia sets, example 10: Julia10 fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10a_Julia10.py, and the XML code in the file D10a_Julia10.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10b_Julia10.py, and the XML code in the file D10b_Julia10.2D.xml.

See also: https://paulbourke.net/fractals/cubicjulia/



19.3.11 Julia sets, example 11: Julia11 fractals

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11a_Julia11.py, and the XML code in the file D11a_Julia11.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11b_Julia11.py, and the XML code in the file D11b_Julia11.2D.xml.

19.4 Newton Fractals

See also: http://yozh.org/2012/10/02/newton_fractals/

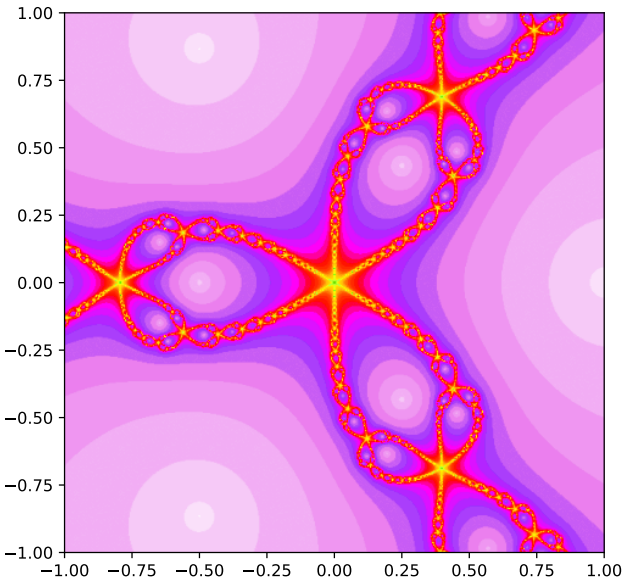
See also: http://www.3d-meier.de/, Mandelbrot und Julia Mengen

See also: https://en.wikipedia.org/wiki/Newton_fractal

19.4.1 Newton, zeros of $z^3 - 1$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_Newton1.py, and the XML code in the file D01a_Newton1.2D.xml.

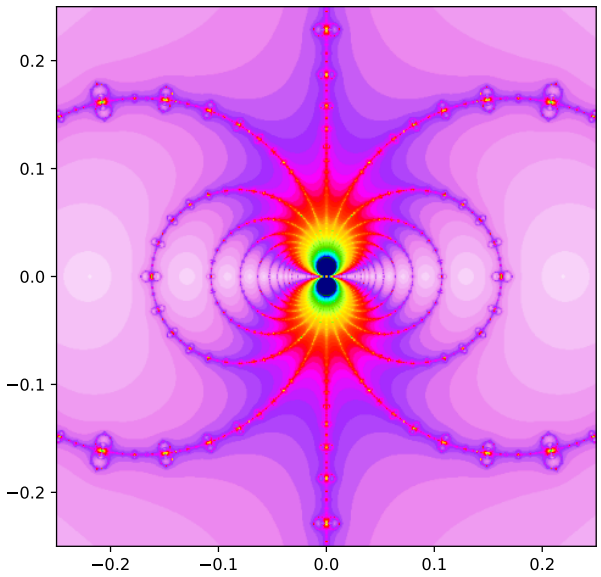
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01b_Newton1.py, and the XML code in the file D01b_Newton1.2D.xml.



19.4.2 Newton, zeros of $\cos(z)$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02a_Newton2.py, and the XML code in the file D02a_Newton2.2D.xml.

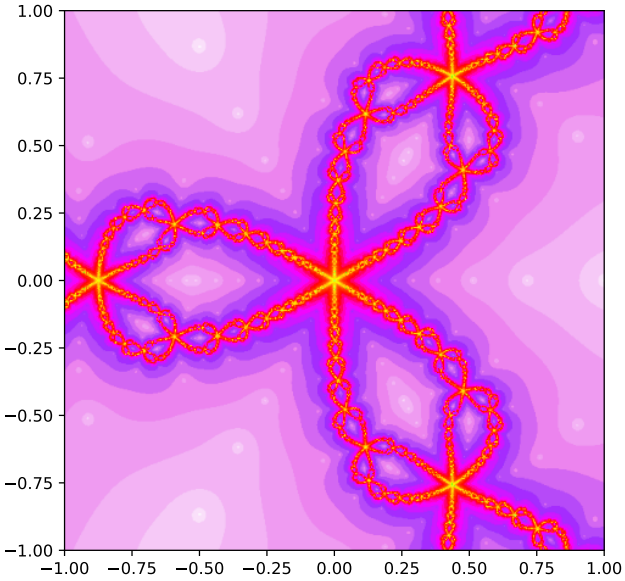
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02b_Newton2.py, and the XML code in the file D02b_Newton2.2D.xml.



19.4.3 Modified Newton (containing an error), zeros of $z^3 - 1$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03a_Newton3.py, and the XML code in the file D03a_Newton3.2D.xml.

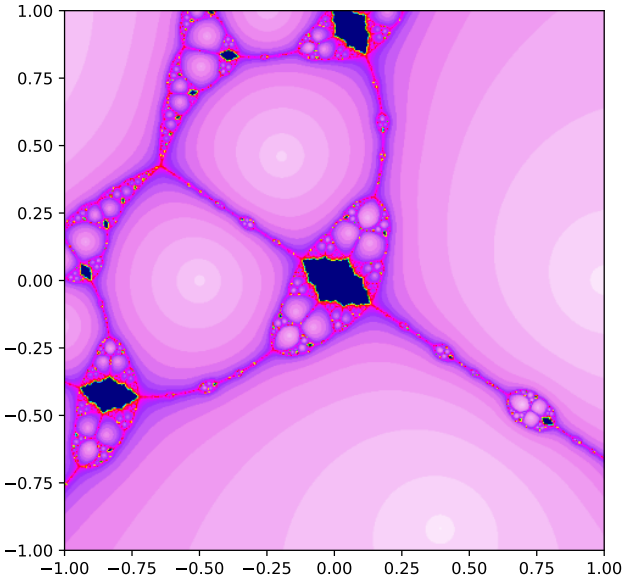
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03b_Newton3.py, and the XML code in the file D03b_Newton3.2D.xml.



19.4.4 Modified Newton (containing an error), not converging

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04a_Newton4.py, and the XML code in the file D04a_Newton4.2D.xml.

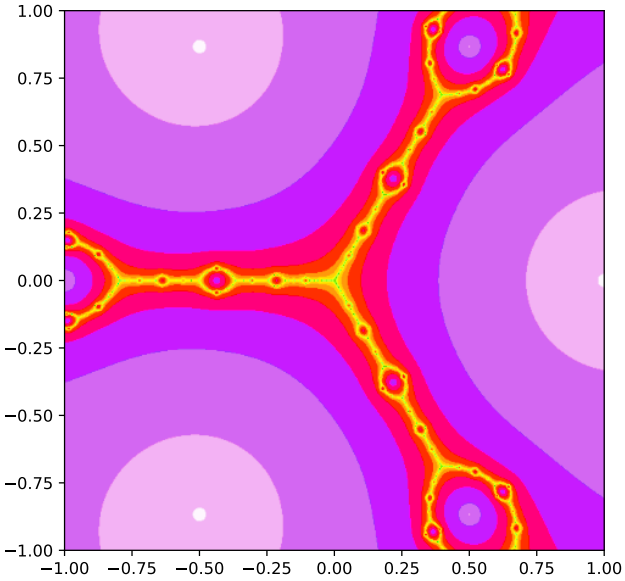
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04b_Newton4.py, and the XML code in the file D04b_Newton4.2D.xml.



19.4.5 Halley, zeros of $z^3 - 1$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05a_Newton5.py, and the XML code in the file D05a_Newton5.2D.xml.

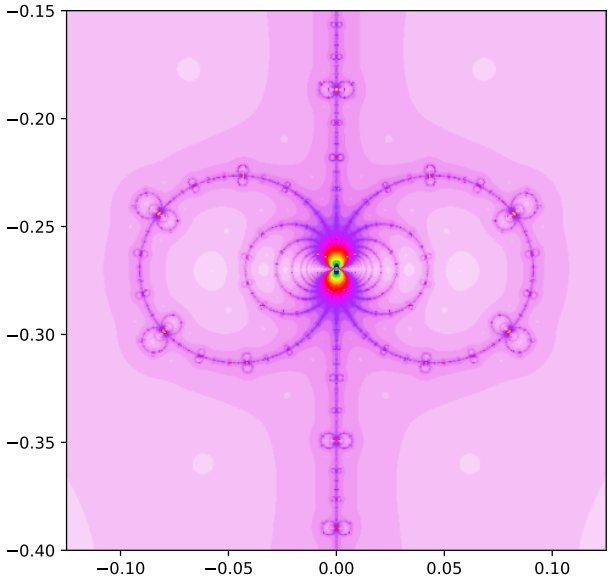
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05b_Newton5.py, and the XML code in the file D05b_Newton5.2D.xml.



19.4.6 Halley, zeros of $\cos(z)$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06a_Newton6.py, and the XML code in the file D06a_Newton6.2D.xml.

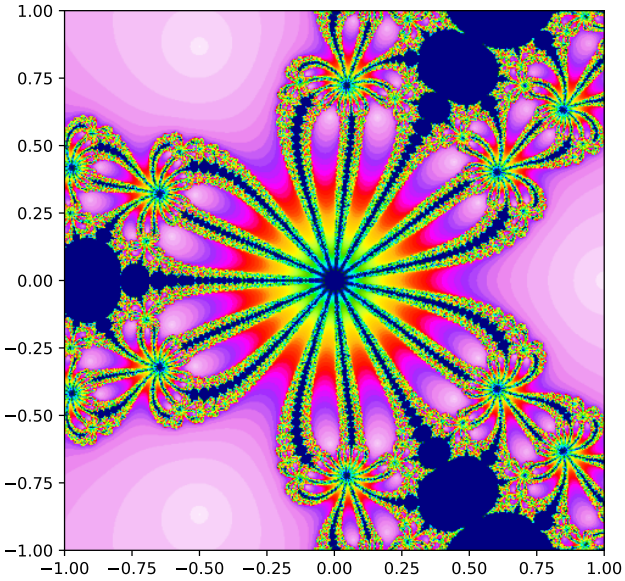
The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06b_Newton6.py, and the XML code in the file D06b_Newton6.2D.xml.



19.4.7 Modified Halley (containing an error), zeros of $z^3 - 1$

The Python code for the example below, *without* using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_Newton7.py, and the XML code in the file D07a_Newton7.2D.xml.

The Python code for the example below, using `numba`, can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_Newton7.py, and the XML code in the file D07b_Newton7.2D.xml.



19.5 Domain coloring

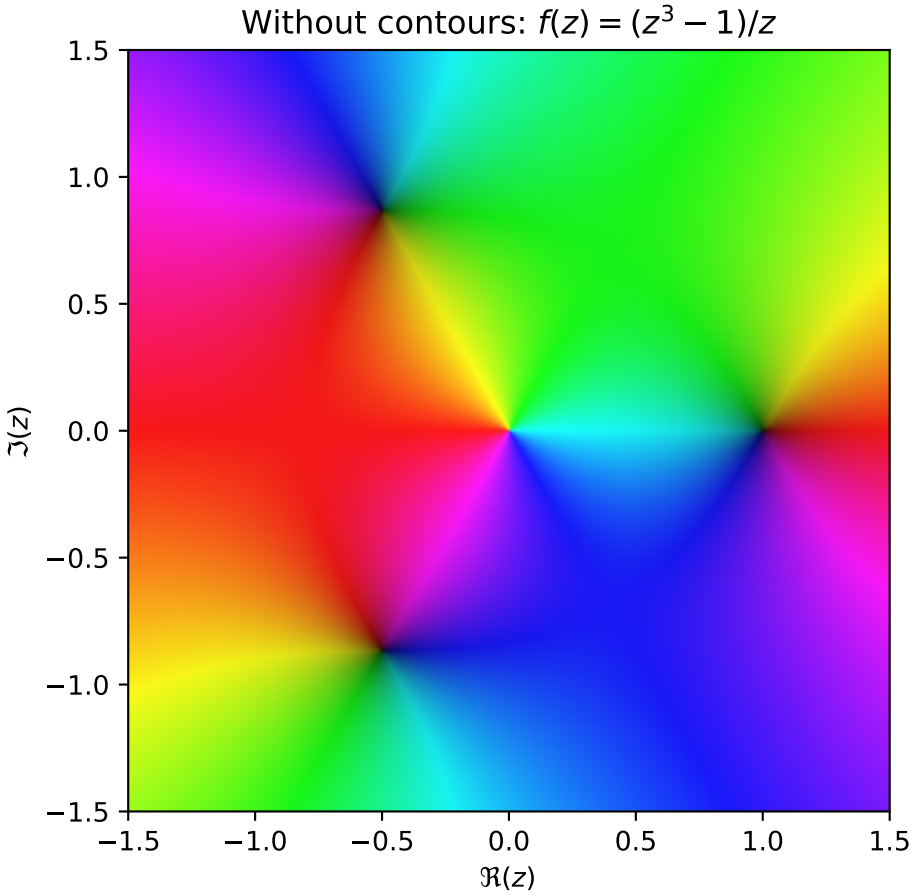
19.5.1 Domain coloring without contours: $f(z) = (z^3 - 1)/z$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z**3-1)/z, style='c', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\dfrac{z^3-1}{z}$', daxis=True)
```

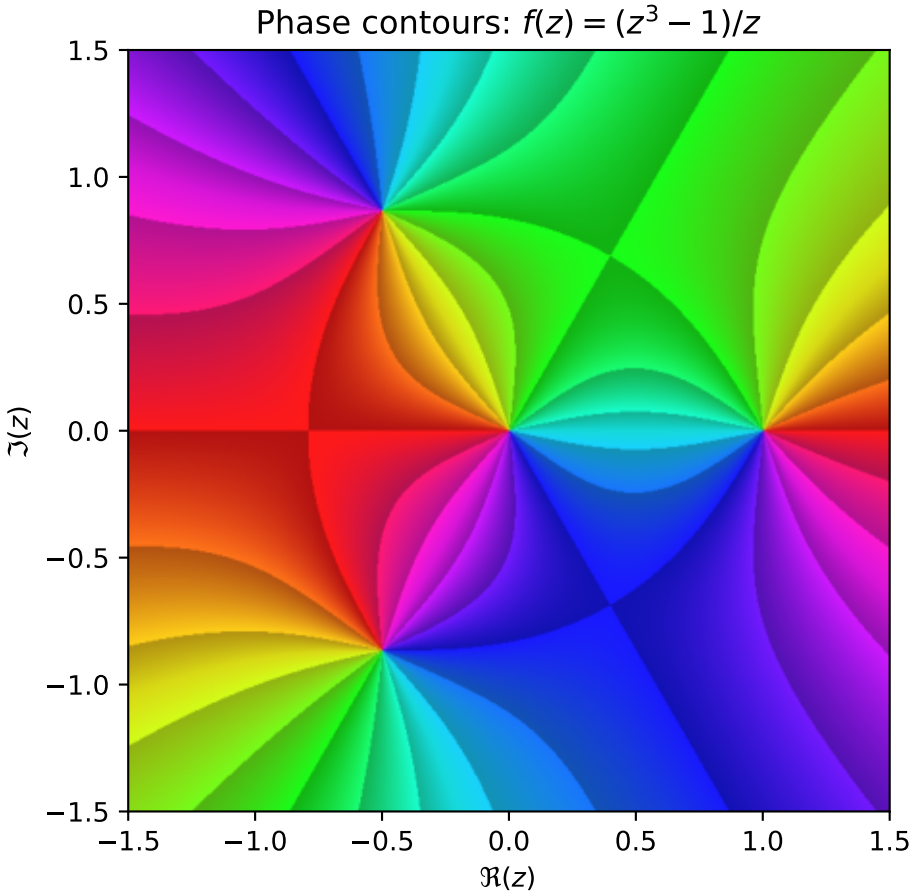


19.5.2 Domain coloring with contours of the phase: $f(z) = (z^3 - 1)/z$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z**3-1)/z, style='p', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\dfrac{z^3-1}{z}$', daxis=True)
```

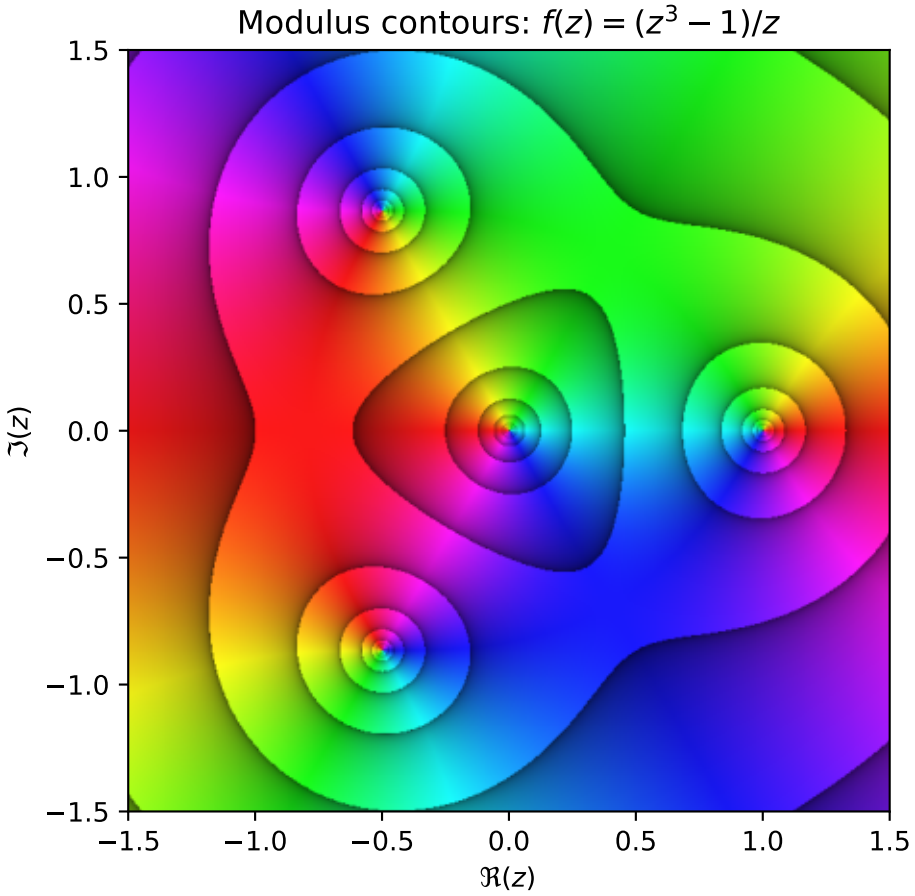


19.5.3 Domain coloring with contours of the modulus: $f(z) = (z^3 - 1)/z$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z**3-1)/z, style='m', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\dfrac{z^3-1}{z}$', daxis=True)
```

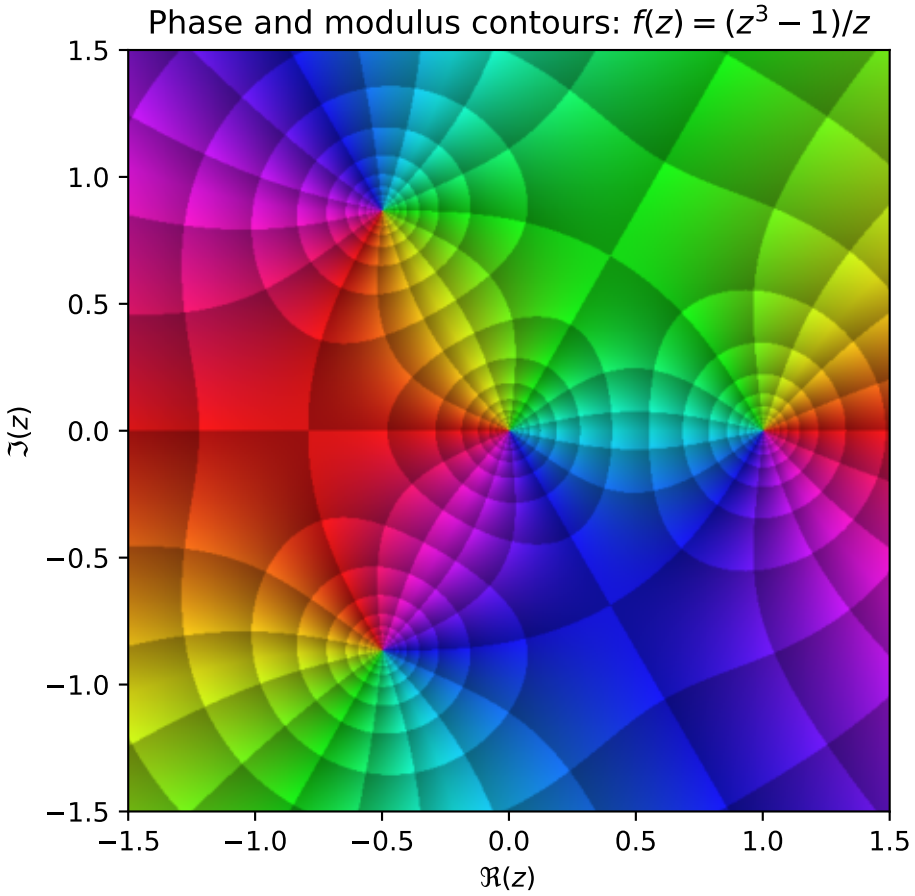


19.5.4 Domain coloring with contours of phase and modulus: $f(z) = (z^3 - 1)/z$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z**3-1)/z, style='pm', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\dfrac{z^3-1}{z}$', daxis=True)
```

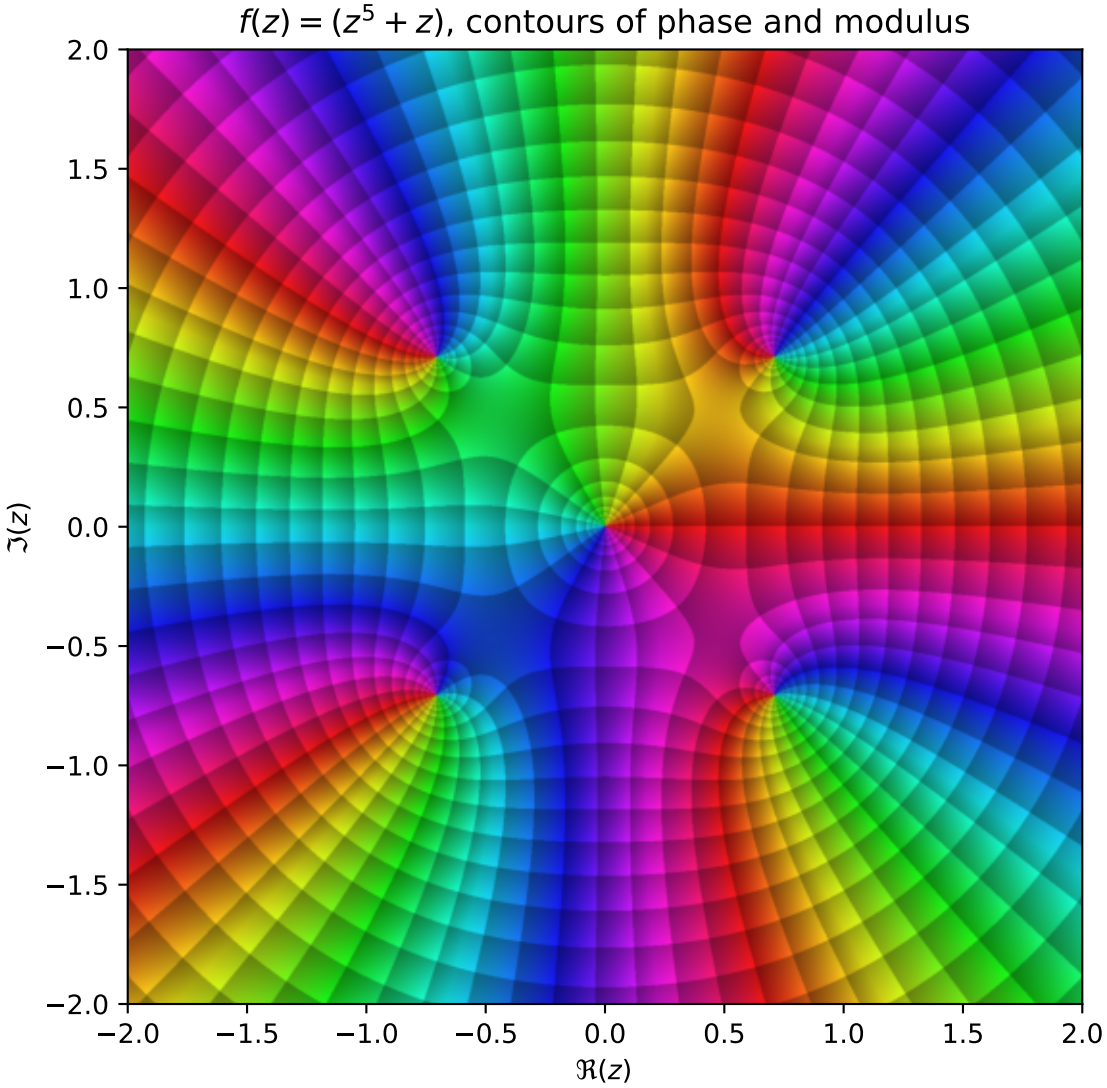


19.5.5 Domain coloring with contours of phase and modulus: $f(z) = z^5 + z$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:z**5 + z, style='pm', re=[-2, 2],
            im=[-2, 2], Title=r'$f(z)=(z^5+z)$', daxis=True)
```

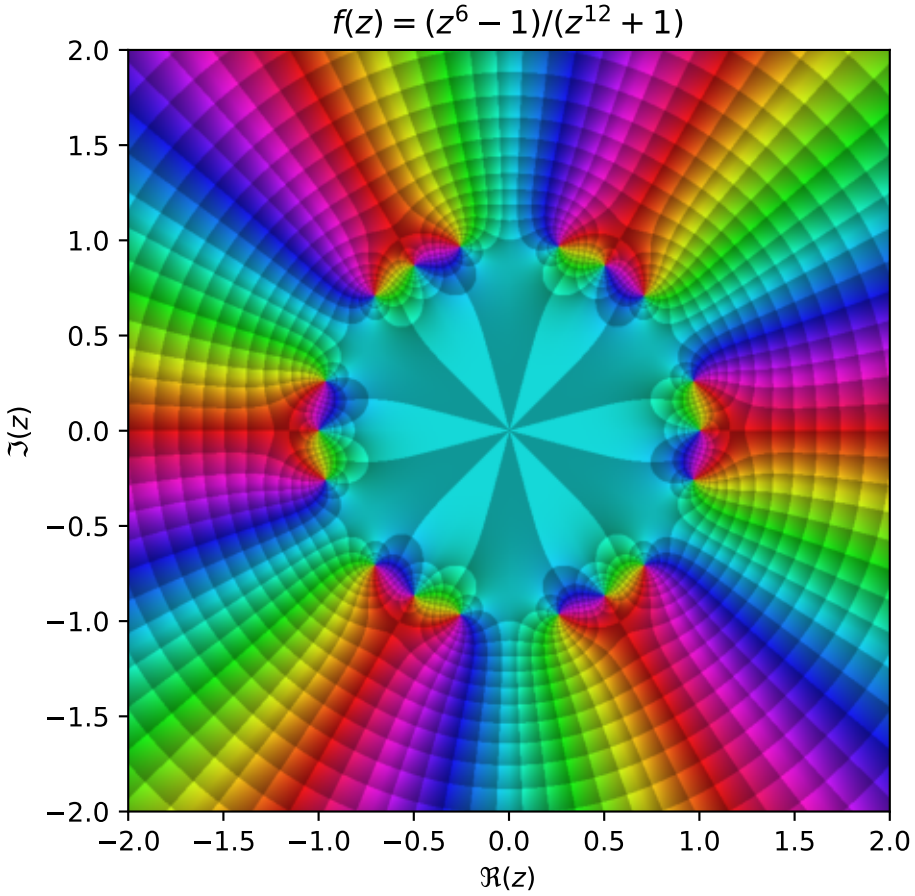


19.5.6 Domain coloring with contours of phase and modulus: $f(z) = (z^6 - 1)/(z^{12} + 1)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z**6-1) / (z**12+1), style='pm', re=[-2.0, 2.0],
            im=[-2.0, 2.0], Title=r'$f(z)=\dfrac{z^6-1}{z^{12}+1}$', daxis=True)
```

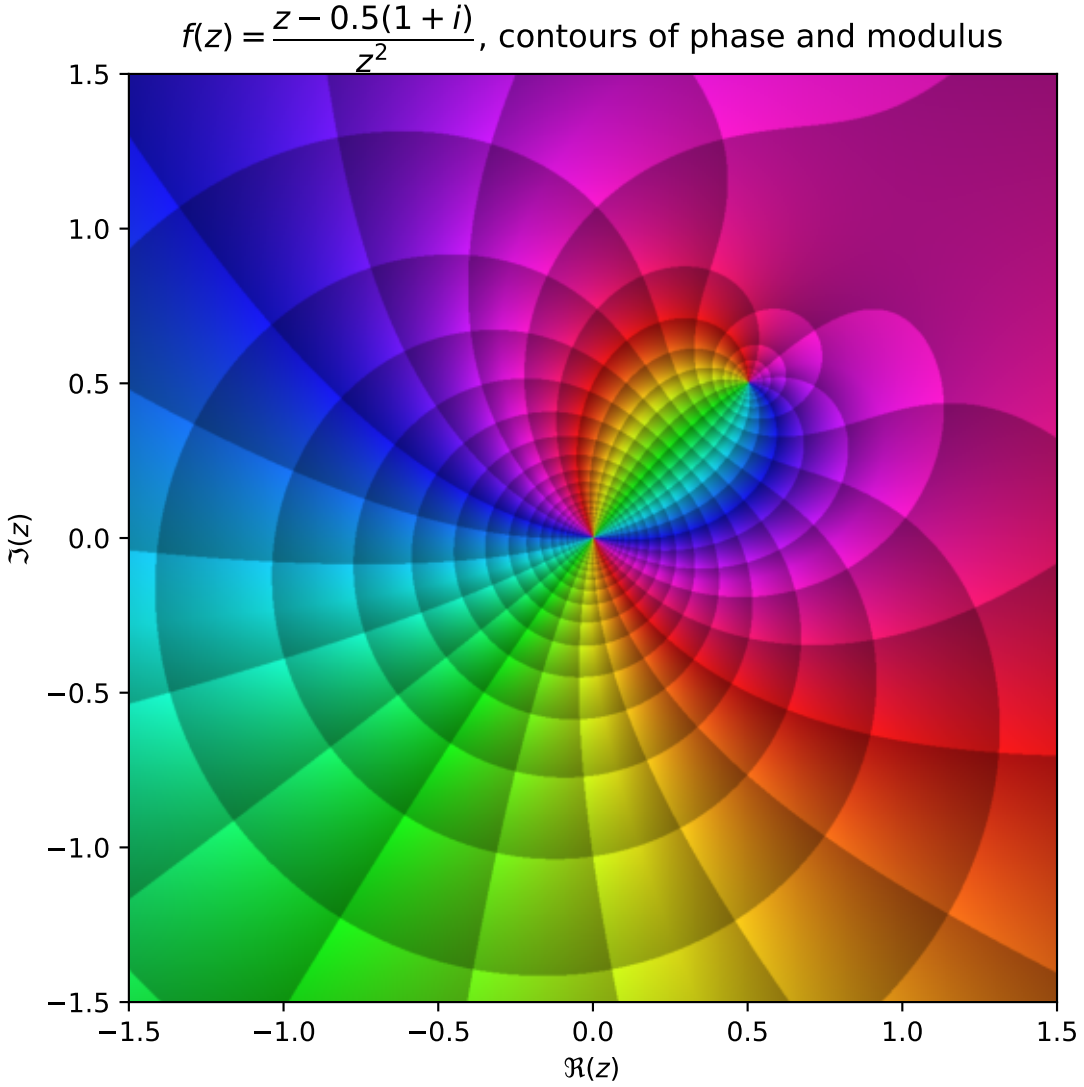


19.5.7 Domain coloring with contours of phase and modulus: $f(z) = (z - 0.5(1 + i))/z^2$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:(z - 0.5 - 0.5*1j) / z**2, style='pm', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\dfrac{z-0.5(1+i)}{z^2}$', daxis=True)
```

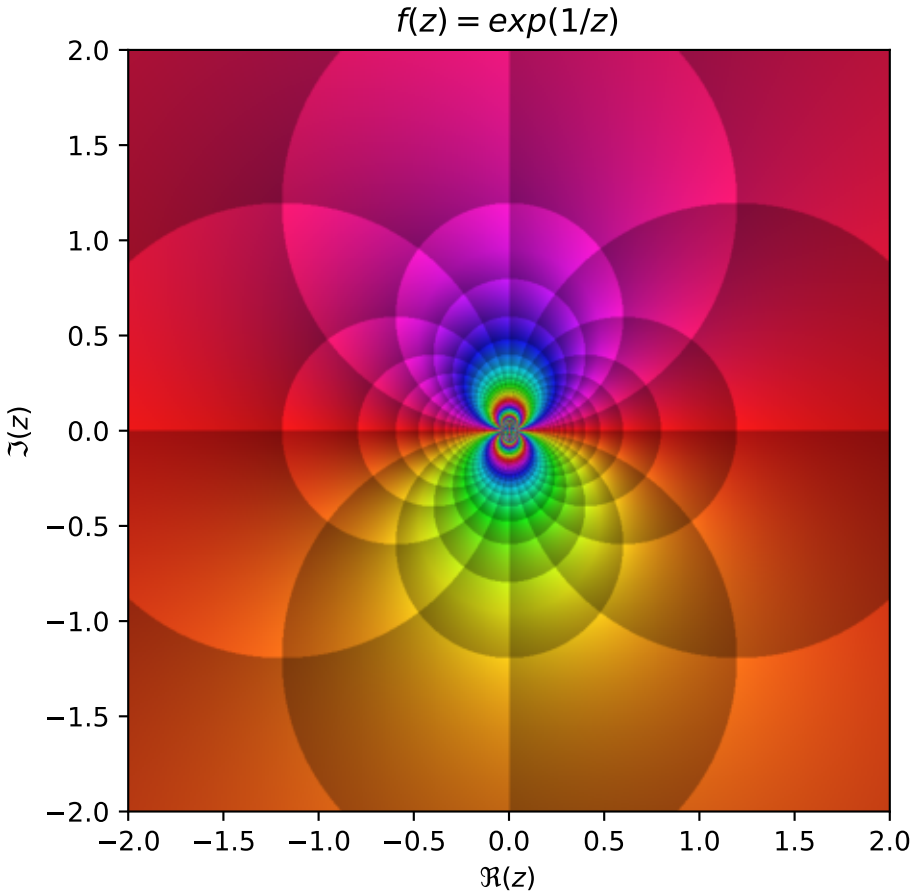


19.5.8 Domain coloring with contours of phase and modulus: $f(z) = \exp(1/z)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.exp(1/z), style='pm', re=[-2.0, 2.0],
            im=[-2.0, 2.0], Title=r'$f(z)=\exp(1/z)$', daxis=True)
```

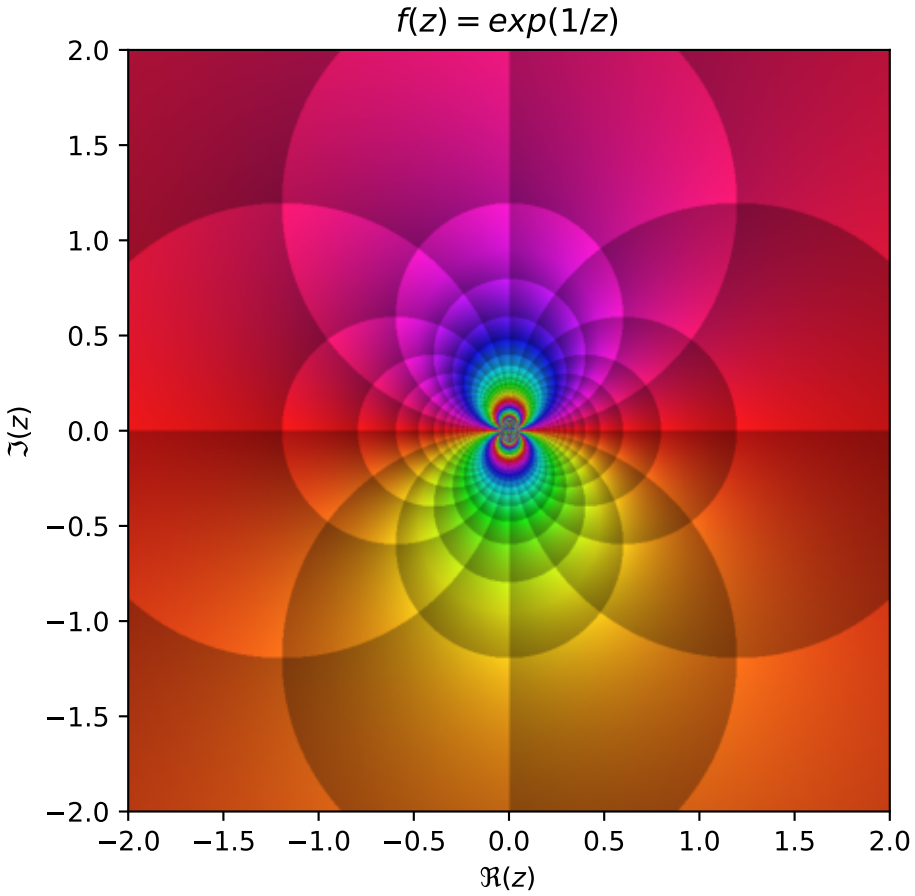


19.5.9 Domain coloring with contours of phase and modulus: $f(z) = z\exp(1/z)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.exp(1/z), style='pm', re=[-2.0, 2.0],
            im=[-2.0, 2.0], Title=r'$f(z)=\exp(1/z)$', daxis=True)
```

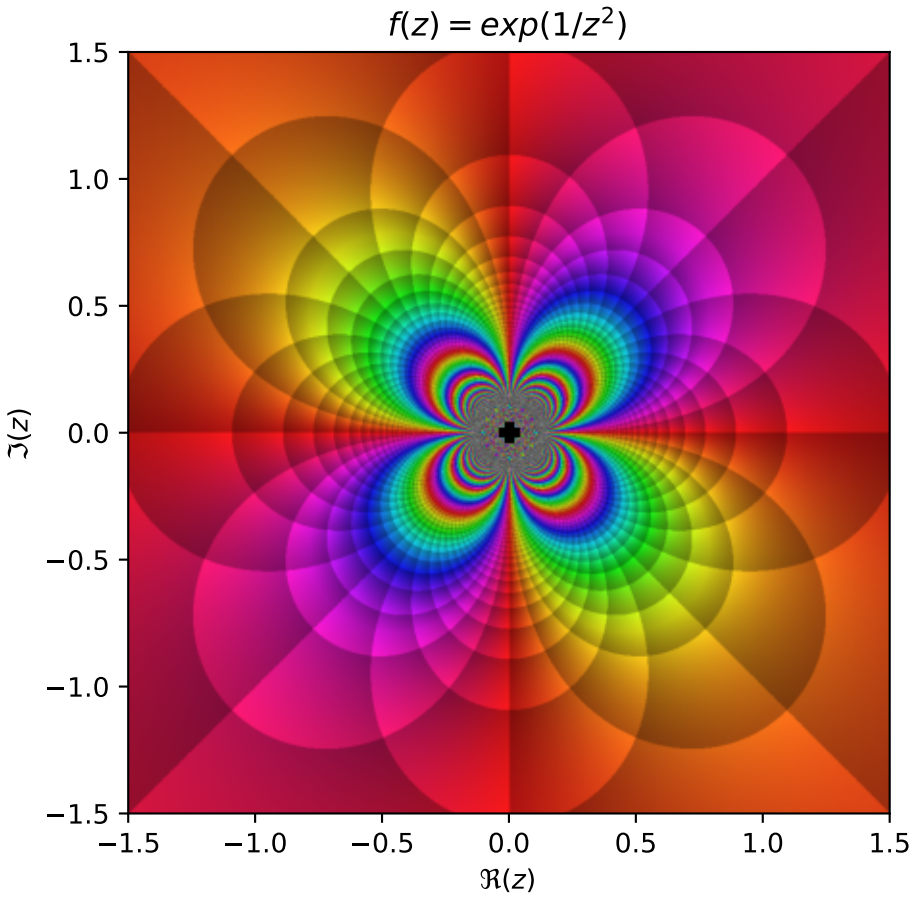


19.5.10 Domain coloring with contours of phase and modulus: $f(z) = \exp(1/z^2)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.exp(1.0 / z**2), style='pm', re=[-1.5, 1.5],
            im=[-1.5, 1.5], Title=r'$f(z)=\exp(1/z^2)$', daxis=True)
```

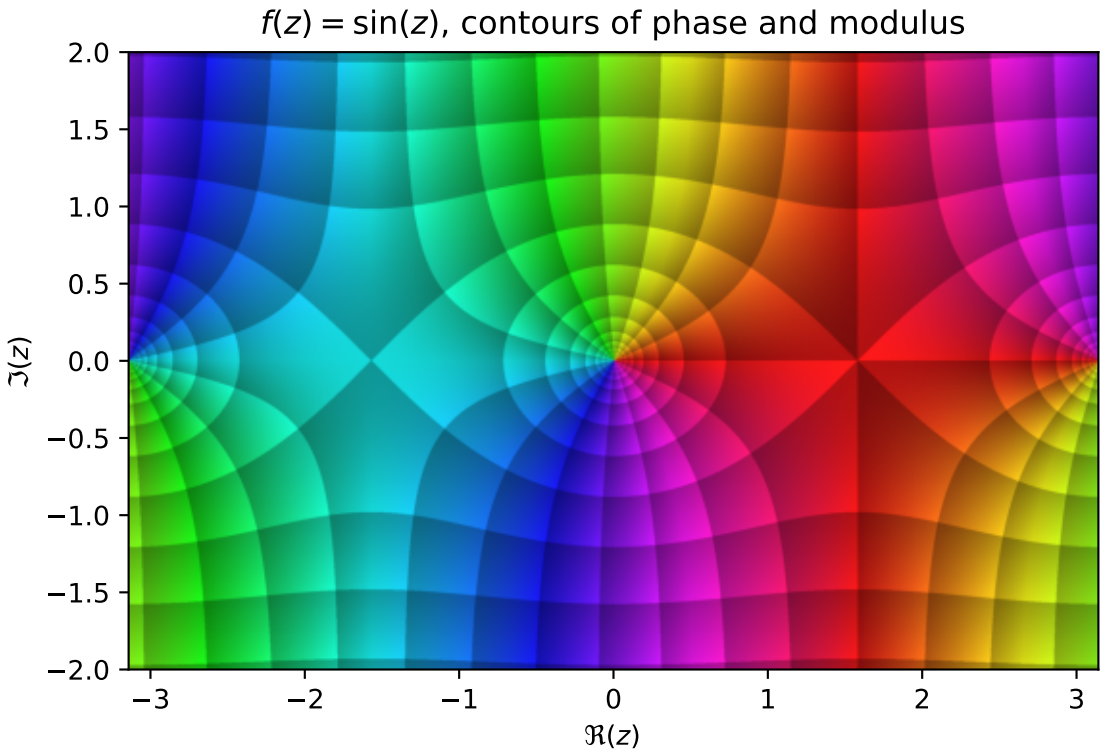


19.5.11 Domain coloring with contours of phase and modulus: $f(z) = \sin(z)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.sin(z), style='pm', re=[-np.pi, np.pi],
            im=[-2, 2], Title=r'$f(z)=\sin(z)$', daxis=True)
```

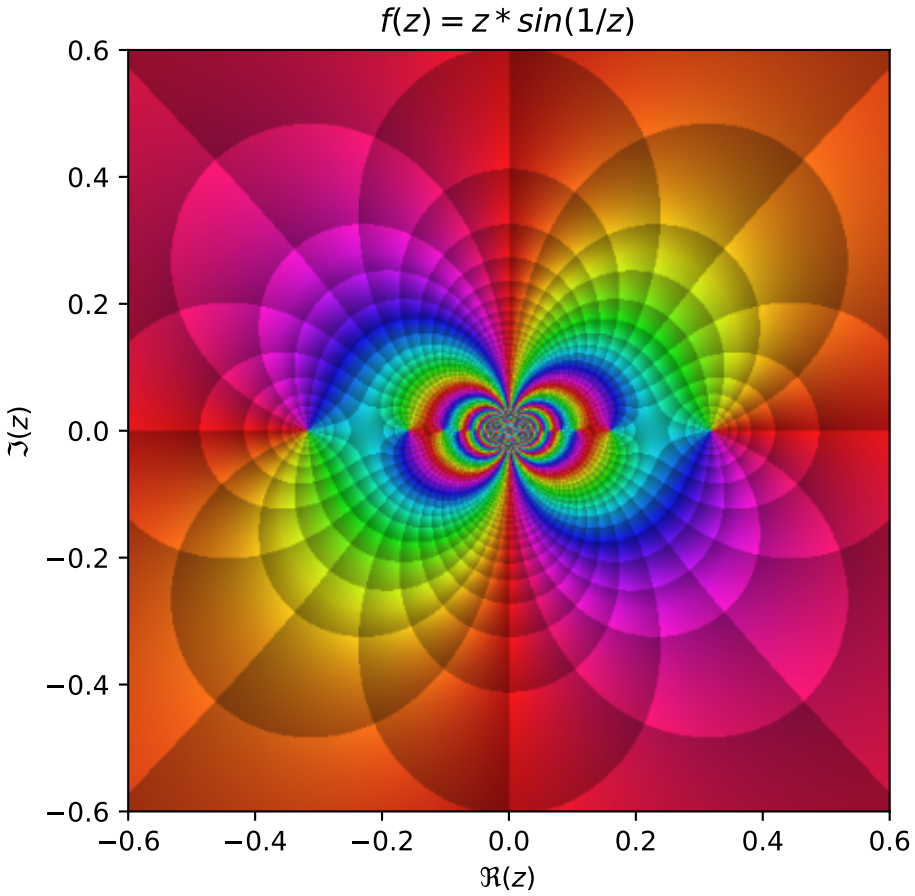


19.5.12 Domain coloring with contours of phase and modulus: $f(z) = z\sin(1/z)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:z*np.sin(1/z), style='pm', re=[-0.6, 0.6],
            im=[-0.6, 0.6], Title=r'$f(z)=z \cdot \sin(1/z)$', daxis=True)
```

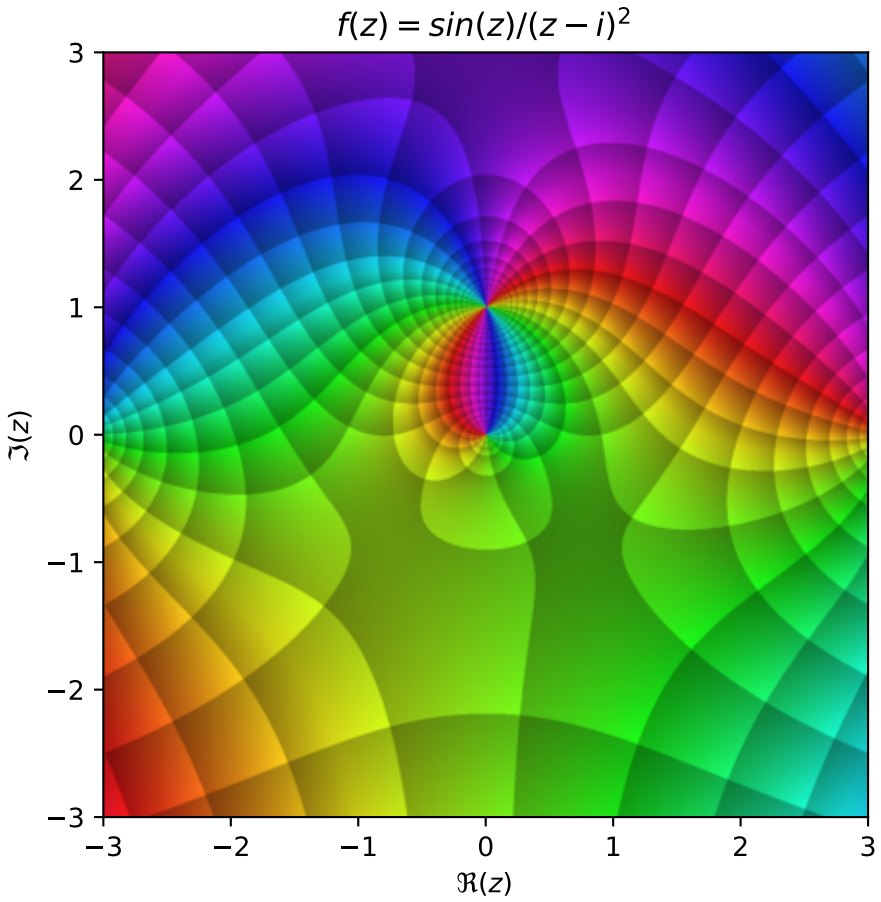


19.5.13 Domain coloring with contours of phase and modulus: $f(z) = \sin(z)/(z-i)^2$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.sin(z) / (z-1j)**2, style='pm', re=[-3, 3],
            im=[-3, 3], Title=r'$f(z)=\dfrac{\sin(z)}{(z-i)^2}$', daxis=True)
```

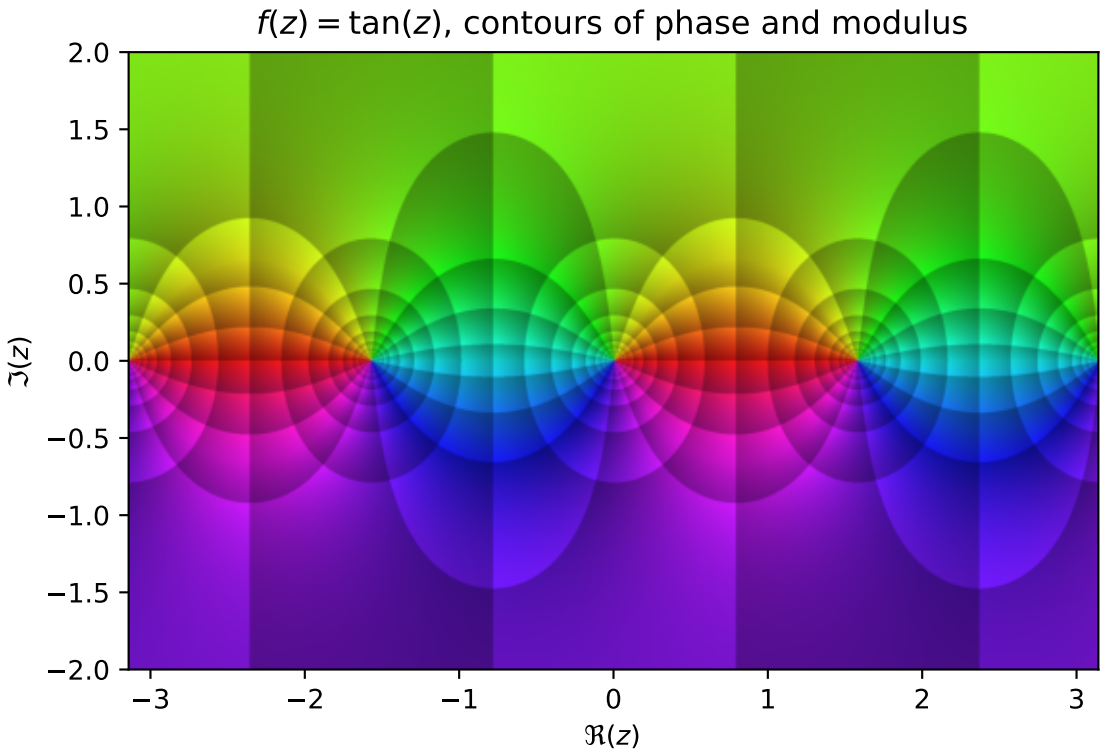


19.5.14 Domain coloring with contours of phase and modulus: $f(z) = \tan(z)$

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_DomainColoring.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        DomainColoring(func=lambda z:np.tan(z), style='pm', re=[-np.pi, np.pi],
            im=[-2, 2], Title=r'$f(z)=\tan(z)$', daxis=True)
```



CHAPTER

TWENTY

MATPLOTLIB 3D GRAPHICS

20.1 Introduction

20.1.1 Overview

Matplotlib was initially designed with only two-dimensional plotting in mind. Around the time of the 1.0 release, some three-dimensional plotting utilities were built on top of Matplotlib's two-dimensional display, and the result is a convenient (if somewhat limited) set of tools for three-dimensional data visualization. Three-dimensional plots are enabled by importing the mplot3d toolkit, included with the main Matplotlib installation.

Once this submodule is imported, a three-dimensional axes can be created by passing the keyword projection='3d' to any of the normal axes creation routines.

With this three-dimensional axes enabled, we can now plot a variety of three-dimensional plot types. Three-dimensional plotting is one of the functionalities that benefits immensely from viewing figures interactively.

See also: https://matplotlib.org/stable/api/toolkits/mplot3d/faq.html

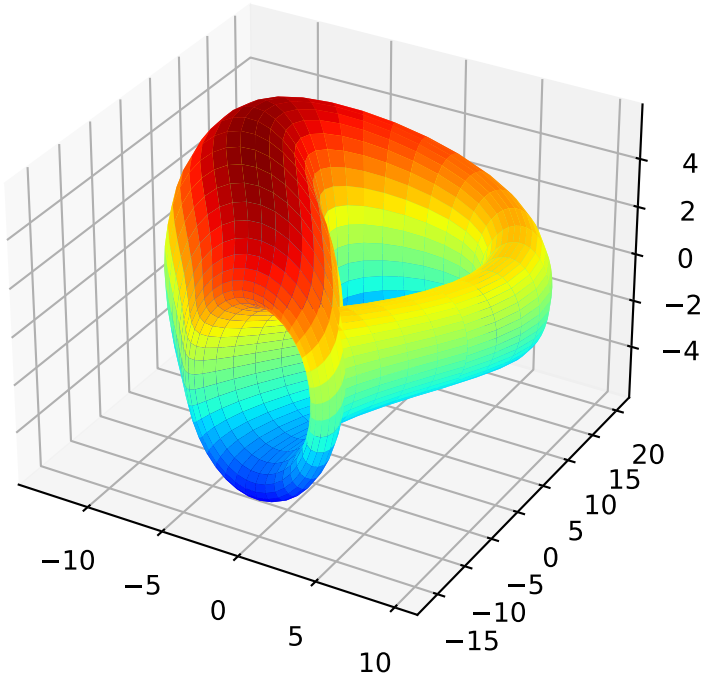
mplot3d was intended to allow users to create simple 3D graphs with the same "look-and-feel" as matplotlib's 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

20.2 Matplotlib: 3D Graphics (from Matplotlib tutorials)

See Test2DFunctions

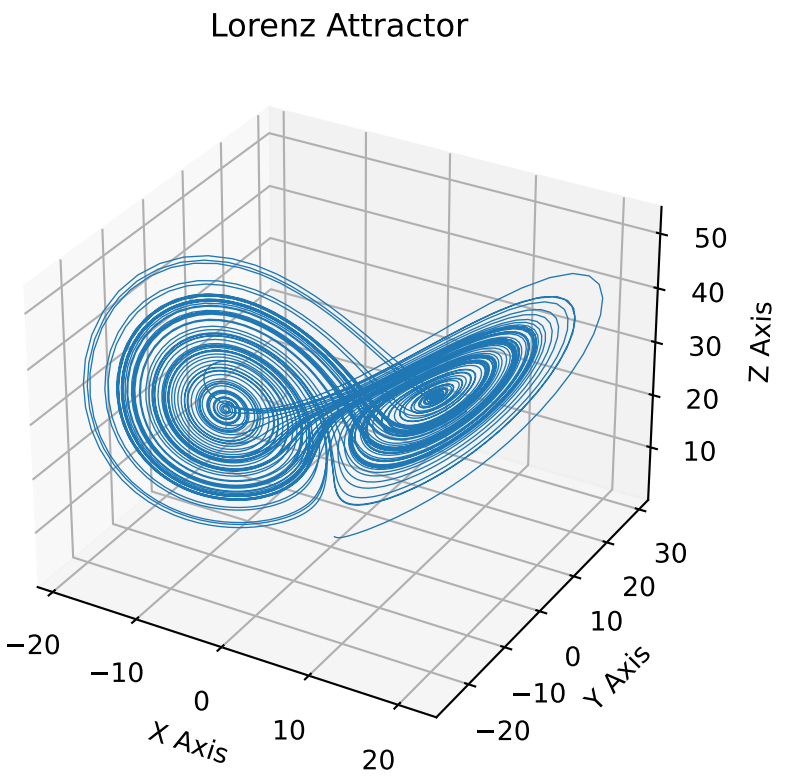
20.2.1 Klein bottle

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_KleinBottle.py, and the XML code in the file D01_DomainColoringRF1.2D.xml.



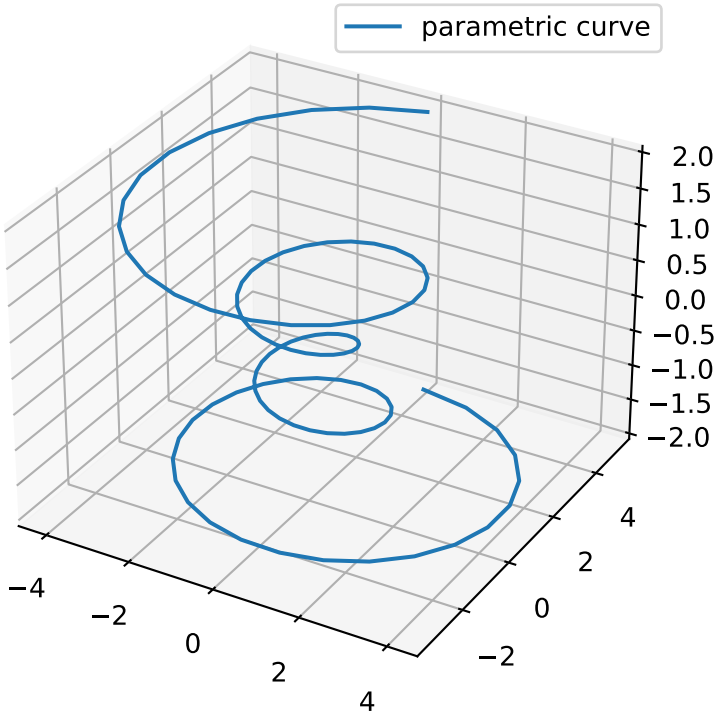
20.2.2 Lorentz attractor

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_LorenzAttractor.py, and the XML code in the file D02_LorenzAttractor.2D.xml.



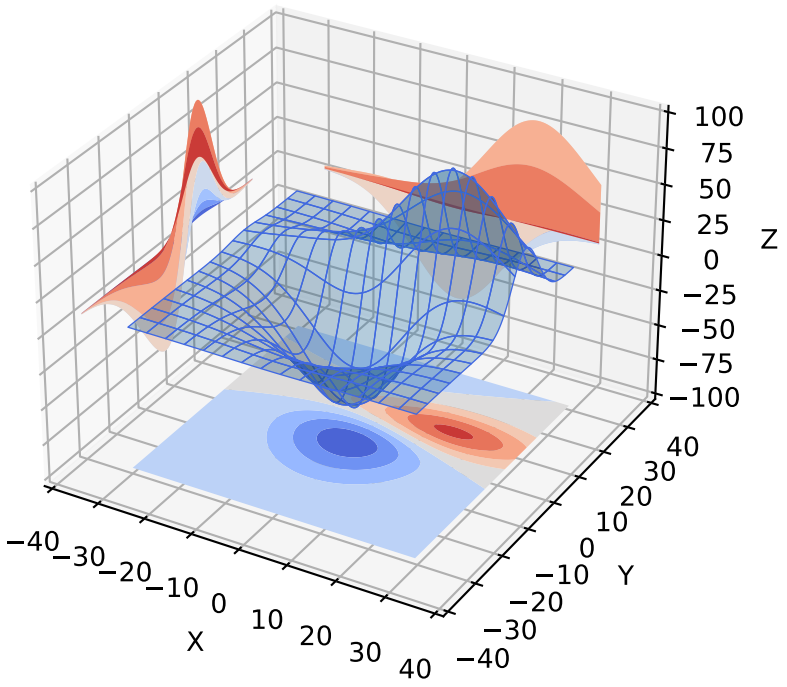
20.2.3 Parametric curve

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_ParametricCurve.py, and the XML code in the file D03_ParametricCurve.2D.xml.



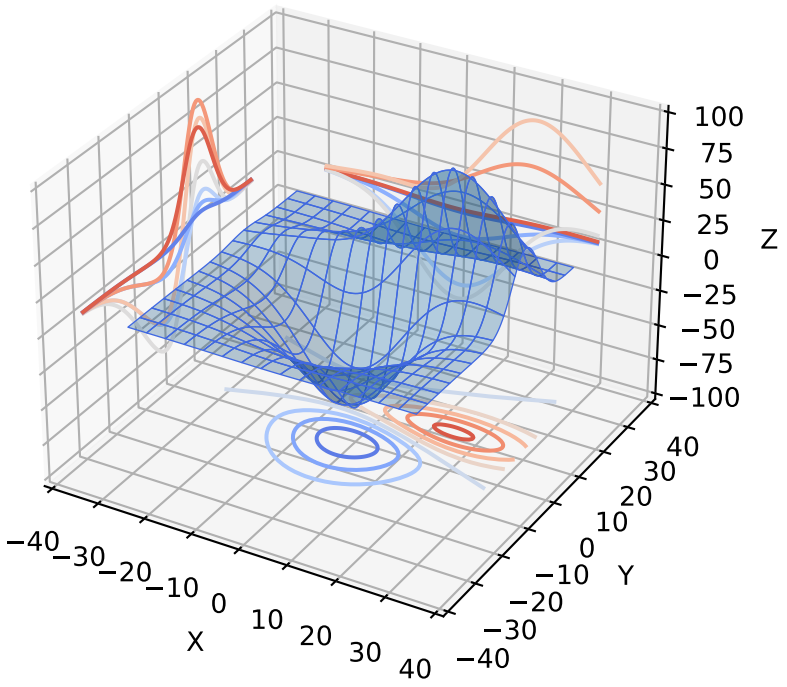
20.2.4 Projected filled contour

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_ProjectFilledContour.py, and the XML code in the file D04_ProjectFilledContour.2D.xml.



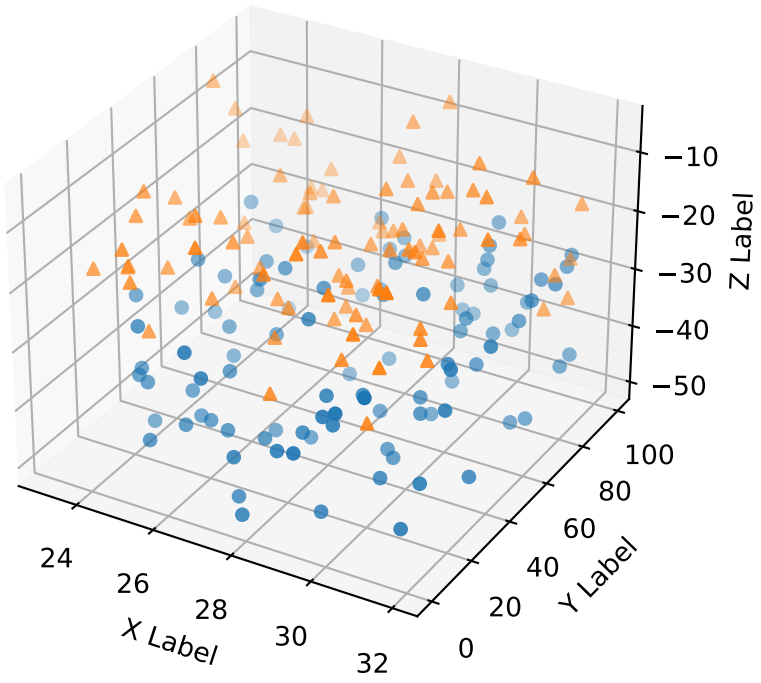
20.2.5 Projected open contour

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_ProjectOpenContour.py, and the XML code in the file D05_ProjectOpenContour.2D.xml.



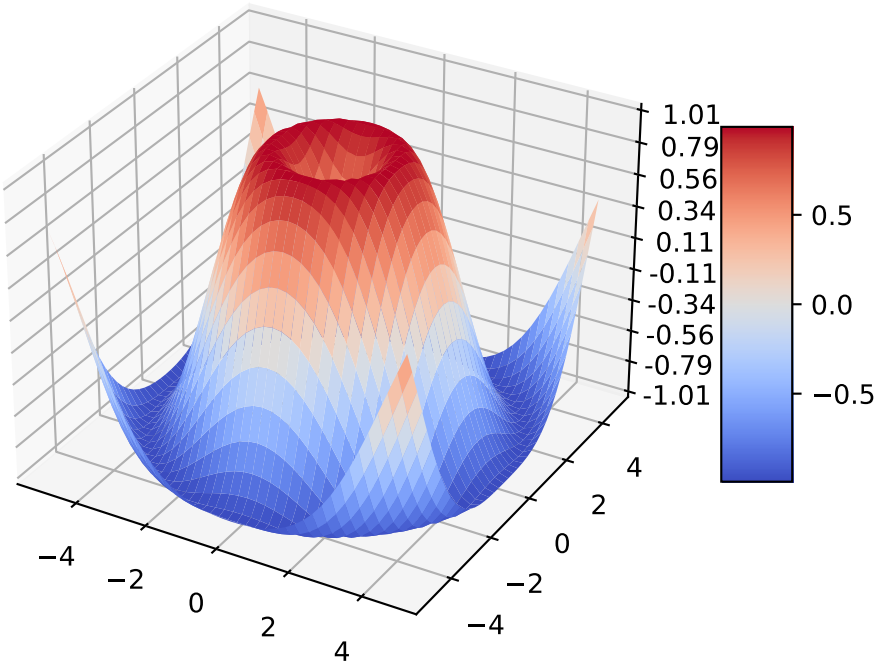
20.2.6 Scatterplot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Scatterplot3D.py, and the XML code in the file D06_Scatterplot3D.2D.xml.



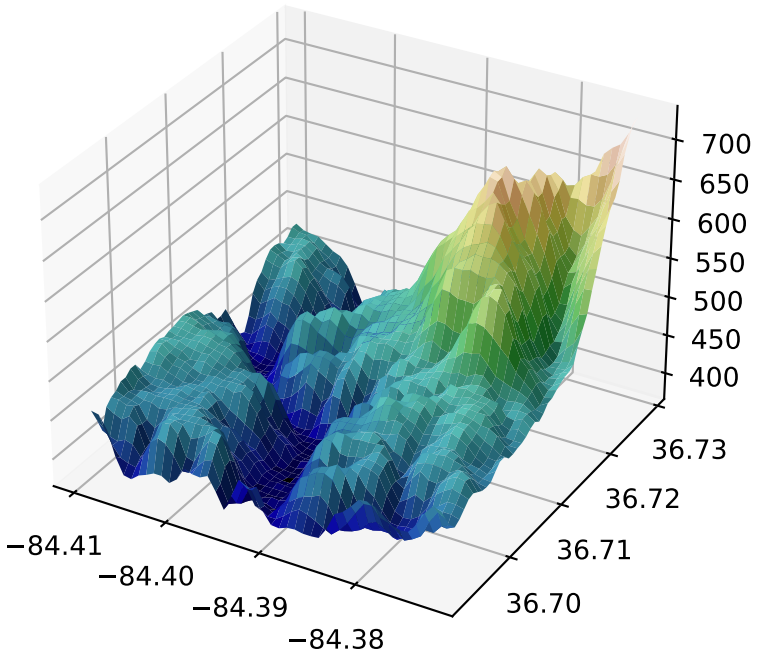
20.2.7 Surface colormap

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_SurfaceColormap.py, and the XML code in the file D07_SurfaceColormap.2D.xml.



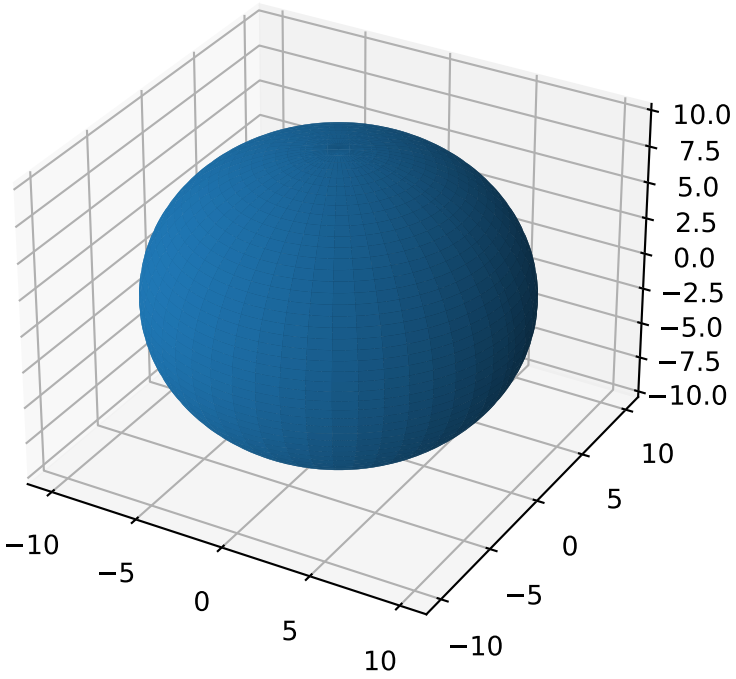
20.2.8 Surface hillshading

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_SurfaceHillshading.py, and the XML code in the file D08_SurfaceHillshading.2D.xml.



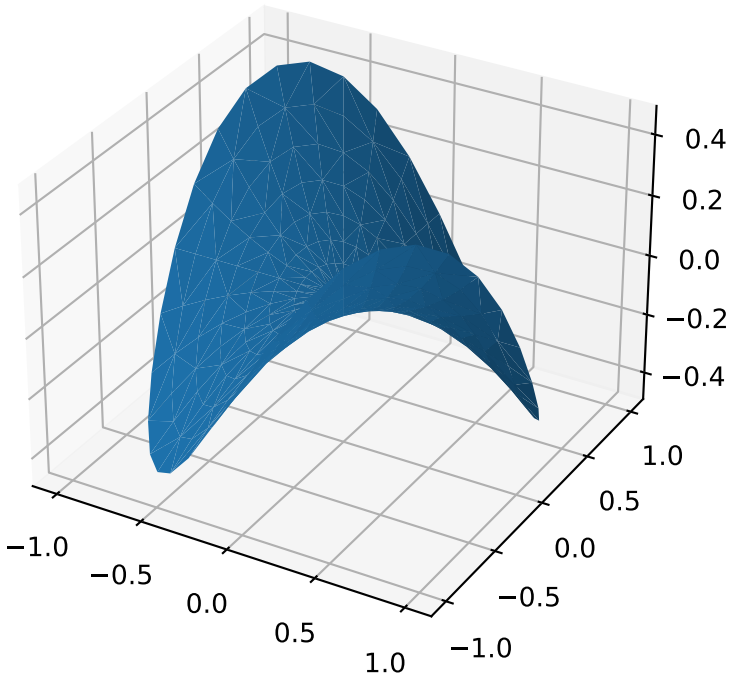
20.2.9 Surface solid

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_SurfaceSolid.py, and the XML code in the file D09_SurfaceSolid.2D.xml.



20.2.10 Surface triangular

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_SurfaceTriangular.py, and the XML code in the file D10_SurfaceTriangular.2D.xml.

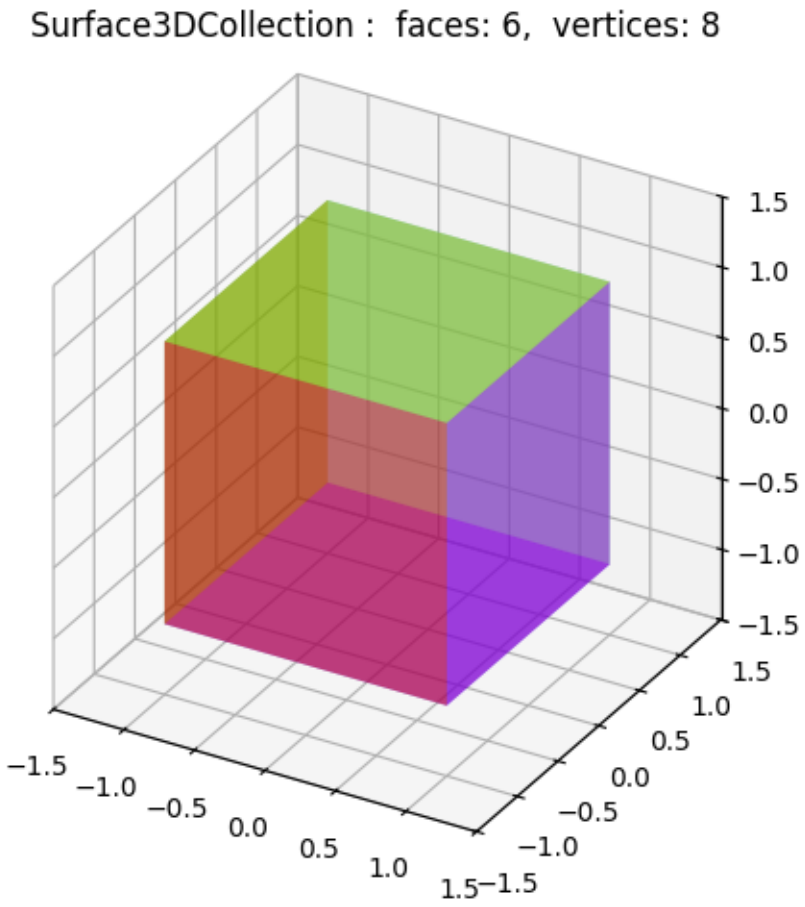


20.3 S3dlib: Basic geometric figures

20.3.1 Base 3D class surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Base3DClassSurface.py, and the XML code in the file D01_Base3DClassSurface.2D.xml.

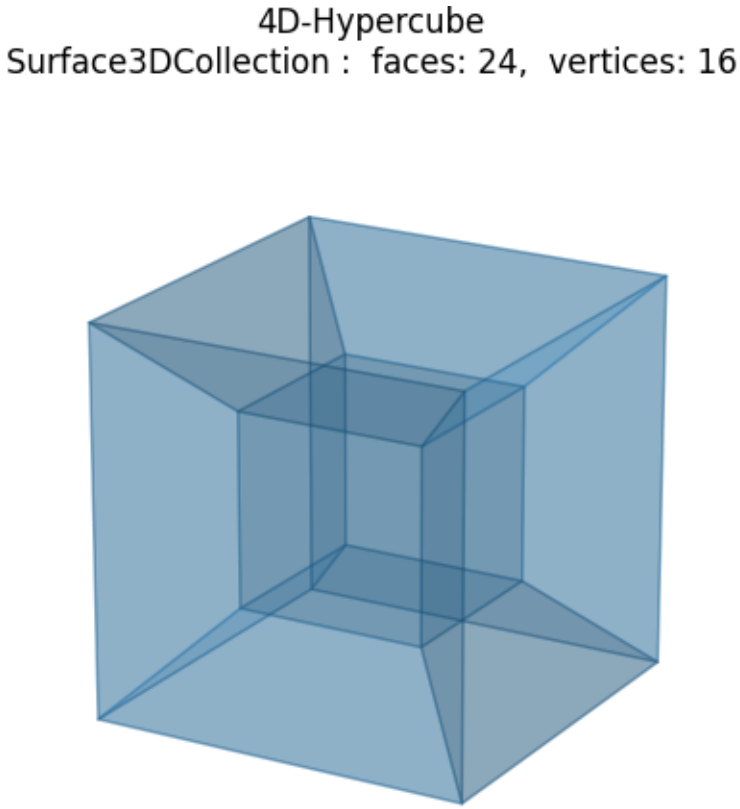
See: https://s3dlib.org/examples/functional/cube.html



20.3.2 Hypercube

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Hypercube.py, and the XML code in the file D02_Hypercube.2D.xml.

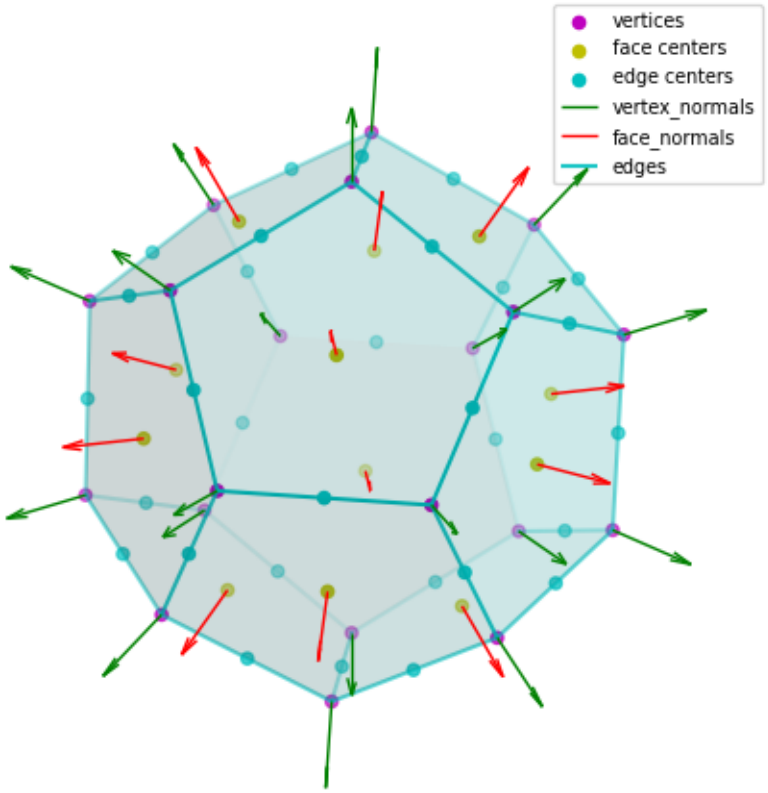
See: https://s3dlib.org/examples/functional/hypercube.html



20.3.3 Surface elements

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_SurfaceElements.py, and the XML code in the file D03_SurfaceElements.2D.xml.

See: https://s3dlib.org/examples/functional/fev_fn_vn.html



SphericalSurface (0 , dodeca*): faces: 12, vertices: 20

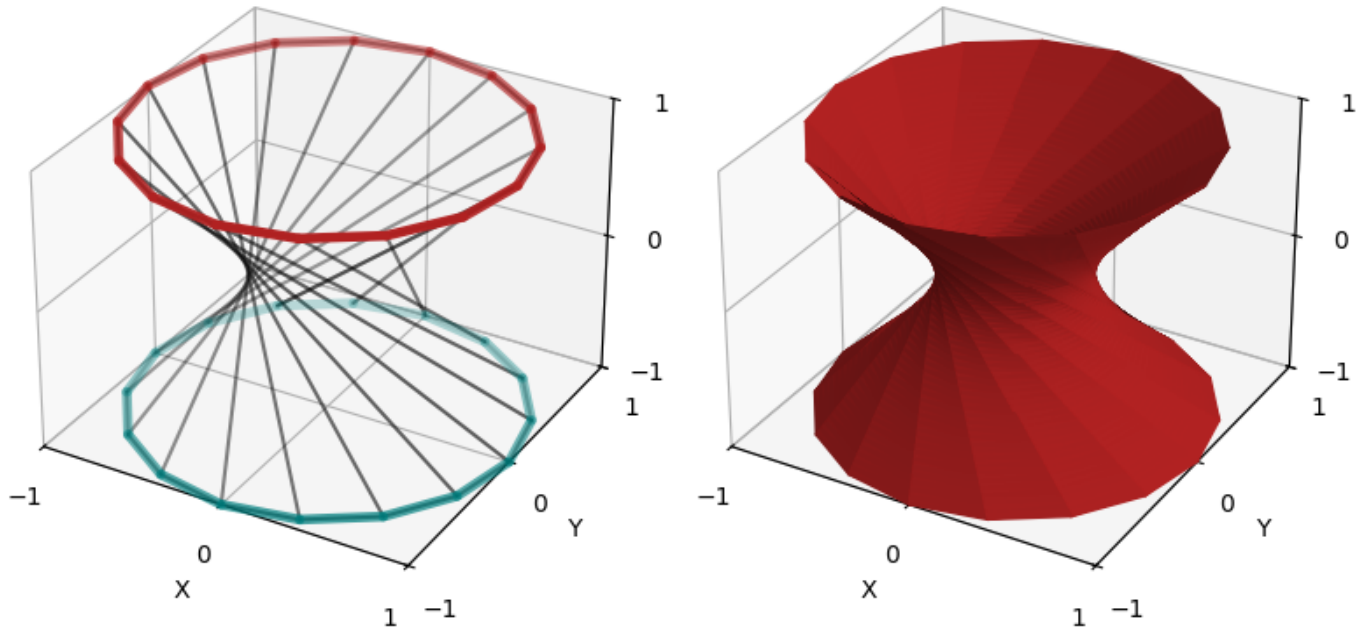
20.3.4 Hyperboloid 3D

See also: https://mathworld.wolfram.com/One-SheetedHyperboloid.html

See also: https://en.wikipedia.org/wiki/Hyperboloid

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Hyperboloid3D.py, and the XML code in the file D04_Hyperboloid3D.2D.xml .

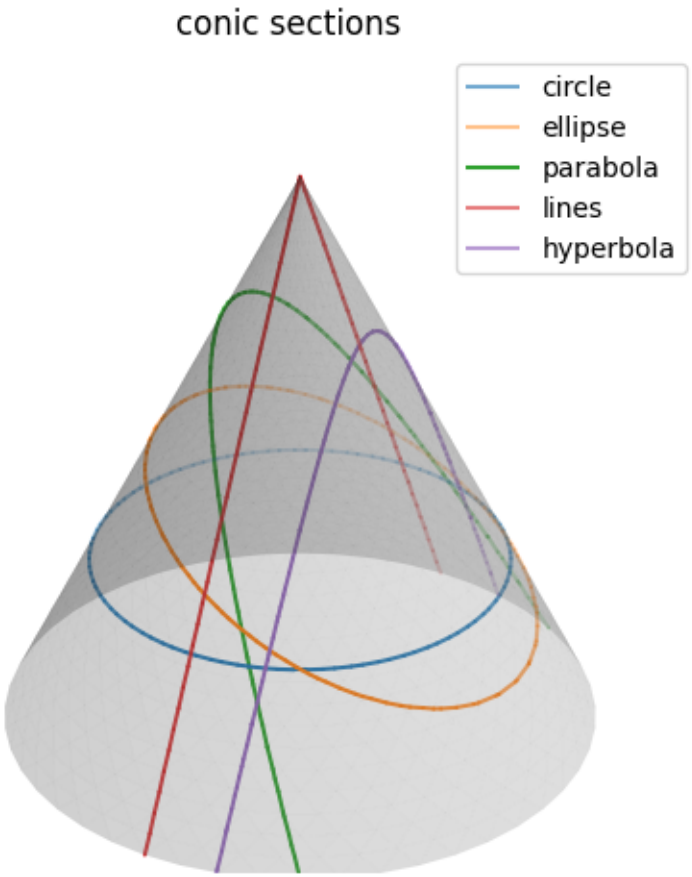
See: https://github.com/fzaverl/s3dlib



20.3.5 Conic sections

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Conic_Sections.py, and the XML code in the file D05_Conic_Sections.2D.xml.

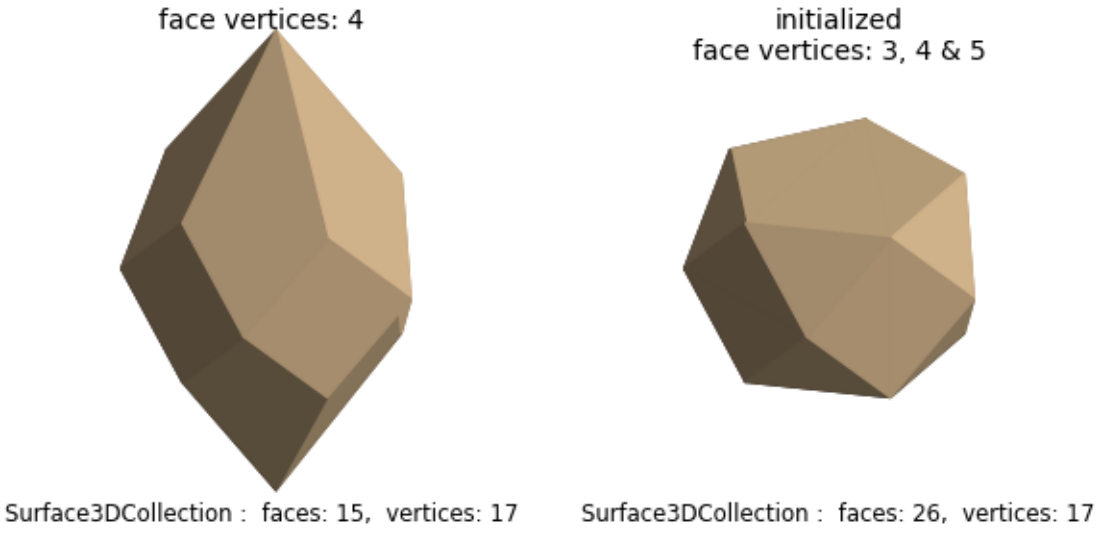
See: https://s3dlib.org/examples/lines/conic.html



20.3.6 Base 3D class surface, part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Base3DClassSurface2.py, and the XML code in the file D06_Base3DClassSurface2.2D.xml.

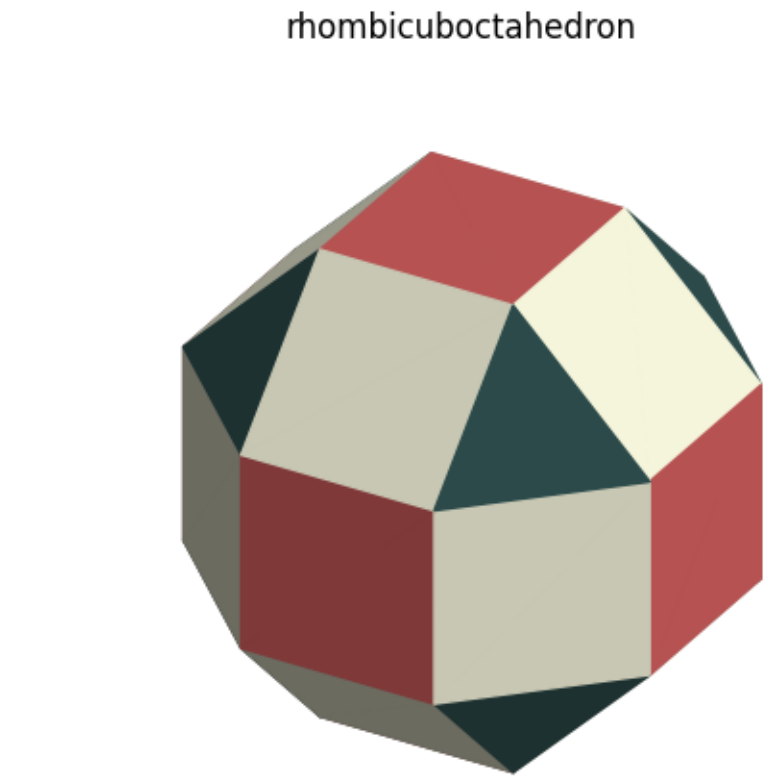
See: https://s3dlib.org/examples/functional/base_surface.html



20.3.7 Rhombicuboctahedron

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_RhombicuboctahedronPlain.py, and the XML code in the file D07a_RhombicuboctahedronPlain.2D.xml.

See: https://s3dlib.org/examples/functional/arch_solid.html

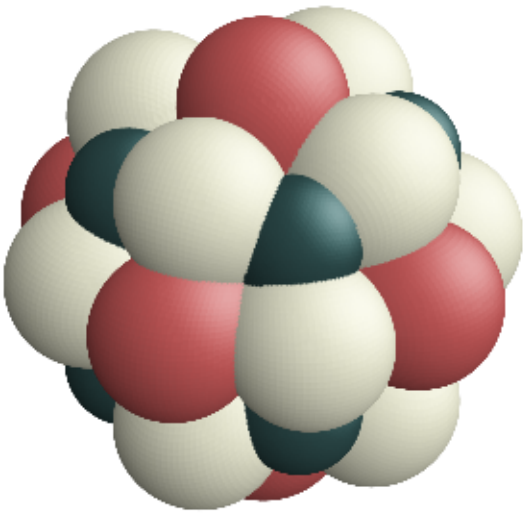


```
Surface3DCollection :  faces: 44,  vertices: 24
```

20.3.8 Rhombicuboctahedron, bubbles

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07b_RhombicuboctahedronBubbles.py, and the XML code in the file D07b_RhombicuboctahedronBubbles.2D.xml.

See: https://s3dlib.org/examples/functional/arch_solid.html



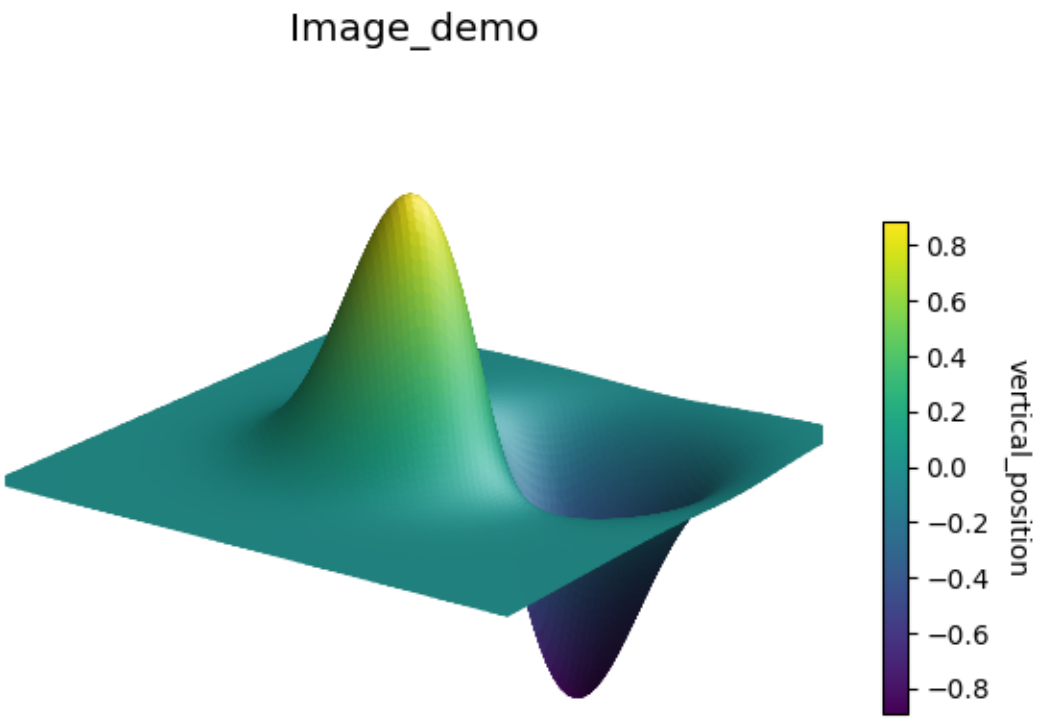
```
Surface3DCollection :  faces: 45056,  vertices: 22530
```

20.4 S3dlib: Real functions

20.4.1 Surface plot of a real function, basic example

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_HelloWorldExample.py, and the XML code in the file D01_HelloWorldExample.2D.xml.

See: https://s3dlib.org/examples/functional/hw_example.html

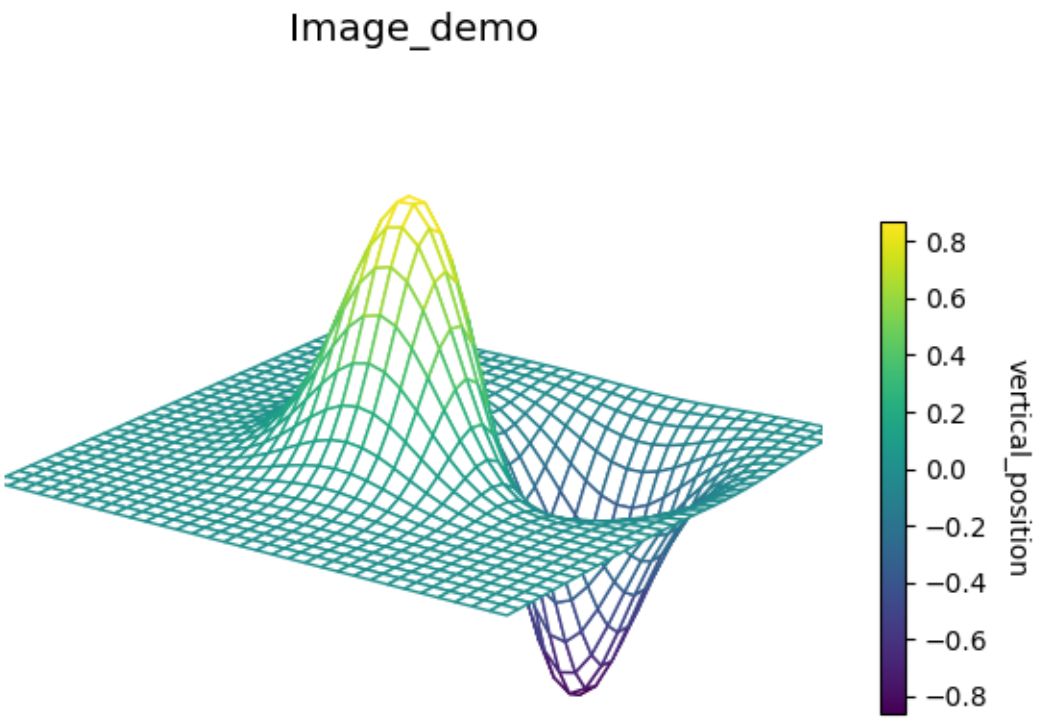


```
PlanarSurface ( 6 , quad ):  faces: 16384,  vertices: 8321
```

20.4.2 Surface plot of a real function, grid

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_HelloWorldExampleGrid.py, and the XML code in the file D02_HelloWorldExampleGrid.2D.xml.

See: https://s3dlib.org/examples/functional/hw_example_grid.html

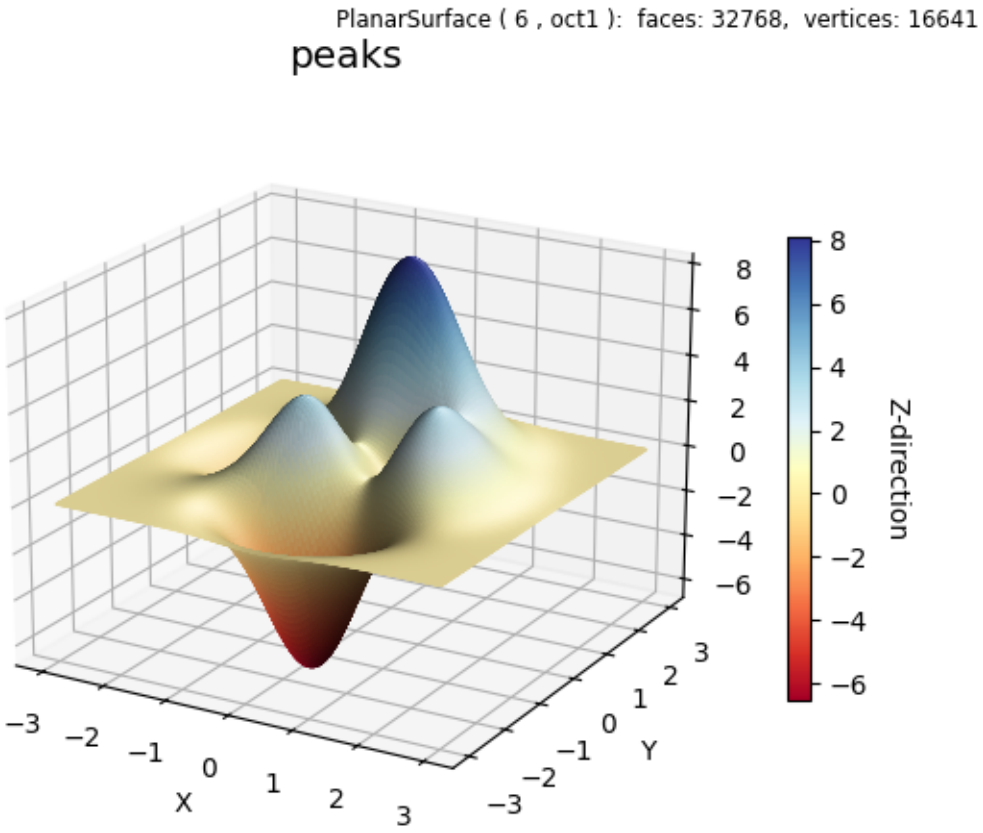


```
PlanarSurface ( 4 , squ ):  faces: 1024,  vertices: 1089
```

20.4.3 Surface plot of a real function, peaks example

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_HelloWorldExample2b.py, and the XML code in the file D03_HelloWorldExample2b.2D.xml.

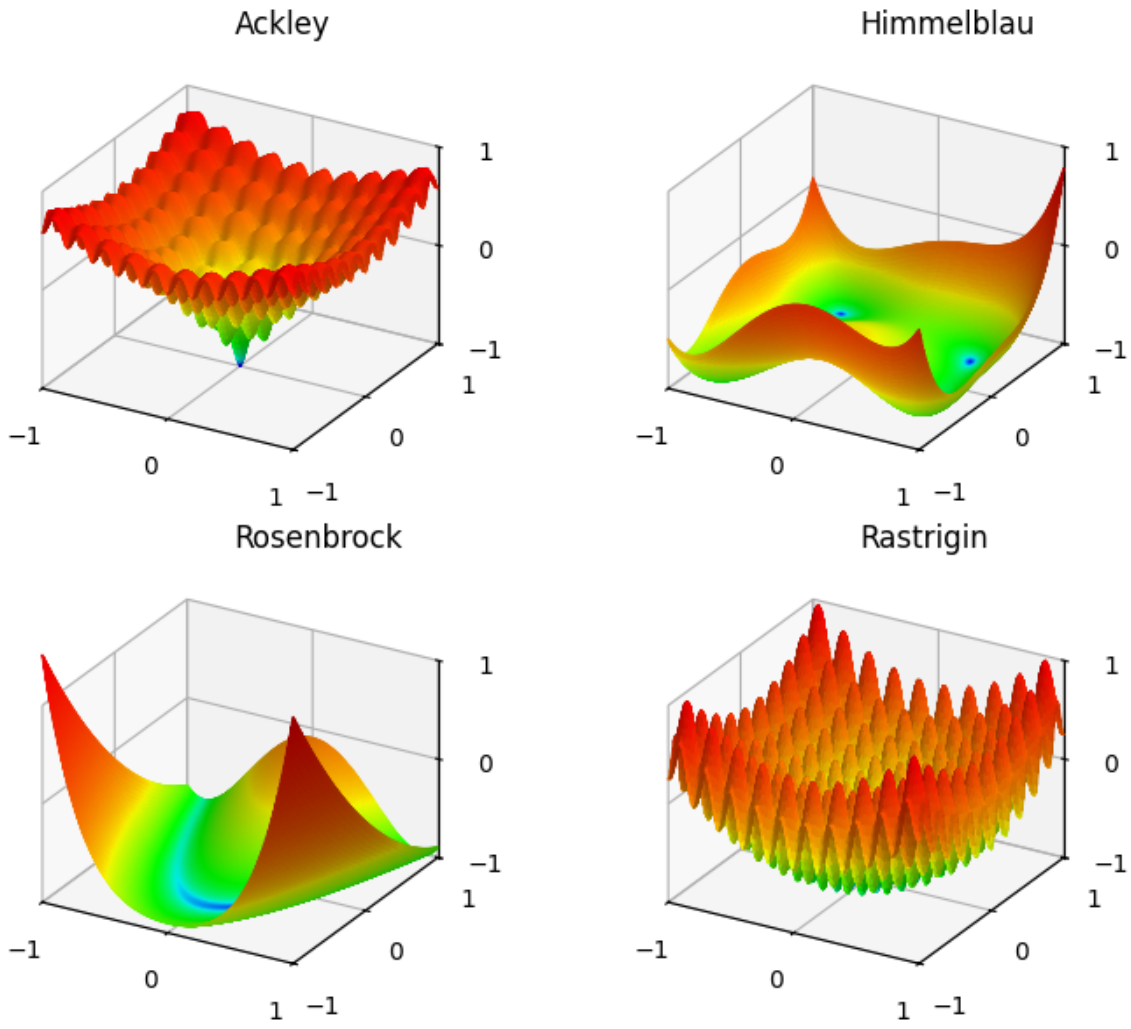
See: https://s3dlib.org/examples/functional/swirl.html



20.4.4 Function plots: Ackley, Himmelblau, Rosenbrock, Rastrigin

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_FunctionPlots.py, and the XML code in the file D04_FunctionPlots.2D.xml.

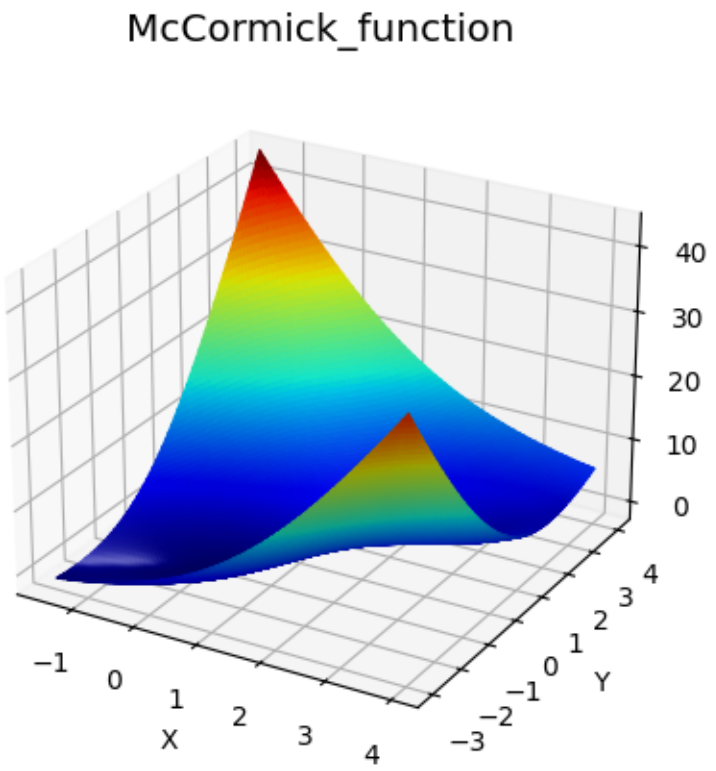
See: https://s3dlib.org/examples/functional/funcplots.html



20.4.5 McCormick function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_FunctionPlots2.py, and the XML code in the file D05_FunctionPlots2.2D.xml.

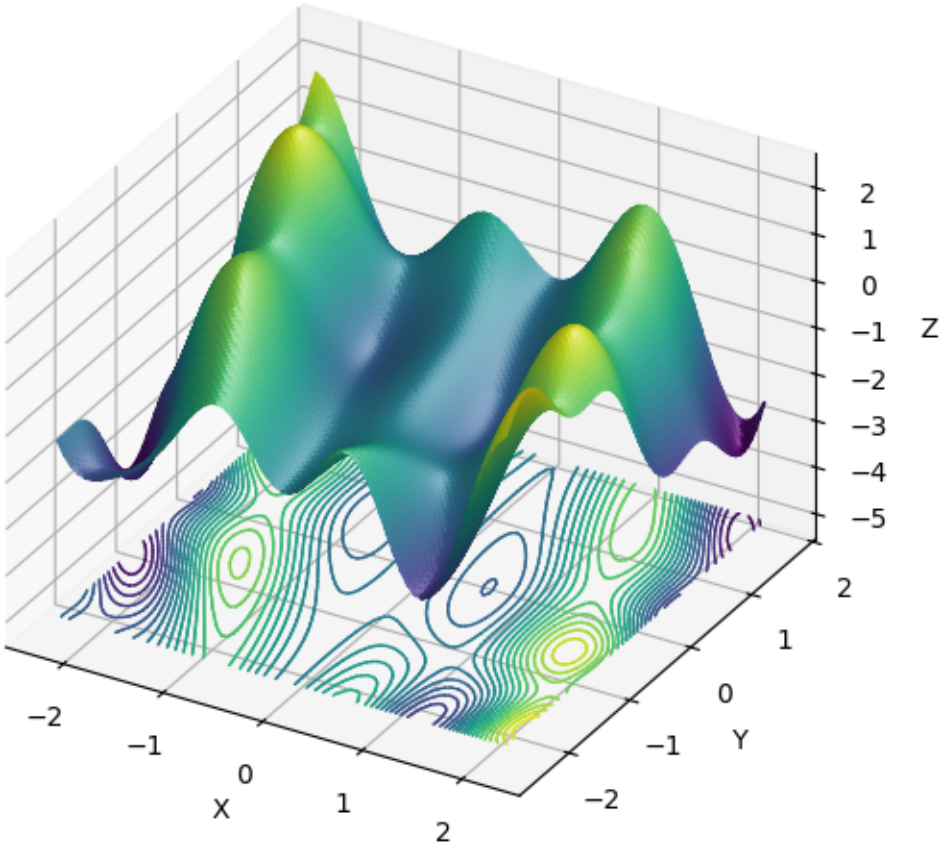
See: https://s3dlib.org/examples/functional/domain.html



20.4.6 Surface plot combined with contour

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_SurfaceContours.py, and the XML code in the file D06_SurfaceContours.2D.xml.

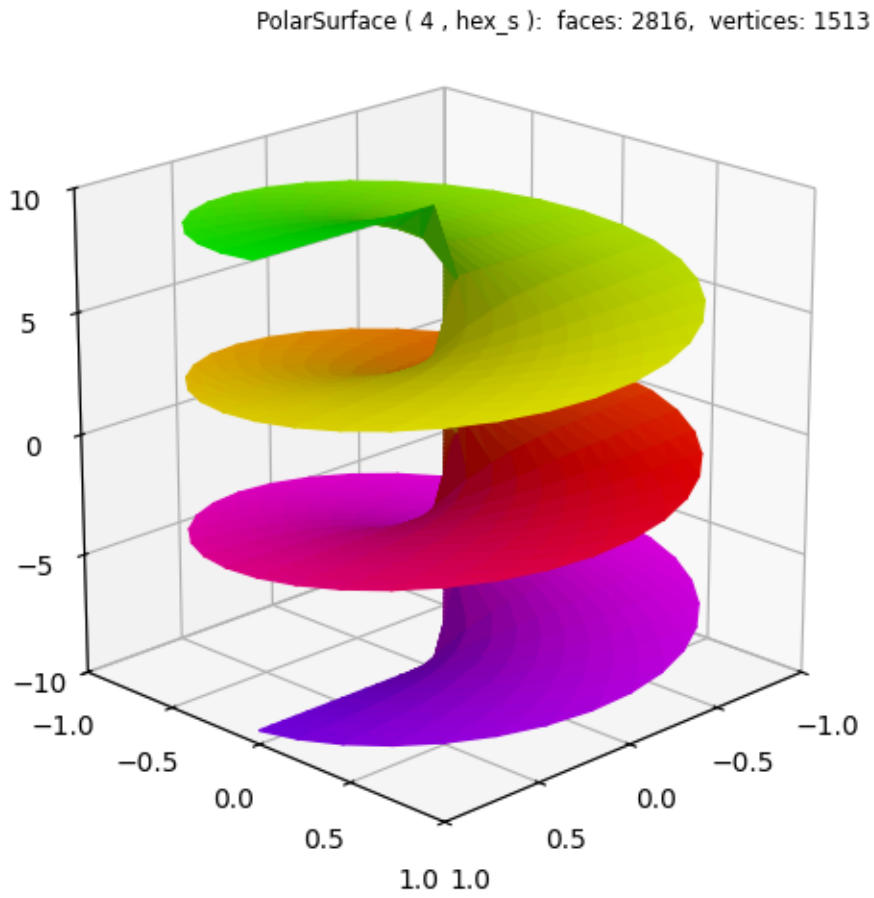
See: https://github.com/fzaverl/s3dlib



20.4.7 Sliced polar surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_SlicedPolarSurface.py, and the XML code in the file D07_SlicedPolarSurface.2D.xml.

See: https://s3dlib.org/examples/functional/screw.html



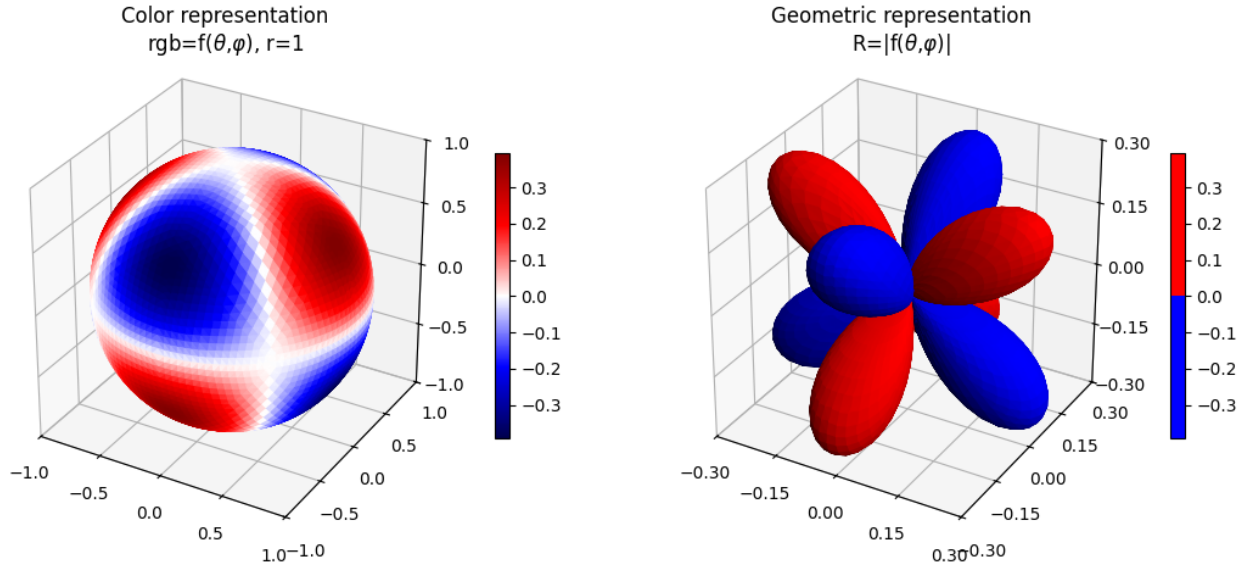
20.5 S3dlib: Parametric Surfaces

See Test2DFunctions

20.5.1 Color representation vs geometric representation, part 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_TwoMethodsA.py, and the XML code in the file D01_TwoMethodsA.2D.xml.

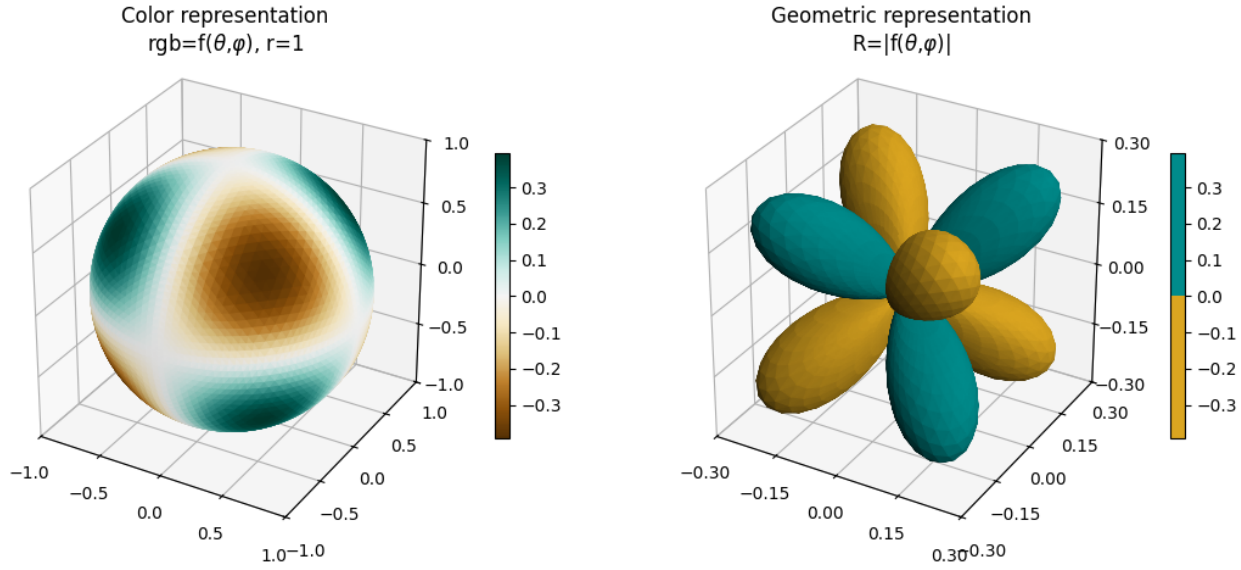
See: https://s3dlib.org/examples/functional/sph_harm.html



20.5.2 Color representation vs geometric representation, part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_TwoMethodsB.py, and the XML code in the file D02_TwoMethodsB.2D.xml.

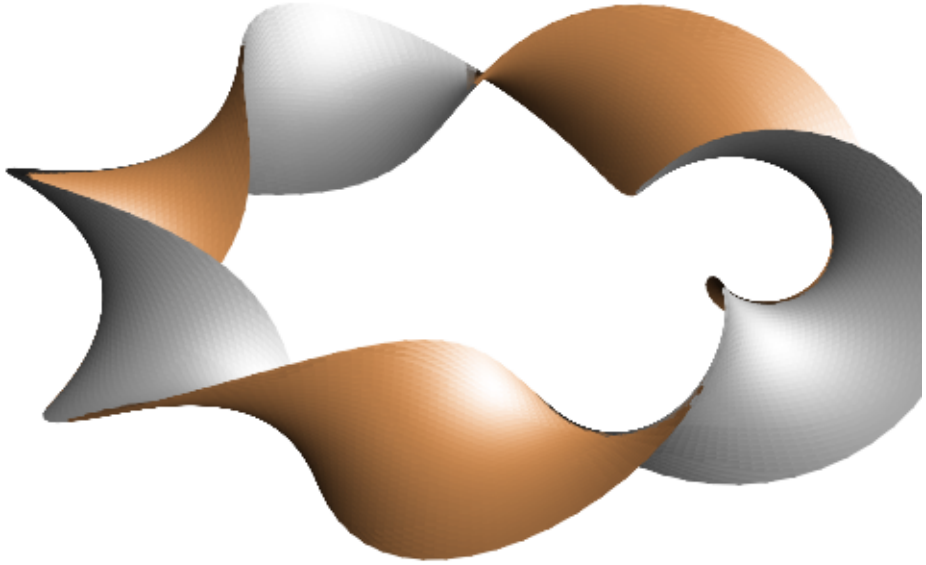
See: https://s3dlib.org/examples/functional/sph_harm.html



20.5.3 Color maps: Möbius function example

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Colormaps.py, and the XML code in the file D03_Colormaps.2D.xml.

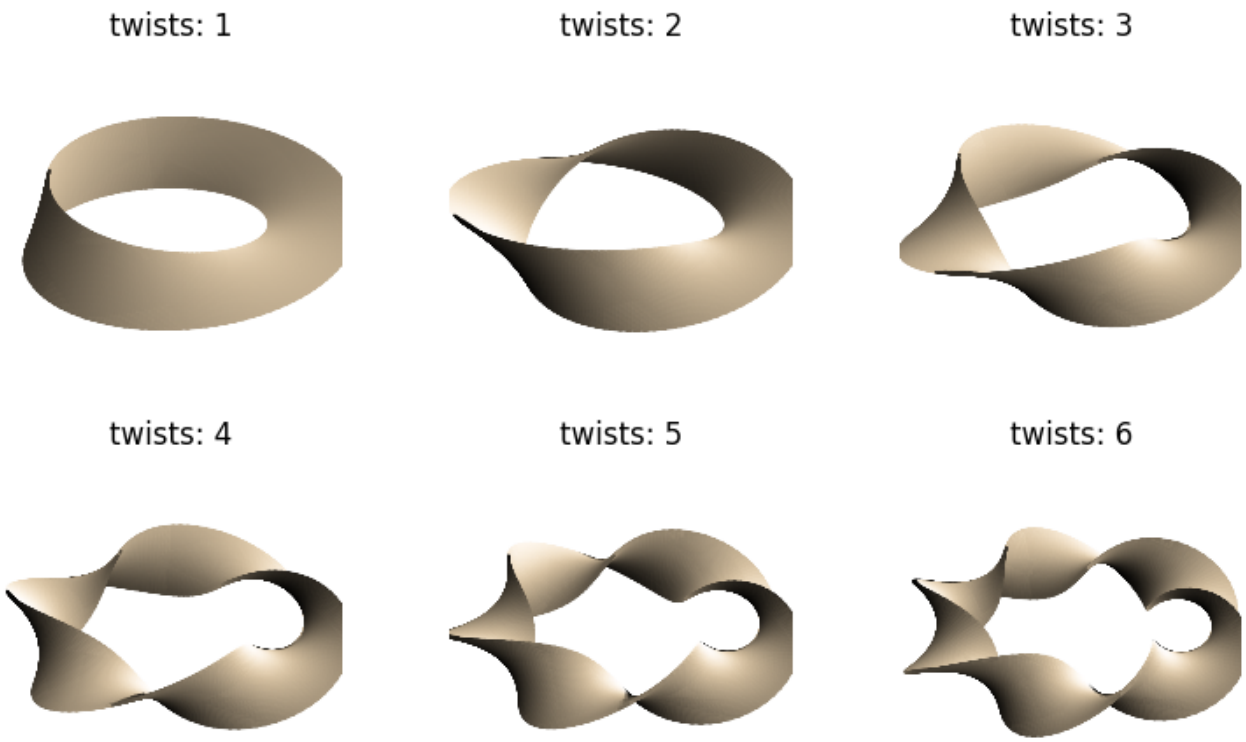
See: https://github.com/fzaverl/s3dlib



20.5.4 Shading: Möbius function example

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_TwistSet.py, and the XML code in the file D04_TwistSet.2D.xml.

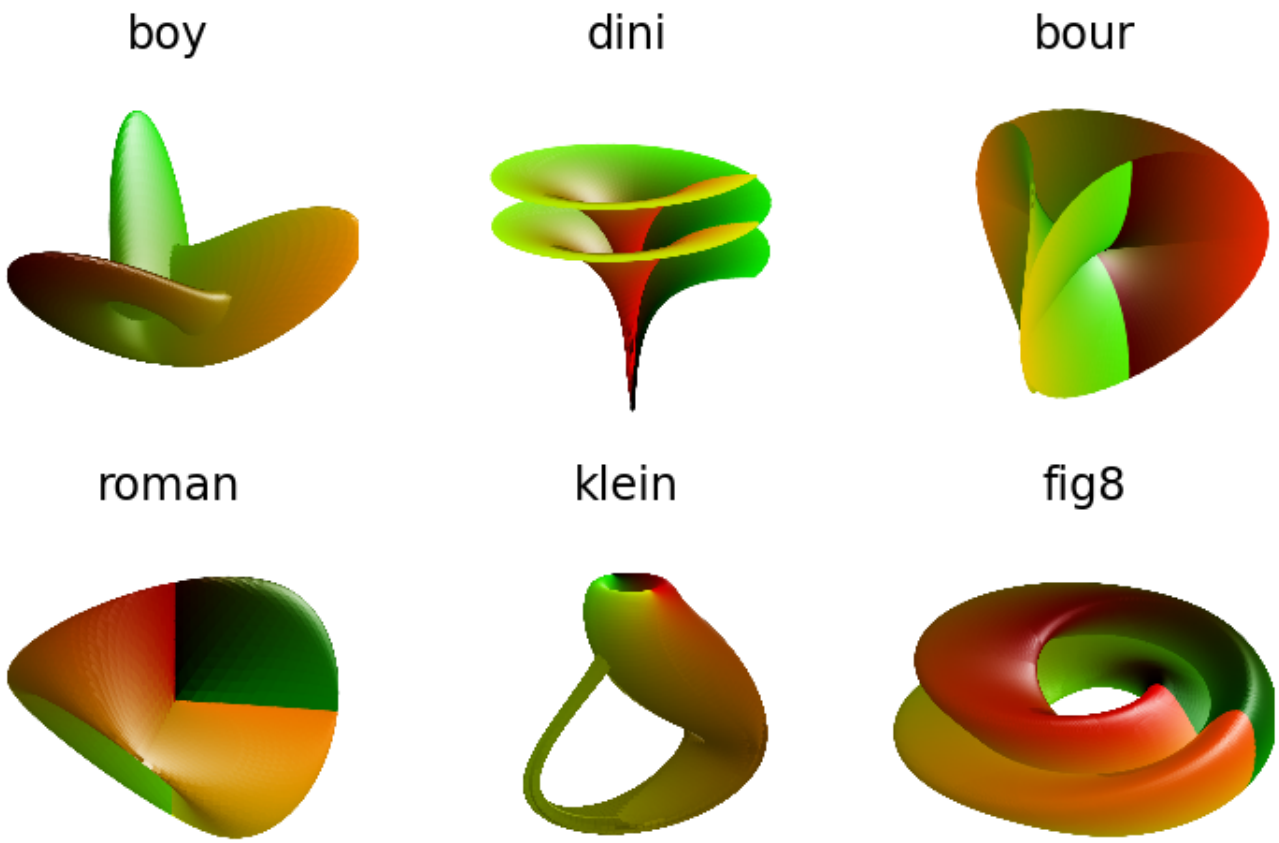
See: https://github.com/fzaverl/s3dlib



20.5.5 Color maps: Boy, Dini, Bour, Roman, Klein, and Figure8 examples

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Colormaps2.py, and the XML code in the file D05_Colormaps2.2D.xml.

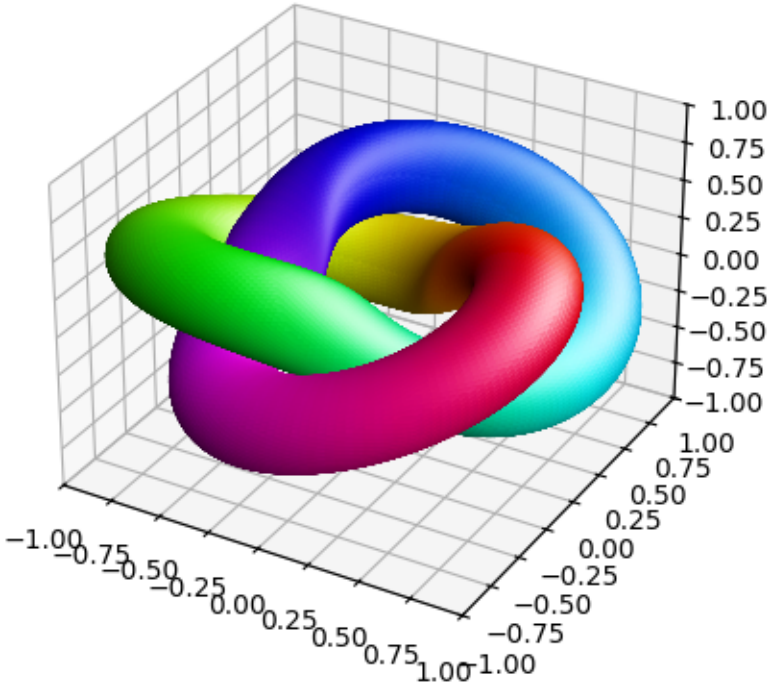
See: https://github.com/fzaverl/s3dlib



20.5.6 Colored knot in 3D

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Knot.py, and the XML code in the file D06_Knot.2D.xml.

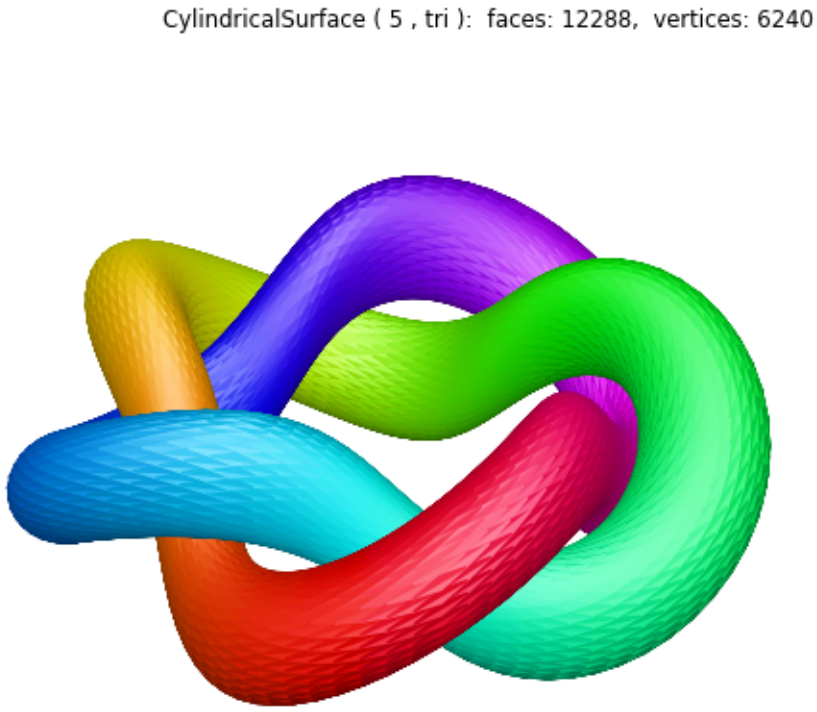
See: https://github.com/fzaverl/s3dlib



20.5.7 Multiple geometric maps

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_MultipleGeometricMaps.py, and the XML code in the file D07_MultipleGeometricMaps.2D.xml.

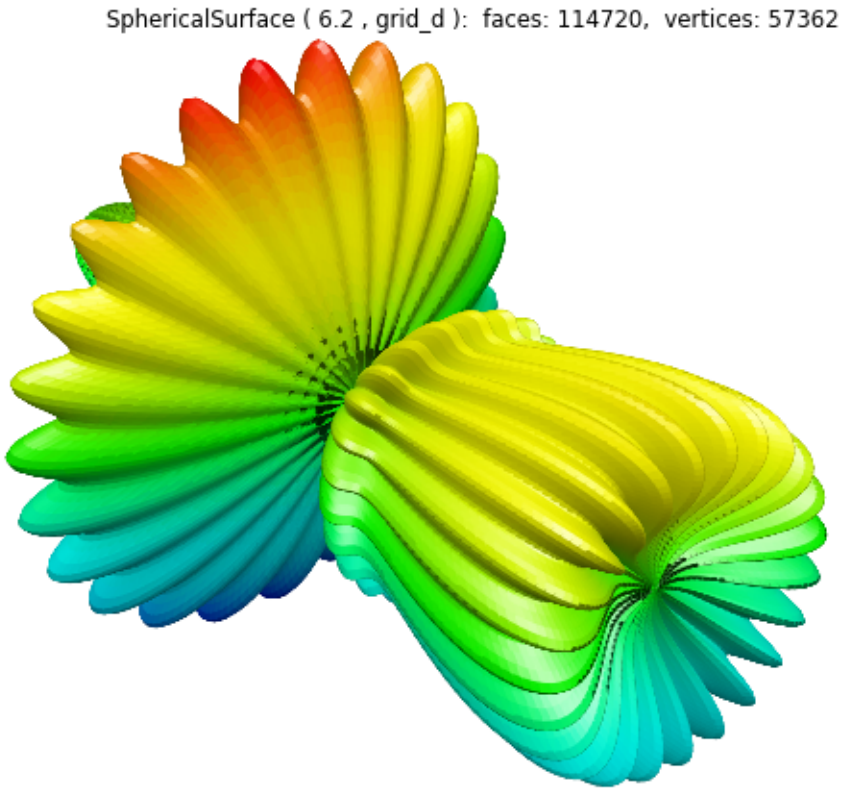
See: https://s3dlib.org/examples/functional/knot.html



20.5.8 Example from Mayavi

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Mayavi.py, and the XML code in the file D08_Mayavi.2D.xml.

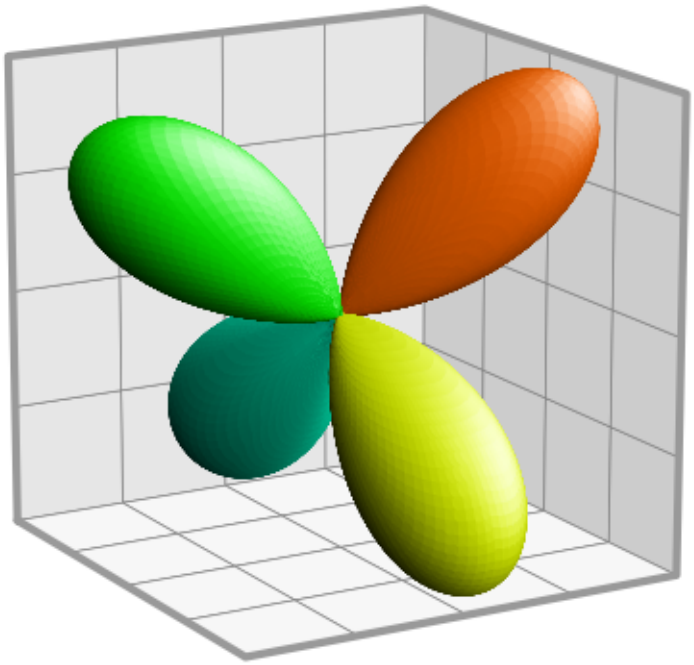
See: https://s3dlib.org/examples/functional/a_demo.html



20.5.9 S3Dlib Logo

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_S3dlibLogo.py, and the XML code in the file D09_S3dlibLogo.2D.xml.

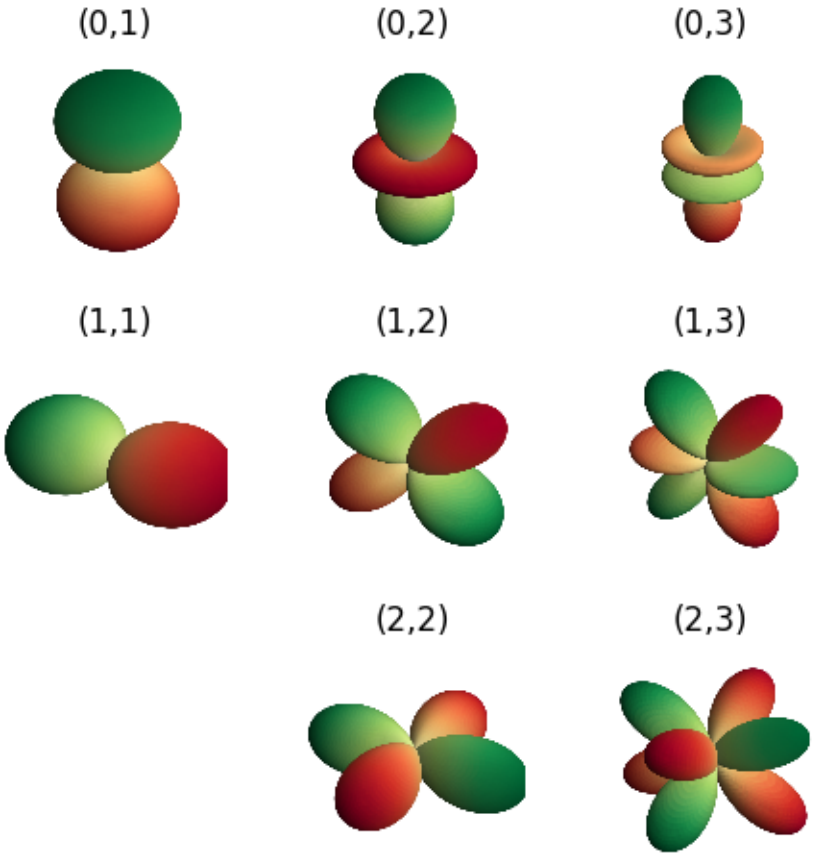
See: https://s3dlib.org/examples/functional/s3d_sph.html



20.5.10 Spherical harmonics, 3D representation

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10_SphericalHarmonics.py, and the XML code in the file D10_SphericalHarmonics.2D.xml.

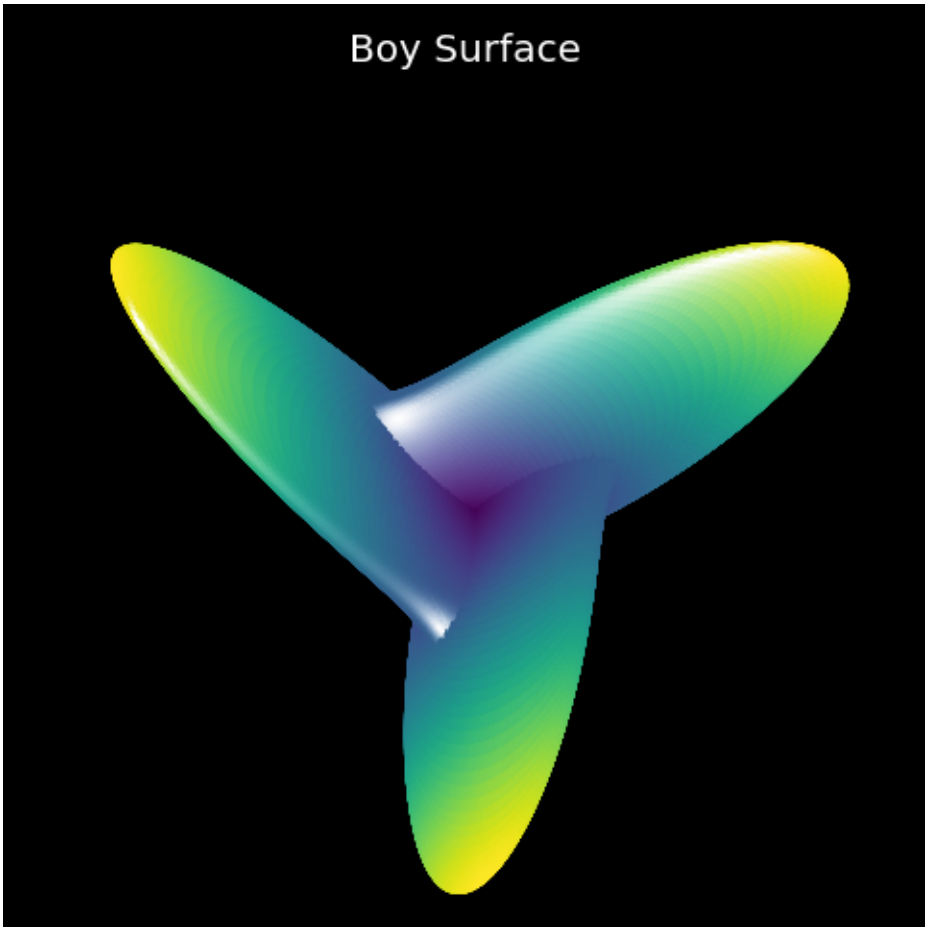
See: https://github.com/fzaverl/s3dlib



20.5.11 Boy surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11_BoySurface.py

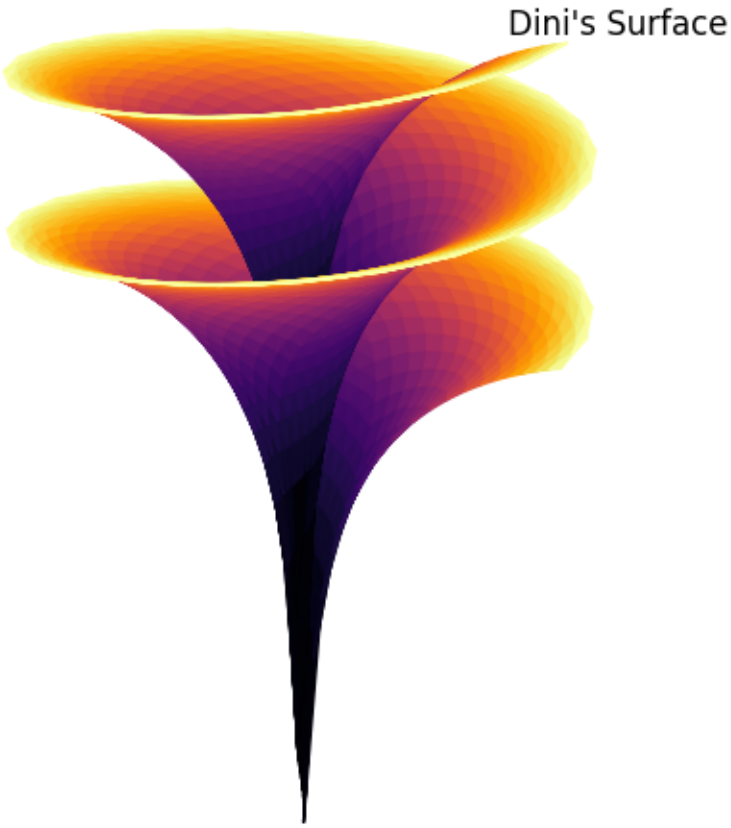
See: https://s3dlib.org/examples/functional/boy.html



20.5.12 Dini surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12_DiniSurface.py, and the XML code in the file D12_DiniSurface.2D.xml.

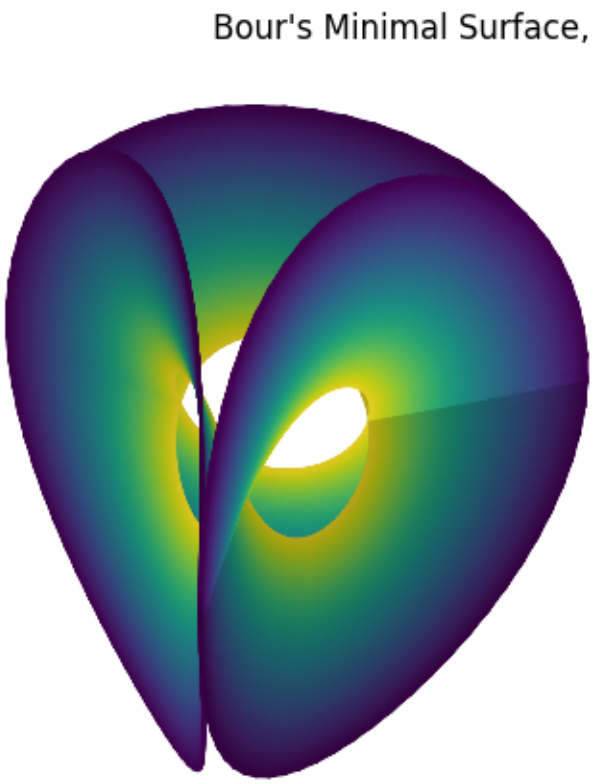
See: https://s3dlib.org/examples/functional/dini.html



20.5.13 Bour surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13_BourSurface.py, and the XML code in the file D13_BourSurface.2D.xml.

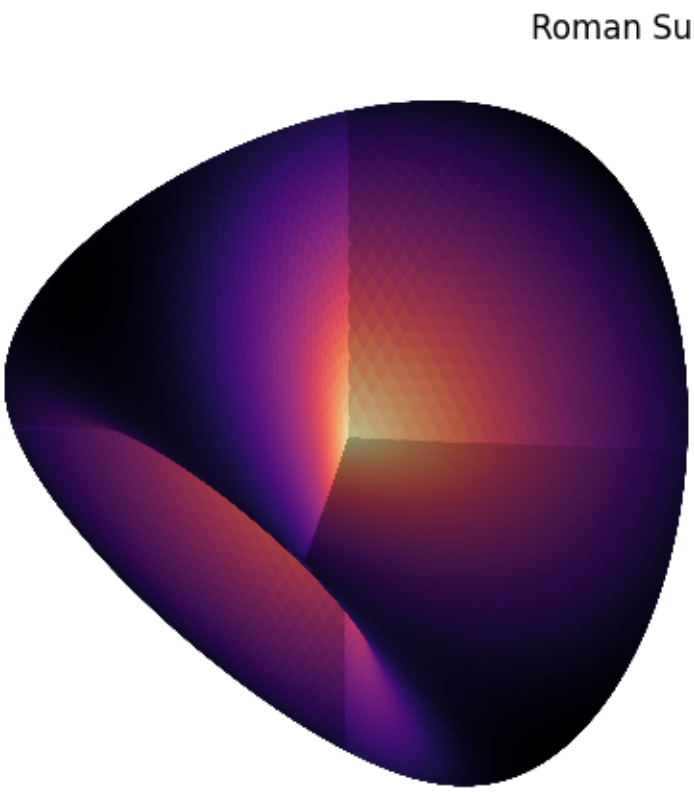
See: https://s3dlib.org/examples/functional/dini.html



20.5.14 Roman surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14_RomanSurface.py, and the XML code in the file D14_RomanSurface.2D.xml.

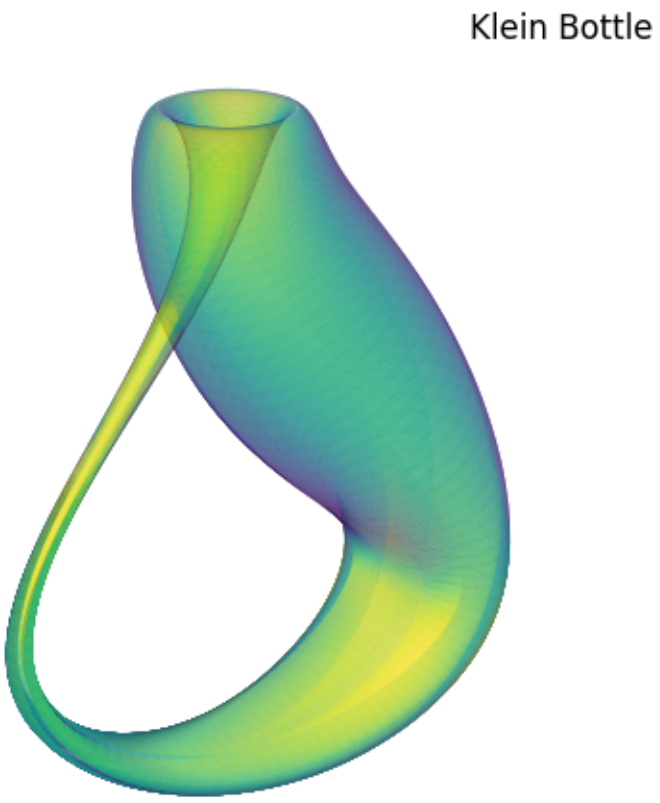
See: https://s3dlib.org/examples/functional/roman.html



20.5.15 Klein bottle

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D15_KleinBottle.py, and the XML code in the file D15_KleinBottle.2D.xml.

See: https://s3dlib.org/examples/functional/klein_bottle.html

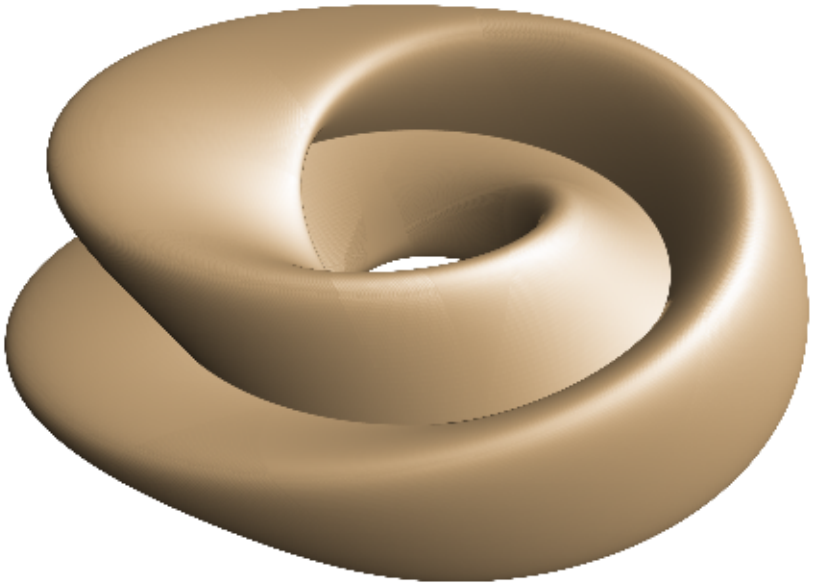


20.5.16 Klein bottle8

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D16_KleinBottle8.py, and the XML code in the file D16_KleinBottle8.2D.xml.

See: https://s3dlib.org/examples/functional/klein_figure8.html

Figure 8 Immersion of the Klein Bottle

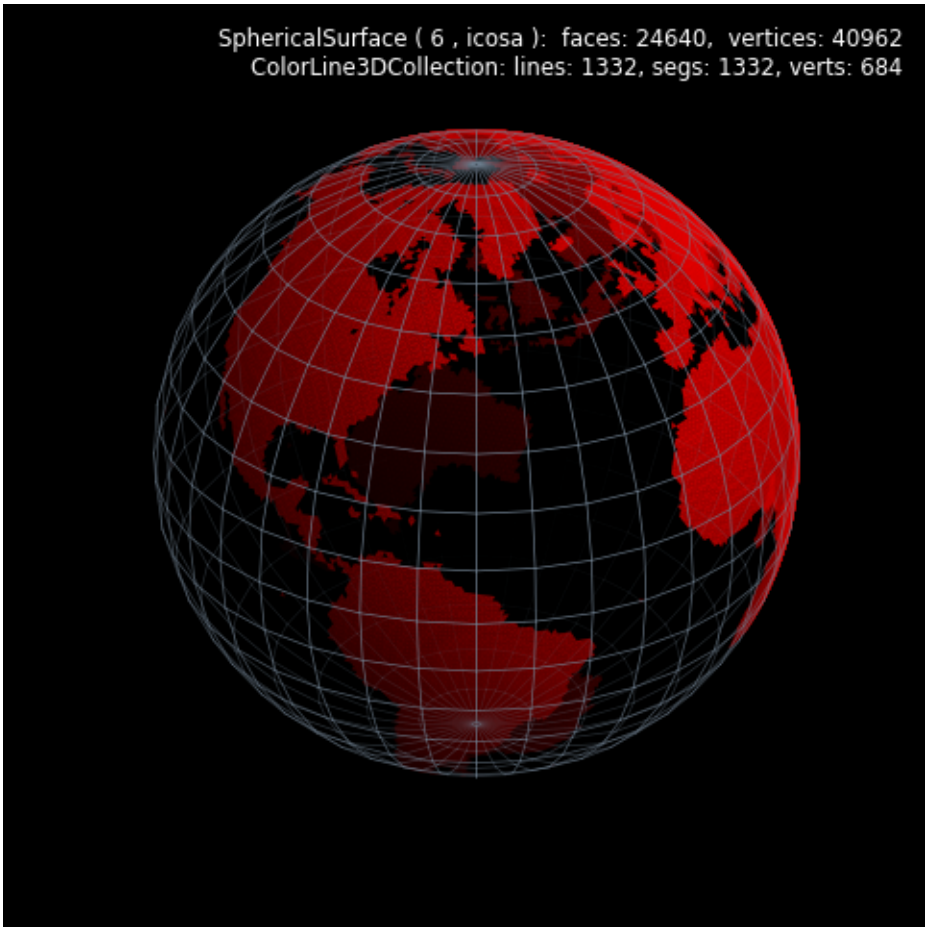


20.6 S3dlib: Image mapping and clipping

20.6.1 Image HSV value clipping

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Image_HSV_Value_Clipping.py, and the XML code in the file D01_Image_HSV_Value_Clipping.2D.xml.

See: https://s3dlib.org/examples/imagemap/earth_land_clipped.html



20.6.2 Spherical image mapping

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Spherical_ImageMapping.py, and the XML code in the file D02_Spherical_ImageMapping.2D.xml.

See: https://s3dlib.org/examples/imagemap/earth_shaded.html

20.6.3 Earth in 3D

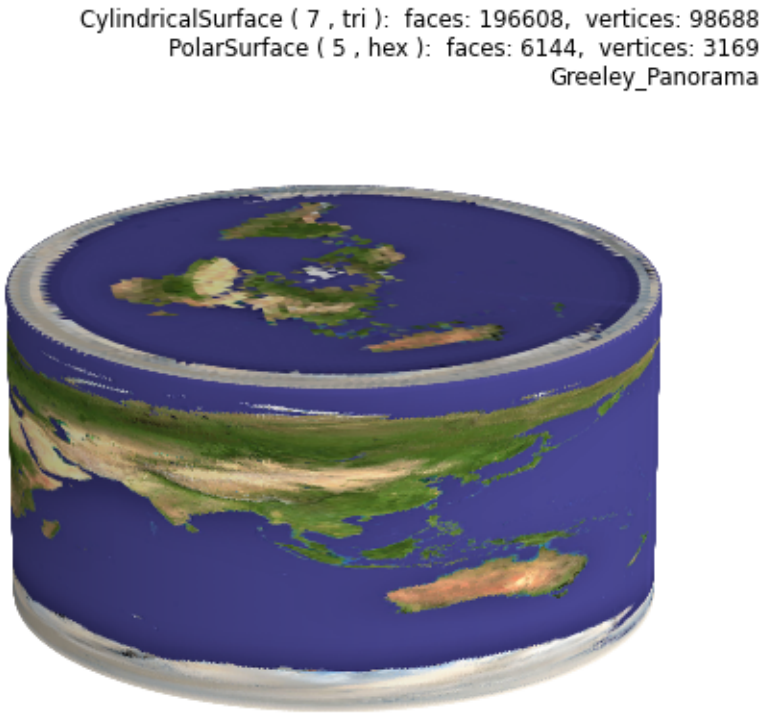
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Earth3D.py, and the XML code in the file D03_Earth3D.2D.xml.

See: https://github.com/fzaverl/s3dlib

20.6.4 Cylindrical image mapping

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Cylindrical_ImageMapping.py, and the XML code in the file D04_Cylindrical_ImageMapping.2D.xml.

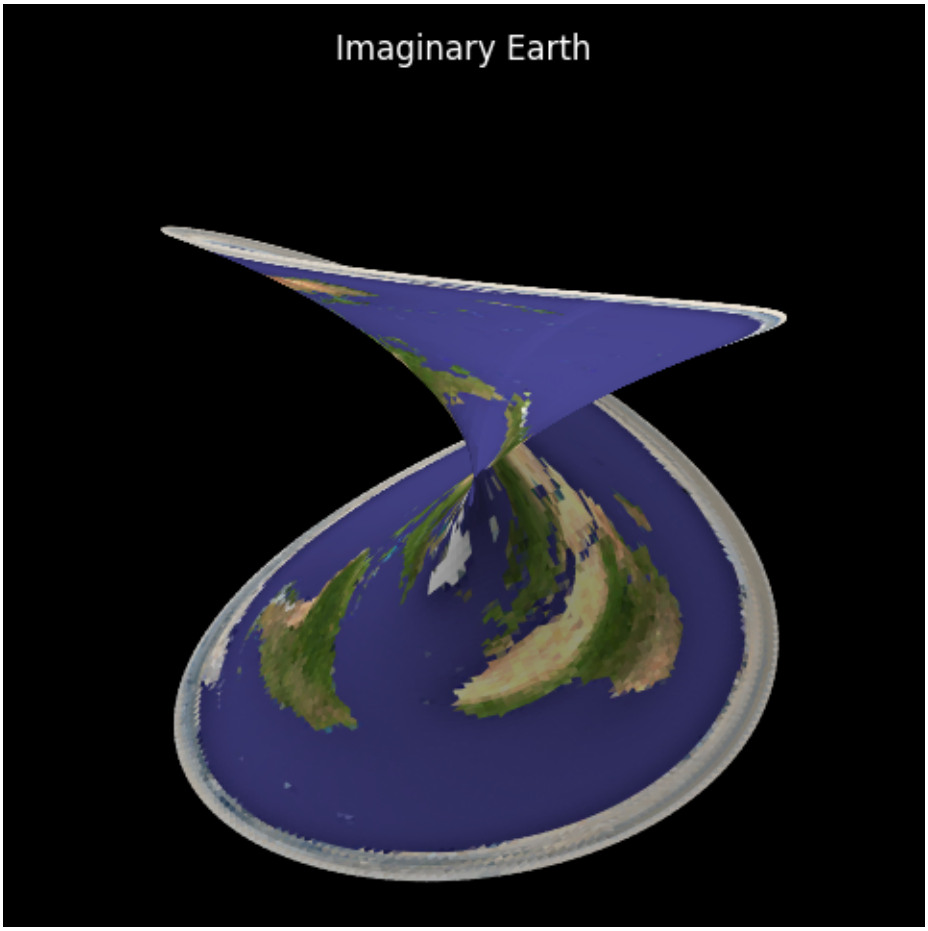
See: https://s3dlib.org/examples/imagemap/mars_cyl.html



20.6.5 Imaginary Earth, part A

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Imaginary_Earth_a.py, and the XML code in the file D05_Imaginary_Earth_a.2D.xml.

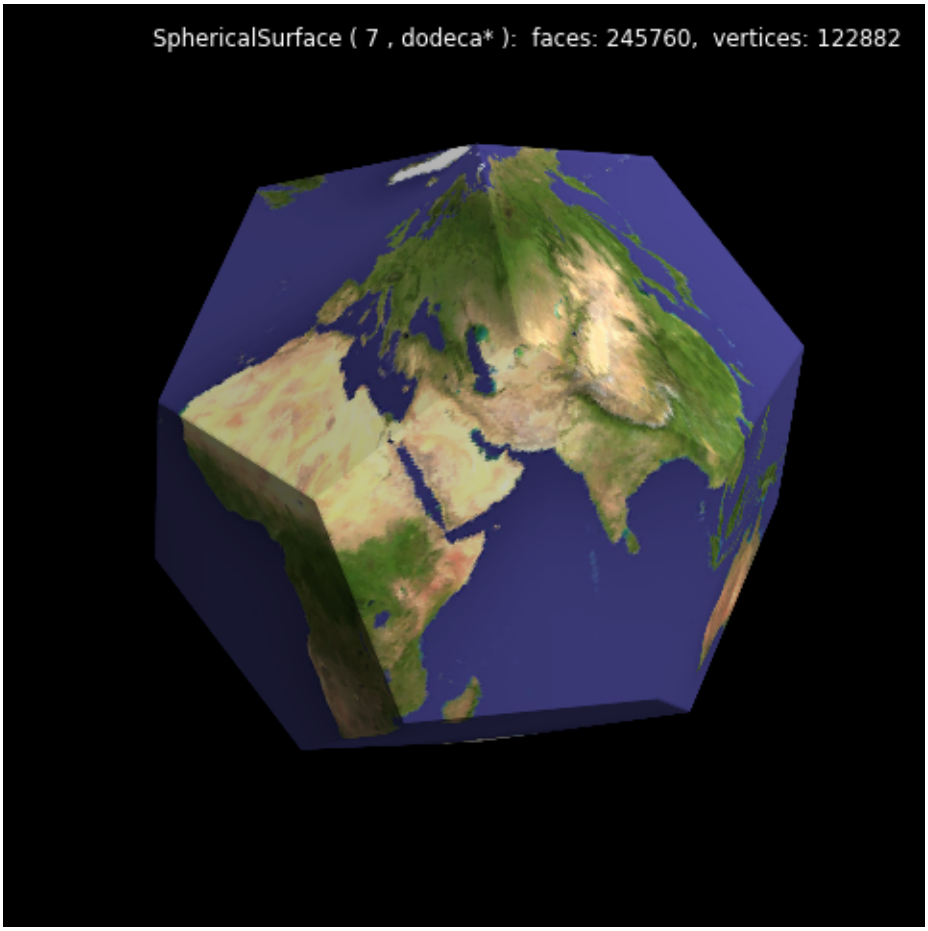
See: https://s3dlib.org/examples/imagemap/imaginary_earth.html



20.6.6 Imaginary Earth, part B

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Imaginary_Earth_b.py, and the XML code in the file D06_Imaginary_Earth_b.2D.xml.

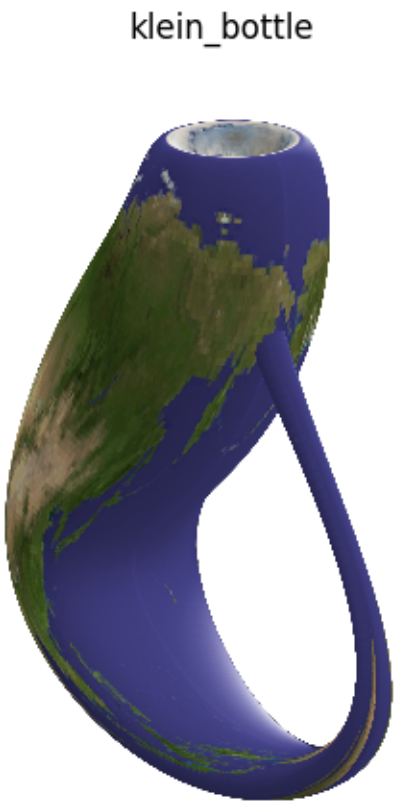
See: https://s3dlib.org/examples/imagemap/imaginary_earth.html



20.6.7 Earth, projected on Klein bottle

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Klein_Earth_a.py, and the XML code in the file D07_Klein_Earth_a.2D.xml.

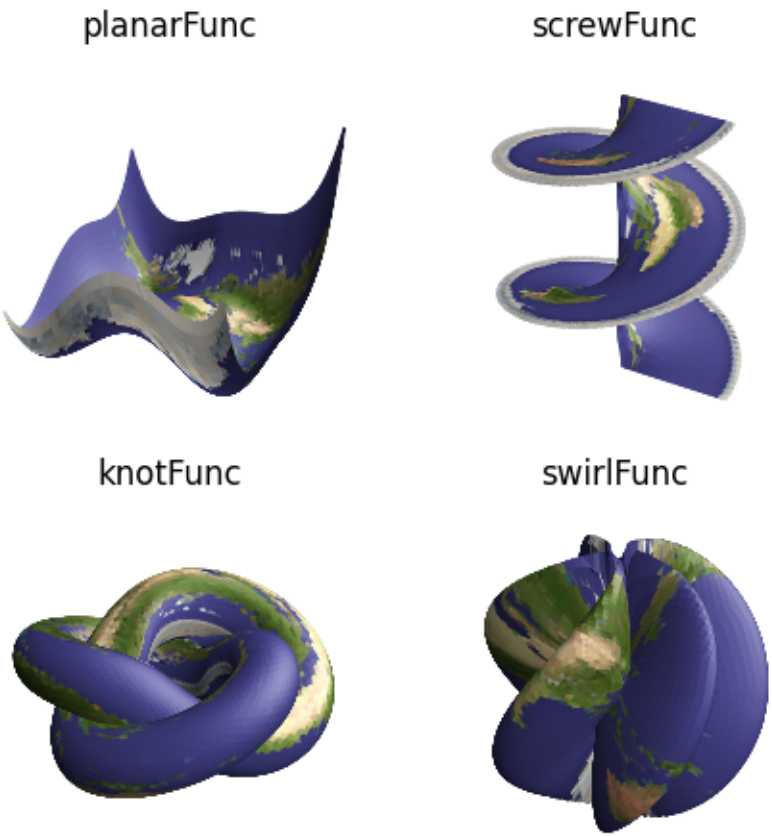
See: https://s3dlib.org/examples/imagemap/earth_klein.html



20.6.8 Earth, projected on planar, screw, knot and swirl surfaces

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Klein_Earth_b.py, and the XML code in the file D08_Klein_Earth_b.2D.xml.

See: https://s3dlib.org/examples/imagemap/earth_klein.html

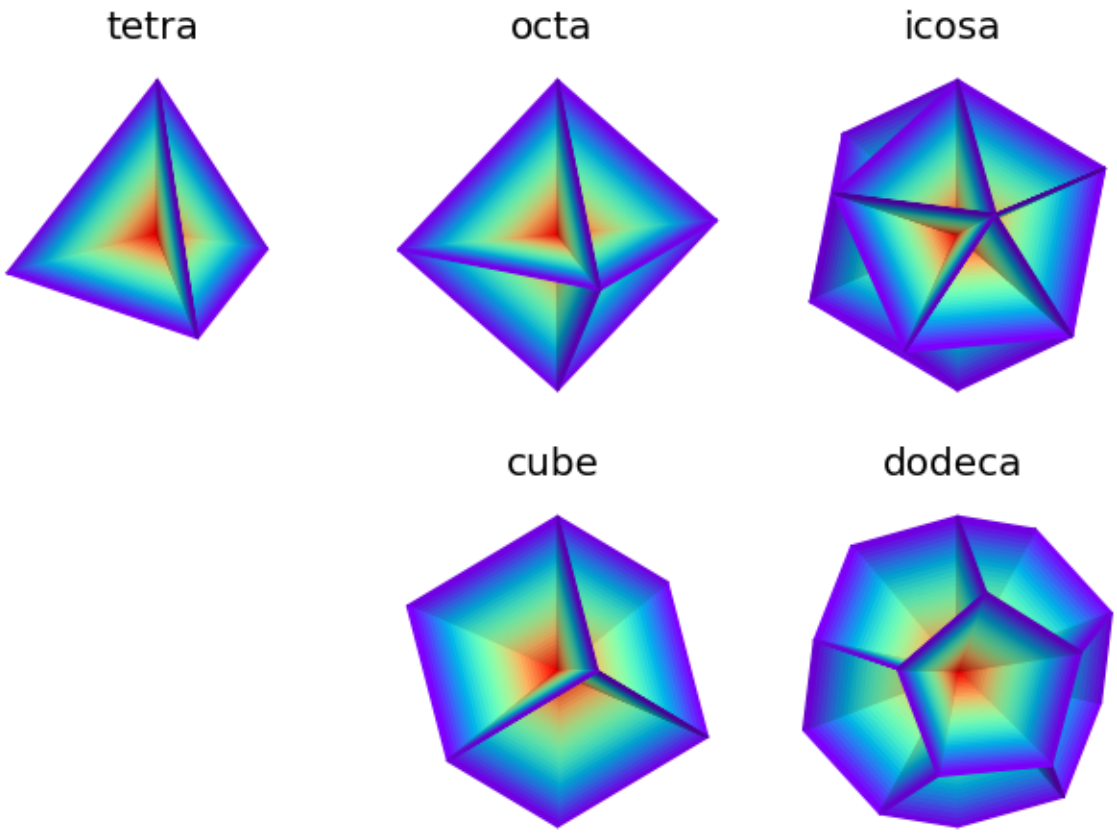


20.7 S3dlib: Edge-to-edge surface coloring

20.7.1 Platonic solid, with surface edges filled, part 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Platonic_Solid_Surface_Edges_Filled.py, and the XML code in the file D01_Platonic_Solid_Surface_Edges_Filled.2D.xml.

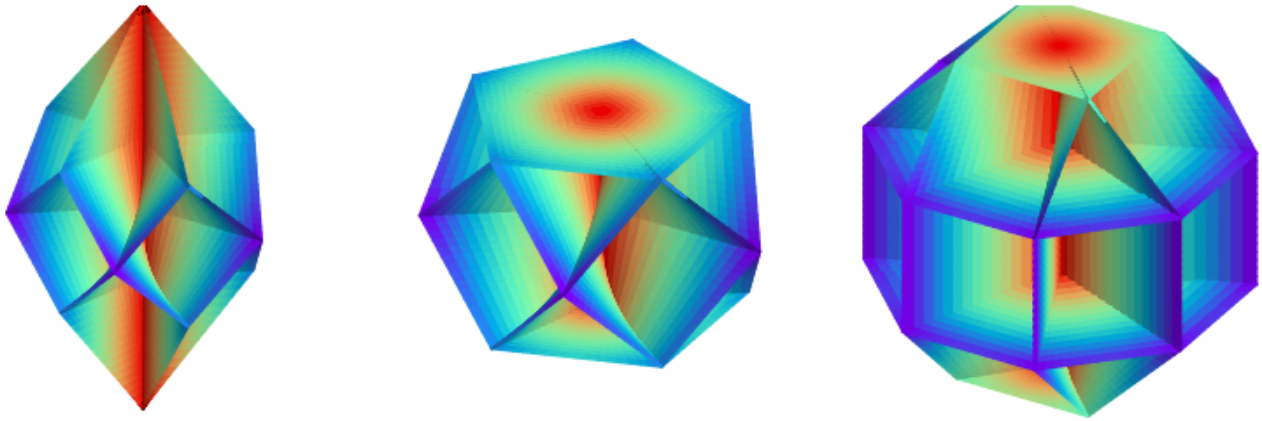
See: https://s3dlib.org/examples/lines/platonic_proj.html



20.7.2 Platonic solid, with surface edges filled, part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Platonic_Solid_Surface_Edges_Filled.py, and the XML code in the file D02_Platonic_Solid_Surface_Edges_Filled.2D.xml.

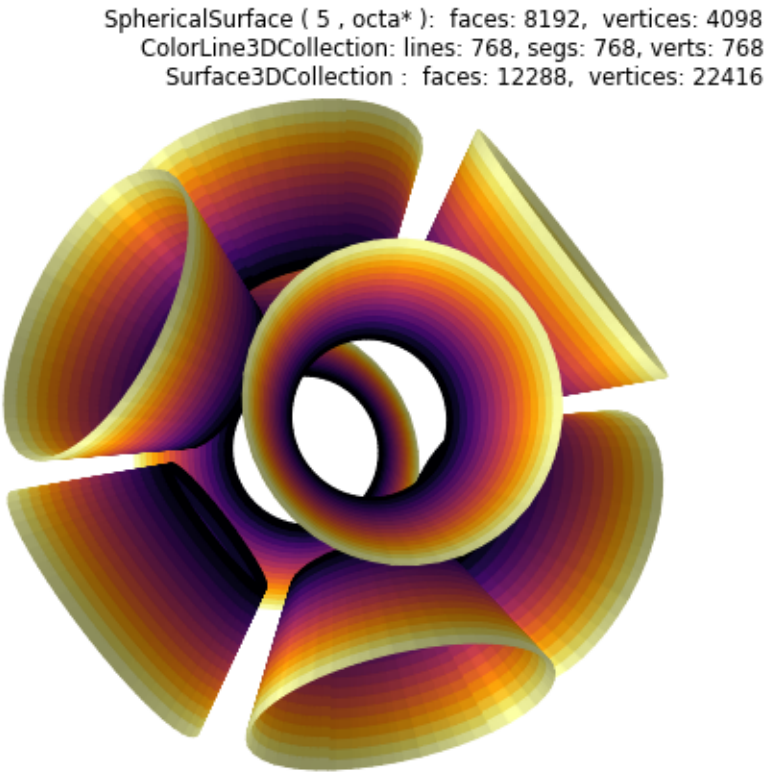
See: https://s3dlib.org/examples/lines/platonic_proj.html



20.7.3 Spherical contour surface, filled

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Spherical_Contour_Filled_Surface.py, and the XML code in the file D03_Spherical_Contour_Filled_Surface.2D.xml.

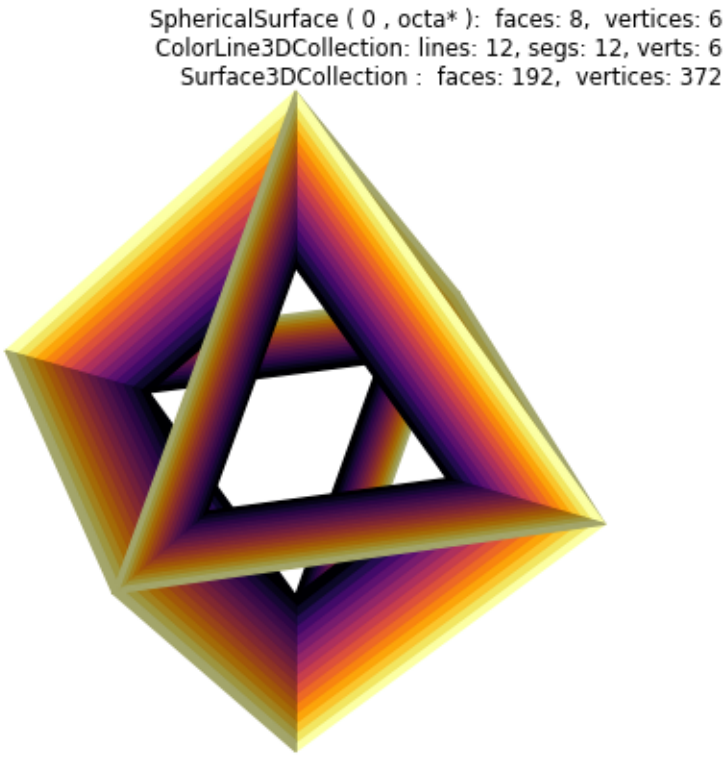
See: https://s3dlib.org/examples/lines/filled_octa_cont.html



20.7.4 Edge-to-edge surface, part 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Edge_to_Edge_Surface.py, and the XML code in the file D04_Edge_to_Edge_Surface.2D.xml.

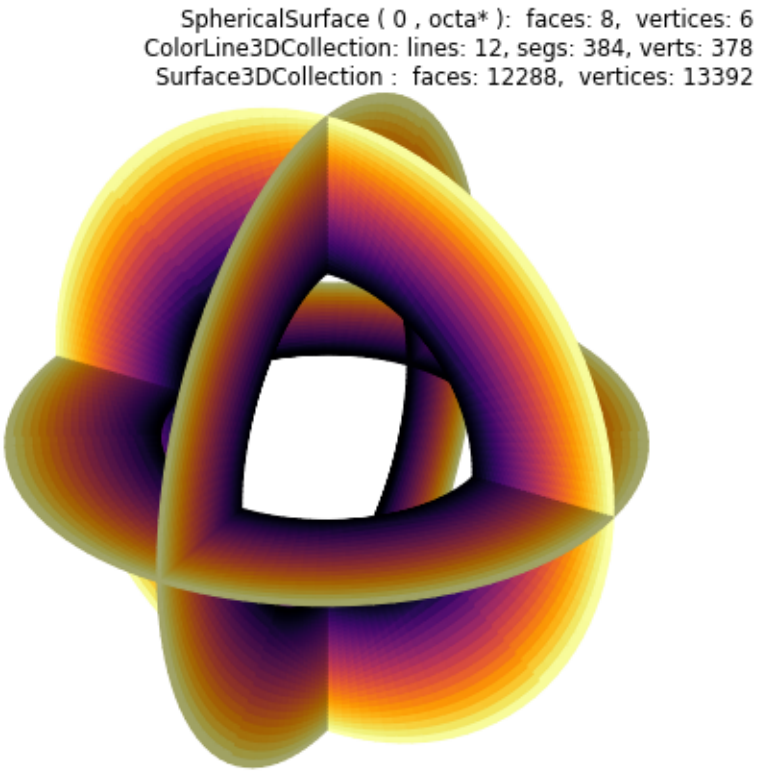
See: https://s3dlib.org/examples/lines/surf_edge2edge.html



20.7.5 Spherical edge surface, filled

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Spherical_Edge_Filled_Surface_2.py, and the XML code in the file D06_Spherical_Edge_Filled_Surface_2.2D.xml.

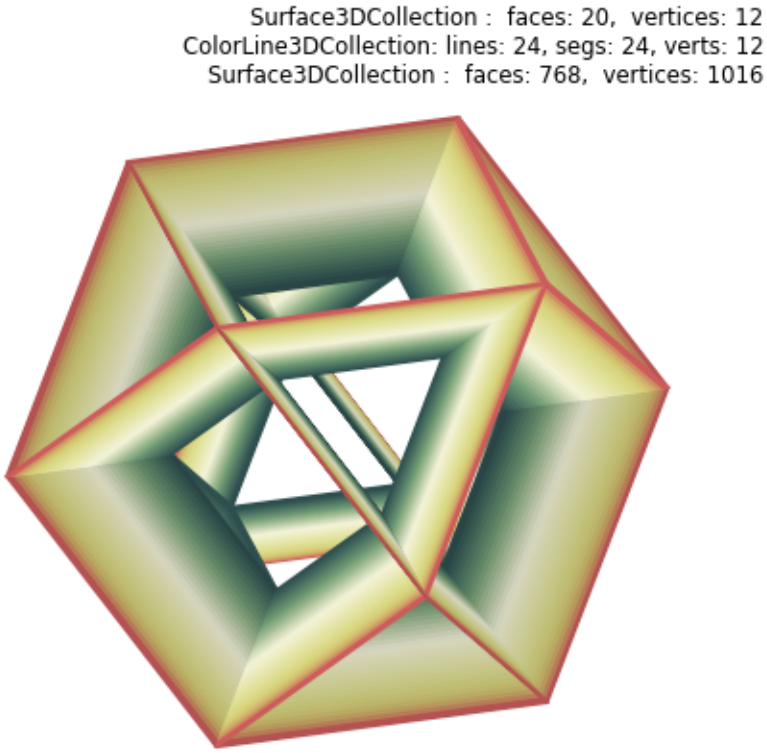
See: https://s3dlib.org/examples/lines/filled_octa_edges.html



20.7.6 Edge-to-edge surface, part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Spherical_Edge_Filled_Surface_2.py, and the XML code in the file D06_Spherical_Edge_Filled_Surface_2.2D.xml.

See: https://s3dlib.org/examples/lines/surf_edge2edge_2.html



20.7.7 Line colormap sequence

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Line_Colormap_Sequence.py, and the XML code in the file D07_Line_Colormap_Sequence.2D.xml.

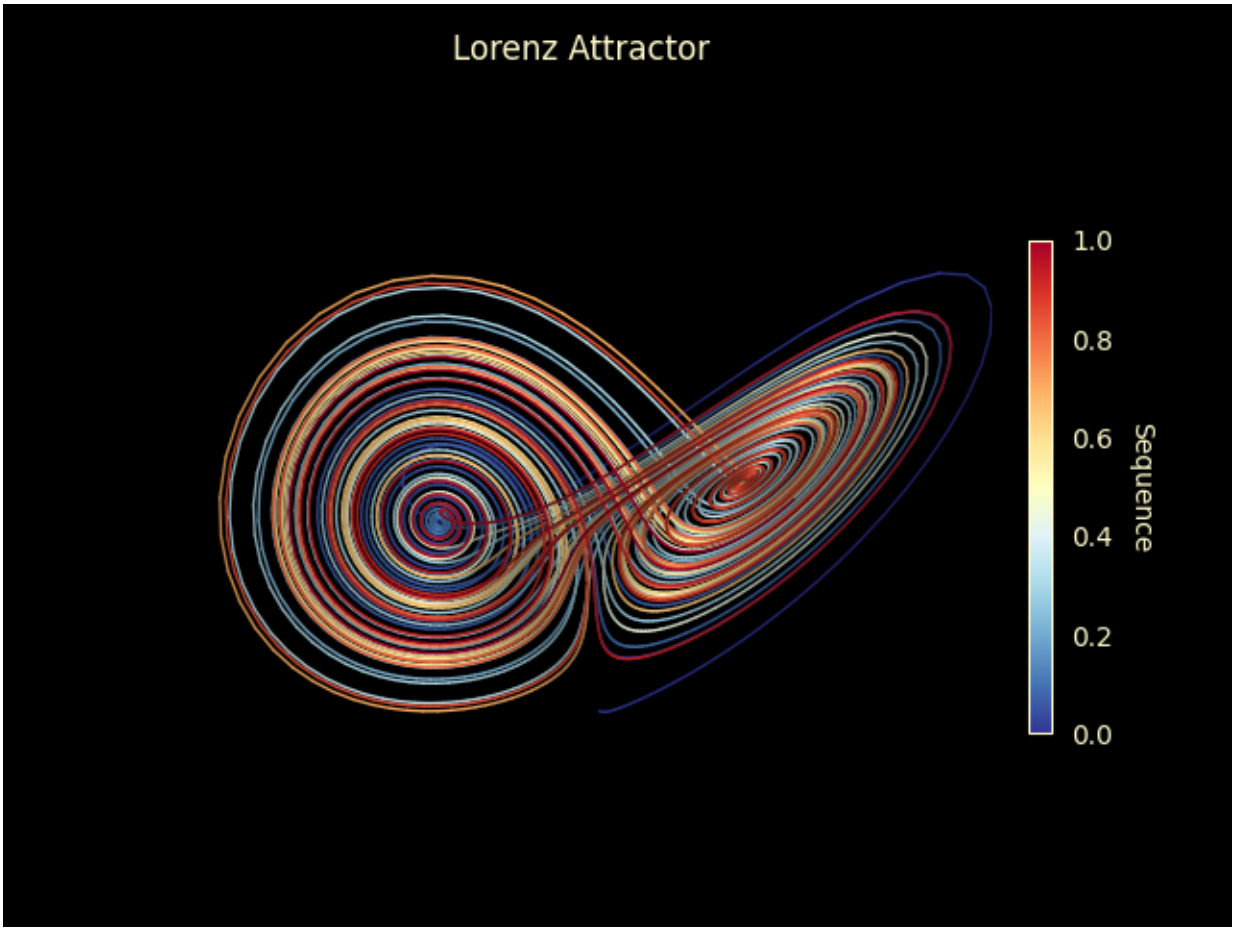
See: https://s3dlib.org/examples/lines/loop3d.html

ParametricLine (9):: lines: 1, segs: 1024, verts: 1025
sop() sequential operation

20.7.8 Sequential line color, part 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Sequential_Line_Color.py, and the XML code in the file D08_Sequential_Line_Color.2D.xml.

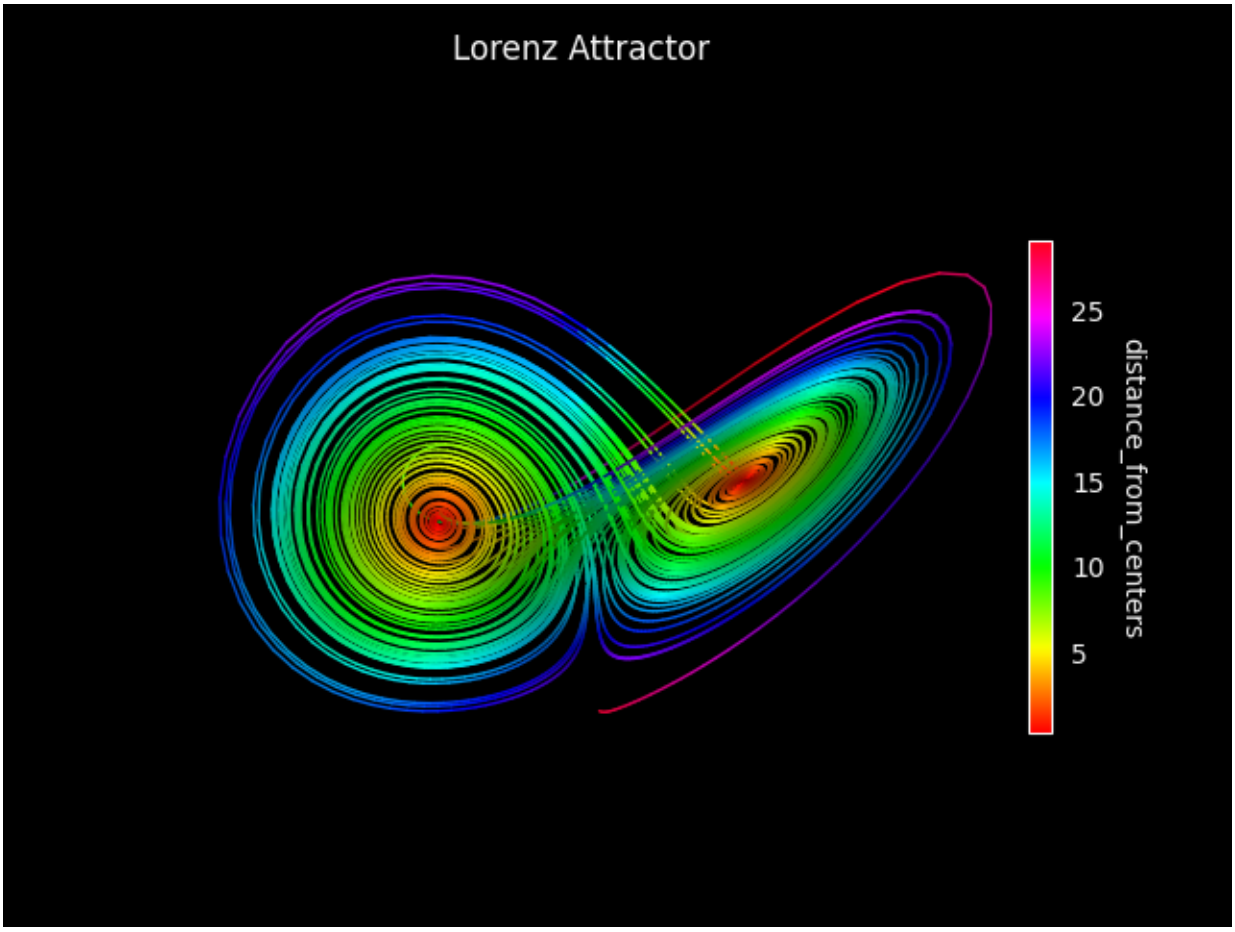
See: https://s3dlib.org/examples/lines/lorenz_seq.html



20.7.9 Sequential line color, part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09_Sequential_Line_Color2.py, and the XML code in the file D09_Sequential_Line_Color2.2D.xml.

See: https://s3dlib.org/examples/lines/lorenz_op.html

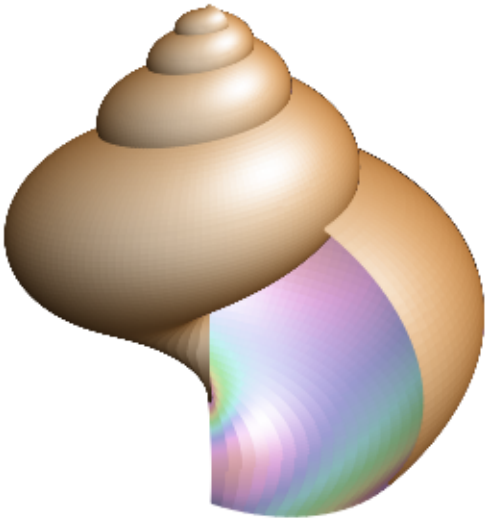


20.8 S3dlib: Decorative parametric surfaces

20.8.1 Shell surface with colormap

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Surface_Colormap_2.py, and the XML code in the file D01_Surface_Colormap_2.2D.xml.

See: https://s3dlib.org/examples/colormaps/shell.html



SphericalSurface (5.3 , grid_x): faces: 32400, vertices: 33001

20.8.2 Escher Knot

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Escher_Knot_2.py, and the XML code in the file D02_Escher_Knot_2.2D.xml.

See: https://s3dlib.org/examples/showcase/mceknot_2.html

20.8.3 Escher sphere spirals

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Escher_Sphere_Spirals.py, and the XML code in the file D03_Escher_Sphere_Spirals.2D.xml.

See: https://s3dlib.org/examples/showcase/sphericalspirals.html

20.8.4 Escher spirals

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Escher_Spirals.py, and the XML code in the file D04_Escher_Spirals.2D.xml.

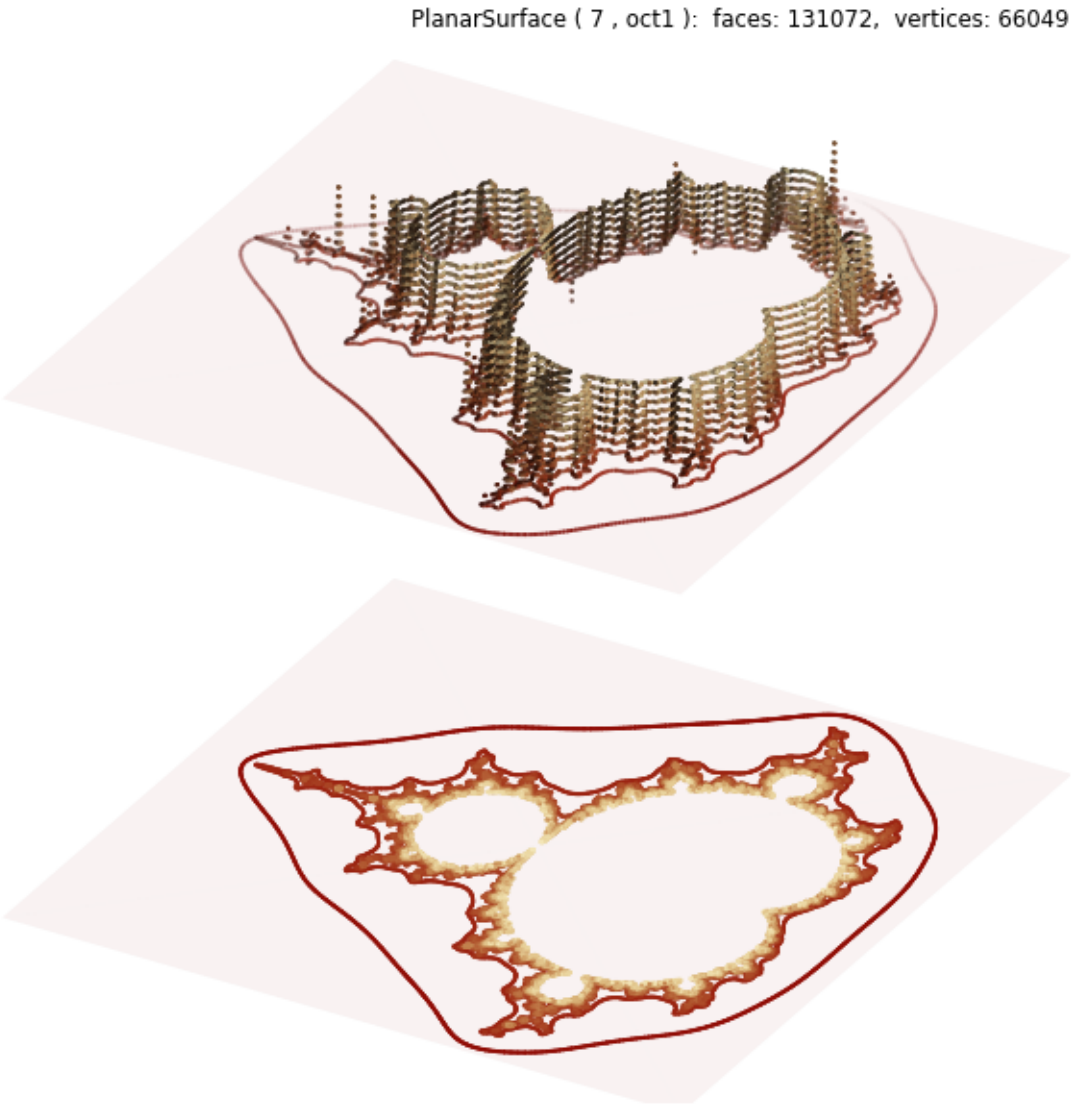
See: https://s3dlib.org/examples/showcase/spirals.html

20.9 S3dlib: Geometric and color datagrid mapping (requires scipy)

20.9.1 Mandelbrot contours

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Mandelbrot_Contours.py, and the XML code in the file D01_Mandelbrot_Contours.2D.xml.

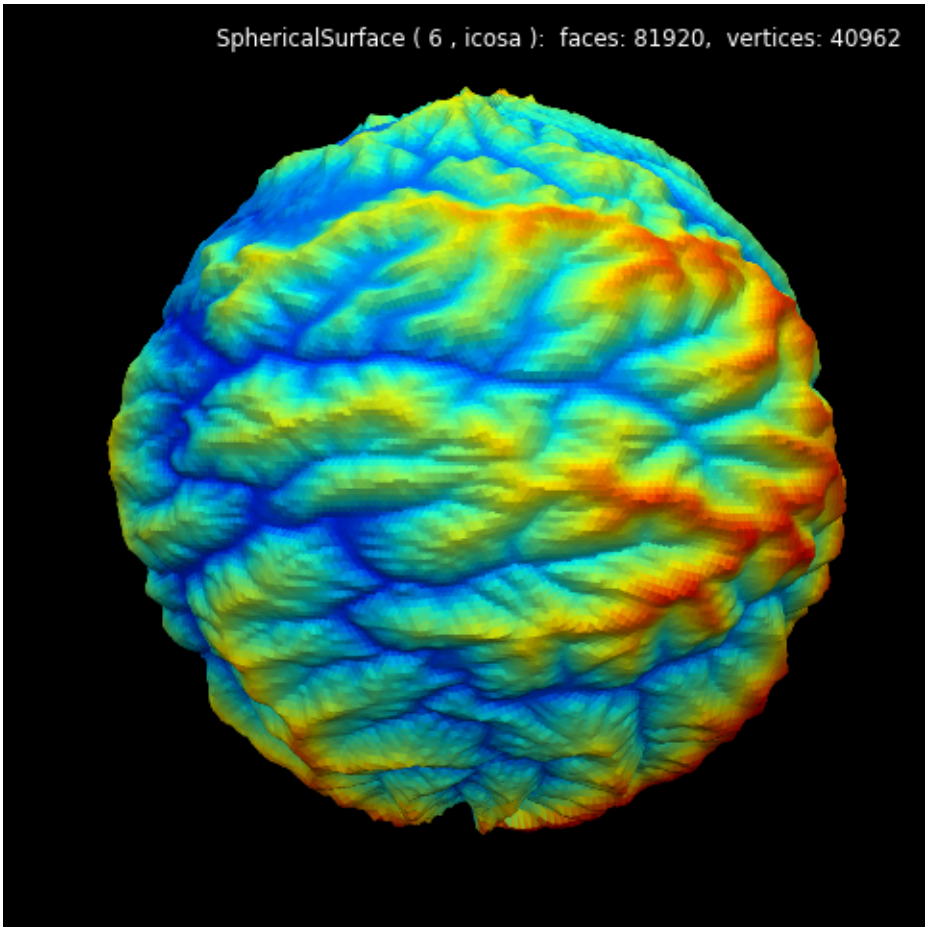
See: https://s3dlib.org/examples/lines/mand_contours.html



20.9.2 Geometric and color datagrid mapping

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_GeometricMapping.py, and the XML code in the file D02_GeometricMapping.2D.xml.

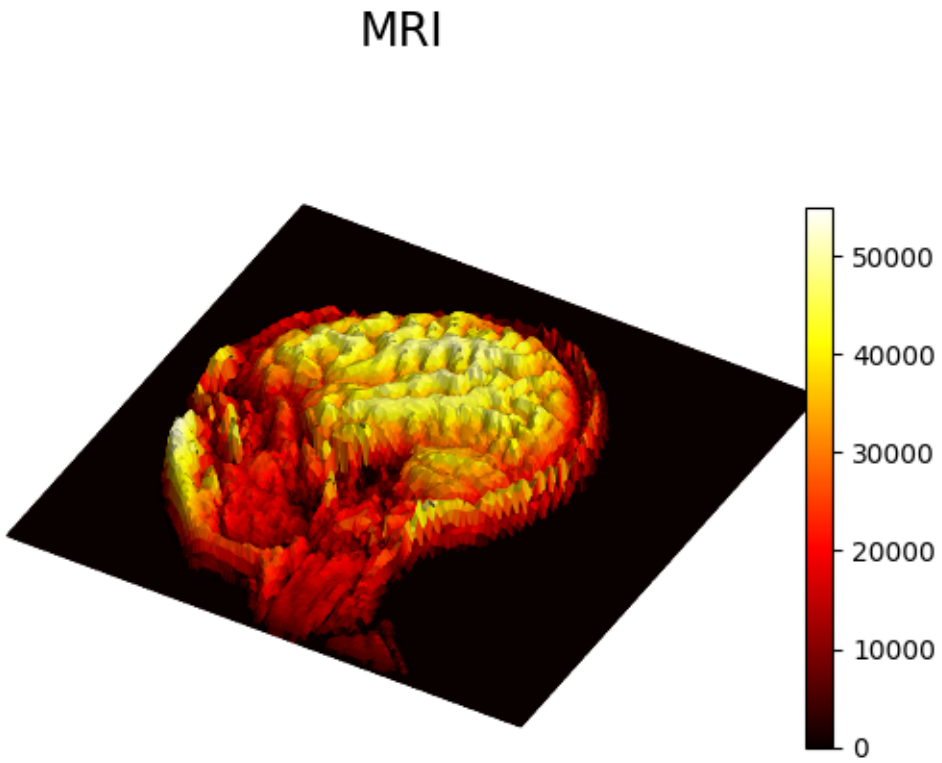
See: https://s3dlib.org/examples/datagridmap/jacks_shaded.html



20.9.3 MRI 3D

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_MRI_3D.py, and the XML code in the file D03_MRI_3D.2D.xml.

See: https://s3dlib.org/examples/datagridmap/mri_3d.html

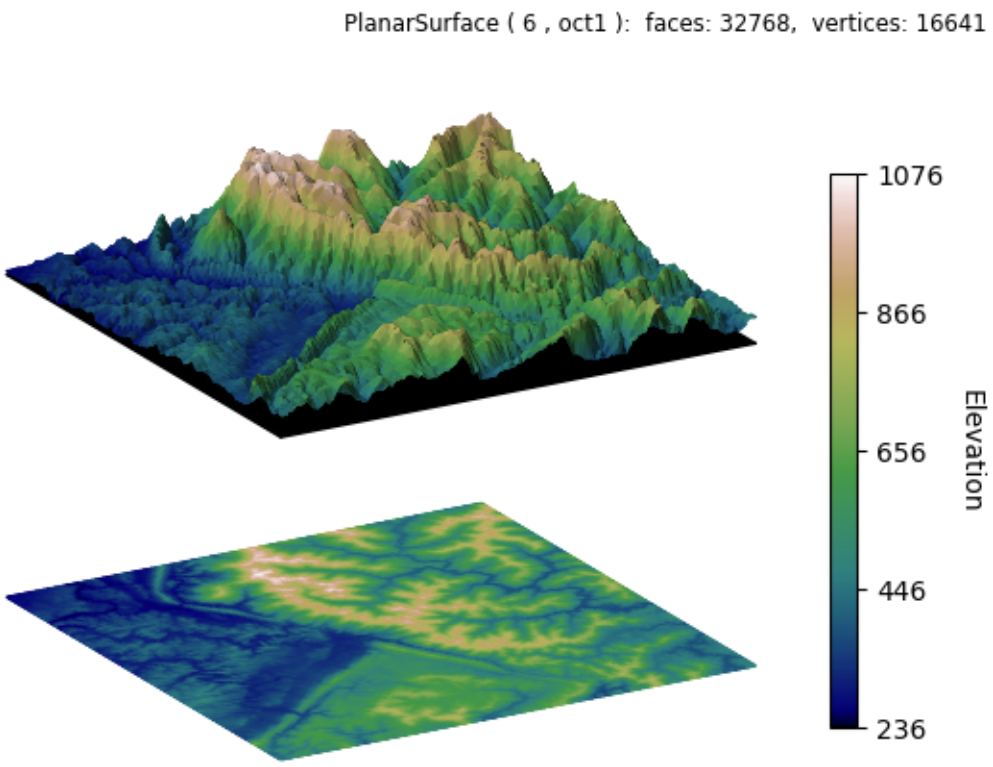


PlanarSurface (6 , oct1): faces: 32768, vertices: 16641

20.9.4 Jacksboro fault

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Jacksboro_Fault.py, and the XML code in the file D04_Jacksboro_Fault.2D.xml.

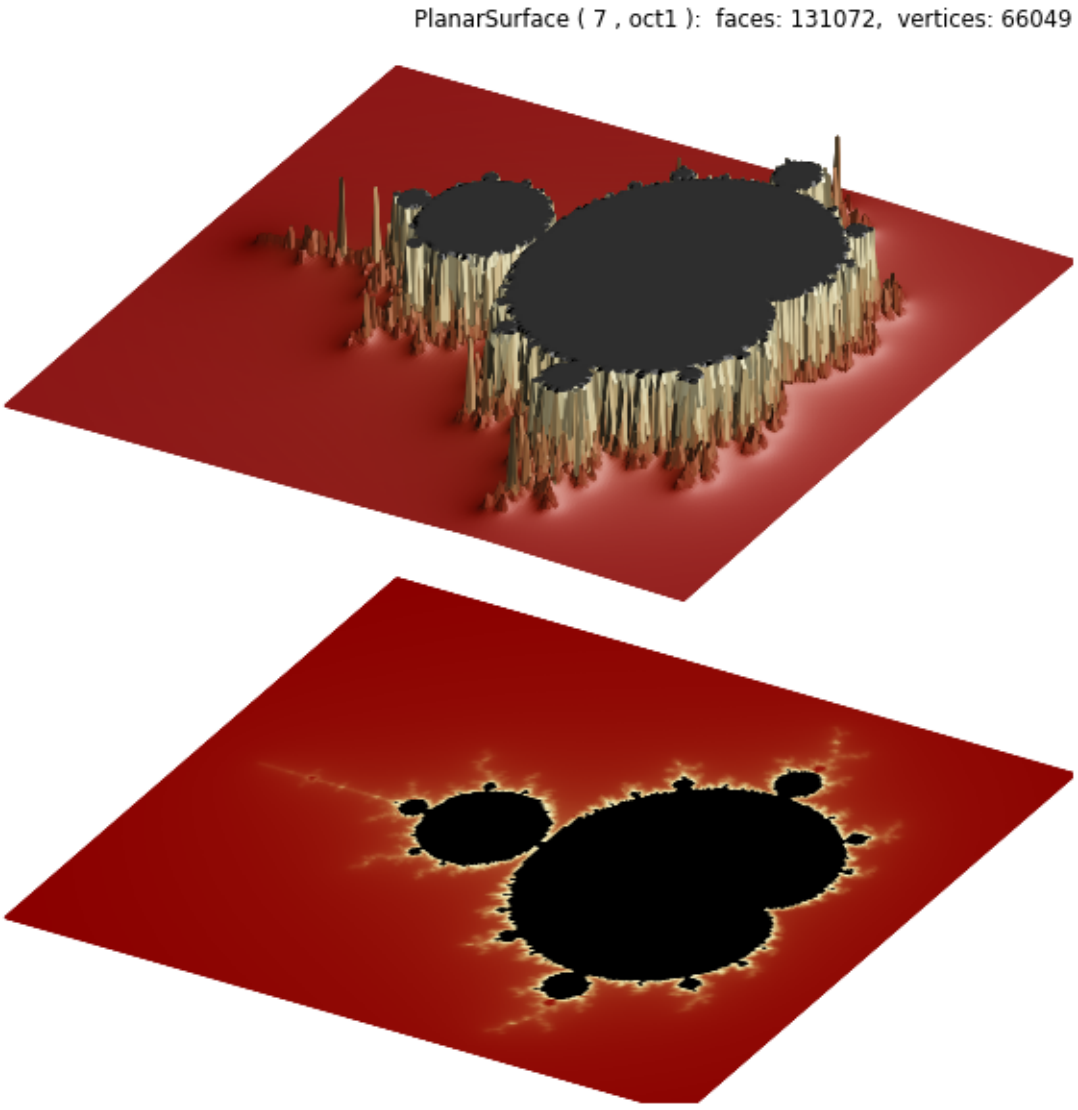
See: https://s3dlib.org/examples/datagridmap/jacks_shaded2.html



20.9.5 Mandelbrot 3D

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Mandelbrot_3D.py, and the XML code in the file D05_Mandelbrot_3D.2D.xml.

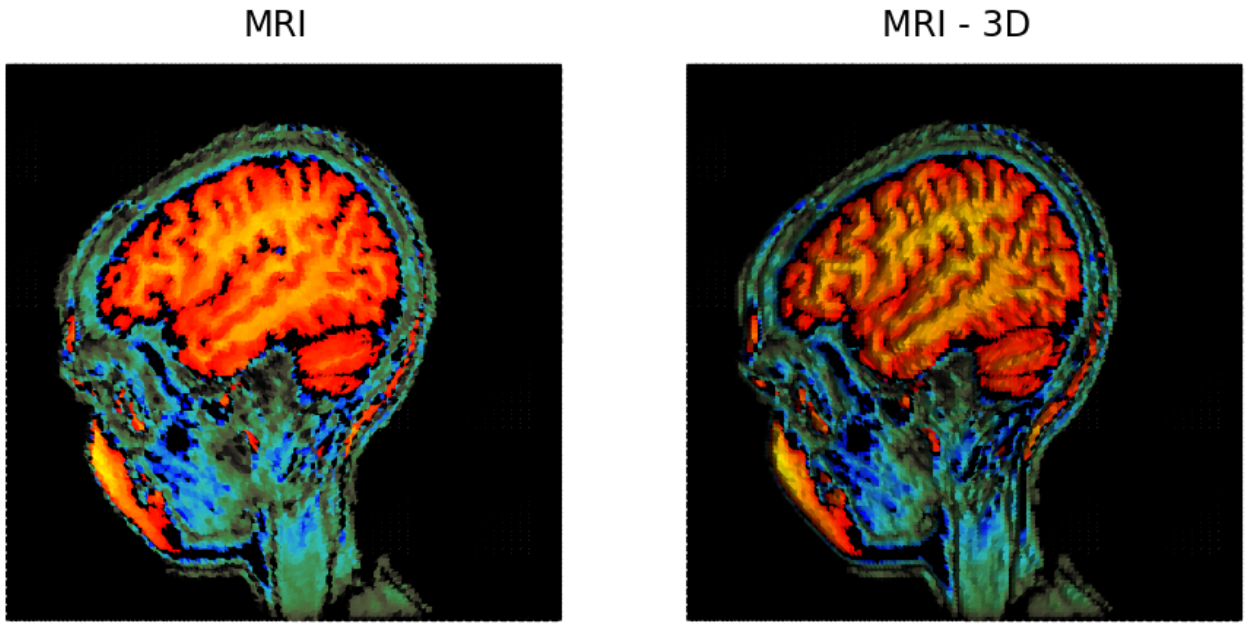
See: https://s3dlib.org/examples/datagridmap/mandelbrot.html



20.9.6 MRI regions

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_MRI_Regions.py, and the XML code in the file D06_MRI_Regions.2D.xml.

See: https://s3dlib.org/examples/colormaps/mri.html



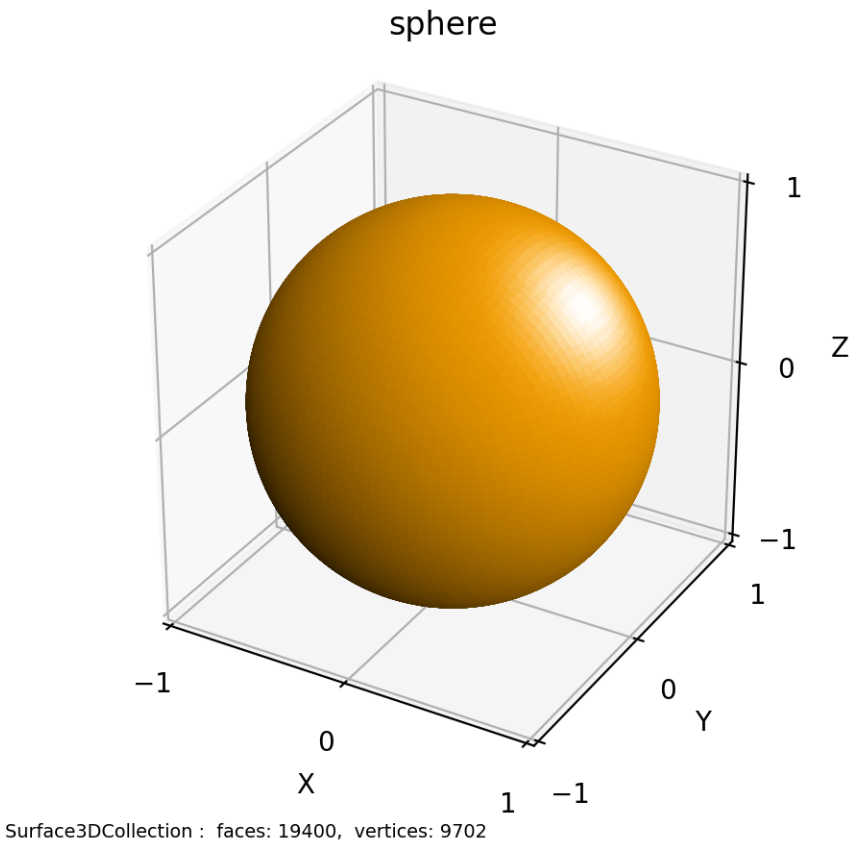
PlanarSurface (6 , oct1): faces: 32768, vertices: 16641

20.10 S3dlib: Implicit surfaces (requires scikit-image)

20.10.1 Sphere (implicit definition), part 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Sphere_Implicit_a.py, and the XML code in the file D01_Sphere_Implicit_a.2D.xml.

See: https://s3dlib.org/examples/functional/world_hello.html

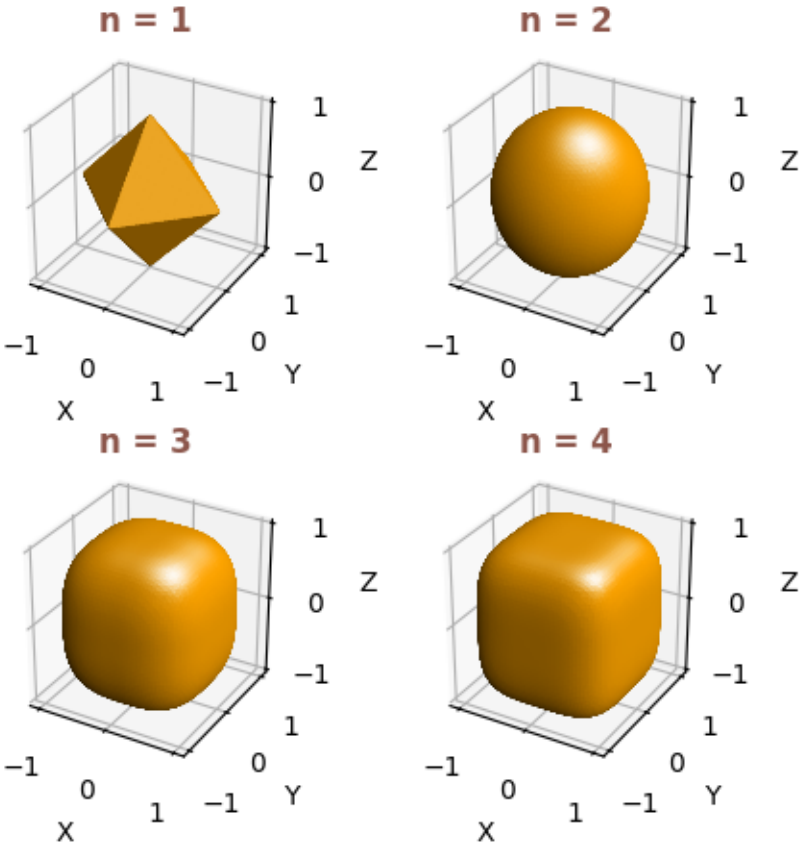


Surface3DCollection : faces: 19400, vertices: 9702

20.10.2 Sphere (implicit definition), part 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Sphere_Implicit_b.py, and the XML code in the file D02_Sphere_Implicit_b.2D.xml.

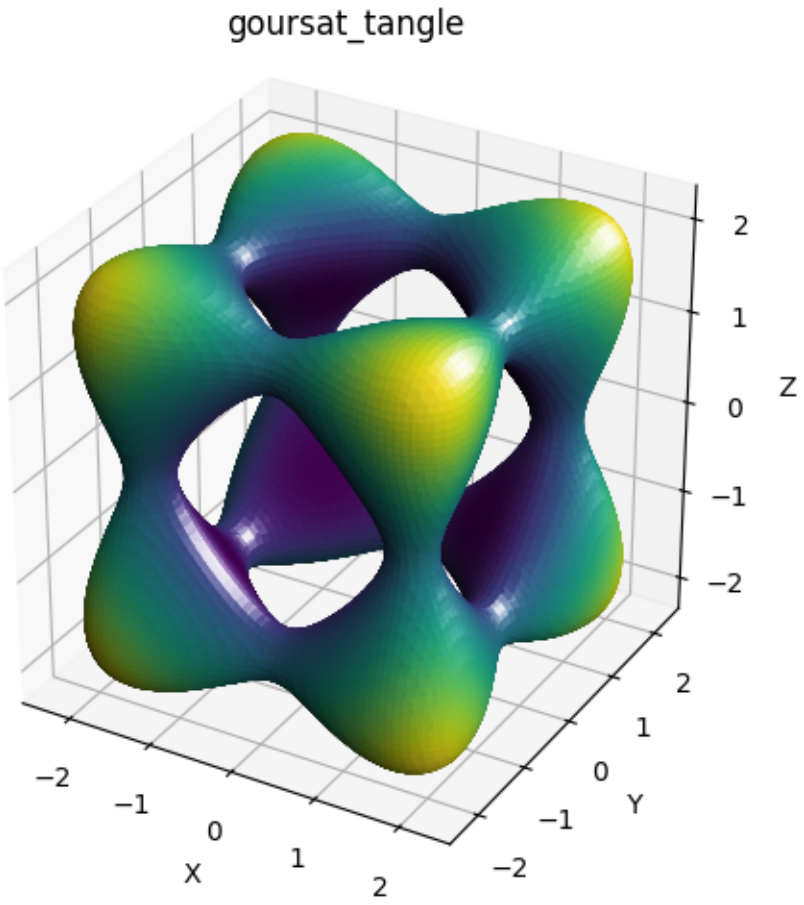
See: https://s3dlib.org/examples/functional/world_hello.html



20.10.3 Goursat surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Goursat_Surface.py, and the XML code in the file D03_Goursat_Surface.2D.xml.

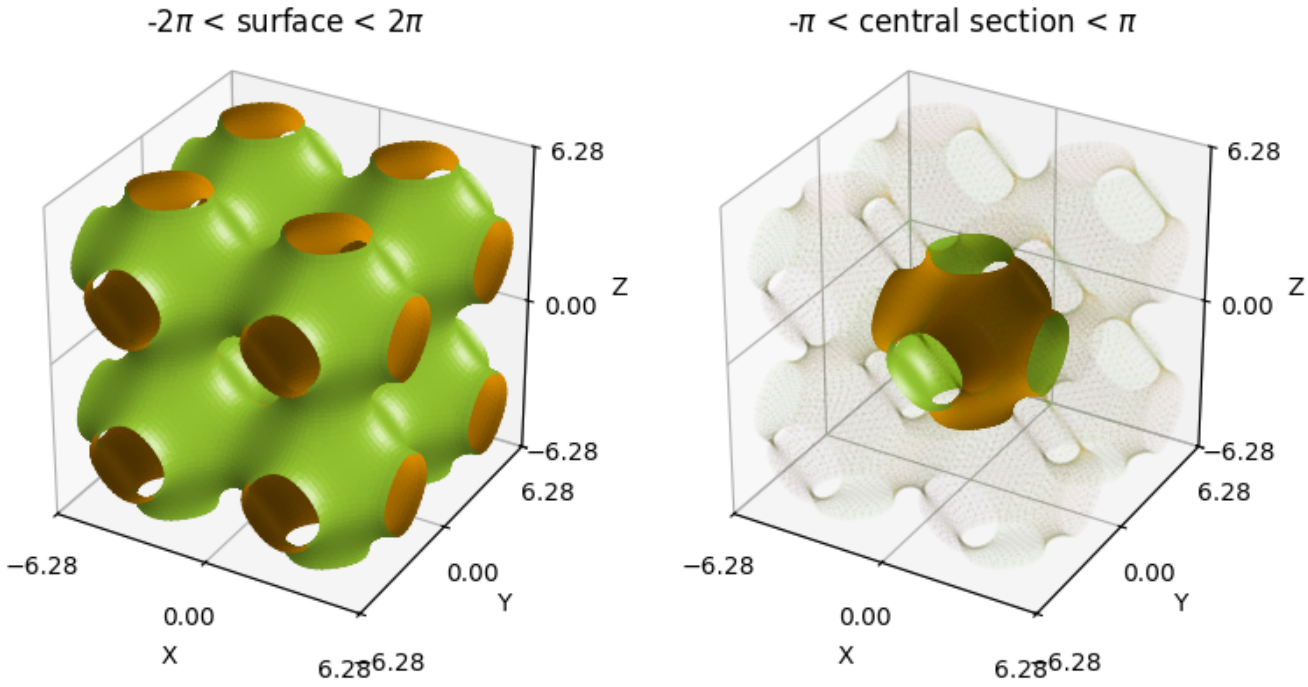
See: https://s3dlib.org/examples/functional/goursat.html



20.10.4 Schwarz P surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Schwarz_P_Surface.py, and the XML code in the file D04_Schwarz_P_Surface.2D.xml.

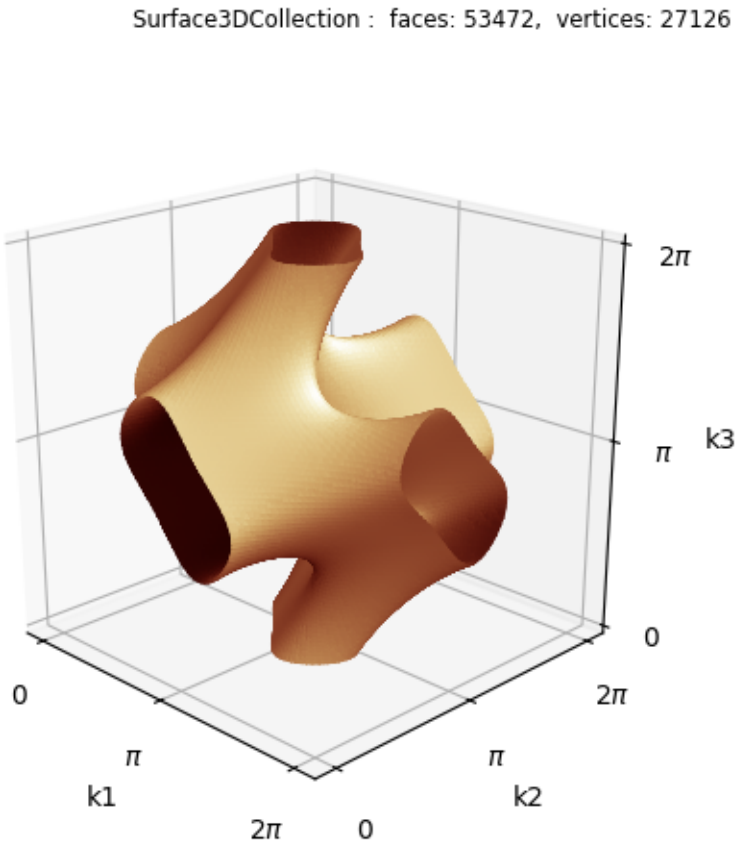
See: https://s3dlib.org/examples/functional/schwarz.html



20.10.5 Nodal surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Nodal_Surface.py, and the XML code in the file D05_Nodal_Surface.2D.xml.

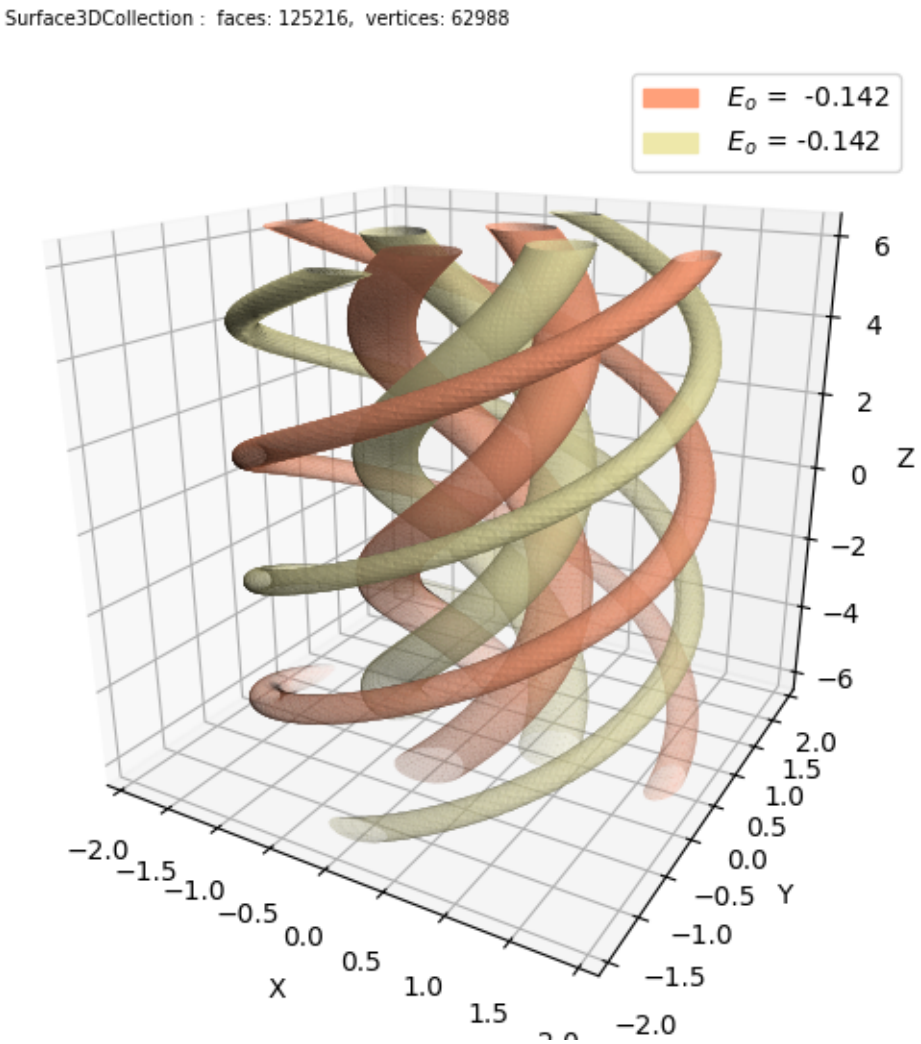
See: https://s3dlib.org/examples/functional/nodesurf.html



20.10.6 Spirals surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Spirals_Surface.py, and the XML code in the file D06_Spirals_Surface.2D.xml.

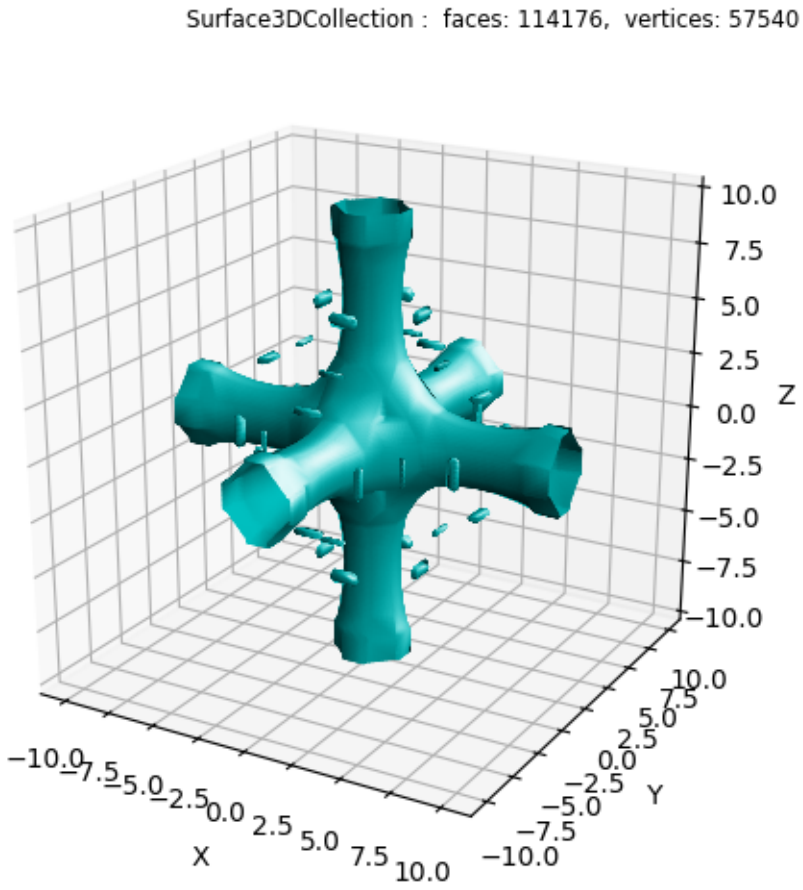
See: https://s3dlib.org/examples/functional/spiralsurf.html



20.10.7 Iso surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Iso_Surface.py, and the XML code in the file D07_Iso_Surface.2D.xml.

See: https://s3dlib.org/examples/functional/mayavi_surfcont.html



20.10.8 Implicit surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_Implicit_Surface.py, and the XML code in the file D08_Implicit_Surface.2D.xml.

See: https://s3dlib.org/examples/functional/bc_surf.html

CHAPTER

TWENTYONE

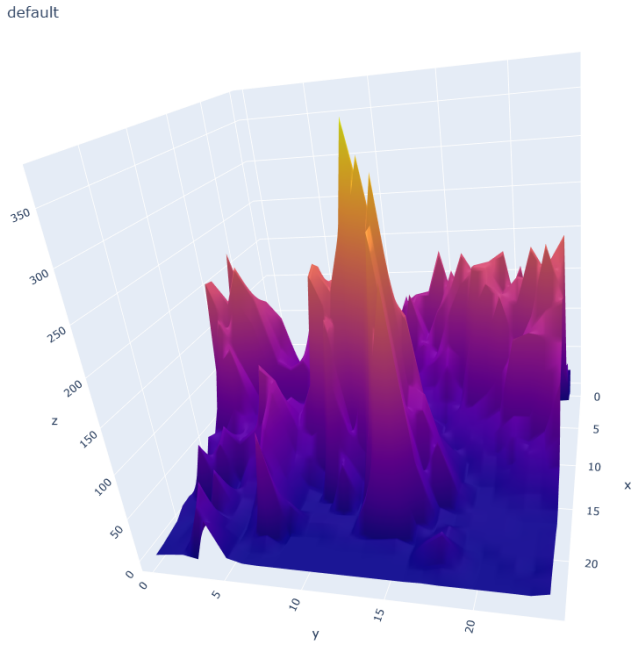
PLOTLY

21.1 General surface plots in 3D

See Test2DFunctions

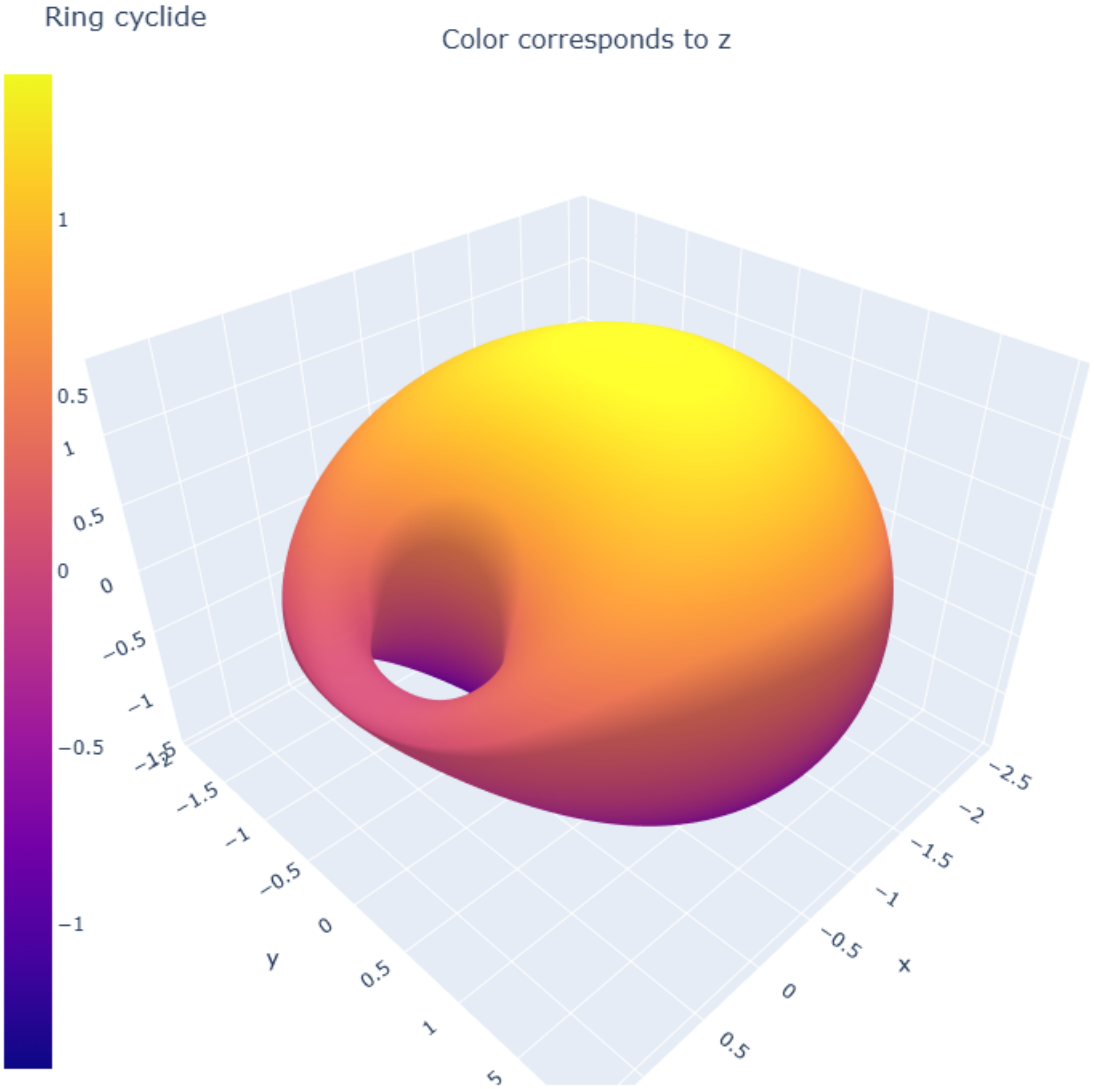
21.1.1 Mount Bruno

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_Plotly3D_MtBruno.py, and the XML code in the file D01_Plotly3D_MtBruno.2D.xml.



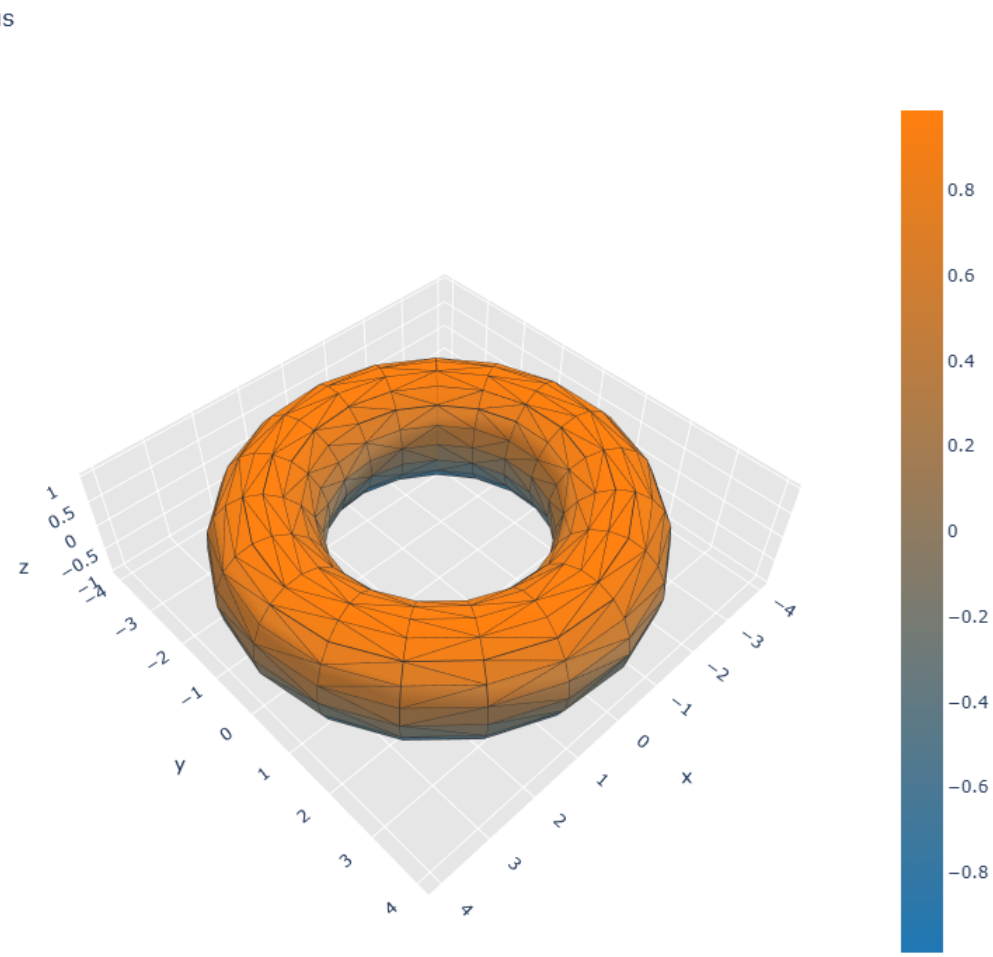
21.1.2 Ring Cyclide

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_Plotly3D_RingCyclide.py, and the XML code in the file D02_Plotly3D_RingCyclide.2D.xml.



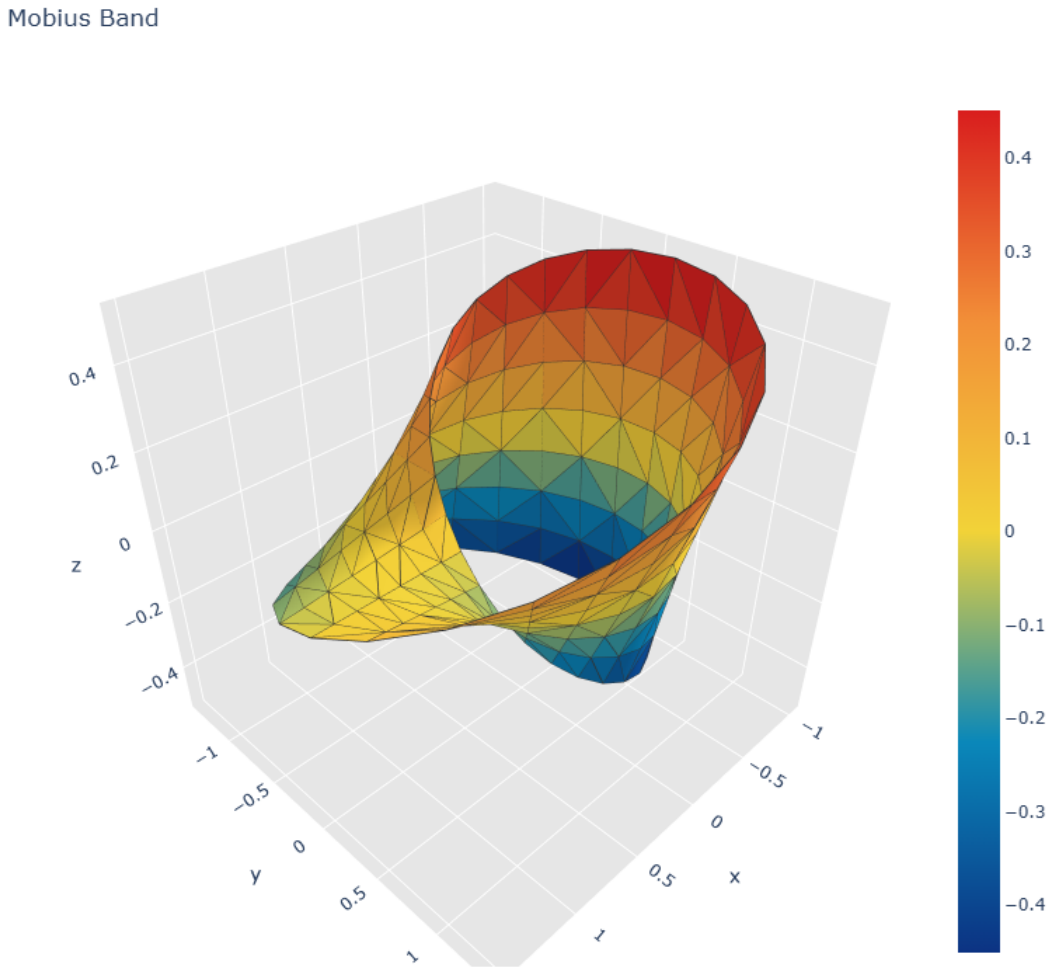
21.1.3 Torus

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_Plotly3D_Torus.py, and the XML code in the file D03_Plotly3D_Torus.2D.xml.



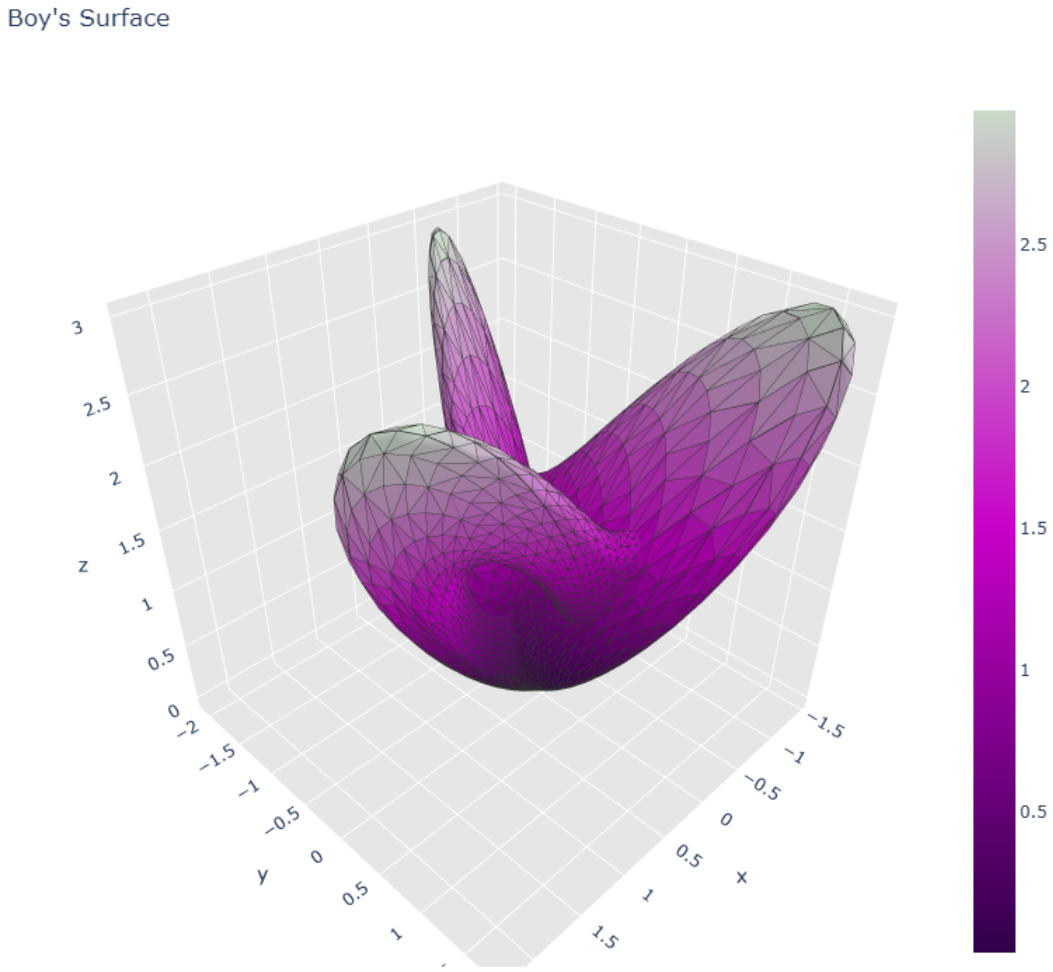
21.1.4 Möbius surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_Plotly3D_M%C3%B6bius.py, and the XML code in the file D04_Plotly3D_M%C3%B6bius.2D.xml.



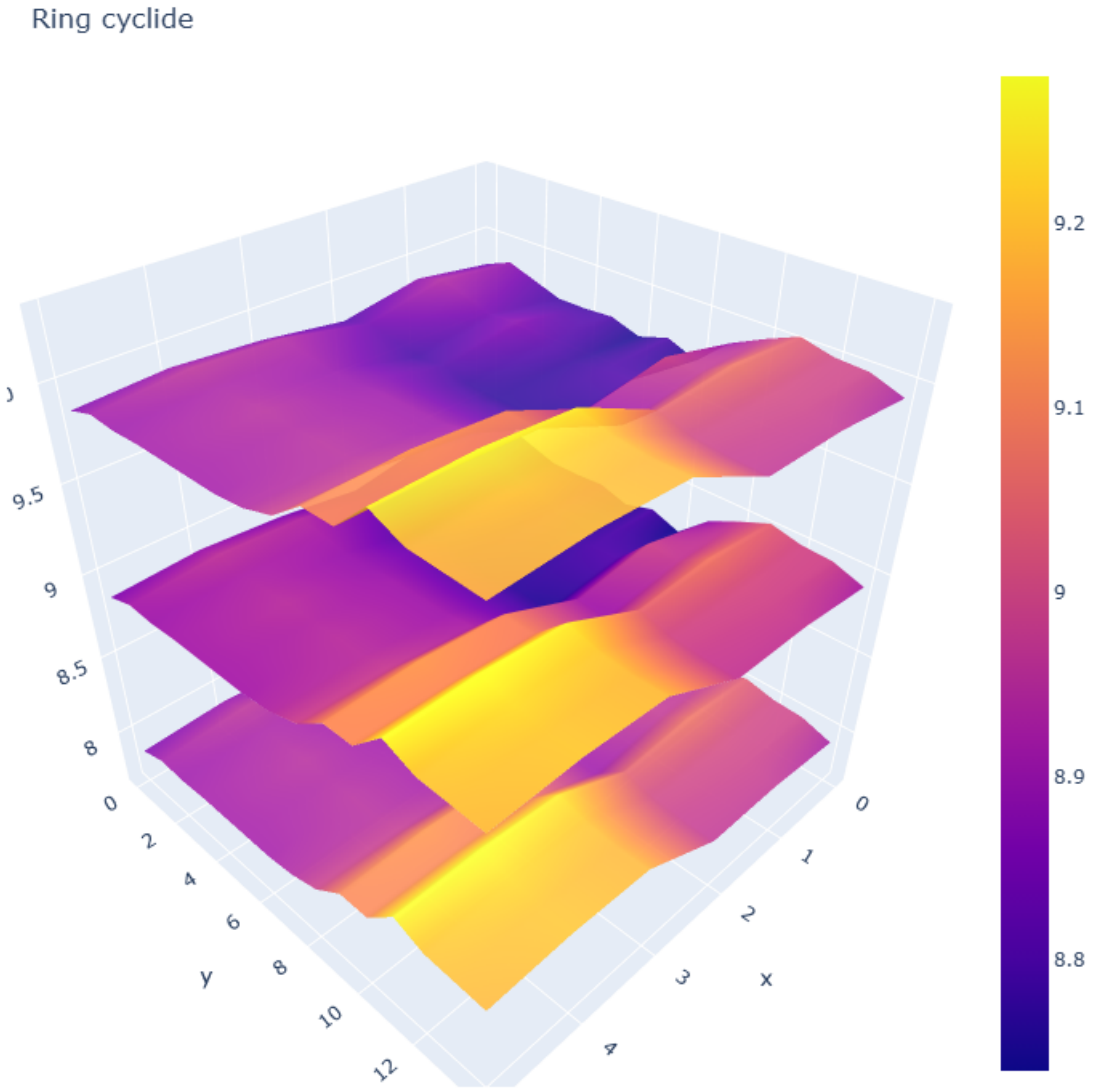
21.1.5 Boy surface

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05_Plotly3D_Boy.py, and the XML code in the file D05_Plotly3D_Boy.2D.xml.



21.1.6 Overlaid function

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06_Plotly3D_OverlaidFunctions.py, and the XML code in the file D06_Plotly3D_OverlaidFunctions.2D.xml.



21.1.7 Iris data

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_Plotly3D_IrisData.py, and the XML code in the file D07_Plotly3D_IrisData.2D.xml.

21.2 Geographical plots

See Test2DFunctions

21.2.1 Movable projection of the world

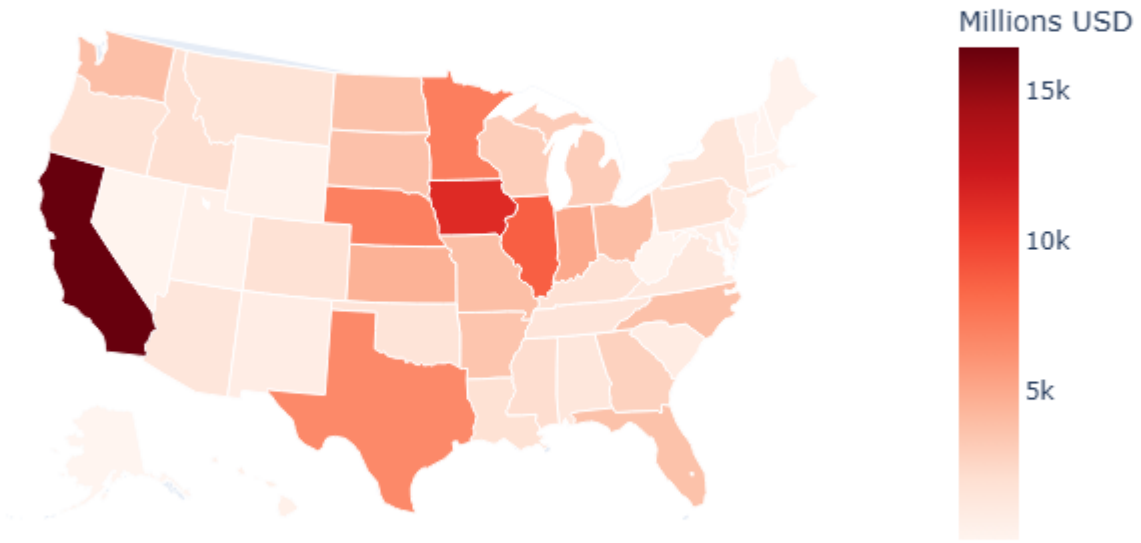
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_PlotlyGeo_MovableProjection.py, and the XML code in the file D01_PlotlyGeo_MovableProjection.2D.xml.

21.2.2 Rotatable globe

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_PlotlyGeo_MovableGlobe.py, and the XML code in the file D02_PlotlyGeo_MovableGlobe.2D.xml.

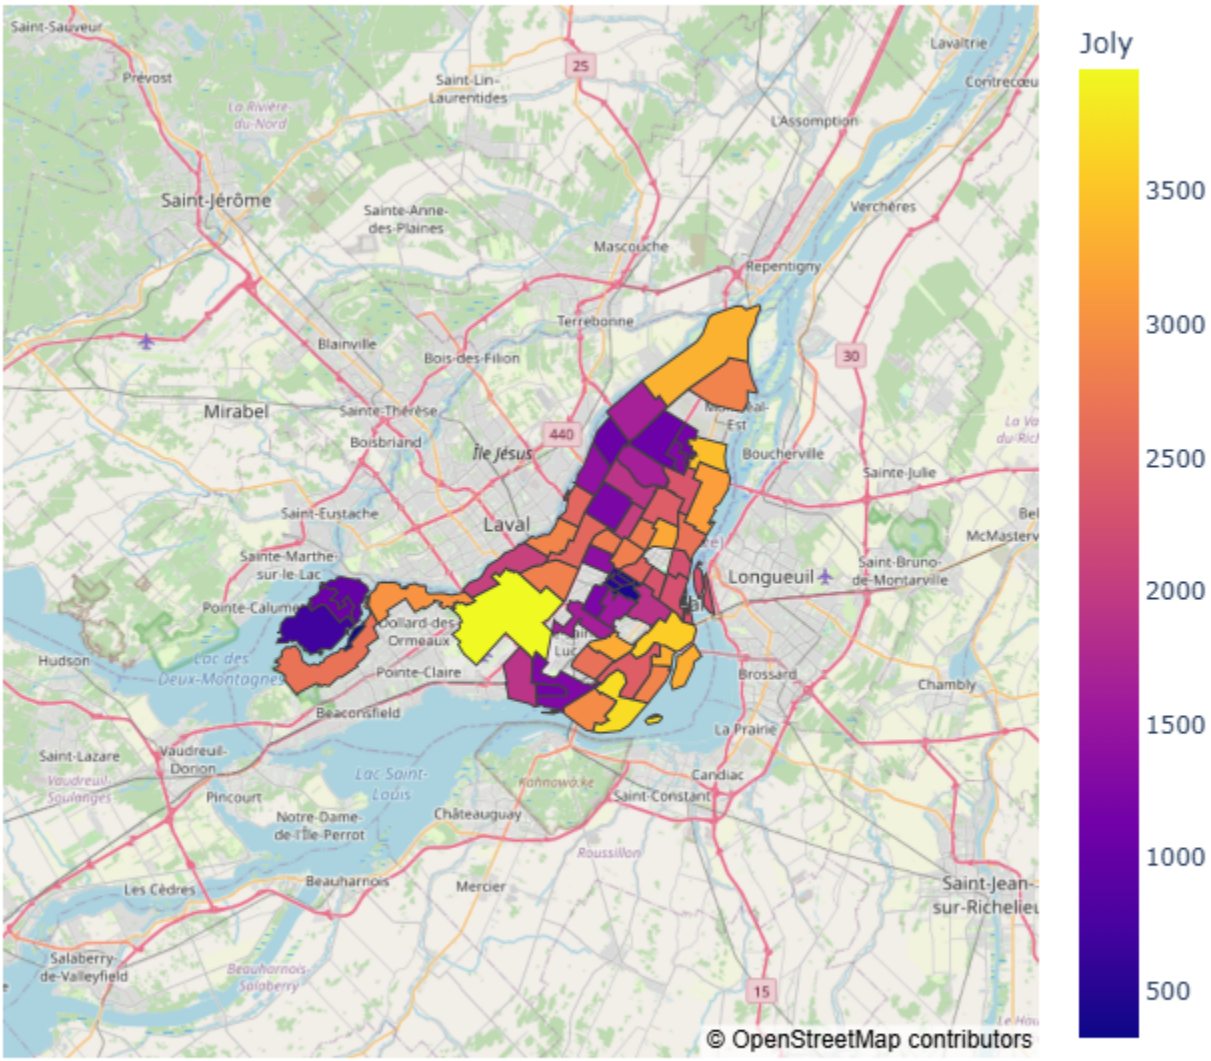
21.2.3 Choropleth of the US with Alaska and Hawai

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_PlotlyGeo_USA_Agriculture.py, and the XML code in the file D03_PlotlyGeo_USA_Agriculture.2D.xml.



21.2.4 Voting results embedded in map

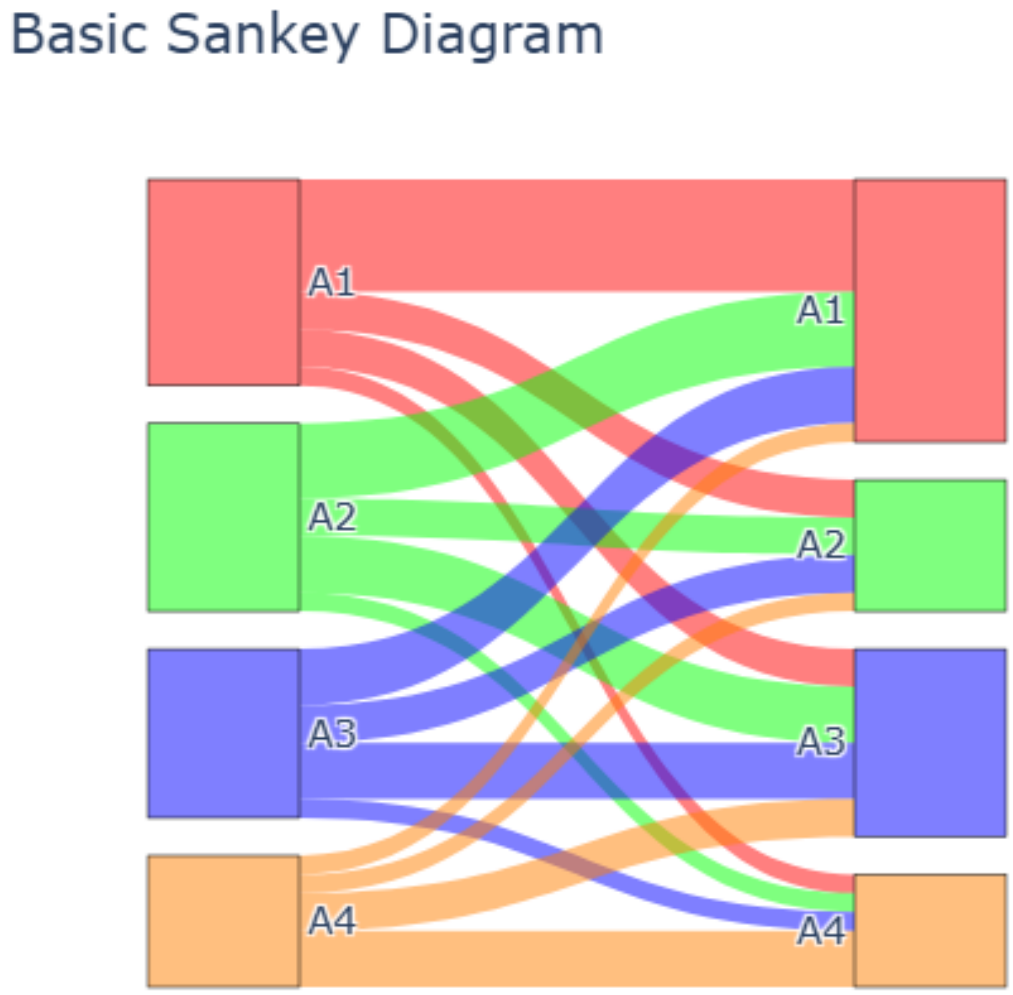
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04_PlotlyGeo_MontrealVotingWithMap.py, and the XML code in the file D04_PlotlyGeo_MontrealVotingWithMap.2D.xml.



21.3 Sankey plots

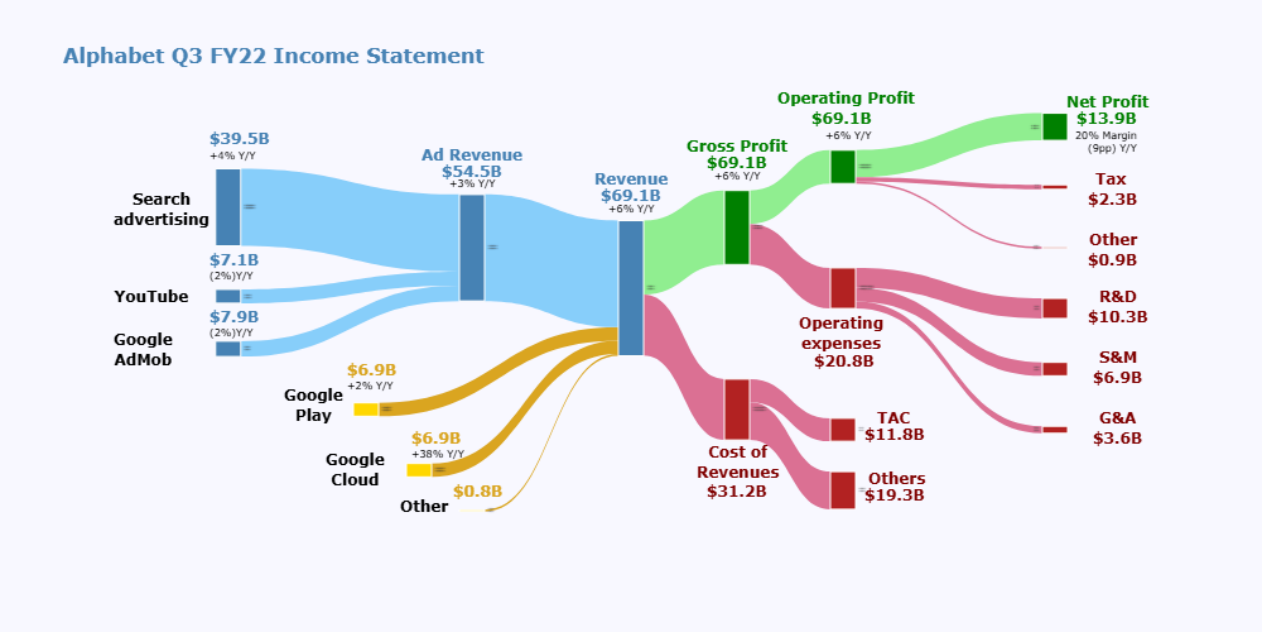
21.3.1 Sankey plot 1

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01_PlotlySankey.py, and the XML code in the file D01_PlotlySankey.2D.xml.



21.3.2 Sankey plot 2

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02_PlotlySankey.py, and the XML code in the file D02_PlotlySankey.2D.xml.



21.3.3 Sankey plot 3

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03_PlotlySankey.py, and the XML code in the file D03_PlotlySankey.2D.xml.

Interactive 3D Wpf Plots

CHAPTER

TWENTYTWO

WPF: ALTITUDE SURFACES IN 3D, REAL AND COMPLEX FUNCTIONS

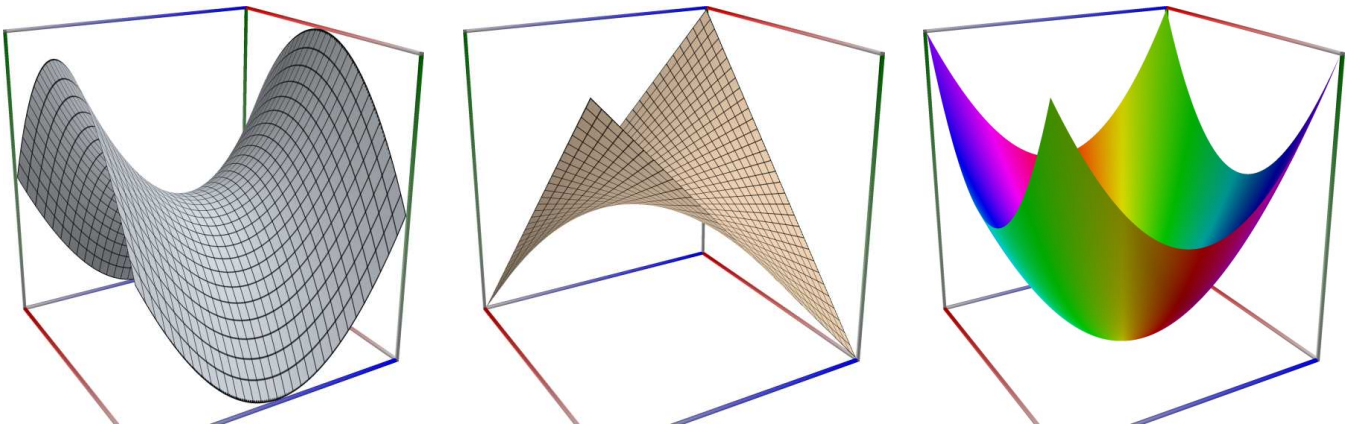
Explicit Surfaces: $z = f(x, y)$

22.1 Special techniques for height surfaces, real and complex functions

22.1.1 Wpf figures as standard display of complex functions

This is a description of the standard display of complex functions, using the square function as an example:

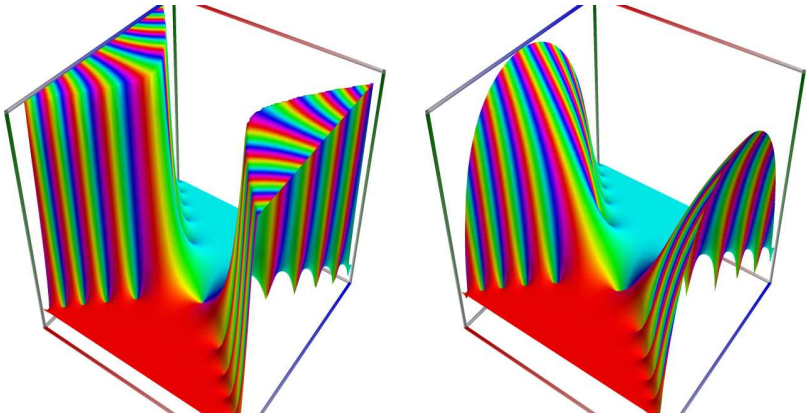
The figures below are showing the real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex function $z = \mathrm{sqr}(x + iy)$ with $-2 \leq x \leq 2$ (blue axis), $-2 \leq y \leq 2$ (red axis), $-10 \leq z \leq 10$ (green axis).



Note

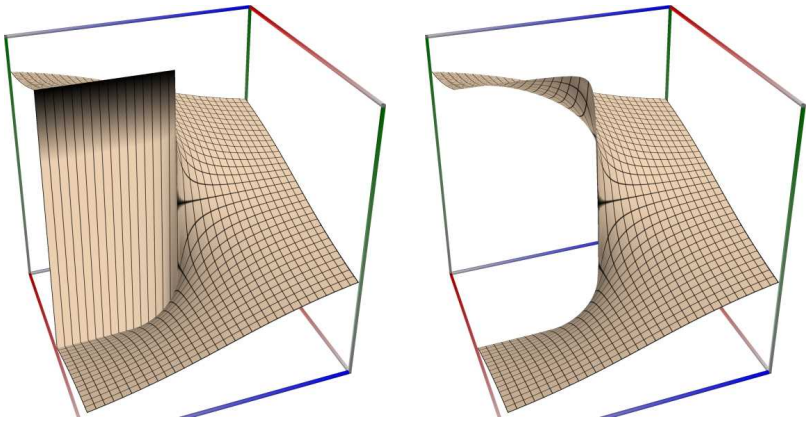
Although the range of the green axis is stated in the form $z_{\min} \leq z \leq z_{\max}$, with $z_{\min} \neq 0$ in general, this applies only for the figures showing the real and imaginary part. For the figure showing the absolute value we have always $z_{\min} = 0$. This note is omitted from the standard text describing complex functions in this manual for better readability.

22.1.2 Truncation vs loglog transformation



3D wpf plot: Surface plot without cutting of the branch cut (left figure), Surface plot with cutting of the branch cut (right figure)

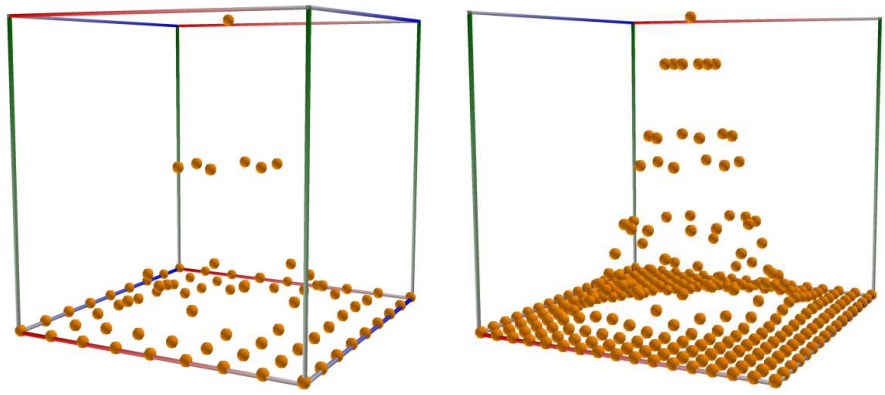
22.1.3 Displaying branch cuts



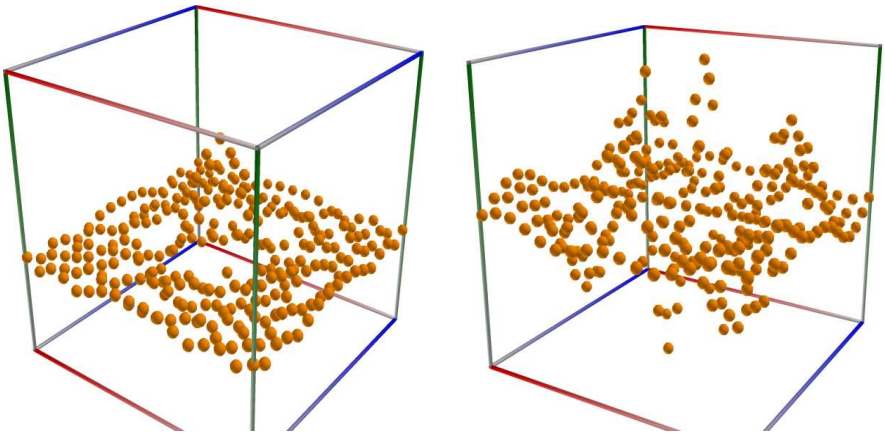
3D wpf plot: Surface plot without cutting of the branch cut (left figure). Surface plot with cutting of the branch cut (right figure).

22.2 Scatterplots and building 3D scenes

22.2.1 Scatter plot of bivariate normal



22.2.2 Scatter plot of surfaces



22.3 Height plots of general bivariate real functions

WPF: PARAMETRIC SURFACES

23.1 Surfaces of translation

See also: https://en.wikipedia.org/wiki/Translation_surface_(differential_geometry)

See also:http://www.3d-meier.de/tut3/Seite0.html

See also: https://en.wikipedia.org/wiki/Implicit_surface

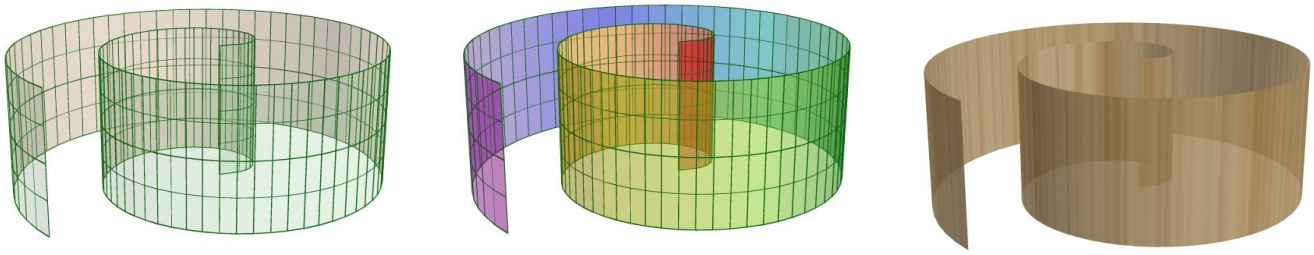
23.1.1 Fermat spiral as generator

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_FermatSpiral.3D.xml (D01a-c).

The example below uses the following code in C#

```
var h = 2;
var x = 4*Math.Sqrt(u) * Math.Cos(u);
var y = 4*Math.Sqrt(u) * Math.Sin(u);
var z = h * v;
```

See also Wikipedia [1368], MathWorld [1070].



23.1.2 Lemniscate as generator

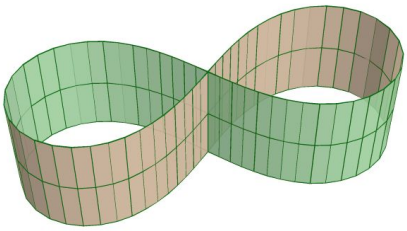
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Lemniscate.3D.xml (D02a-c).

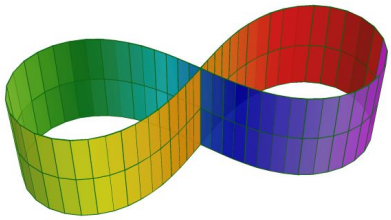
The example below uses the following code in C#

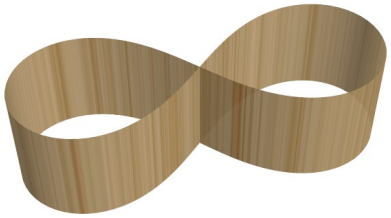
```
double a = 0.3;
double c = 1.0;
double r = c * 0.5;
var x = r * (Math.Cos(u) / (1 + Math.Sin(u) * Math.Sin(u)));
var y = r * (Math.Sin(u) * Math.Cos(u) / (1 + Math.Sin(u) * Math.Sin(u)));
var z = a * v;
```

// see also: http://www.3d-meier.de/tut3/Seite152.html

See also Wikipedia [1368], MathWorld [1070].







23.1.3 Tanh spiral as generator

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_TanhSpiral.3D.xml (D03a-c).

The example below uses the following code in C#

```
var h = 0.5;
double c = 0.2;
double a = 6.0;
var x = c * (Math.Sinh(2 * u) / (Math.Cos(2 * a * u) + Math.Cosh(2 * u)));
var y = c * (Math.Sin(2 * a * u) / (Math.Cos(2 * a * u) + Math.Cosh(2 * u)));
var z = h * v;
```

// see http://www.3d-meier.de/tut3/Seite187.html // see Krivoshapko, p. 498

23.1.4 Rose curve as generator

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_RoseCurve.3D.xml (D04a-c).

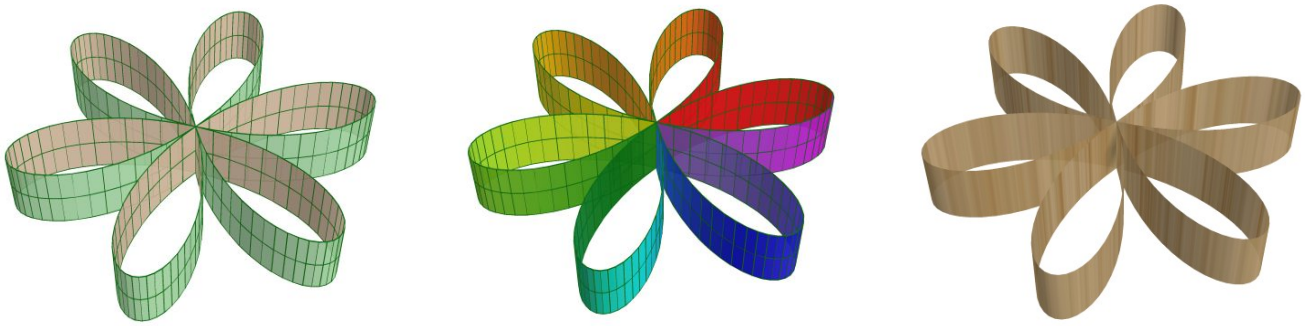
The example below uses the following code in C#

```
double a = 0.6;
double h = 2.0;
double n = 3.0;
double ca = Math.Cos(a);

var x = (h * Math.Abs(Math.Cos(n * u)) * ca) * Math.Cos(u);
var y = (h * Math.Abs(Math.Cos(n * u)) * ca) * Math.Sin(u);
var z = a * v;
```

// see http://www.3d-meier.de/tut3/Seite189.html

See also Wikipedia [1368], MathWorld [1070].



23.1.5 Hypocycloid as generator

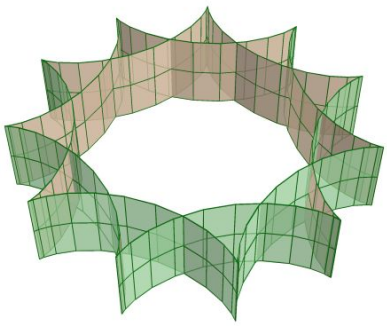
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Hypocycloid_55.3D.xml (D05a-c).

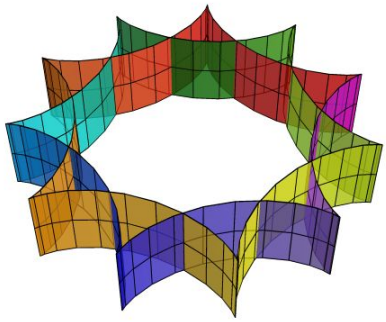
The example below uses the following code in C#

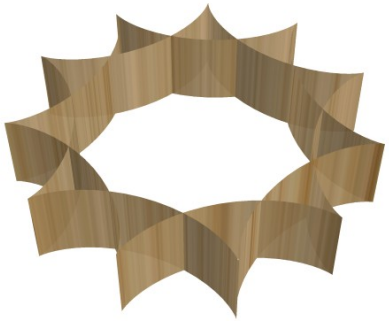
```
double a = 3.7;
double r = 1.5;
double k = 5.5;
var x = r * (k - 1) * Math.Cos(u) + r * Math.Cos((k - 1) * u);
var y = r * (k - 1) * Math.Sin(u) - r * Math.Sin((k - 1) * u);
var z = a * v;
```

// see http://www.3d-meier.de/tut3/Seite189.html

See also Wikipedia [1368], MathWorld [1070].







23.1.6 Epicycloid as generator

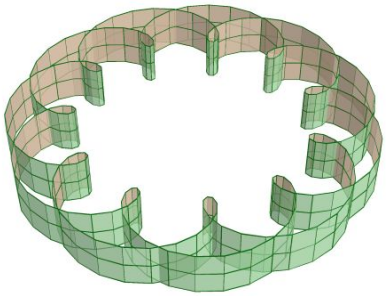
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Epicycloid_55.3D.xml (D06a-c).

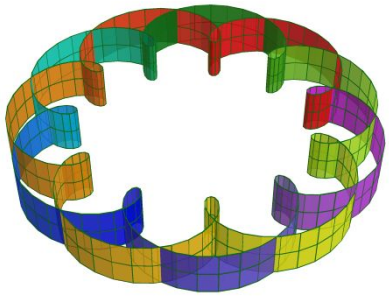
The example below uses the following code in C#

```
double a = 2.0;
double r = 1.0;
double k = 5.5;
var h = 1.5;
var x = r * (k + 1) * Math.Cos(u) - h * r * Math.Cos((k + 1) * u);
var y = r * (k + 1) * Math.Sin(u) - h * r * Math.Sin((k + 1) * u);
var z = a * v;
```

// see http://www.3d-meier.de/tut3/Seite189.html

See also Wikipedia [1368], MathWorld [1070].





23.2 Surfaces of revolution

See also: https://mathworld.wolfram.com/SurfaceofRevolution.html

A surface of revolution is a surface generated by rotating a two-dimensional curve about an axis. The resulting surface therefore always has azimuthal symmetry. Examples of surfaces of revolution include the apple surface, cone (excluding the base), conical frustum (excluding the ends), cylinder (excluding the ends), Darwin-de Sitter spheroid, Gabriel's horn, hyperboloid, lemon surface, oblate spheroid, paraboloid, prolate spheroid, pseudosphere, sphere, spheroid, and torus (and its generalization, the toroid).

The standard parameterization of a surface of revolution is given by

$$x(u, v) = \phi(v)\cos(u)$$

$$y(u, v) = \phi(v)\sin(u)$$

$$z(u, v) = \psi(v)$$

23.2.1 One-Sheeted Hyperboloid

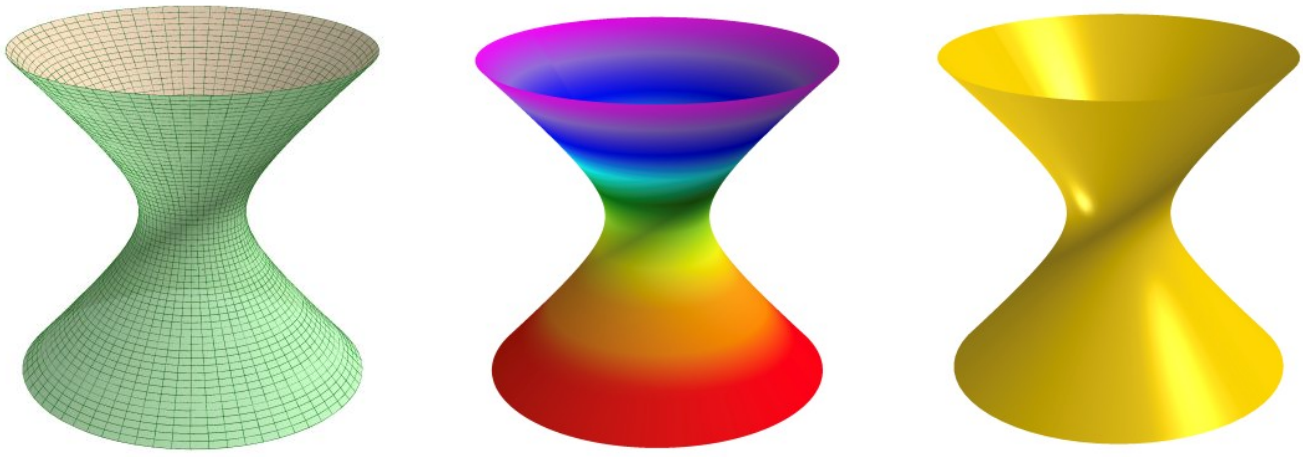
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Hyperboloid1.3D.xml (D01a-c).

The example below uses the following code in C#

```
var a = 1;
var c = 1;
var b = Math.Sqrt(1 + u * u);
var x = a * b * Math.Sin(v);
var y = a * b * Math.Cos(v);
var z = c * u;
```

See also: https://mathworld.wolfram.com/One-SheetedHyperboloid.html

See also: https://en.wikipedia.org/wiki/Hyperboloid



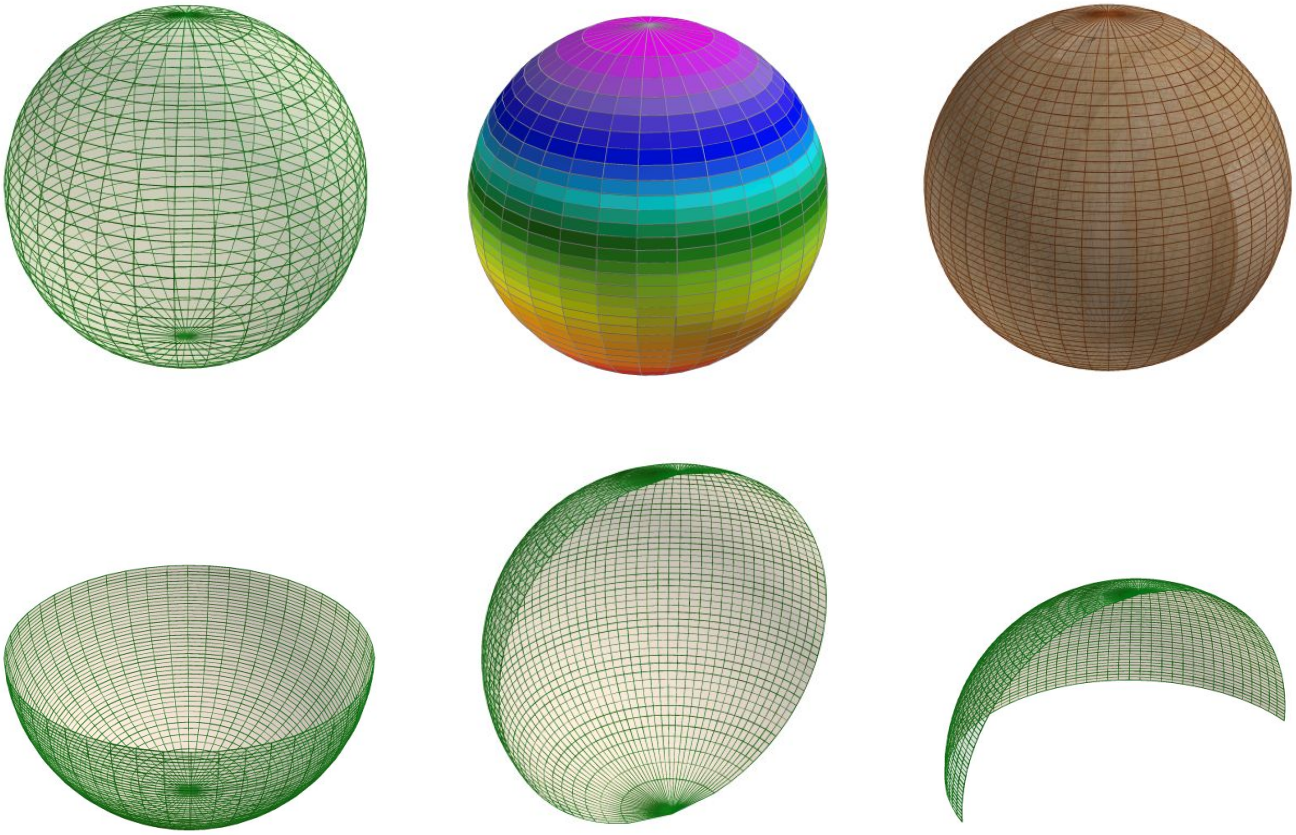
23.2.2 Sphere

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_SphereSqrt.3D.xml (D02a-f).

The example below uses the following code in C#

```
var y = Math.Sqrt(1-u*u) * Math.Cos(v);
var x = Math.Sqrt(1-u*u) * Math.Sin(v);
var z =  u;
```

See also: http://www.3d-meier.de/tut3/Seite86.html, Sphere



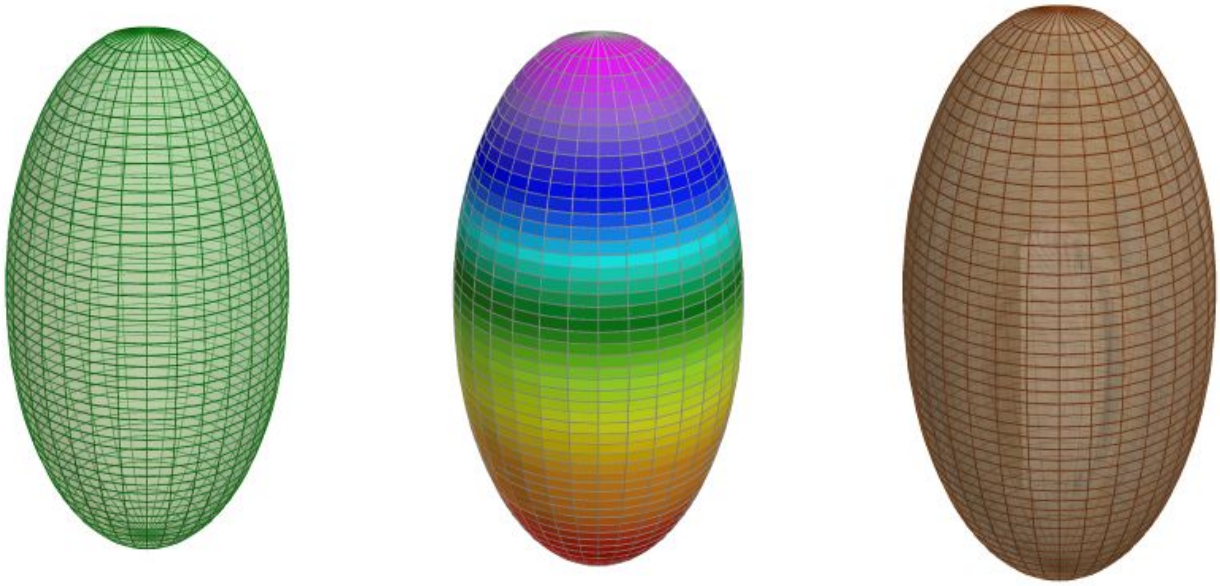
23.2.3 Prolate Spheroid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_ProlateSpheroidoid.3D.xml (D03a-c).

The example below uses the following code in C#

```
var a = 1;
var b = 1;
var c = 2;
var x = b * Math.Sqrt(1-u*u) * Math.Sin(v);
var y = a * Math.Sqrt(1-u*u) * Math.Cos(v);
var z =  c * u;
```

See also: http://paulbourke.net/geometry/spherical/ prolate spheroid, or ellipsoid of revolution See also: https://en.wikipedia.org/wiki/Ellipsoid#Parameterization ellipsoid of revolution See also: https://mathworld.wolfram.com/OblateSpheroid.html Oblate Spheroid



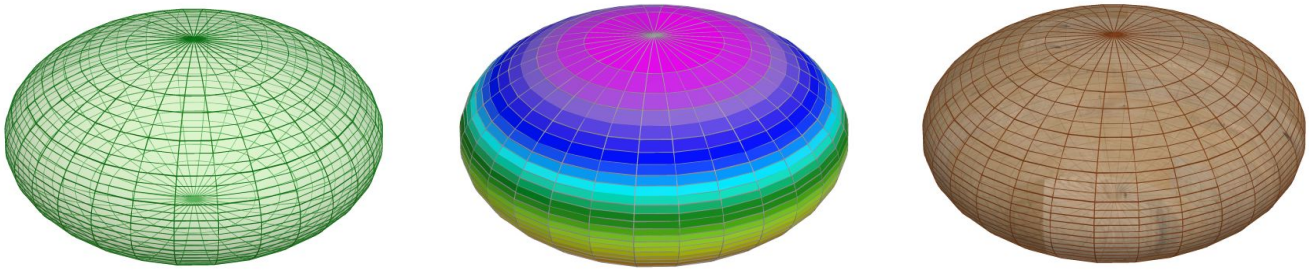
23.2.4 Oblate Spheroid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_OblateSpheroidoid.3D.xml (D04a-c).

The example below uses the following code in C#

```
var a = 2;
var b = 2;
var c = 1;
var x = b * Math.Sqrt(1-u*u) * Math.Sin(v);
var y = a * Math.Sqrt(1-u*u) * Math.Cos(v);
var z =  c * u;
```

See also: http://paulbourke.net/geometry/spherical/ prolate spheroid, or ellipsoid of revolution See also: https://en.wikipedia.org/wiki/Ellipsoid#Parameterization ellipsoid of revolution See also: https://mathworld.wolfram.com/OblateSpheroid.html Oblate Spheroid



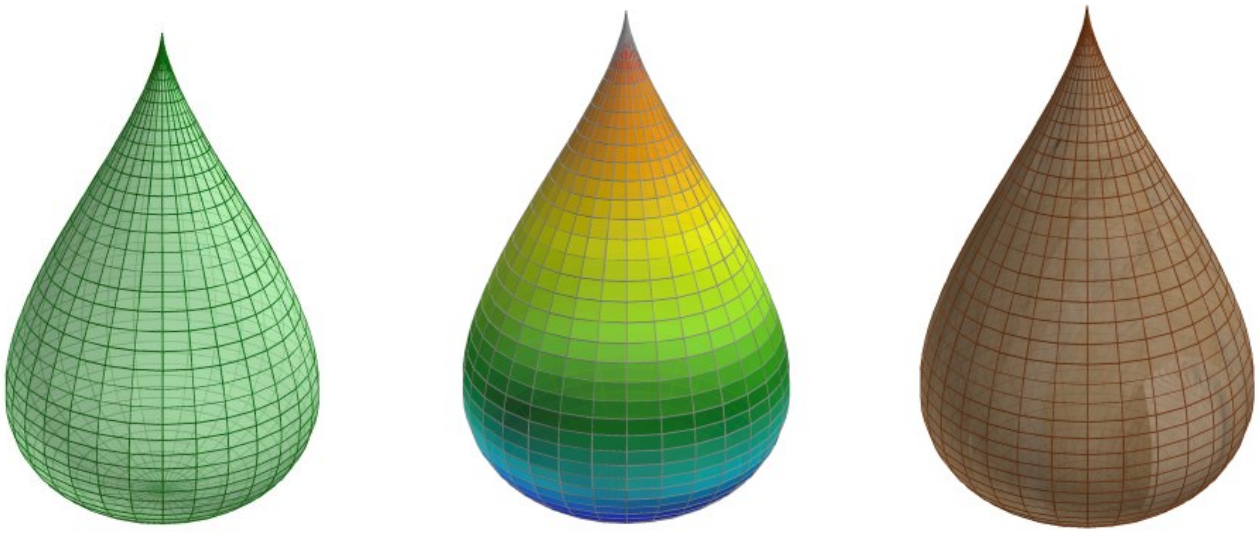
23.2.5 Drop surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_DropSurface.3D.xml (D05a-c).

The example below uses the following code in C#

```
double a = 0.5;  //(0 to 1)
double b = 1.00;  //(0 to 1)
var x = a * (b - Math.Cos(u)) * Math.Sin(u) * Math.Cos(v);
var y = a * (b - Math.Cos(u)) * Math.Sin(u) * Math.Sin(v);
var z = Math.Cos(u);
```

// see http://www.3d-meier.de/tut3/Seite44.html



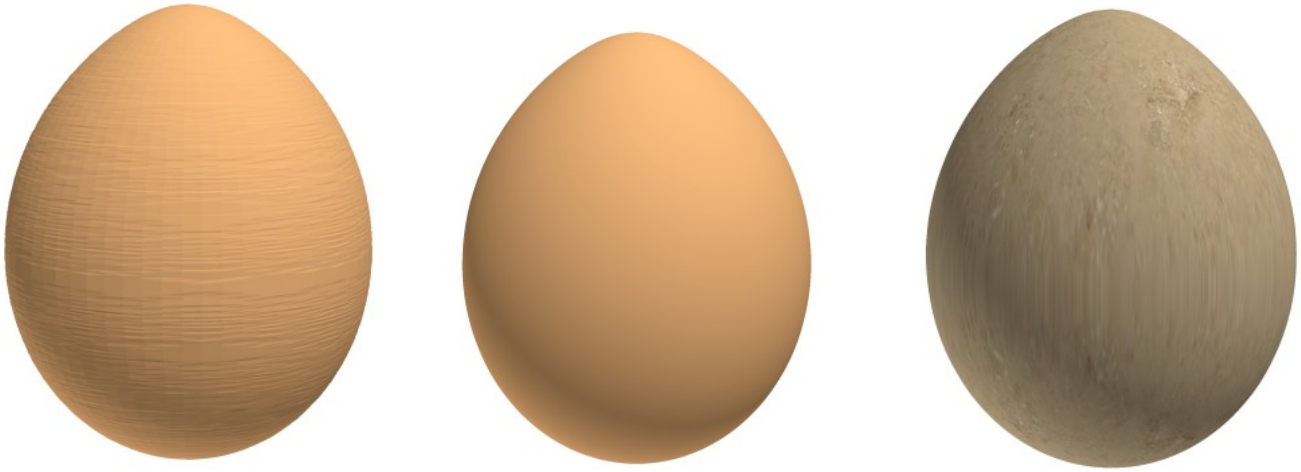
23.2.6 Egg surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_EggSurface.3D.xml (D06a-c).

The example below uses the following code in C#

```
double a = 2.0;  //(0 to 1)
double b = 0.75;  //(0 to 1)
var x = Math.Sqrt(0.75 * u * (2 * a - u) * (1 - (a * a * b * b) / ((u + a) * (u + a)))) * Math.Sin(v);
var y = Math.Sqrt(0.75 * u * (2 * a - u) * (1 - (a * a * b * b) / ((u + a) * (u + a)))) * Math.Cos(v);
var z = u;
```

For the egg surface, also see Meier



23.2.7 Apple surface

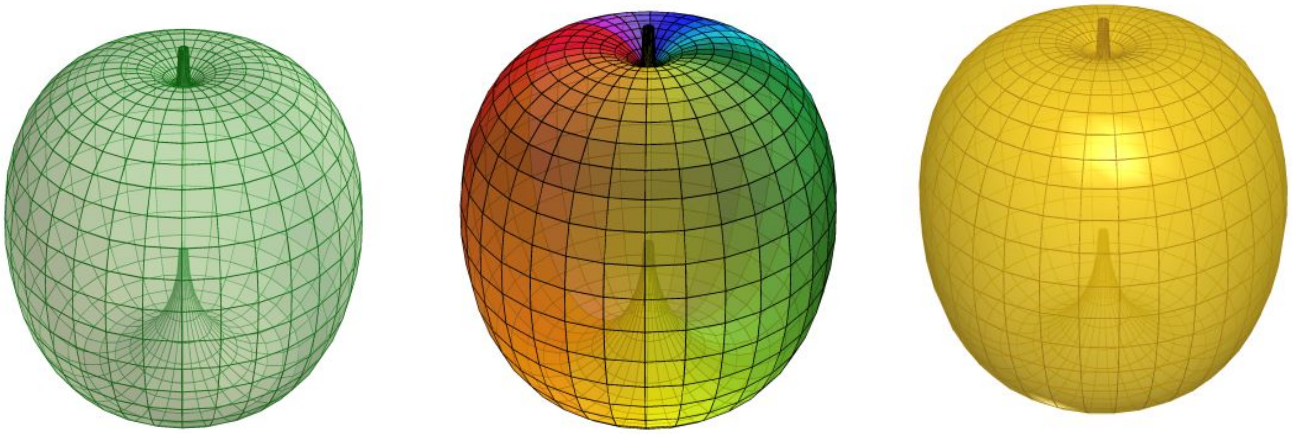
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Apple.3D.xml (D07a-c).

The example below uses the following code in C#

```
var x =  Math.Cos(u) * (4 + 3.8 * Math.Cos(v));
var y =  Math.Sin(u) * (4 + 3.8 * Math.Cos(v));
var z = (Math.Cos(v) + Math.Sin(v) - 1) * (1 + Math.Sin(v)) * Math.Log(1 - Math.PI * v / 10) + 7.5 * Math.Sin(v);
```

// see http://www.3d-meier.de/tut3/Seite54.html

For the apple surface, also see Meier



23.2.8 Spinning top

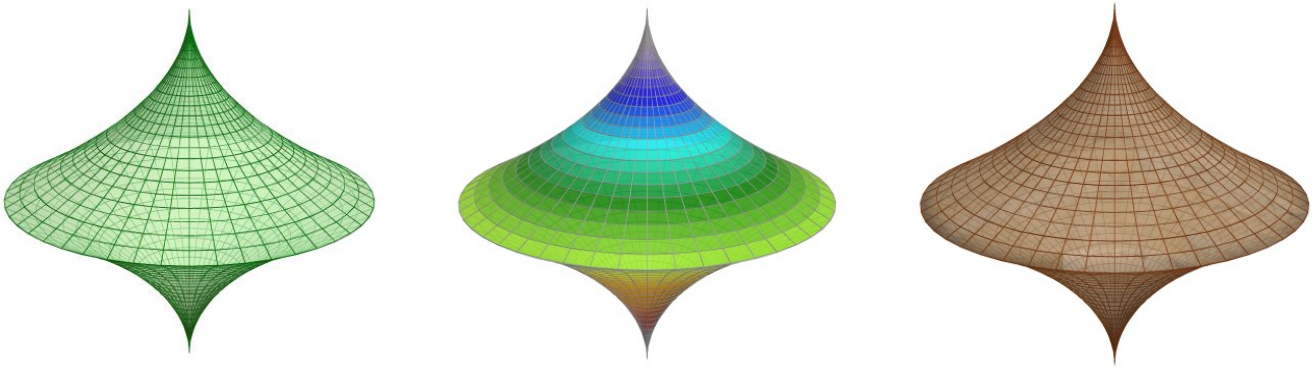
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Spinningtop.3D.xml (D08a-c).

The example below uses the following code in C#

```
var x = (Math.Abs(u) - 1) * (Math.Abs(u) - 1) * Math.Sin(v);
var y = (Math.Abs(u) - 1) * (Math.Abs(u) - 1) * Math.Cos(v);
var z = u;
```

See also http://www.3d-meier.de/tut3/Seite150.html Kreisel

See also Wikipedia [1368], MathWorld [1070].



23.2.9 Pseudosphere

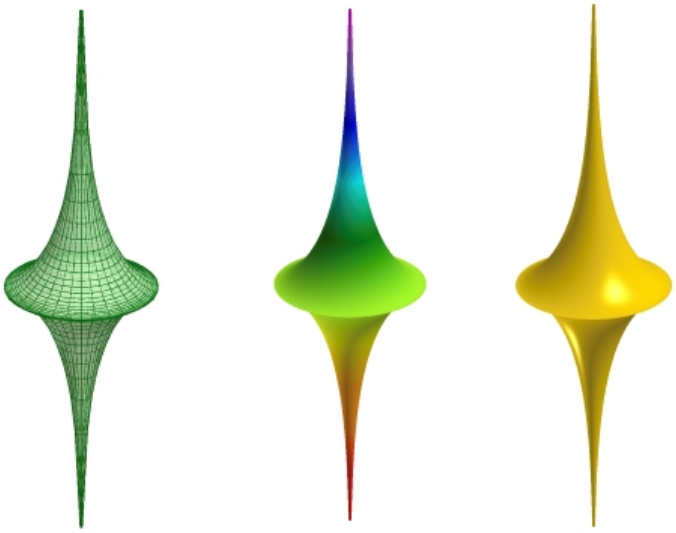
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D09a_PseudoSphere.3D.xml (D09a-c).

The example below uses the following code in C#

```
var x = Math.Cos(u) * Math.Sin(v);
var y = Math.Sin(u) * Math.Sin(v);
var z = (Math.Cos(v) + Math.Log(Math.Tan(0.5 * v)));
```

See also: https://mathworld.wolfram.com/Pseudosphere.html

// see http://www.3d-meier.de/tut3/Seite28.html



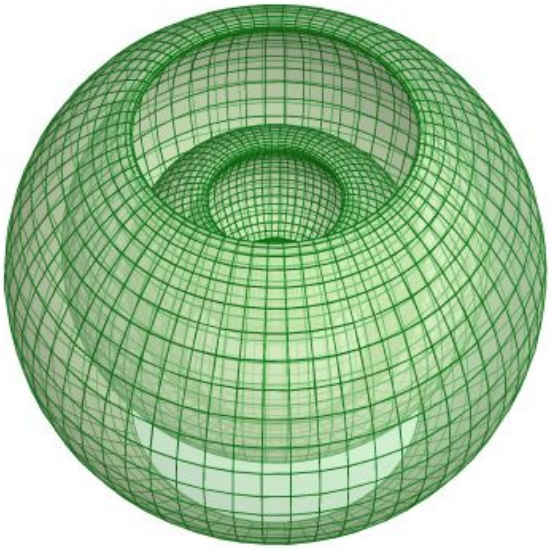
23.2.10 Wave sphere Surface

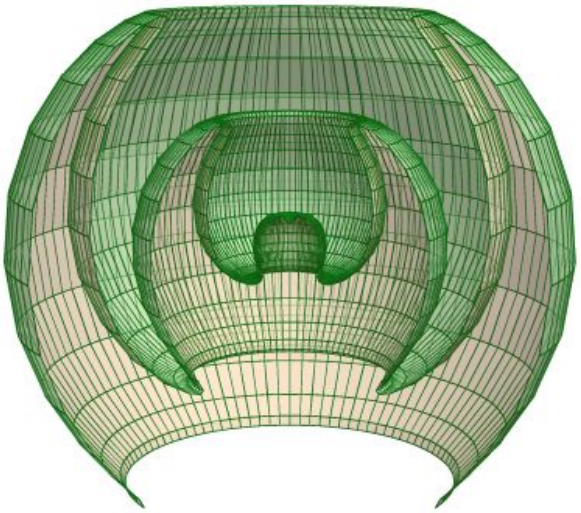
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D10a_WaveSphere.3D.xml (D10a-b).

The example below uses the following code in C#

```
var x = u * Math.Cos(Math.Cos(u)) * Math.Cos(v);
var y = u * Math.Cos(Math.Cos(u)) * Math.Sin(v);
var z = u * Math.Sin(Math.Cos(u));
```

// see http://www.3d-meier.de/tut3/Seite63.html





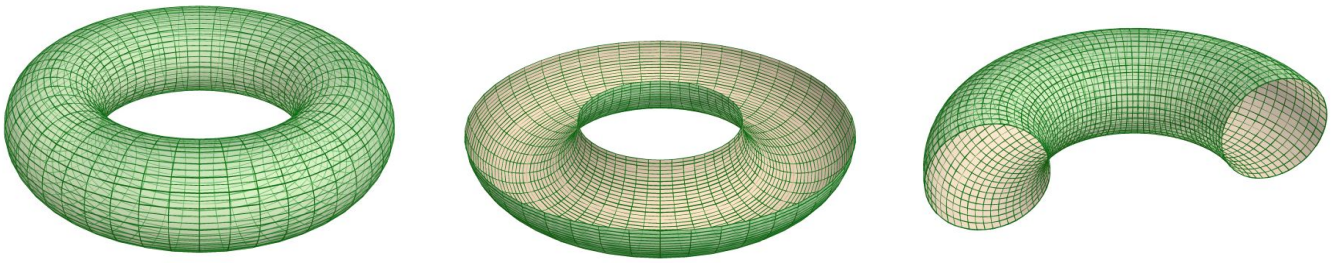
23.2.11 Torus

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D11a_Torus.3D.xml (D11a-c).

The example below uses the following code in C#

```
var R = 1.5;
var r = 0.5;
var x = (R + r * Math.Cos(v)) * Math.Cos(u);
var y = (R + r * Math.Cos(v)) * Math.Sin(u);
var z = r * Math.Sin(v);
```

See also Wikipedia [1368], MathWorld [1070].



23.2.12 Horn Torus

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D12a_HornTorus.3D.xml (D12a-c).

The example below uses the following code in C#

```
var R = 1.5;
var r = 1.5;
var x = (R + r * Math.Cos(v)) * Math.Cos(u);
var y = (R + r * Math.Cos(v)) * Math.Sin(u);
var z = r * Math.Sin(v);
```

See also Wikipedia [1368], MathWorld [1070].

23.2.13 Spindle Torus

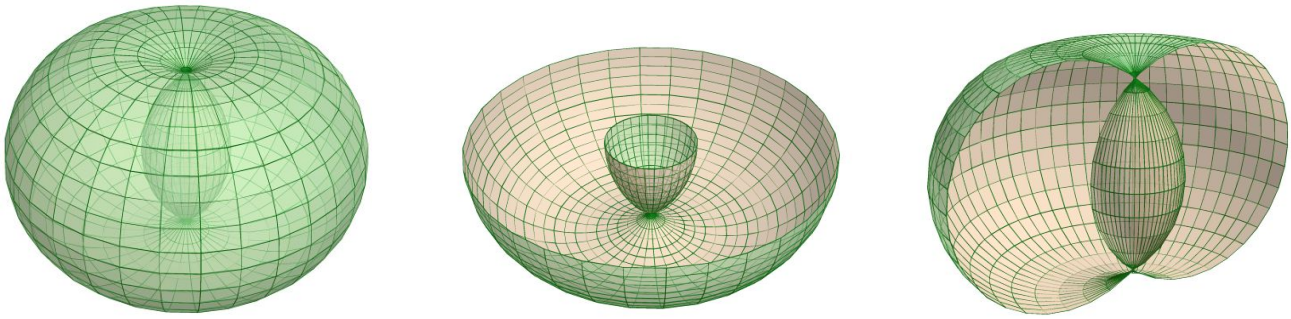
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D13a_SpindelTorus.3D.xml (D13a-c).

The example below uses the following code in C#

```
var R = 1.5;
var r = 2.5;
var x = (R + r * Math.Cos(v)) * Math.Cos(u);
var y = (R + r * Math.Cos(v)) * Math.Sin(u);
var z = r * Math.Sin(v);
```

See also: https://mathworld.wolfram.com/EllipticTorus.html

See also Wikipedia [1368], MathWorld [1070].



23.2.14 Elliptic Torus

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D14a_EllipticTorus.3D.xml (D14a-c).

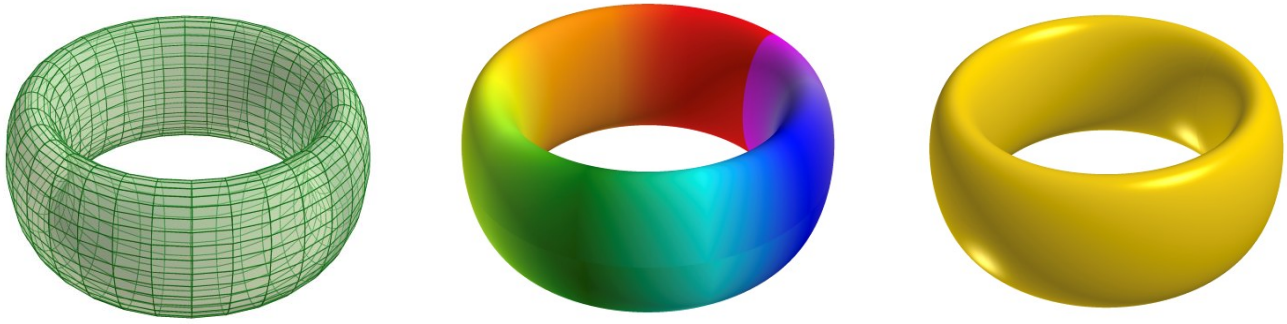
The example below uses the following code in C#

```
var a = 0.2;
var b = 0.5;
var c = 1;
var su = Math.Sin(u);
var sv = Math.Sin(v);
var cu = Math.Cos(u);
var cv = Math.Cos(v);

var x = (c + a * cv) * cu;
var y = (c + a * cv) * su;
var z = b * sv;
```

See also: https://mathworld.wolfram.com/EllipticTorus.html

See also Wikipedia [1368], MathWorld [1070].



23.3 Generalisations of common surfaces

Parametric Surfaces: $x = f(u, v)$, $y = g(u, v)$, $z = h(u, v)$

23.3.1 Ellipsoid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Ellipsoid.3D.xml (D01a-c).

The parametric equations of an ellipsoid can be written as

$$x(u, v) = a\cos(u)\sin(v),$$

$$y(u, v) = b\sin(u)\sin(v),$$

$$z(u, v) = r\sin(t),$$

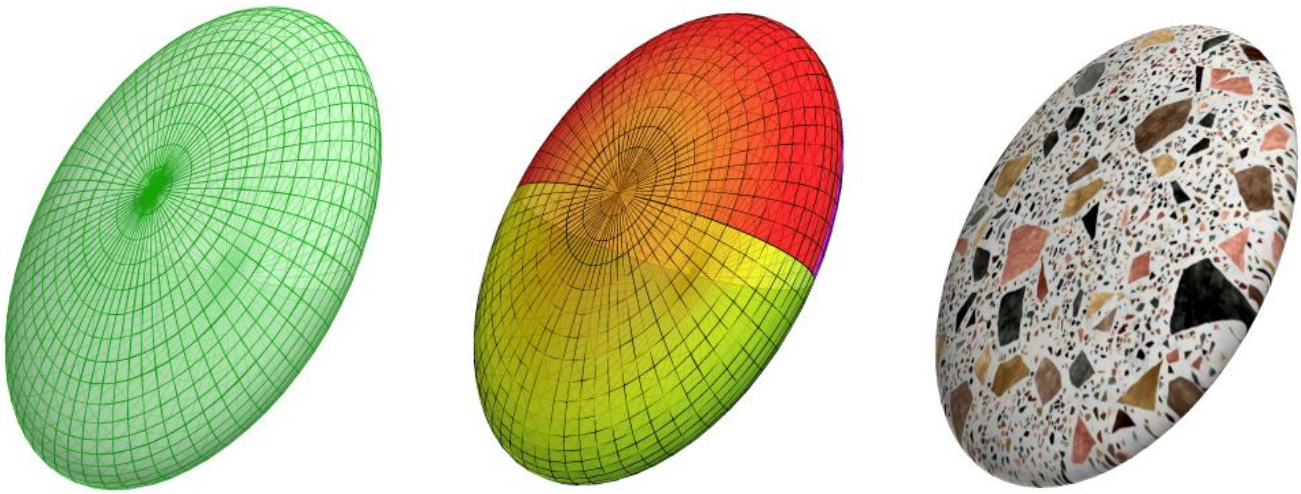
for $u \in [0, 2\pi)$ and $v \in [0, \pi]$.

See also: http://paulbourke.net/geometry/spherical/ See also: https://mathcurve.com/surfaces.gb/lame/lame.shtml See also: https://mathworld.wolfram.com/Ellipsoid.html

See also Gray *et al.* [353], Krivoshapko and Ivanov [399].

```
var a = 1.0;
var b = 2.0;
var c = 3.0;
var x = a * Math.Cos(u) * Math.Cos(v);
var y = b * Math.Cos(u) * Math.Sin(v);
var z = c * Math.Sin(u);
```

If the lengths of two axes of an ellipsoid are the same, the figure is called an ellipsoid of revolution or spheroid. Denote the equal semi-axes lengths of a spheroid $a = b$, call a the equatorial radius, and call the other semi-axis length the polar radius c. Then if $a > c$, the spheroid is called an oblate spheroid, and if $a < c$, the spheroid is called an prolate spheroid. If all three semi-axes lengths are the same so $a = b = c$, the ellipsoid is a sphere.



23.3.2 Superellipsoid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_SuperEllipse.3D.xml (D02a-c).

Superellipsoid is the name given to a family of shapes formed from the spherical product of two superquadratric curves. These shapes can be used to model a wide range of shapes including spheres, cylinders, and parallelepipeds as well as shapes in between. The parametric equations of an superellipsoid can be written as

$$x(u,v) = \text{sgn}(\cos(u)) \cdot |\cos(u)|^{p1} \cdot \text{sgn}(\cos(v)) \cdot |\cos(v)|^{p2},$$

$$y(u,v) = \text{sgn}(\cos(u)) \cdot |\cos(u)|^{p1} \cdot \text{sgn}(\sin(v)) \cdot |\sin(v)|^{p2},$$

$$z(u,v) = \text{sgn}(\sin(u)) \cdot |\sin(u)|^{p1},$$

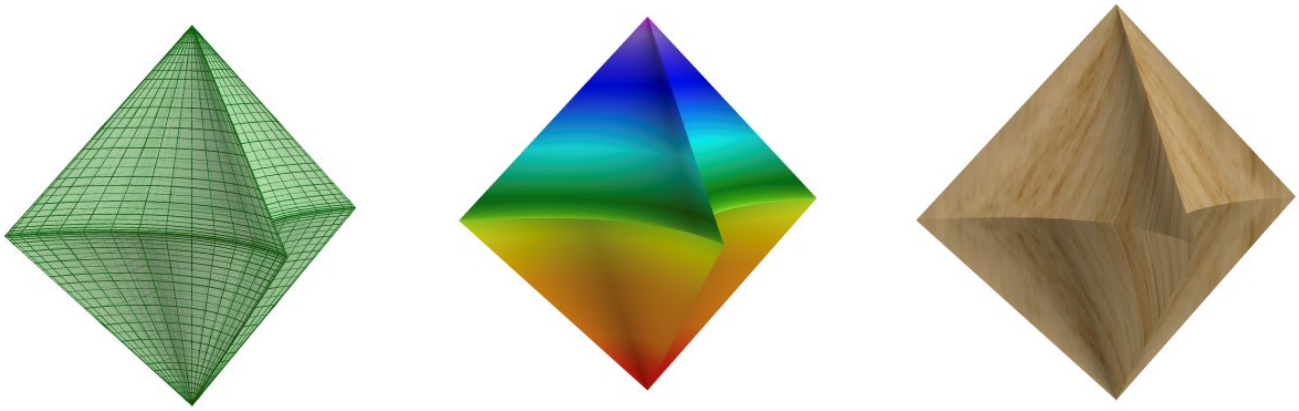
where $\frac{-\pi}{2} \leq u \leq \frac{\pi}{2}$, $-\pi \leq v \leq \pi$, and $0 < p1, p2 < \infty$.

```
double p1 = 2.0;
double p2 = 3.8;

double u = u;
double v = v;

\cos(u) = Math.Cos(u);
\cos(v) = Math.Cos(v);
\sin(u) = Math.Sin(u);
\sin(v) = Math.Sin(v);

tmp  = Math.Sign(\cos(u)) * Math.Pow(Math.Abs(\cos(u)),p1);
x = tmp * Math.Sign(\cos(v)) * Math.Pow(Math.Abs(\cos(v)),p2);
y = -Math.Sign(\sin(u)) * Math.Pow(Math.Abs(\sin(u)),p1);
z = tmp * Math.Sign(\sin(v)) * Math.Pow(Math.Abs(\sin(v)),p2);
```

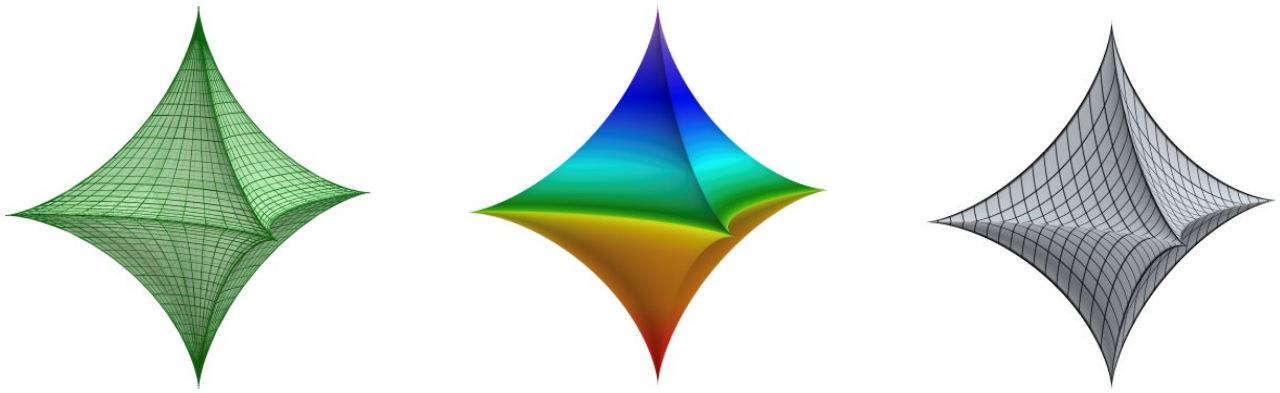


23.3.3 Hexaedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Hexaedron.3D.xml (D03a-c).

See also Wikipedia [1368], MathWorld [1070].

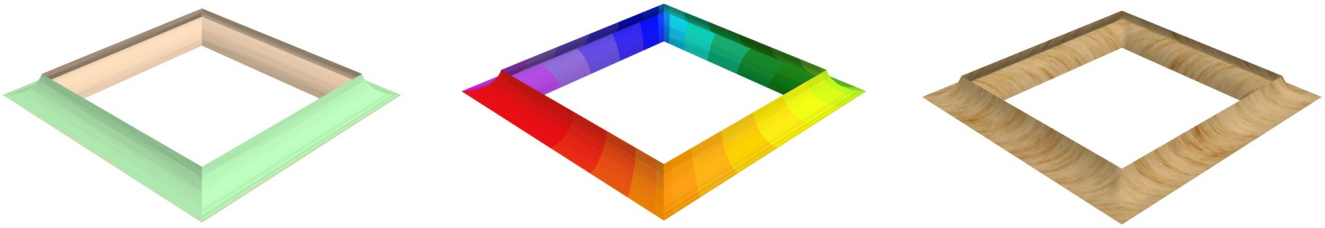
```
double cosu = Math.Cos(u);
double sinu = Math.Sin(u);
double cosv = Math.Cos(v);
double sinv = Math.Sin(v);
x = cosv * cosv * cosv * cosu * cosu * cosu;
y = -sinu * sinu * sinu;
z = sinv * sinv * sinv * cosu * cosu * cosu;
```



23.3.4 Super Toroid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_SuperToroid.3D.xml (D04a-c).

See also: http://paulbourke.net/geometry/toroidal/



```
double r0 = 1;
double r1 = 0.3;

double tmp;
double ct1,ct2,st1,st2;

double p1 = 2.0;
double p2 = 3.8;
double t1 = u;
double t2 = v;

ct1 = Math.Cos(t1);
ct2 = Math.Cos(t2);
st1 = Math.Sin(t1);
st2 = Math.Sin(t2);

tmp  = r0 + r1 * Math.Sign(ct2) * Math.Pow(Math.Abs(ct2),p2);

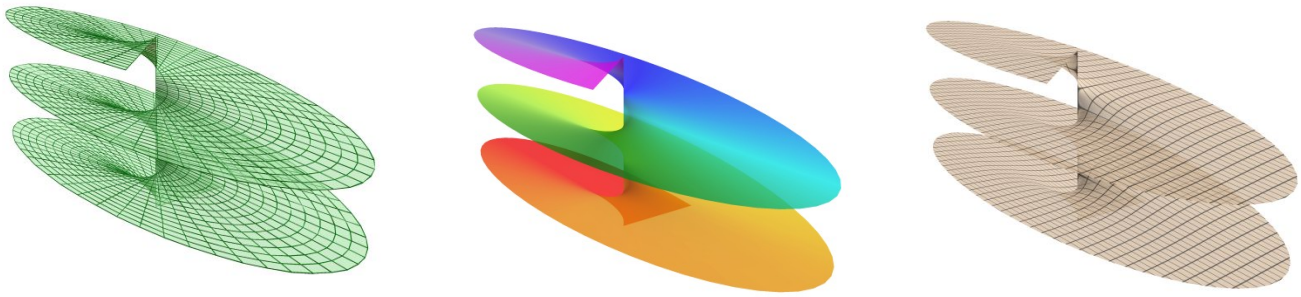
x = tmp * Math.Sign(ct1) * Math.Pow(Math.Abs(ct1),p1);
y = -tmp * Math.Sign(st1) * Math.Pow(Math.Abs(st1),p1);
z = r1 * Math.Sign(st2) * Math.Pow(Math.Abs(st2),p2);
```

23.3.5 Elliptic Helicoid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_EllipticHelicoid.3D.xml (D05a-c).

See also: https://mathworld.wolfram.com/EllipticHelicoid.html

See also Wikipedia [1368], MathWorld [1070].



```
double a = 0.5;
double b = 1.5;
double c = 1;
double su = Math.Sin(u);
double cu = Math.Cos(u);

x = a * v * cu;
z = b * v * su;
y = c * u;
```

23.3.6 Hyperbolic Helicoid

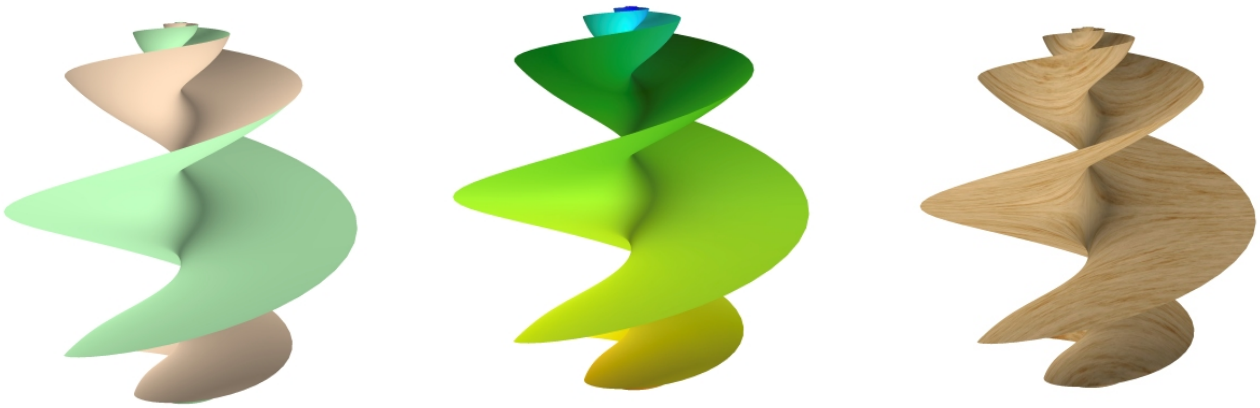
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Hyperhelicoid.3D.xml (D06a-c).

The example below uses the following code in C#

```
var x = (Math.Sinh(v) * Math.Cos(3 * u)) / (1 + Math.Cosh(u) * Math.Cosh(v));
var y = (Math.Sinh(v) * Math.Sin(3 * u)) / (1 + Math.Cosh(u) * Math.Cosh(v));
var z = (Math.Cosh(v) * Math.Sinh(u)) / (1 + Math.Cosh(u) * Math.Cosh(v));
```

See also: https://mathworld.wolfram.com/HyperbolicHelicoid.html

See also Wikipedia [1368], MathWorld [1070].

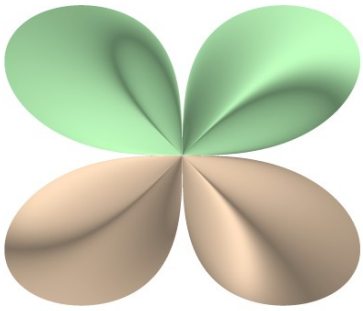


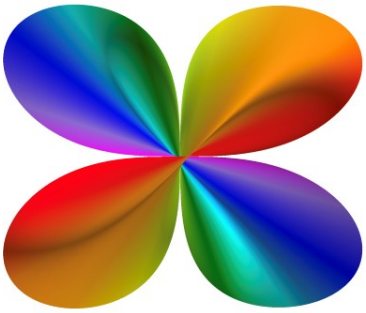
23.3.7 Lemniscate

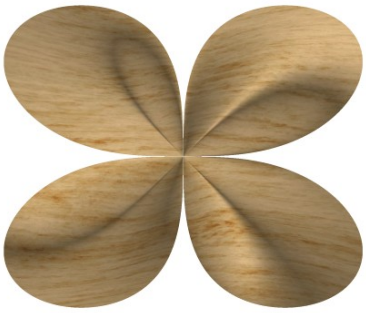
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Lemniscate.3D.xml (D07a-c).

See also: http://paulbourke.net/geometry/lemniscape/

```
var x = Math.Cos(v) * Math.Sqrt(Math.Abs(Math.Sin(2 * u))) * Math.Cos(u);
var y = Math.Cos(v) * Math.Sqrt(Math.Abs(Math.Sin(2 * u))) * Math.Sin(u);
var z = x * x - y * y + 2 * x * y * Math.Tan(v) * Math.Tan(v);
```







23.3.8 Bohemian Dome

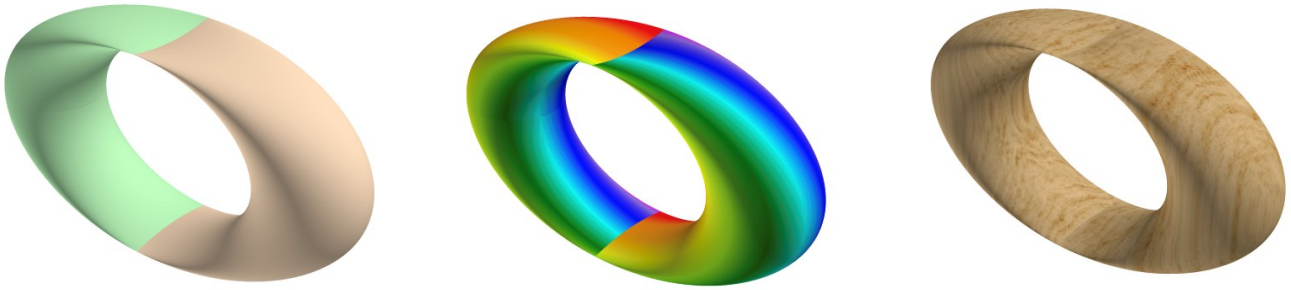
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_BohemianDome.3D.xml (D08a-c).

See also: https://mathworld.wolfram.com/BohemianDome.html

See also Wikipedia [1368], MathWorld [1070].

```
var a = 0.5;
var b = 1.5;
var c = 1;
var su = Math.Sin(u);
var sv = Math.Sin(v);
var cu = Math.Cos(u);
var cv = Math.Cos(v);

var x = a * cu;
var z = b * cv + a * su;
var y = c * sv;
```



23.3.9 Dupin1 surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D09a_Dupin1.3D.xml (D09a-c).

The example below uses the following code in C#

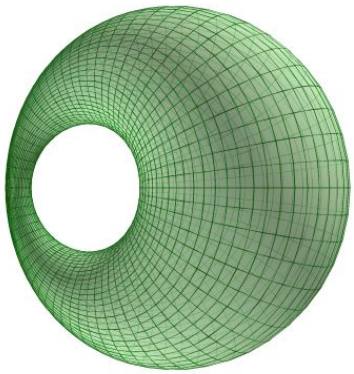
```
var a = 1.5;
var b = 1.4;
var c = Math.Sqrt(a * a - b * b);
var d = b / 2;
var su = Math.Sin(u);
var sv = Math.Sin(v);
var cu = Math.Cos(u);
var cv = Math.Cos(v);
var den = a - c * cu * cv;

var x = (b * sv * (c * cu - d)) / den;
var y = (d * (c - a * cu * cv) + b * b * cu) / den;
var z = (b * su * (a - d * cv)) / den;
```

See also: https://mathcurve.com/surfaces.gb/cyclidedupin/cyclidededupin.shtml

See also: https://en.wikipedia.org/wiki/Dupin_cyclide#Elliptic_cyclides

See also Wikipedia [1368], MathWorld [1070].



23.3.10 Dupin2 surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D10a_Dupin2.3D.xml (D10a-c).

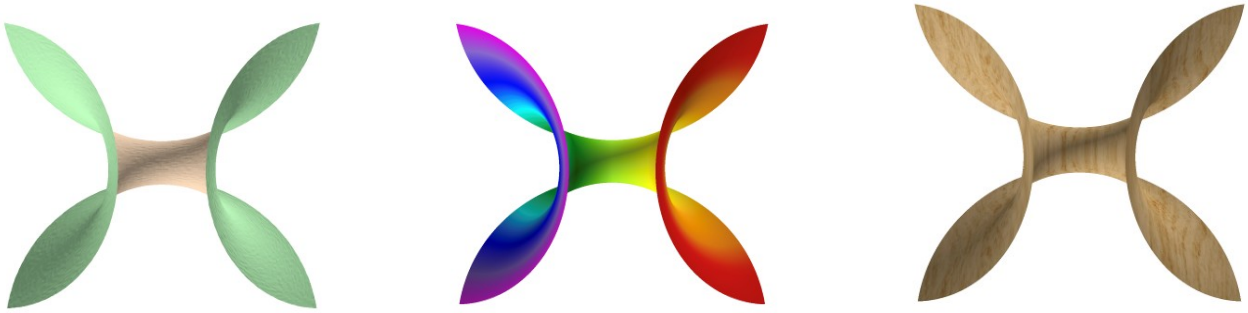
The example below uses the following code in C#

```
var p = 2;
var k = 0.7;
var den = 1 + u * u + v * v;
var x = 0.5 * p * (2 * v * v + k * (1 - u * u - v * v)) / den;
var y = p * u * (v * v + k) / den;
var z = p * v * (1 + u * u - k) / den;
```

See also: https://mathcurve.com/surfaces.gb/cycliddedupin/cyclidededupin.shtml

See also: https://en.wikipedia.org/wiki/Dupin_cyclide#Parabolic_cyclides

See also Wikipedia [1368], MathWorld [1070].



23.3.11 Dinis Surface (twisted pseudosphere)

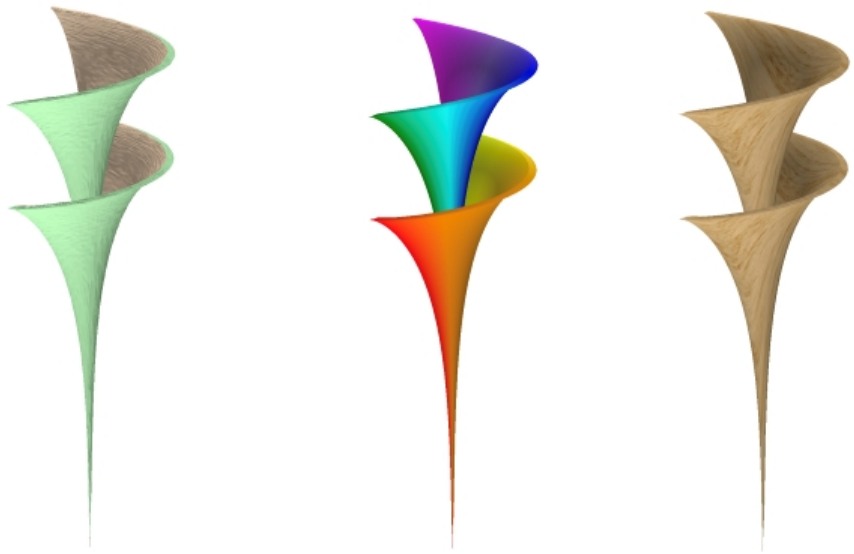
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D11a_Dini.3D.xml (D11a-c).

The example below uses the following code in C#

```
var a = 1;
var b = 0.2;
var x = a * Math.Cos(u) * Math.Sin(v);
var y = a * Math.Sin(u) * Math.Sin(v);
var z = a * (Math.Cos(v) + Math.Log(Math.Tan(0.5 * v))) + b * u;
```

See also: https://mathworld.wolfram.com/DinisSurface.html

See also Wikipedia [1368], MathWorld [1070].



23.3.12 Plueckers conoid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D12a_Pluecker.3D.xml (D12a-f).

// See : https://mathworld.wolfram.com/PlueckersConoid.html // See : Gray, p. 436 // See : https://en.wikipedia.org/wiki/Pl%C3%BCcker%27s_conoid

```
var n = 2;
var r = u;
var theta = v;

var x = r * Math.Cos(theta);
var y = r * Math.Sin(theta);
var z = Math.Sin(n * theta);
```

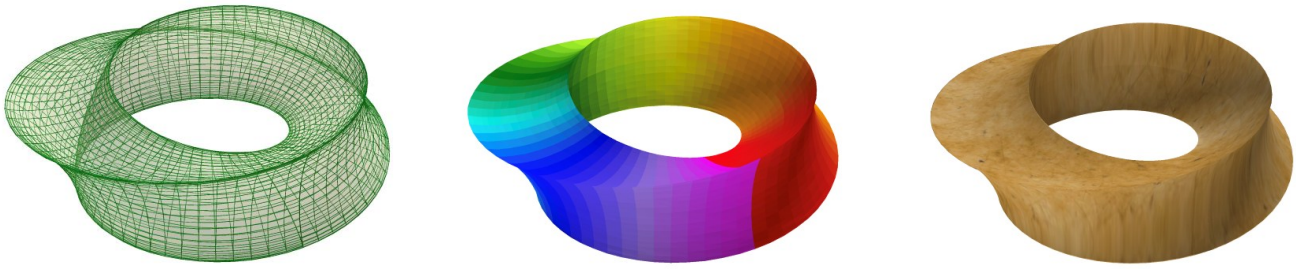
23.3.13 Umbilic Torus

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D13a_UmbilicTorus.3D.xml (D13a-c).

```
var x = Math.Cos(u) * (7 + Math.Cos(u / 3 - 2 * v) + 2 * Math.Cos(u / 3 + v));
var y = Math.Sin(u) * (7 + Math.Cos(u / 3 - 2 * v) + 2 * Math.Cos(u / 3 + v));
var z = Math.Sin(u / 3 - 2 * v) + 2 * Math.Sin(u / 3 + v);
```

// See also: http://www.3d-meier.de/tut3/Seite61.html // Umbilic Torus



23.3.14 Skidian's ruled surface

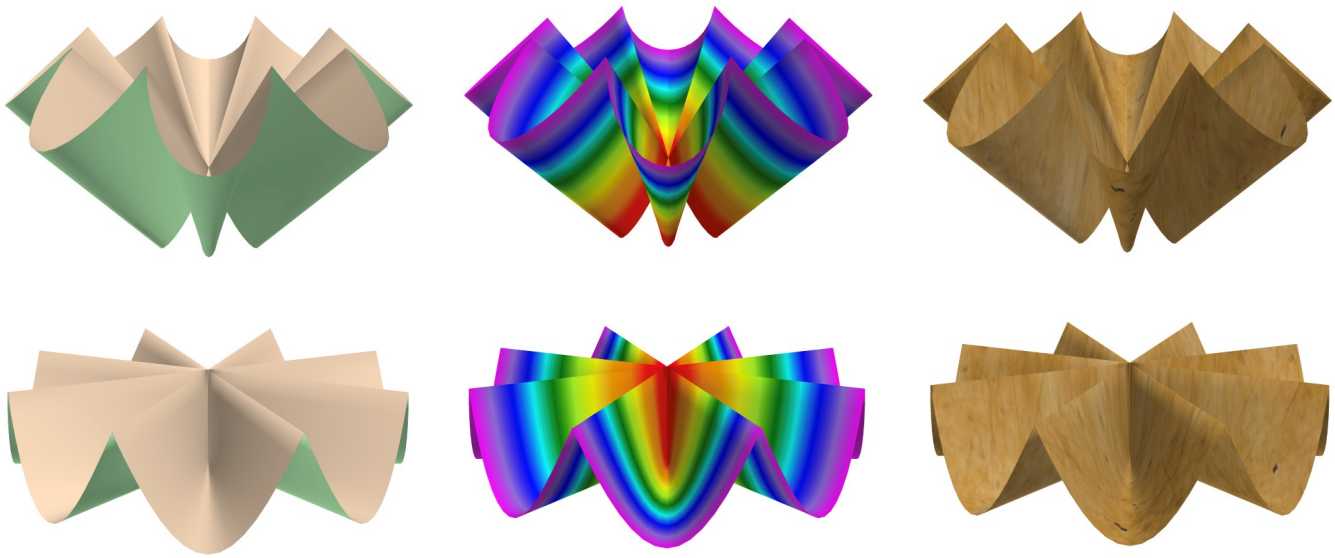
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D14a_Skidan.3D.xml (D14a-f).

```
var a = Math.PI / 4.0;
var h = 2.0;
var n = 4.0;

var b = h * Math.Abs(Math.Cos(n * v));
var ca = Math.Cos(a);
var sa = Math.Sin(a);

var x = (u * sa + b * ca) * Math.Sin(v);
var y = (u * sa + b * ca) * Math.Cos(v);
var z = (u * ca - b * sa);
```

// See also: http://www.3d-meier.de/tut3/Seite227.html // Skidan Ruled Surface // See Krivoshapko, p. 499



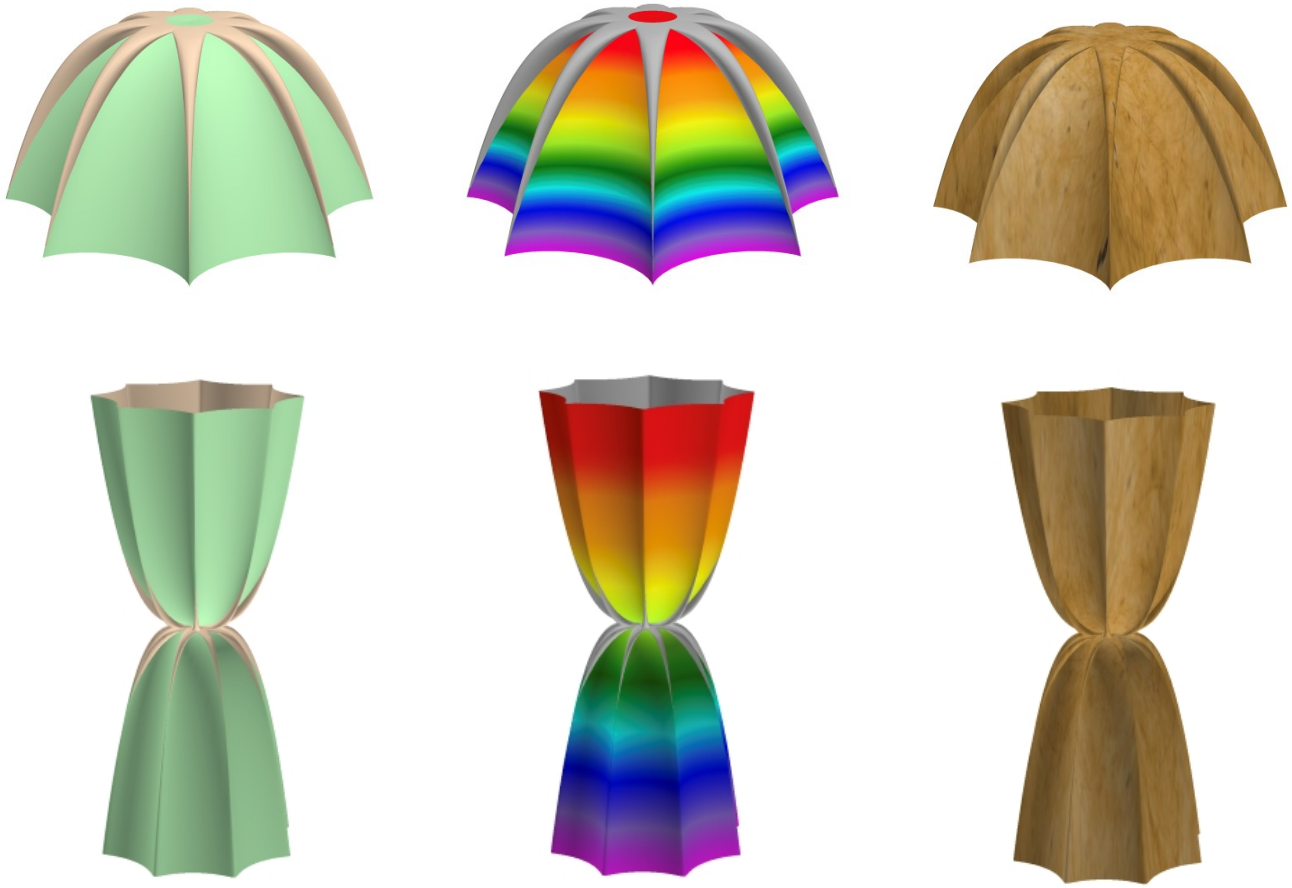
23.3.15 Umbrella surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D15a_Umbrella.3D.xml (D15a-f).

```
var R = 0.6;
var h = 0.6;
var n = 8.0;

var r = R / n;
var x = ctx.cbrt(u) * ((R - r)) * Math.Cos(v) + r * Math.Cos((n - 1) * v);
var y = ctx.cbrt(u) * ((R - r)) * Math.Sin(v) - r * Math.Sin((n - 1) * v);
var z = h * (1 - u);
```

// See also: http://www.3d-meier.de/tut3/Seite215.html // Umbrella Surface // See Krivoshapko, p. 507 - 509 // See Krivoshapko, p. 513 - 515 // See Krivoshapko, p. 521, 526, 530, 531, 533



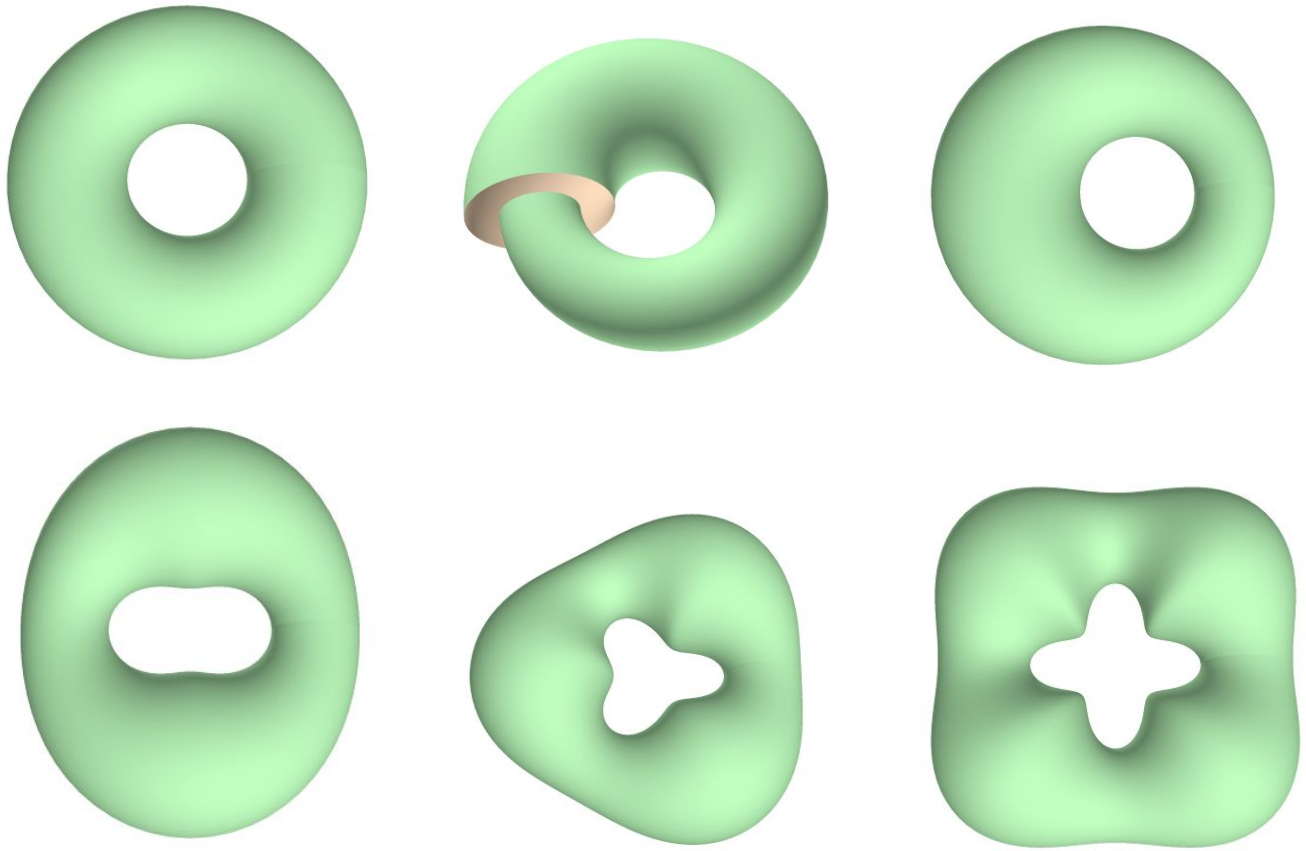
23.3.16 Cyclic surfaces (generalized torus)

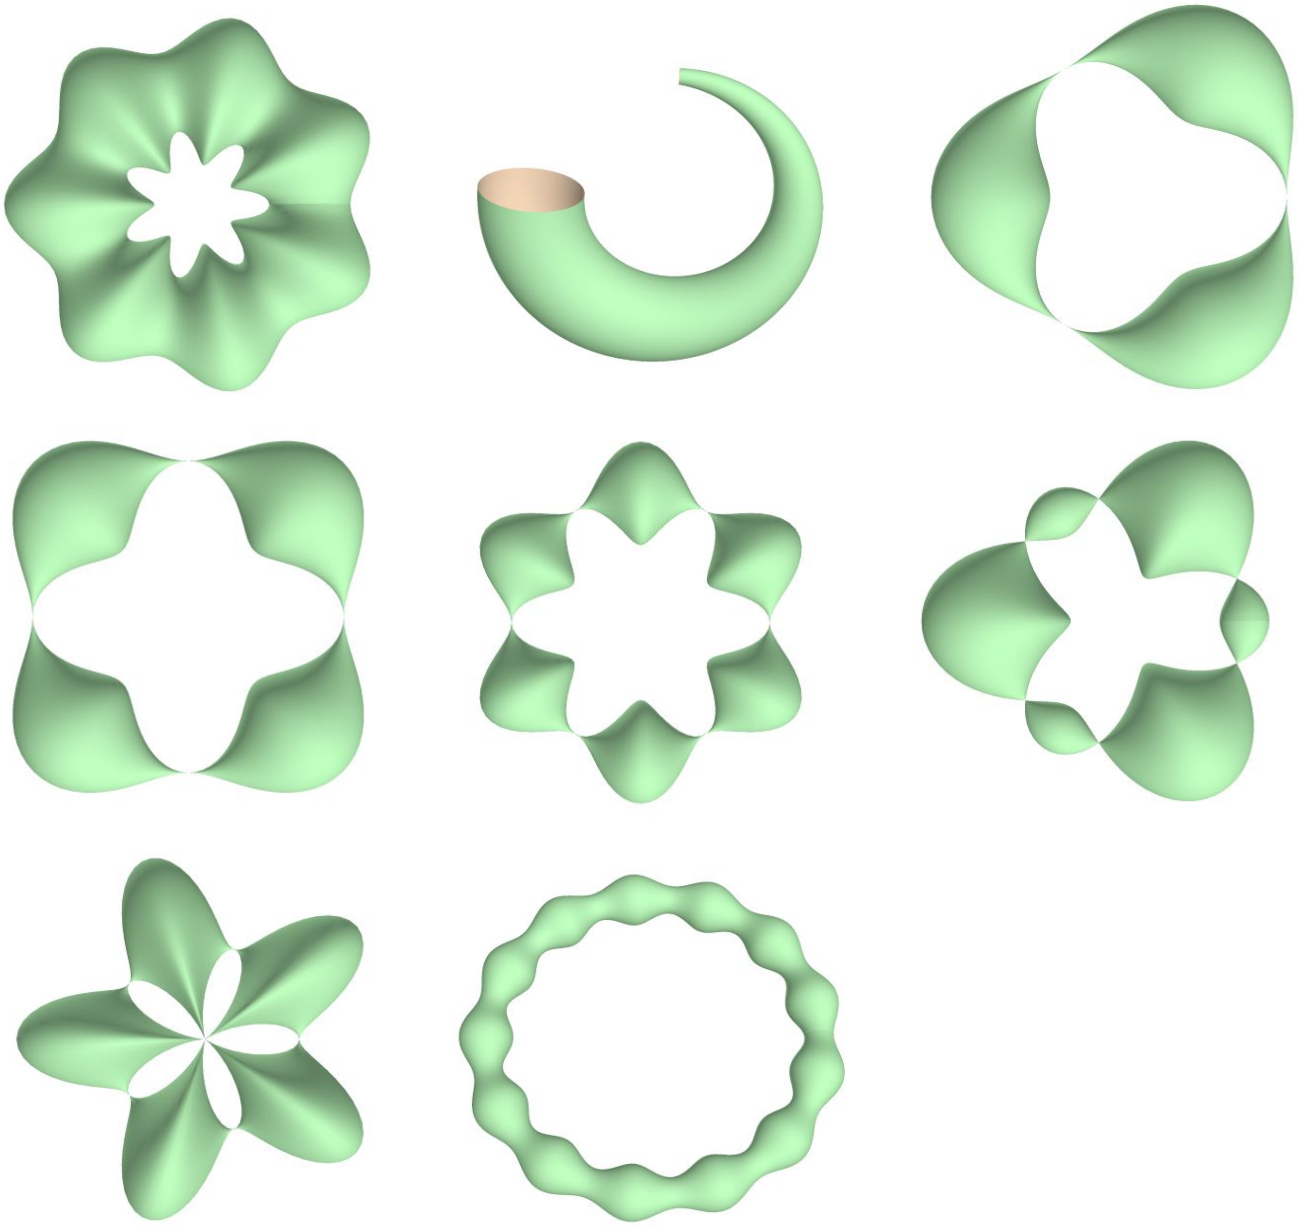
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D16a_CyclicSurface1.3D.xml (D16a-n).

```
var a = 1.0;
var b = 2.0;
var d = 0.0;
var p = 1.0;

var R = a * (1 - d * Math.Cos(p * u));
var x = (b + R * Math.Cos(v)) * Math.Cos(u);
var y = (b + R * Math.Cos(v)) * Math.Sin(u);
var z = R * Math.Sin(v);
```

// See Krivoshapko, p. 376





23.3.17 Goursat surfaces

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D17a_Goursat1.3D.xml (D17a-f).

The example below uses the following code in C#

```
var a = -0.33;
var b = 0.2;
var c = -3;
var p = 1;

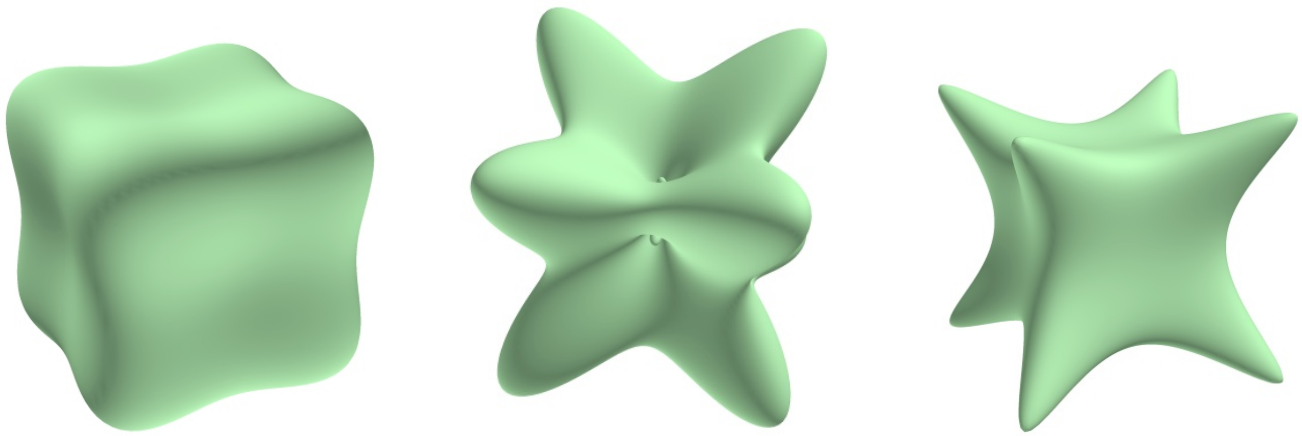
var su = Math.Sin(u);
var cu = Math.Cos(u);
var sv = Math.Sin(v);
var cv = Math.Cos(v);

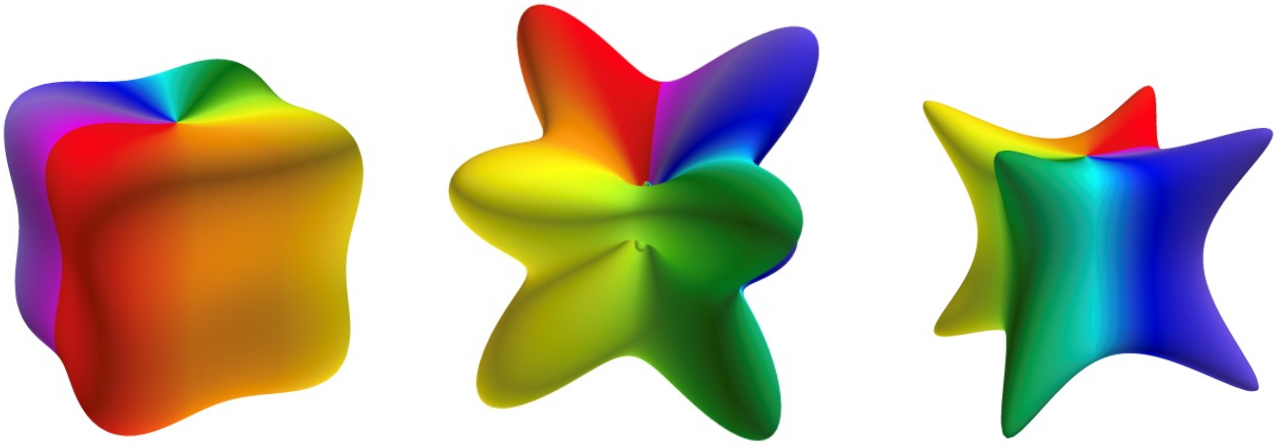
var su4 = su * su * su * su;
var cu4 = cu * cu * cu * cu;

var sv4 = sv * sv * sv * sv;
var cv4 = cv * cv * cv * cv;

var D = (su4 + cu4) * cv4 + sv4;
var R = Math.Sqrt((-b + p * Math.Sqrt(b * b - 4 * c * (a + D))) / (2 * (a + D)));
var x = R * cv * cu;
var y = R * cv * su;
var z = R * sv;
```

// See : Krivoshapko (2015), p. 643 // See: https://mathworld.wolfram.com/GoursatsSurface.html // See Gray 1997, p. 314) // See: https://mathcurve.com/surfaces.gb/goursat/goursat.shtml





23.3.18 Cyclides triples

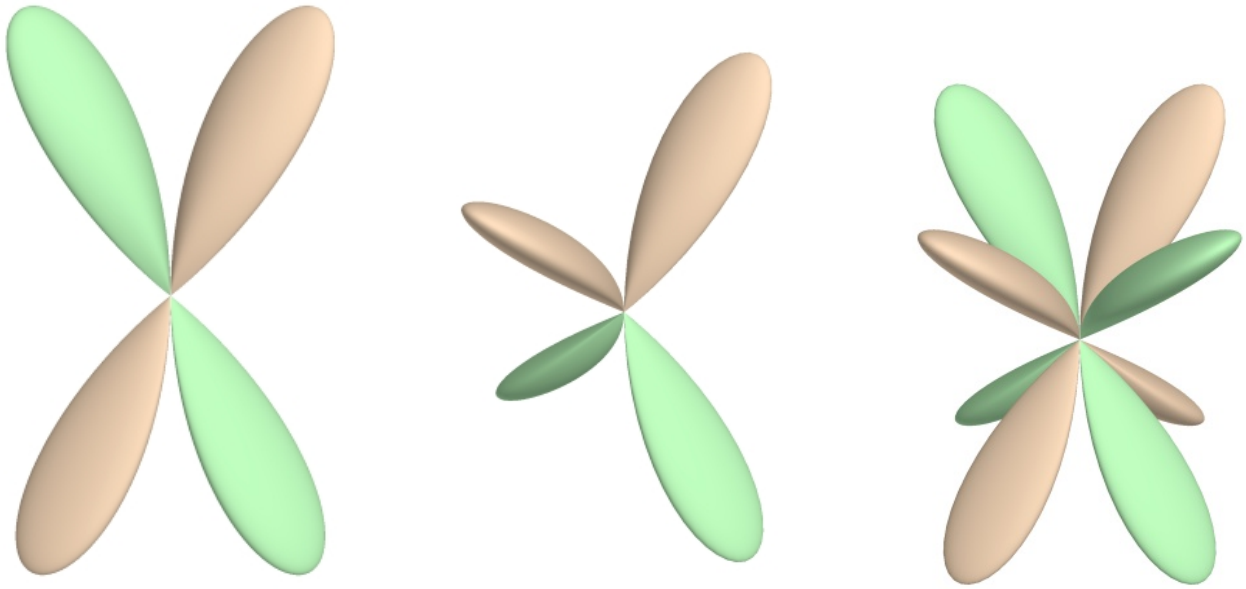
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D18a_CyclidesTriple.3D.xml (D18a-f).

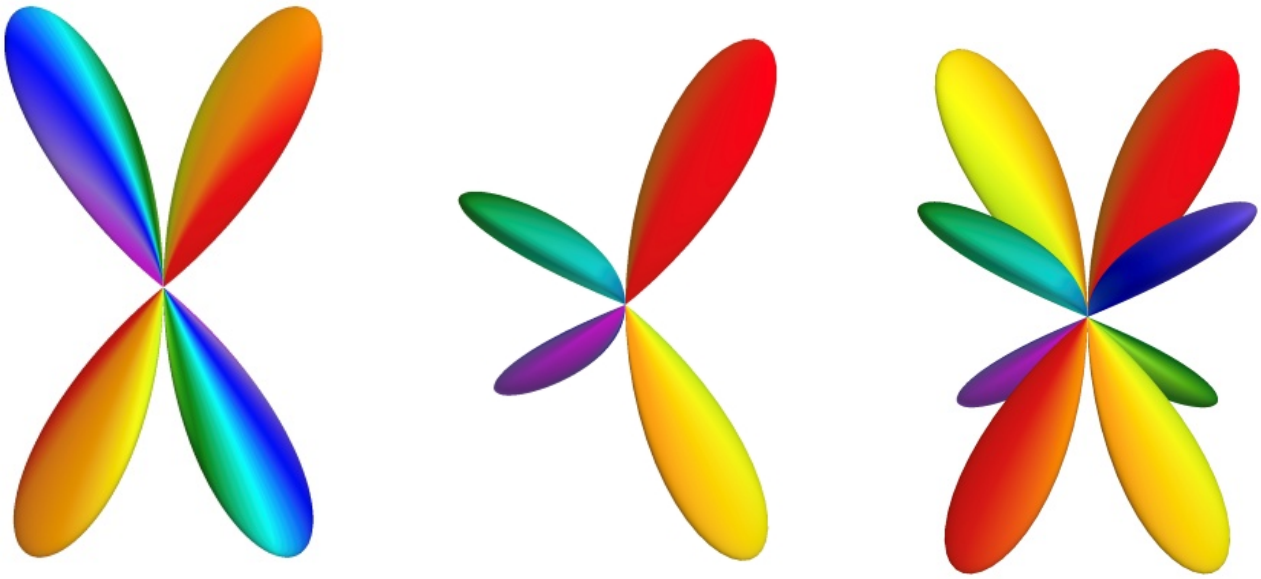
The example below uses the following code in C#

```
var su = Math.Sin(u);
var s2u = Math.Sin(2 * u);
var cu = Math.Cos(u);
var sv = Math.Sin(v);
var cv = Math.Cos(v);

var x = cv * sv * sv * sv * s2u * cu;
var y = cv * sv * sv * sv * s2u * su;
var z = cv * sv * sv * s2u;
```

// See : Krivoshapko (2015), p. 651





23.3.19 Ship Lamé

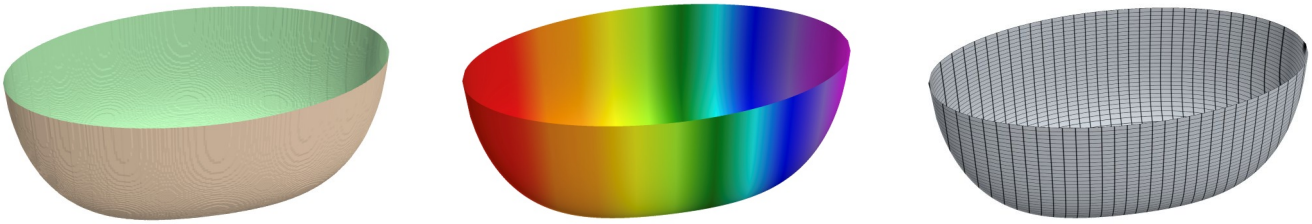
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D19a_ShipLame.3D.xml (D19a-c).

The example below uses the following code in C#

```
var B = 6.5;
var L = 4.0;
var T = 2.0;

var x = u * L;
var y = Math.Sign(Math.Cos(v)) * B * Math.Sqrt(1 - u * u * u * u) * Math.Sqrt(Math.Abs(Math.Cos(v))) / 2.0;
var z = Math.Sign(Math.Sin(v)) * T * Math.Sqrt(1 - u * u) * Math.Sqrt(Math.Abs(Math.Sin(v)));
```

// See : Krivoshapko (2015), p. 671



23.4 Minimal surfaces

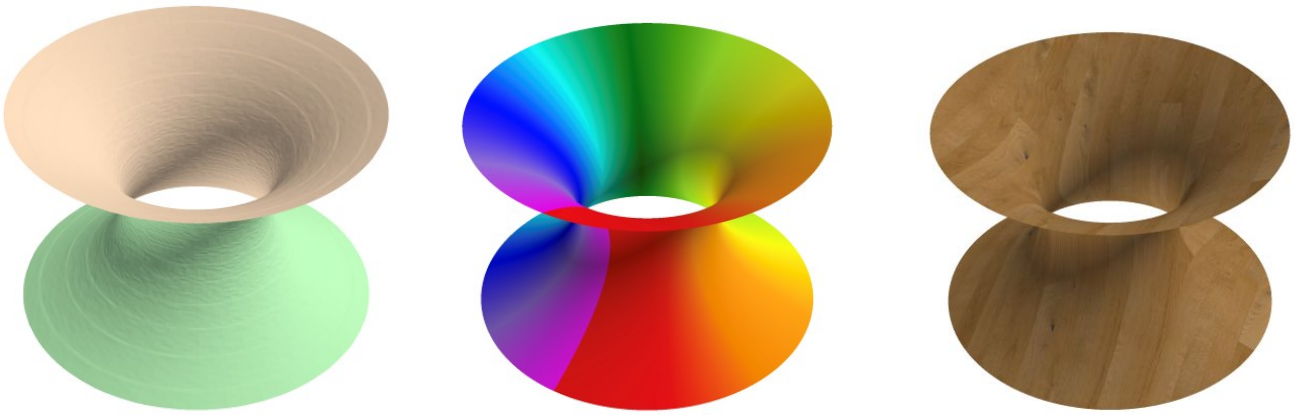
23.4.1 Catenoid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Catenoid.3D.xml (D01a-c).

The example below uses the following code in C#

```
var c = 2;
var x = c * Math.Cosh(v / c) * Math.Cos(u);
var y = c * Math.Cosh(v / c) * Math.Sin(u);
var z = v;
```

See also: https://mathworld.wolfram.com/Catenoid.html



23.4.2 Helicoid

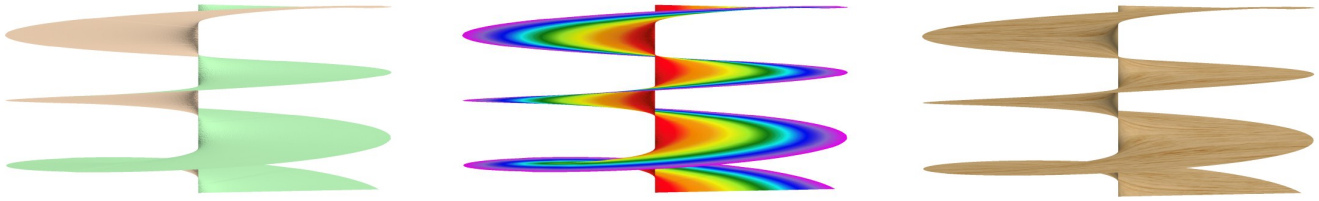
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Helicoid.3D.xml (D02a-c).

The example below uses the following code in C#

```
var x = u * Math.Cos(v);
var y = u * Math.Sin(v);
var z = v;
```

See also: https://mathworld.wolfram.com/Helicoid.html

See also Wikipedia [1368], MathWorld [1070].



References

Gray, A. Modern Differential Geometry of Curves and Surfaces with Mathematica, 2nd ed. Boca Raton, FL: CRC Press, pp. 449 and 644, 1997.

23.4.3 Bours minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Bour.3D.xml (D03a-c).

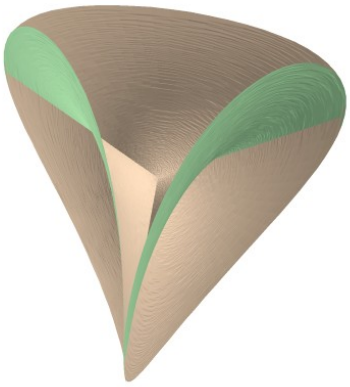
The example below uses the following code in C#

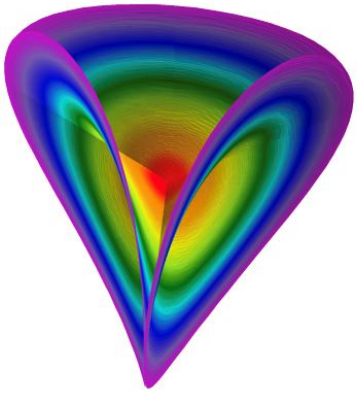
```
var sv = Math.Sin(v);
var s2v = Math.Sin(2 * v);
var c32u = Math.Cos(1.5 * v);
var cv = Math.Cos(v);
var c2v = Math.Cos(2 * v);
var u2 = 0.5 * u * u;
var u32 = (4.0 / 3.0) * Math.Sqrt(u * u * u);

var x = u * cv - u2 * c2v;
var y = -u * sv - u2 * s2v;
var z = u32 * c32u;
```

See also: https://mathworld.wolfram.com/BoursMinimalSurface.html

See also Wikipedia [1368], MathWorld [1070].





23.4.4 Catalan minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Catalan.3D.xml (D04a-c).

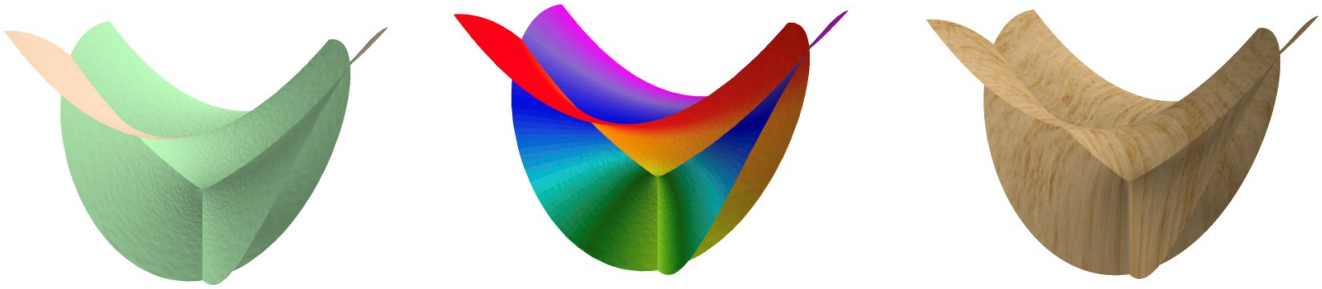
The example below uses the following code in C#

```
var x = u - Math.Sin(u) * Math.Cosh(v);
var y = 4 * Math.Sin(u / 2) * Math.Sinh(v / 2);
var z = 1 - Math.Cos(u) * Math.Cosh(v);
```

See also: https://mathworld.wolfram.com/CatalanMinimalSurface.html

See also: https://en.wikipedia.org/wiki/Catalan%27s_minimal_surface

See also Wikipedia [1368], MathWorld [1070].



23.4.5 Ennepers first minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Enneper.3D.xml (D05a-c).

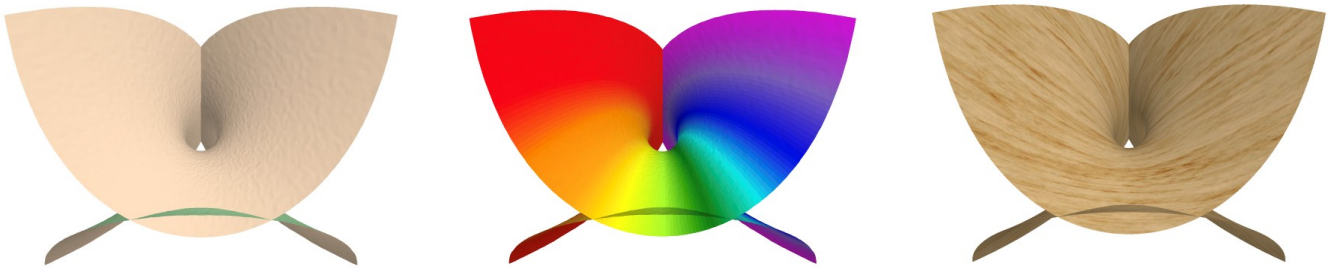
The example below uses the following code in C#

```
var x = u - u * u * u / 3 + u * v * v;
var y = u * u - v * v;
var z = v - v * v * v / 3 + v * u * u;
```

See also: https://mathworld.wolfram.com/EnnepersMinimalSurface.html

See also: https://en.wikipedia.org/wiki/Enneper_surface

See also Wikipedia [1368], MathWorld [1070].



23.4.6 Enneper second minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Enneper2.3D.xml (D06a-c).

The example below uses the following code in C#

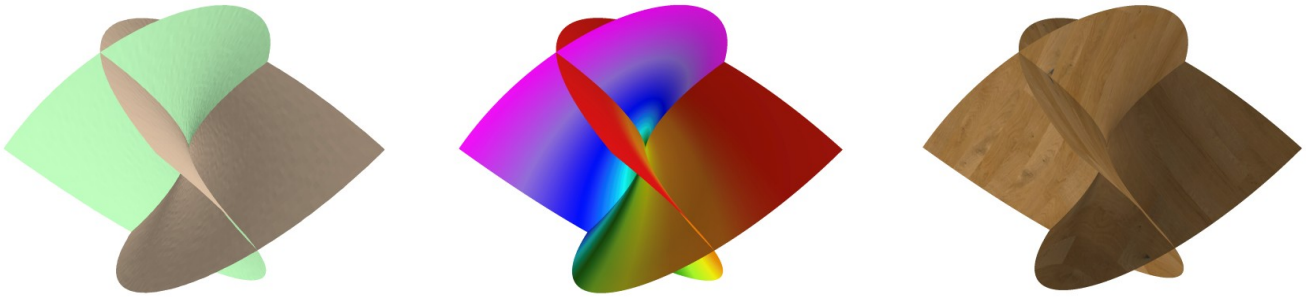
```
var n = 2;
var a = 1;

Complex i = Complex.ImaginaryOne;
Complex w = new Complex(u, v);
Complex w2nm1 = Complex.Pow(w, 2 * n - 1) / (2 * n - 1);
Complex wn = Complex.Pow(w, n);

var x = a * (w - w2nm1).Real;
var y = a * (-i * (w + w2nm1)).Real;
var z = 2 * a * (wn / n).Real;
```

See also: https://mathcurve.com/surfaces.gb/enneper/enneper.shtml

See also Wikipedia [1368], MathWorld [1070].



23.4.7 Hennebergs minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Henneberg.3D.xml (D07a-c).

The example below uses the following code in C#

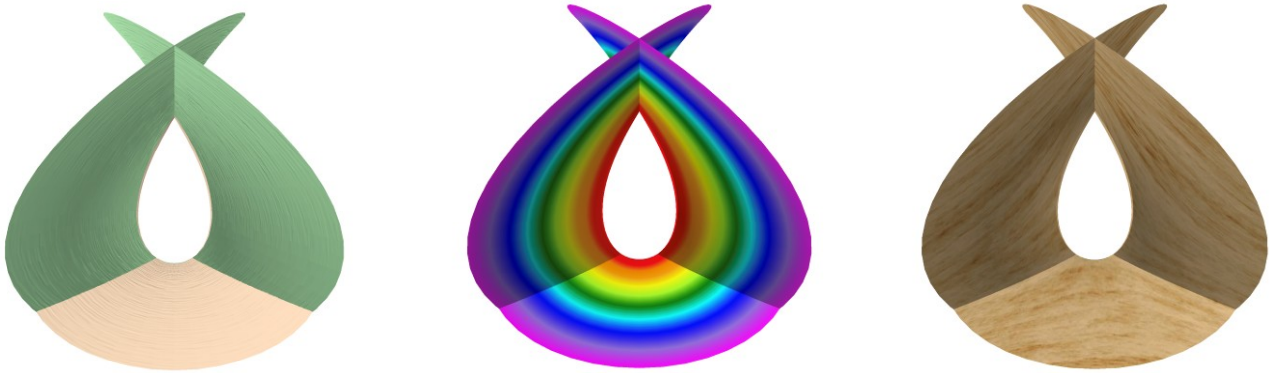
```
var sv = Math.Sin(v);
var s3v = Math.Sin(3 * v);
var cv = Math.Cos(v);
var c2v = Math.Cos(2 * v);
var c3v = Math.Cos(3 * v);
var shu = Math.Sinh(u);
var ch2u = Math.Cosh(2 * u);
var sh3u = Math.Sinh(3 * u);

var x = 2 * shu * cv - (2.0 / 3.0) * sh3u * c3v;
var y = 2 * shu * sv + (2.0 / 3.0) * sh3u * s3v;
var z = 2 * ch2u * c2v;
```

See also: https://mathworld.wolfram.com/HennebergsMinimalSurface.html

See also: https://en.wikipedia.org/wiki/Henneberg_surface

See also Wikipedia [1368], MathWorld [1070].



23.4.8 Scherk's first minimal surface

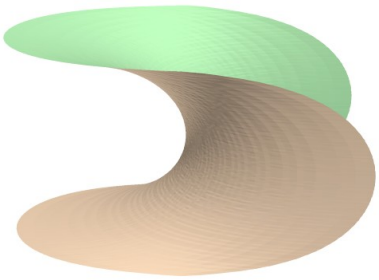
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Scherk1.3D.xml (D08a-c).

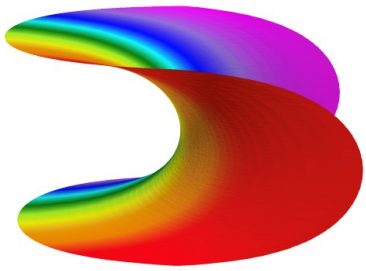
The example below uses the following code in C#

```
var a = 1 / Math.PI;
var y = u;
var x = a * Math.Log(Math.Cos(v / a) / Math.Cos(u / a));
var z = v;
```

See also Wikipedia [1368], MathWorld [1070].

See also https://mathcurve.com/surfaces.gb/scherk/scherk.shtml See also Krivoshapko and Ivanov [399], p. 431





23.4.9 Scherk's second minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D09a_Scherk2.3D.xml (D09a-c).

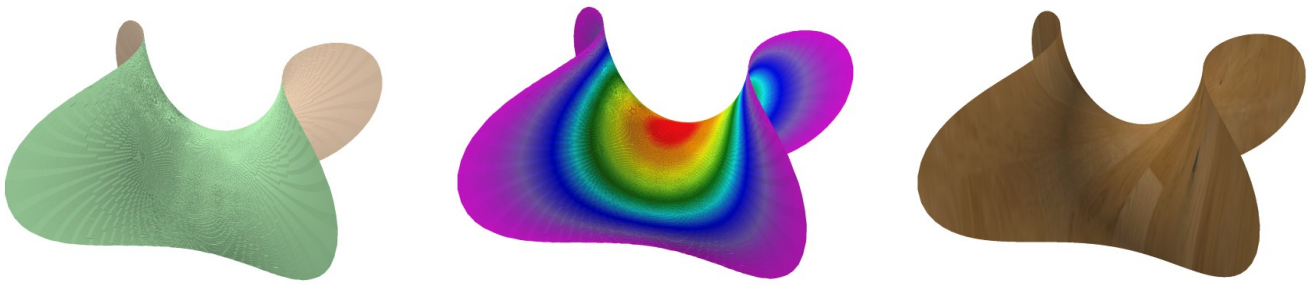
The example below uses the following code in C#

```
var t = v;
var r = u;
var r2 = r * r;
var ct = Math.Cos(t);
var st = Math.Sin(t);
var x = Math.Log((1 + r2 + 2 * r * ct) / (1 + r2 - 2 * r * ct));
var y = Math.Log((1 + r2 - 2 * r * st) / (1 + r2 + 2 * r * st));
var z = 2 * Math.Atan((2 * r2 * Math.Sin(2 * t)) / (r2 * r2 - 1));
y = -y;
```

See also Wikipedia [1368], MathWorld [1070].

See also https://mathworld.wolfram.com/ScherksMinimalSurfaces.html

See also Krivoshapko and Ivanov [399], p. 442



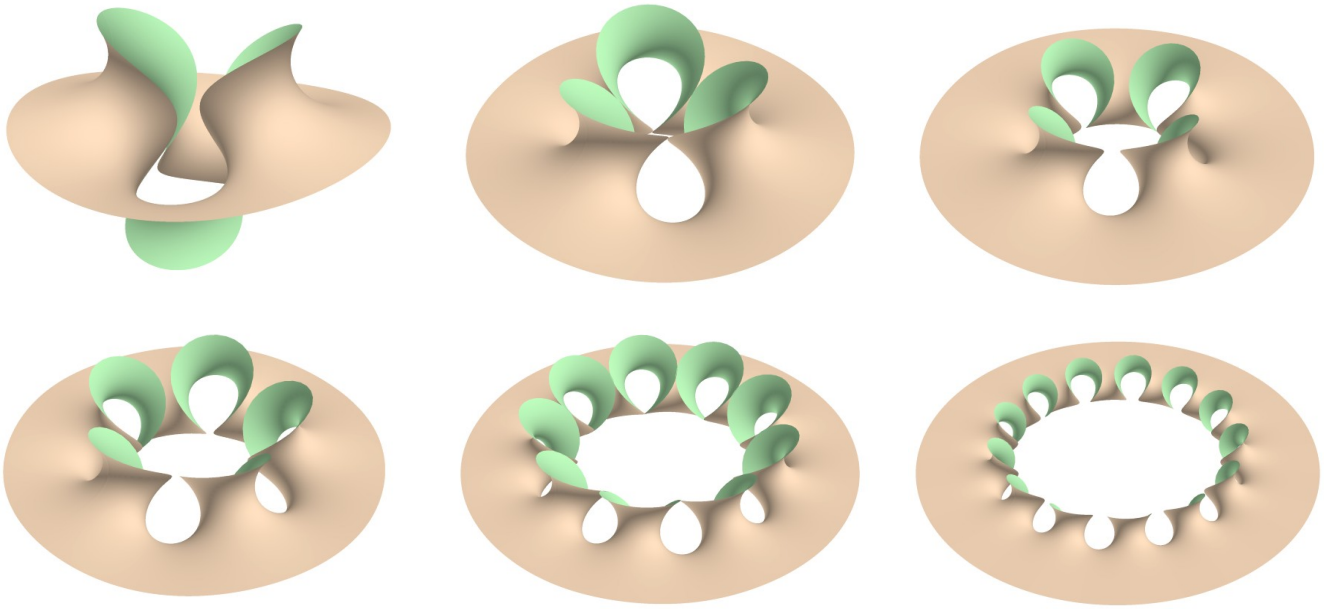
23.4.10 Richmond minimal surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D10a_Richmond.3D.xml (D10a-f).

The example below uses the following code in C#

```
var n = 2.0;
var u2s = Math.Pow(u, 2 * n + 1) / (4 * n + 2);
var x = -Math.Cos(v) / (2 * u) - u2s * Math.Cos(-(2 * n + 1) * v);
var y = -Math.Sin(v) / (2 * u) + u2s * Math.Sin(-(2 * n + 1) * v);
var z = Math.Pow(u, n) * Math.Cos(n * v) / n;
```

// See also: http://www.3d-meier.de/tut3/Seite250.html // Richmond Surface III // See also: https://en.wikipedia.org/wiki/Richmond_surface



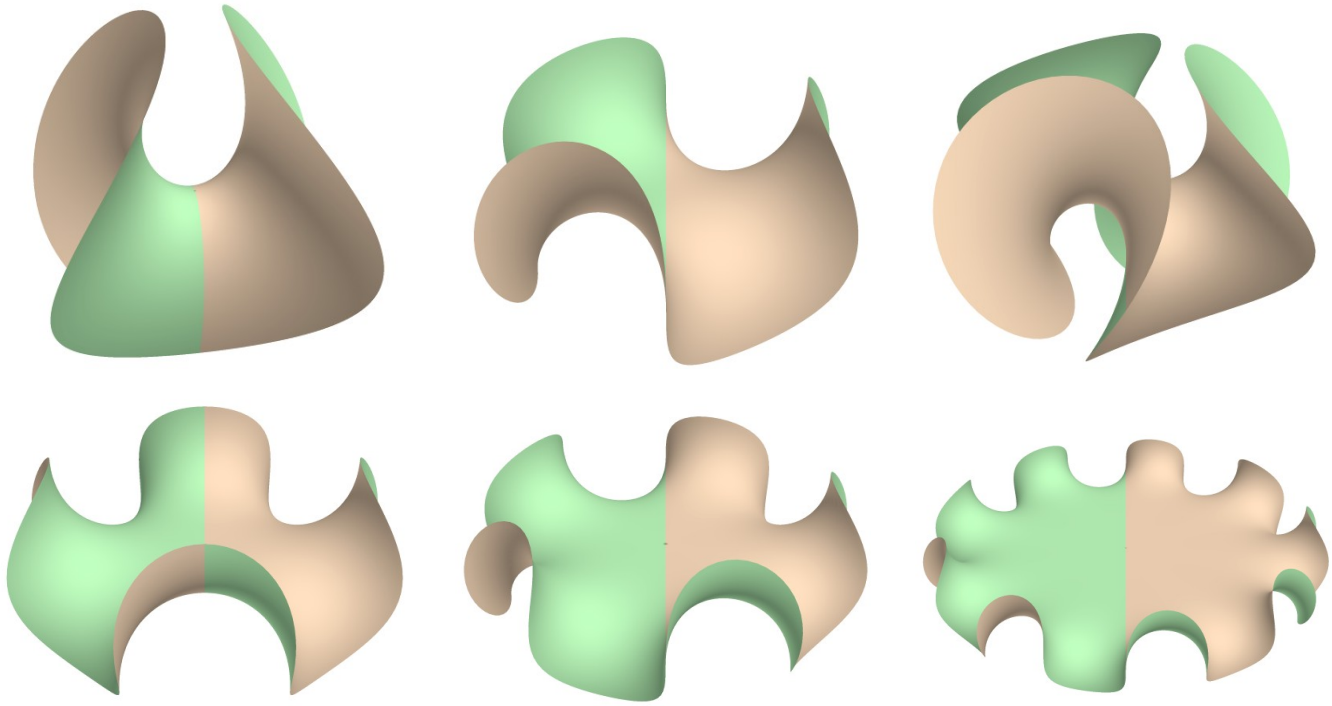
23.4.11 Generalized Ennneper surfaces

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D11a_GenEnneper.3D.xml (D11a-f).

The example below uses the following code in C#

```
var s = 2.0;
var u2s = Math.Pow(u, 2 * s - 1) / (2 * s - 1);
var x = u * Math.Cos(v) - u2s * Math.Cos((2 * s - 1) * v);
var y = -u * Math.Sin(v) - u2s * Math.Sin((2 * s - 1) * v);
var z = 2 * Math.Pow(u, s) * Math.Cos(s * v) / s;
```

// See also: http://www.3d-meier.de/tut3/Seite247.html // Wavy Enneper Surface



23.5 Nonorientable (one-sided) Surfaces

23.5.1 Moebius Strip

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Moebius.3D.xml (D01a-c).

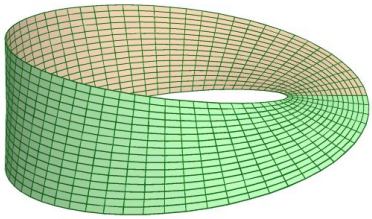
The example below uses the following code in C#

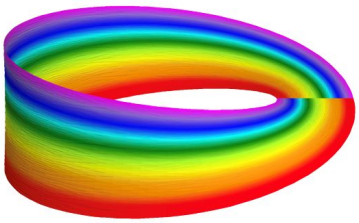
```
var a = 1.0;
var b = 1.0;
int m = 1;

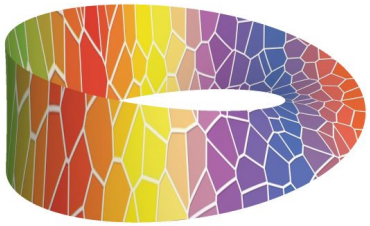
var x = -(a + u * Math.Sin(m * v / 2)) * Math.Cos(v);
var y = (b + u * Math.Sin(m * v / 2)) * Math.Sin(v);
var z = 3 * (u / 2) * Math.Cos(v / 2);
```

See also: http://en.wikipedia.org/wiki/M%C3%B6bius_strip

See also: https://mathworld.wolfram.com/MoebiusStrip.html







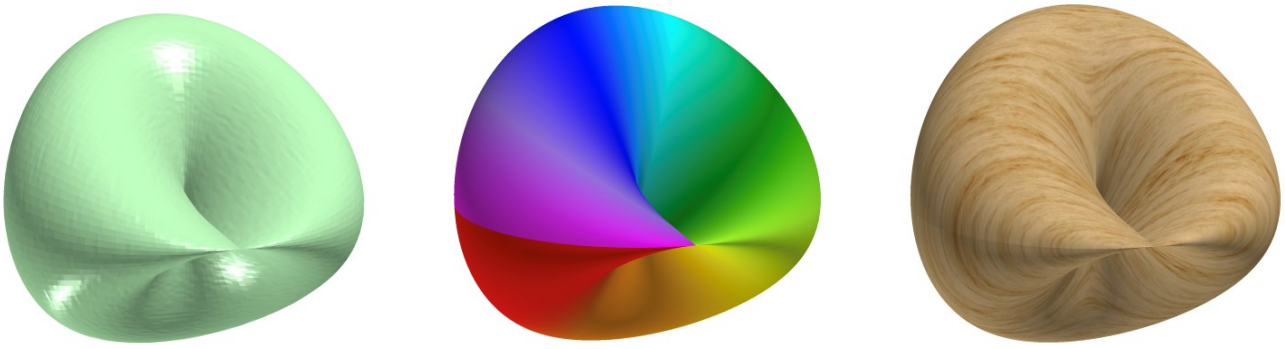
23.5.2 Cross-Cap Surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_CrossCap.3D.xml (D02a-c).

See also: https://mathworld.wolfram.com/Cross-Cap.html

See also Wikipedia [1368], MathWorld [1070].

```
double su = Math.Sin(u);
double sv = Math.Sin(v);
double s2v = Math.Sin(2*v);
double cu = Math.Cos(u);
double cv = Math.Cos(v);
x = 0.5 * cu * s2v;
z = 0.5 * su * s2v;
y = 0.5 * (cv*cv - cu*cu * sv*sv);
```



23.5.3 Pseudo Cross-Cap Surface

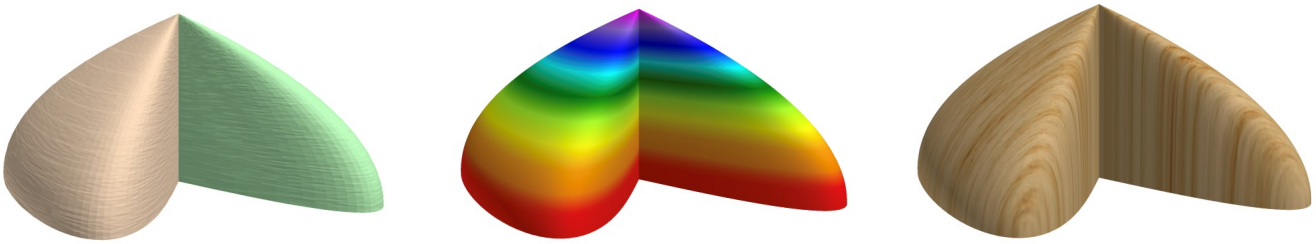
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_PseudoCrossCap.3D.xml (D03a-c).

See also: https://mathworld.wolfram.com/Pseudocrosscap.html

See also: http://www.3d-meier.de/tut3/Seite51.html

See also Wikipedia [1368], MathWorld [1070].

```
double sv = Math.Sin(v);
double s2v = Math.Sin(2*v);
x = (1 - u*u) * sv;
y = (1 - u*u) * s2v;
z = u;
```



23.5.4 Roman Surface (or Steiner Surface)

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Roman.3D.xml (D04a-c).

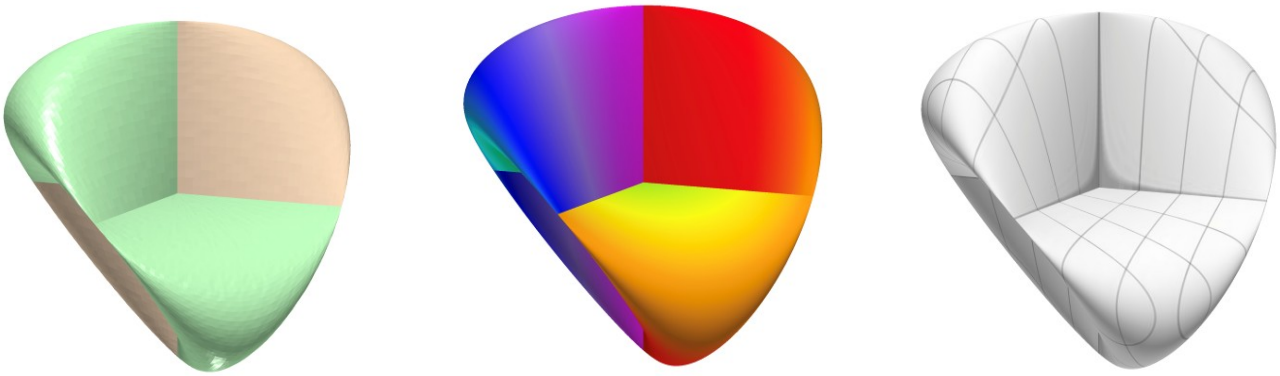
See also: https://mathworld.wolfram.com/RomanSurface.html

See also: https://en.wikipedia.org/wiki/Roman_surface

See also: http://paulbourke.net/geometry/steiner/

```
double r2 = 1;
double su = Math.Sin(u);
double sv = Math.Sin(v);
double cu = Math.Cos(u);
double cv = Math.Cos(v);
x = r2 * cu * su * sv;
y = r2 * cu * su * cv;
z = r2 * cu*cu * sv * cv;
```

See also Wikipedia [1368], MathWorld [1070].



23.5.5 Klein bagel

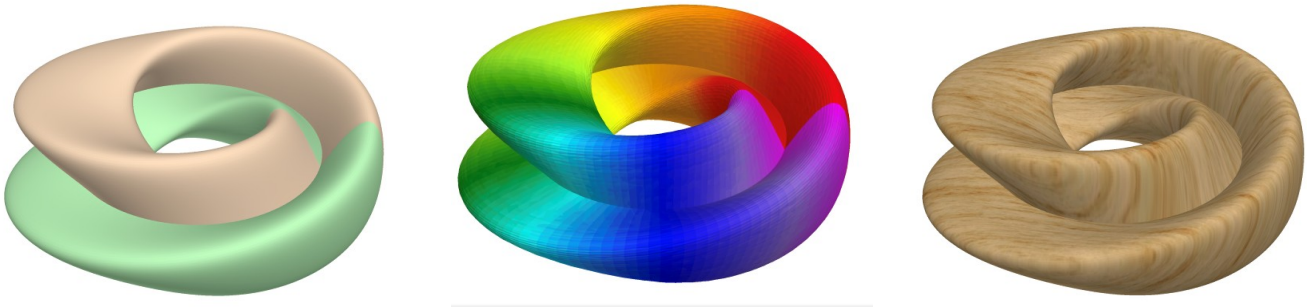
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_KleinBagel.3D.xml (D05a-c).

See also: https://en.wikipedia.org/wiki/Klein_bottle#The_figure_8_immersion

See also: https://mathworld.wolfram.com/KleinBottle.html

```
double r = 2.1;
x = (r + Math.Cos(u / 2) * Math.Sin(v) - Math.Sin(u / 2) * Math.Sin(2 * v)) * Math.Cos(u);
z = (r + Math.Cos(u / 2) * Math.Sin(v) - Math.Sin(u / 2) * Math.Sin(2 * v)) * Math.Sin(u);
y = Math.Sin(u / 2) * Math.Sin(v) + Math.Cos(u / 2) * Math.Sin(2 * v);
```

This is the 'bagel' form of a Klein bottle, a 4 dimensional object with a single surface (lacking 'inside' or 'outside'), projected into 3-space as a self-intersecting solid.



23.5.6 Klein bottle

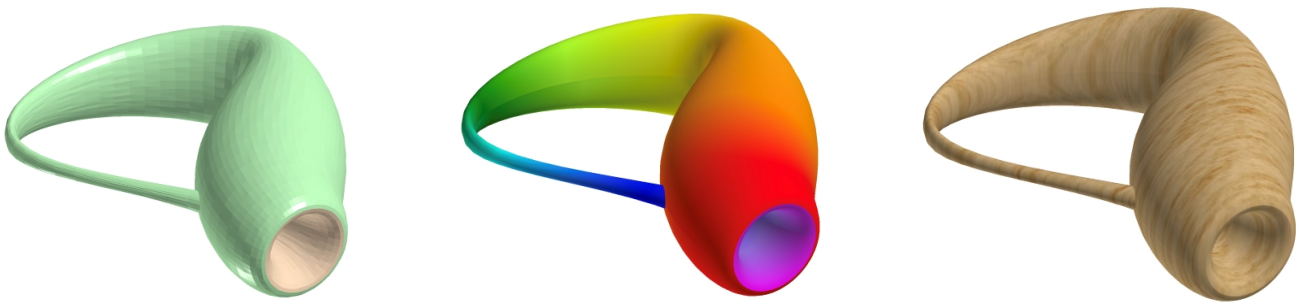
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_KleinBottle3.3D.xml (D06a-c).

See also: http://www.mapleprimes.com/maplesoftblog/95570-Klein-Bottle-Plot

See also: http://www.chebfun.org/examples/geom/ParametricSurfaces.html

See also: https://mathworld.wolfram.com/KleinBottle.html

```
double a = Math.Cos(u);
double b = Math.Sin(u);
double c = Math.Cos(v);
double a2 = a * a;
double a4 = a2 * a2;
x = -(2.0 / 15.0) * a * (3 * c + b * (-30 + a4 * (90 - 60 * a2) + 5 * a * c));
z = -(1.0 / 15.0) * b * b * (c * b * (3 - 48 * a4 + 5 * a * b * (1 - 16 * a4)) - 60);
y = -(2.0 / 15.0) * (3 + 5 * a * b) * Math.Sin(v);
```



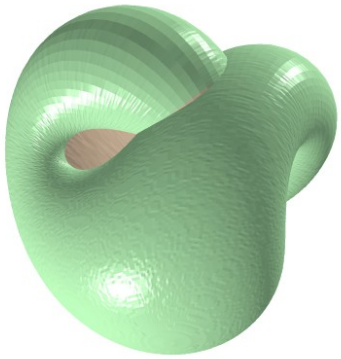
23.5.7 3D Boy Surface, version 1

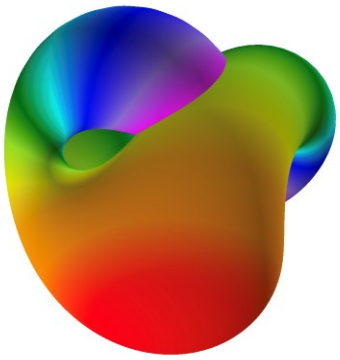
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_BoySurface.3D.xml (D07a-c).

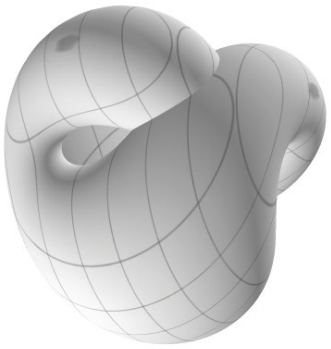
See also: https://en.wikipedia.org/wiki/Boy%27s_surface

See also: http://mathworld.wolfram.com/BoySurface.html

```
double sqrt5 = Math.Sqrt(5);
// w = u*e^(iv)
double wr = Math.Cos(v);
double wi = Math.Sin(v);
Complex w = u * new Complex(wr, wi);
Complex w3 = w * w * w;
Complex w4 = w3 * w;
Complex w6 = w3 * w3;
Complex d = w6 + sqrt5 * w3 - 1;
Complex wa = w * (1 - w4) / d;
Complex wb = w * (1 + w4) / d;
Complex wc = (1 + w6) / d;
double g1 = -1.5 * wa.Imaginary;
double g2 = -1.5 * wb.Real;
double g3 = wc.Imaginary - 0.5;
double l2 = g1 * g1 + g2 * g2 + g3 * g3;
x = g1 / l2;
y = -g2 / l2;
z = g3 / l2;
```







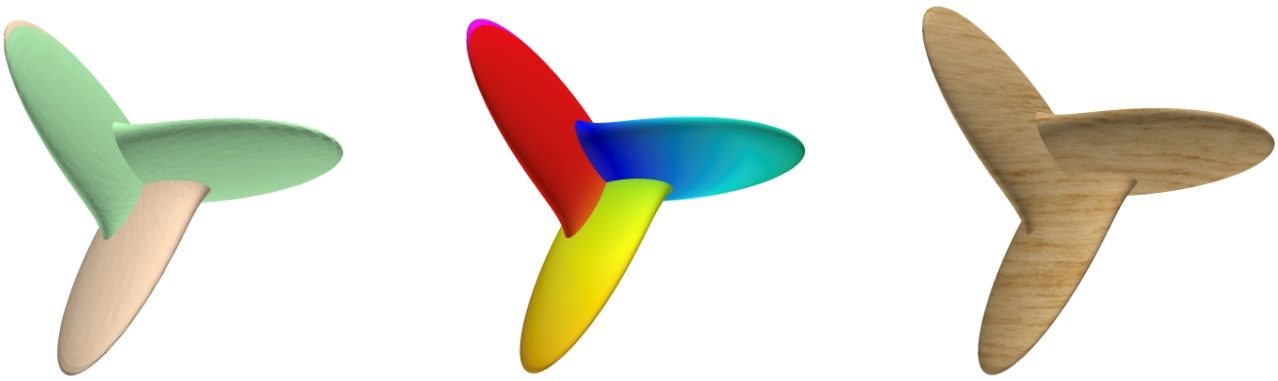
23.5.8 3D Boy Surface, version 2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_BoySurface2.3D.xml (D08a-c).

See also: https://en.wikipedia.org/wiki/Boy%27s_surface

See also: http://mathworld.wolfram.com/BoySurface.html

```
double sqrt2 = Math.Sqrt(2);
double s2v = Math.Sin(2 * v);
double cu = Math.Cos(u);
double cv = Math.Cos(v);
double cv2 = cv * cv;
double n1 = sqrt2 * cv2 * Math.Cos(2*u);
double xn = sqrt2 * cv2 * Math.Cos(2 * u) + cu * s2v;
double yn = sqrt2 * cv2 * Math.Sin(2 * u) - Math.Sin(u) * s2v;
double zn = 3 * cv2;
double d = 2 - sqrt2 * Math.Sin(3 * u) * s2v;
x = xn / d;
y = yn / d;
z = zn / d;
```



23.5.9 Morin Surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_BoySurface2.3D.xml (D09a-f).

// See also: http://www.3d-meier.de/tut3/Seite221.html // Morin Surface // See also: https://mathcurve.com/surfaces.gb/morin/morin.shtml // See also: https://en.wikipedia.org/wiki/Morin_surface // See also: Bednorz 2019

```
var k = 1.0;
var n = 3.0;

var Sqrt2 = Math.Sqrt(2);
var cu = Math.Cos(u);
var su = Math.Sin(u);
var K = cu / (Sqrt2 - k * Math.Sin(2 * u) * Math.Sin(n * v));

var x = K * (2 / (n - 1) * cu * Math.Cos((n - 1) * v) + Sqrt2 * su * Math.Cos(v));
var y = K * (2 / (n - 1) * cu * Math.Sin((n - 1) * v) - Sqrt2 * su * Math.Sin(v));
var z = K * cu;
```

23.6.1 Bourke Seashell

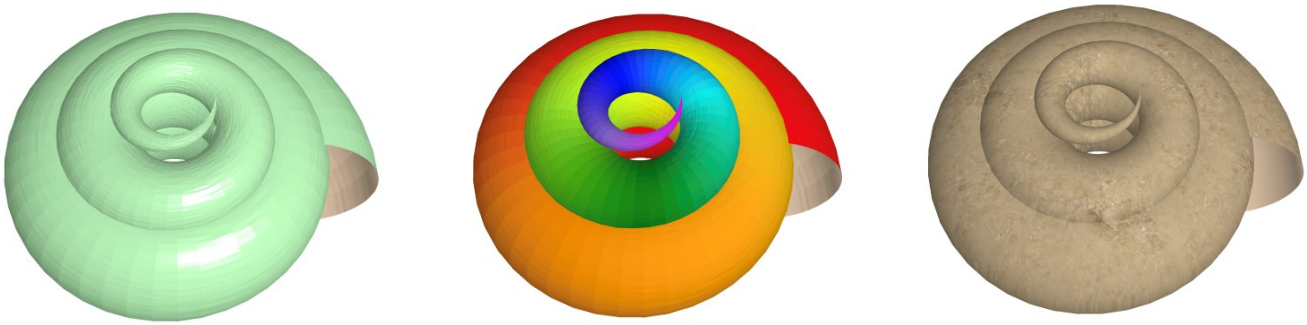
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_BourkeSeaShell.3D.xml (D01a-c).

See also: http://paulbourke.net/geometry/spiral/

```
double n = 3;  // number of spirals
double a = 1;  // final shell radius
double b = 2;  // height
double c = 0.4;  // inner radius

double s = v;
double t = u;
double pt = t/(2*Math.PI);  // inner radius

x = a * (1 - pt) * Math.Cos(n*t) * (1 + Math.Cos(s)) + c * Math.Cos(n*t);
z = a * (1 - pt) * Math.Sin(n*t) * (1 + Math.Cos(s)) + c * Math.Sin(n*t);
y = b * pt + a * (1 - pt) * Math.Sin(s);
```



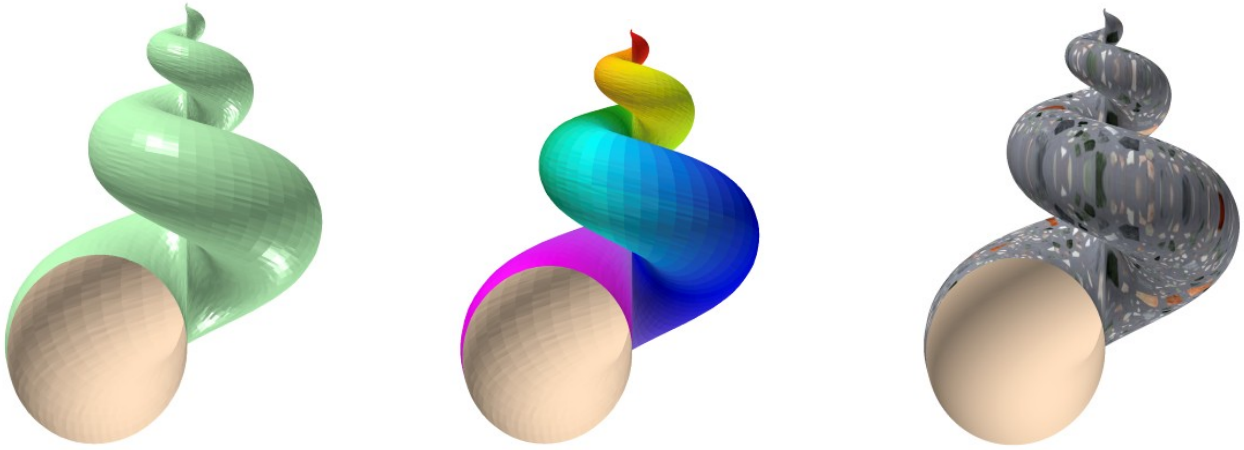
23.6.2 Seashell (mathworld.wolfram)

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Seashell.3D.xml (D02a-c).

See also: https://mathworld.wolfram.com/Seashell.html

```
double a = Math.Exp(u / (6.0 * Math.PI));
double b = Math.Cos(v / 2.0);

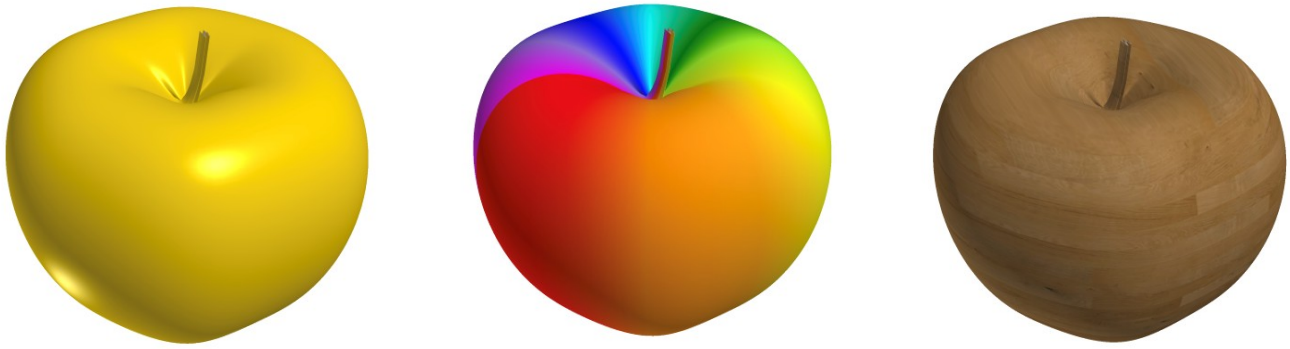
x = 2.0 * (1.0 - a) * Math.Cos(u) * b * b;
y = 2.0 * (-1.0 + a) * Math.Sin(u) * b * b;
z = (1.0 - a * a - Math.Sin(v) * (1.0 - a));
```



23.6.3 3D Apple

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Apple.3D.xml (D03a-c).

```
double R1 = 5.0;
double R2 = 4.8;
double su = Math.Sin(u);
double sv = Math.Sin(v);
double cu = Math.Cos(u);
double c5u = Math.Cos(5*u);
double cv = Math.Cos(v);
x = cu * (R1 + R2 * cv) + Math.Pow(v/Math.PI, 20);
z = su * (R1 + R2 * cv) + 0.25 * c5u;
y = -2.3 * Math.Log(1 - v * 0.3157) + 6 * sv + 2 * cv;
```



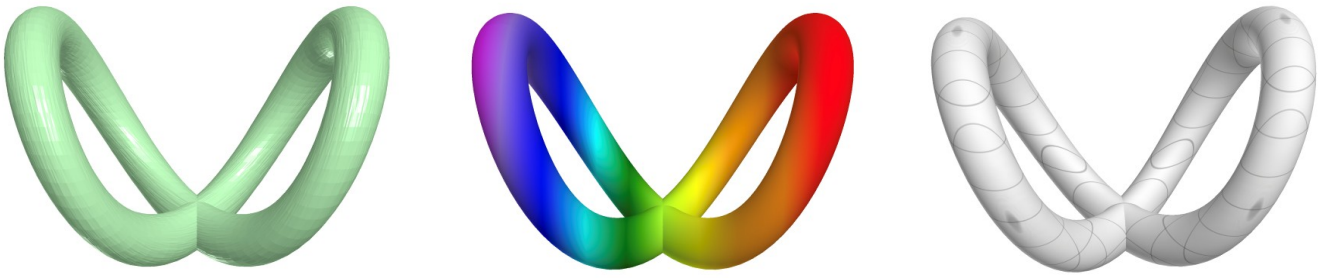
23.6.4 Bow curve

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_BowCurve.3D.xml (D04a-c).

See also: http://paulbourke.net/geometry/toroidal/

```
double p2 = 2*Math.PI;
double p4 = 4*Math.PI;
double T = 0.5; //Thickness

x = (2 + T * Math.Sin(p2 * u)) * Math.Sin(p4 * v);
y = (2 + T * Math.Sin(p2 * u)) * Math.Cos(p4 * v);
z = T * Math.Cos(p2 * u) + 3 * Math.Cos(p2 * v);
```



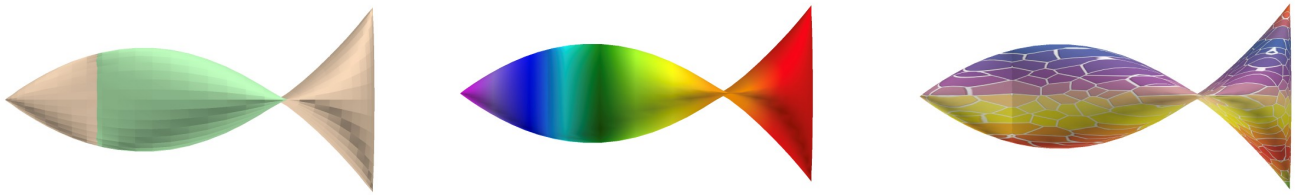
23.6.5 Fish Surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Fish.3D.xml (D05a-c).

See also: http://www.3d-meier.de/tut3/Seite47.html

See also Wikipedia [1368], MathWorld [1070].

```
double su = Math.Sin(u);
double s2u = Math.Sin(2*u);
double sv = Math.Sin(v);
double cu = Math.Cos(u);
double c2u = Math.Cos(2*u);
double cv = Math.Cos(v);
x = (cu - c2u) * cv / 4.0;
y = (su - s2u) * sv / 4.0;
z = cu;
```

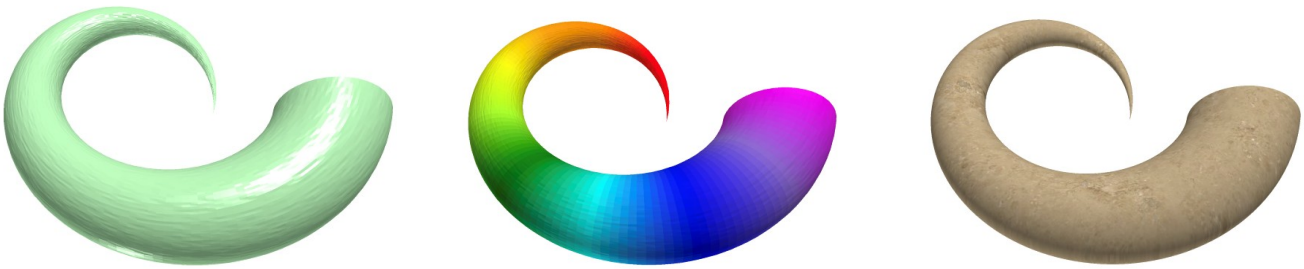


23.6.6 Bourke Horn

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_BourkeHorn.3D.xml (D06a-c).

See also: http://paulbourke.net/geometry/spiral/

```
double p2 = 2*Math.PI;
x = (2 + u * Math.Cos(v)) * Math.Sin(p2 * u);
y = (2 + u * Math.Cos(v)) * Math.Cos(p2 * u) + 2 * u;
z = u * Math.Sin(v);
```



23.6.7 Hexa torus

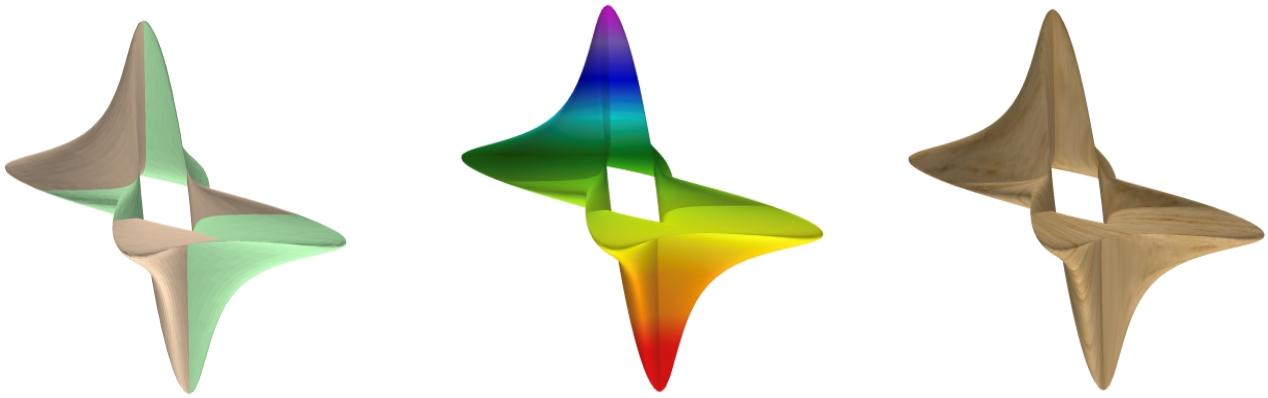
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_HexaTorus.3D.xml (D07a-c).

See also: http://paulbourke.net/geometry/toroidal/

The C# code for the Klein bottle:

```
double a = Math.Cos(u);
double b = Math.Sin(u);
double c = Math.Cos(v);
double a2 = a * a;
double a4 = a2 * a2;

x = -(2.0 / 15.0) * a * (3 * c + b * (-30 + a4 * (90 - 60 * a2) + 5 * a * c));
z = -(1.0 / 15.0) * b * b * (c * b * (3 - 48 * a4 + 5 * a * b * (1 - 16 * a4)) - 60);
y = (2.0 / 15.0) * (3 + 5 * a * b) * Math.Sin(v);
```



23.6.8 3D Breather Surface

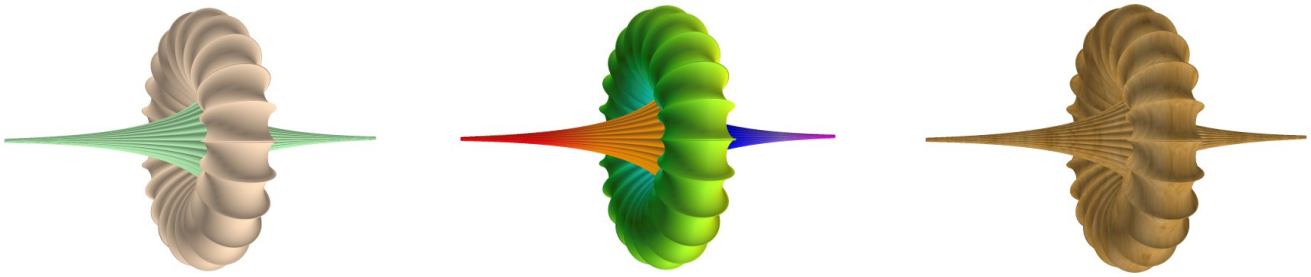
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Breather.3D.xml (D08a-c).

See also: https://en.wikipedia.org/wiki/Breather_surface

See also: https://mathworld.wolfram.com/BreatherSurface.html

```
const double b = 0.4;
double r = 1 - b * b;
double w = Math.Sqrt(r);
double denom = b * (
    (w * Math.Cosh(b * u)) * (w * Math.Cosh(b * u)) +
    (b * Math.Sin(w * v)) * (b * Math.Sin(w * v)));

x = -u + (2 * r * Math.Cosh(b * u) * Math.Sinh(b * u)) / denom;
y = (2 * w * Math.Cosh(b * u) * (-(w * Math.Cos(v) * Math.Cos(w * v)) - Math.Sin(v) * Math.Sin(w * v))) / denom;
z = (2 * w * Math.Cosh(b * u) * (-(w * Math.Sin(v) * Math.Cos(w * v)) + Math.Cos(v) * Math.Sin(w * v))) / denom;
```



23.6.9 Kuen surface

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D09a_Kuen.3D.xml (D09a-c).

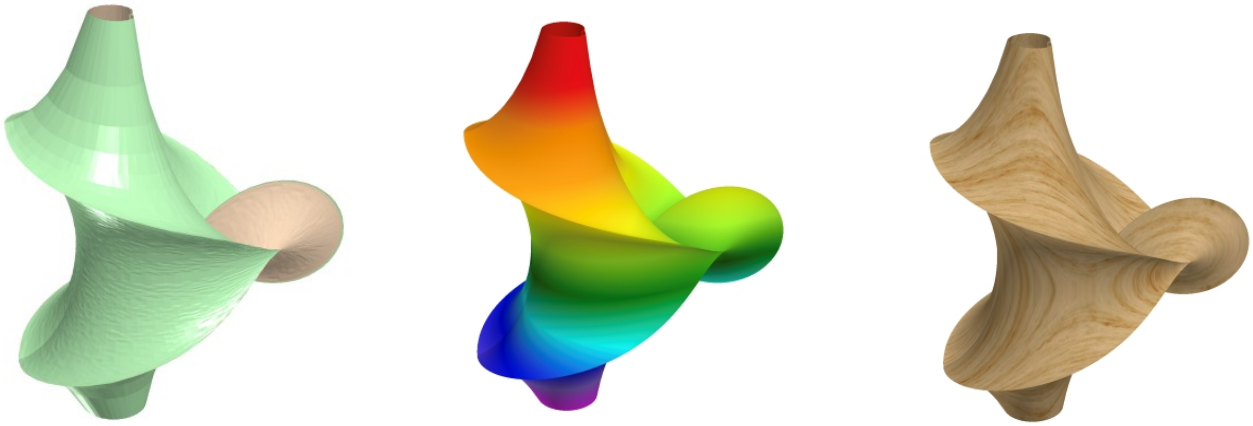
See also: https://mathworld.wolfram.com/KuenSurface.html

See also: https://virtualmathmuseum.org/Surface/kuen/kuen.html

See also: https://mathcurve.com/surfaces.gb/kuen/kuen.shtml

```
double a = 1.0 * Math.Sin(v);
double b = 1.0 + u * u * a * a;

x = 2.0 * a * (Math.Cos(u) + u * Math.Sin(u)) / b;
z = 2.0 * a * (Math.Sin(u) - u * Math.Cos(u)) / b;
y = Math.Log(Math.Tan(v / 2.0)) + 2.0 * Math.Cos(v) / b;
```



23.6.10 Tranguloid trefoil

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D10a_TranguloidTrefoil.3D.xml (D10a-c).

See also: http://paulbourke.net/geometry/tranguloid/

There are other parametrizations:

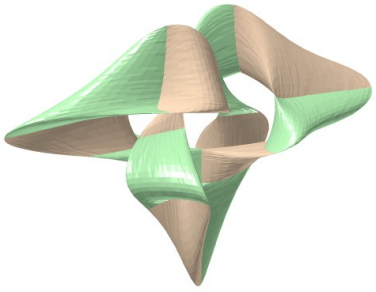
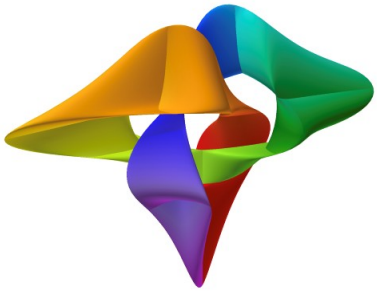
See also: http://www.3d-meier.de/tut3/Seite159.html

```
double p2 = 2*Math.PI/3;
x = 2 * Math.Sin(3 * u) / (2 + Math.Cos(v));
y = 2 * (Math.Sin(u) + 2 * Math.Sin(2 * u)) / (2 + Math.Cos(v + p2));
z = (Math.Cos(u) - 2 * Math.Cos(2 * u)) * (2 + Math.Cos(v)) * (2 + Math.Cos(v + p2)) / 4;
```





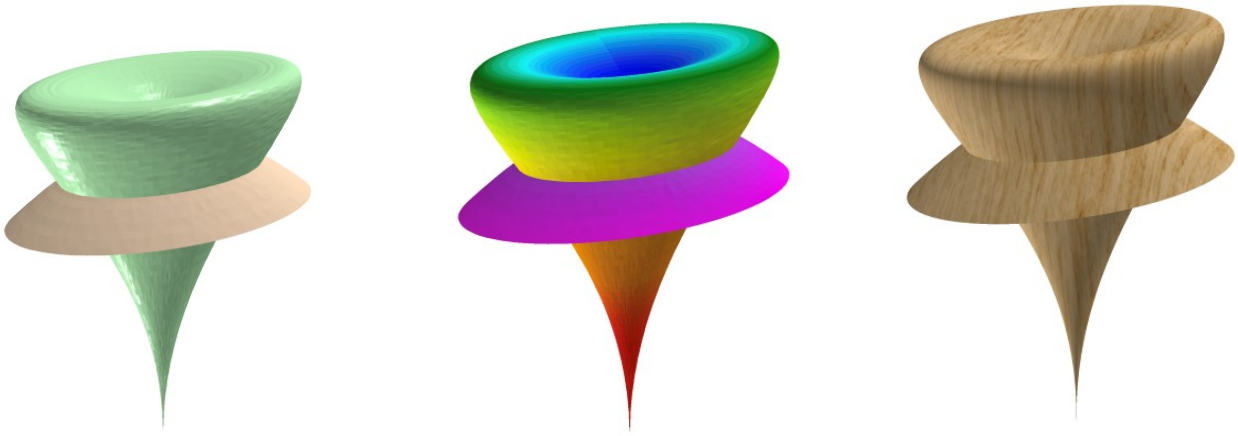
23.6.11 Triaxial teardrop

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D11a_TearDrop.3D.xml (D11a-c).

See also: http://paulbourke.net/geometry/triaxtear/

See also Wikipedia [1368], MathWorld [1070].

```
double p2 = 2*Math.PI/3;
x = ( 1 - Math.Cos(u) ) * Math.Cos(u + p2) * Math.Cos(v + p2) / 2;
y = -( 1 - Math.Cos(u) ) * Math.Cos(u + p2) * Math.Cos(v - p2) / 2;
z = Math.Cos(u - p2);
```

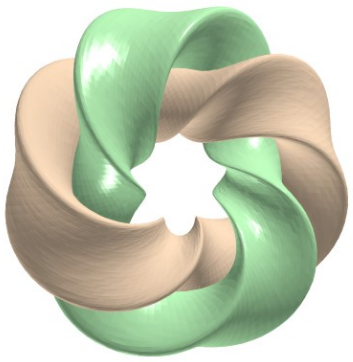


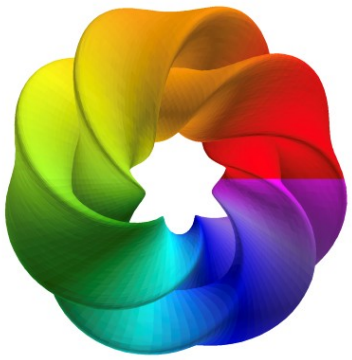
23.6.12 Gray Bottle

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D12a_GrayBottel.3D.xml (D12a-c).

See also: http://paulbourke.net/geometry/toroidal/

```
x = Math.Cos(v) * Math.Sqrt(Math.Abs(Math.Sin(2 * u))) * Math.Cos(u);
y = Math.Cos(v) * Math.Sqrt(Math.Abs(Math.Sin(2 * u))) * Math.Sin(u);
z = x*x - y*y + 2 * x * y * Math.Tan(v) * Math.Tan(v);
```

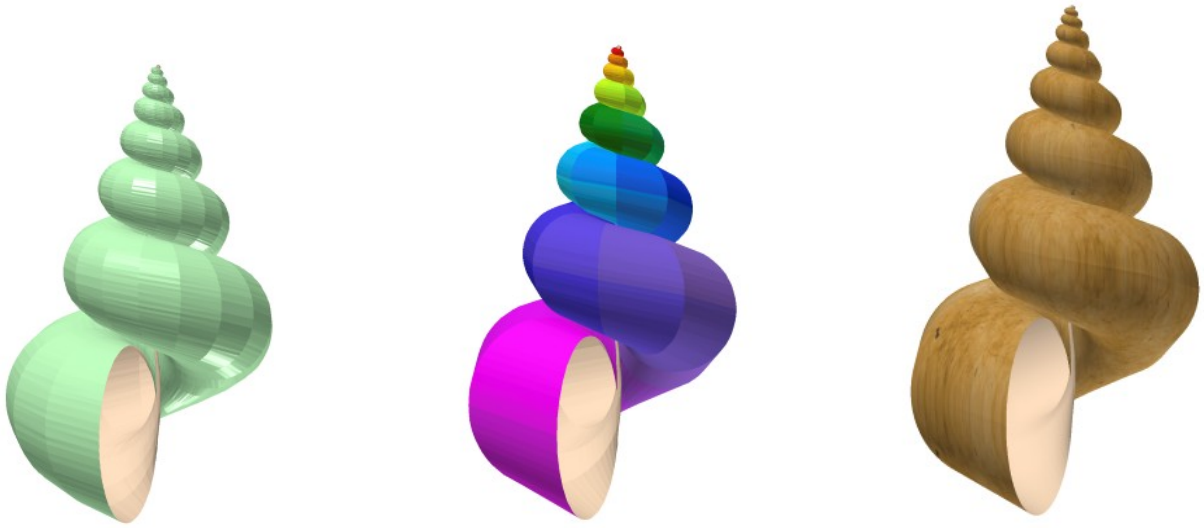




23.6.13 Surfaces mimicking snail shells

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D13a_Snail1.3D.xml (D13a-u).

See also: http://www.3d-meier.de/tut3/Seite89.html



```
double R = 1;
double a = 1.6;
double b = 1.6;
double c = 1.0;
double h = 1.5;
double k = -7.0;
double w = 0.075;
//  umin = -50, umax = -1,    name:  Pseudoheliceras subcatenatum

double su = Math.Sin(u);
double scu = Math.Sin(c*u);
double sv = Math.Sin(v);
double cv = Math.Cos(v);
double ccu = Math.Cos(c*u);

double ewu = Math.Exp(w*u);

x = ewu * (h+a*cv) * ccu;
z = R * ewu * (h+a*cv) * scu;
y = ewu * (k + b * sv);
```

CHAPTER

TWENTYFOUR

WPF: PATH SURFACES IN 3D

Surfaces based on parametric curves: $x = f(t), y = g(t)\ [, z = h(t)]$

24.1 Introduction to path surfaces

24.1.1 Borromean rings, A, B, C

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_BorromeanA.3D.xml (D01a-c).

Some text explaining the importance of building the mesh in x-direction.

The example below uses the following code in C#, for A

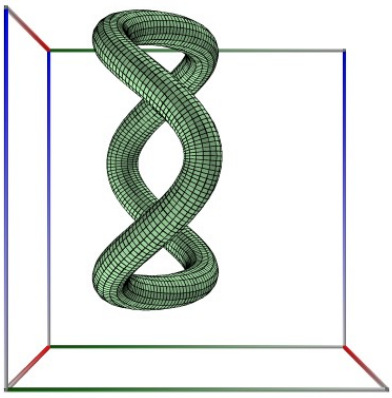
```
var r = Math.Sqrt(3) / 3;
var x = Math.Cos(t);
var y = Math.Sin(t) + r;
var z = Math.Cos(3 * t) / 3;
```

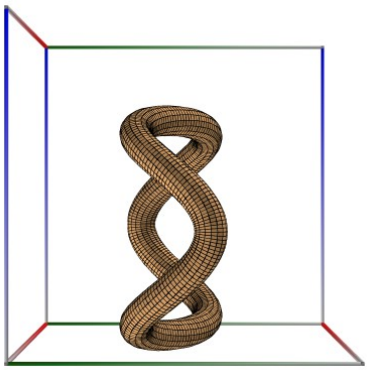
The example below uses the following code in C#, for B

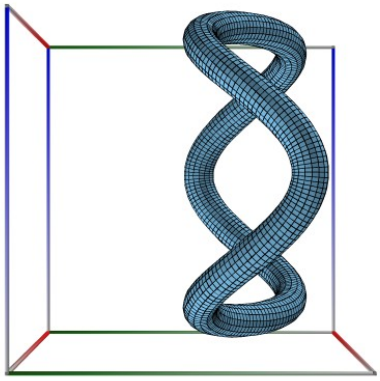
```
var r = Math.Sqrt(3) / 3;
var x = Math.Cos(t) + 0.5;
var y = Math.Sin(t) - r / 2;
var z = Math.Cos(3 * t) / 3;
```

The example below uses the following code in C#, for C

```
var r = Math.Sqrt(3) / 3;
var x = Math.Cos(t) - 0.5;
var y = Math.Sin(t) - r / 2;
var z = Math.Cos(3 * t) / 3;
```







24.1.2 Ellipses, A, B, C

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Ellipses.3D.xml (D01a-i).

Some text explaining the importance of building the mesh in x-direction.

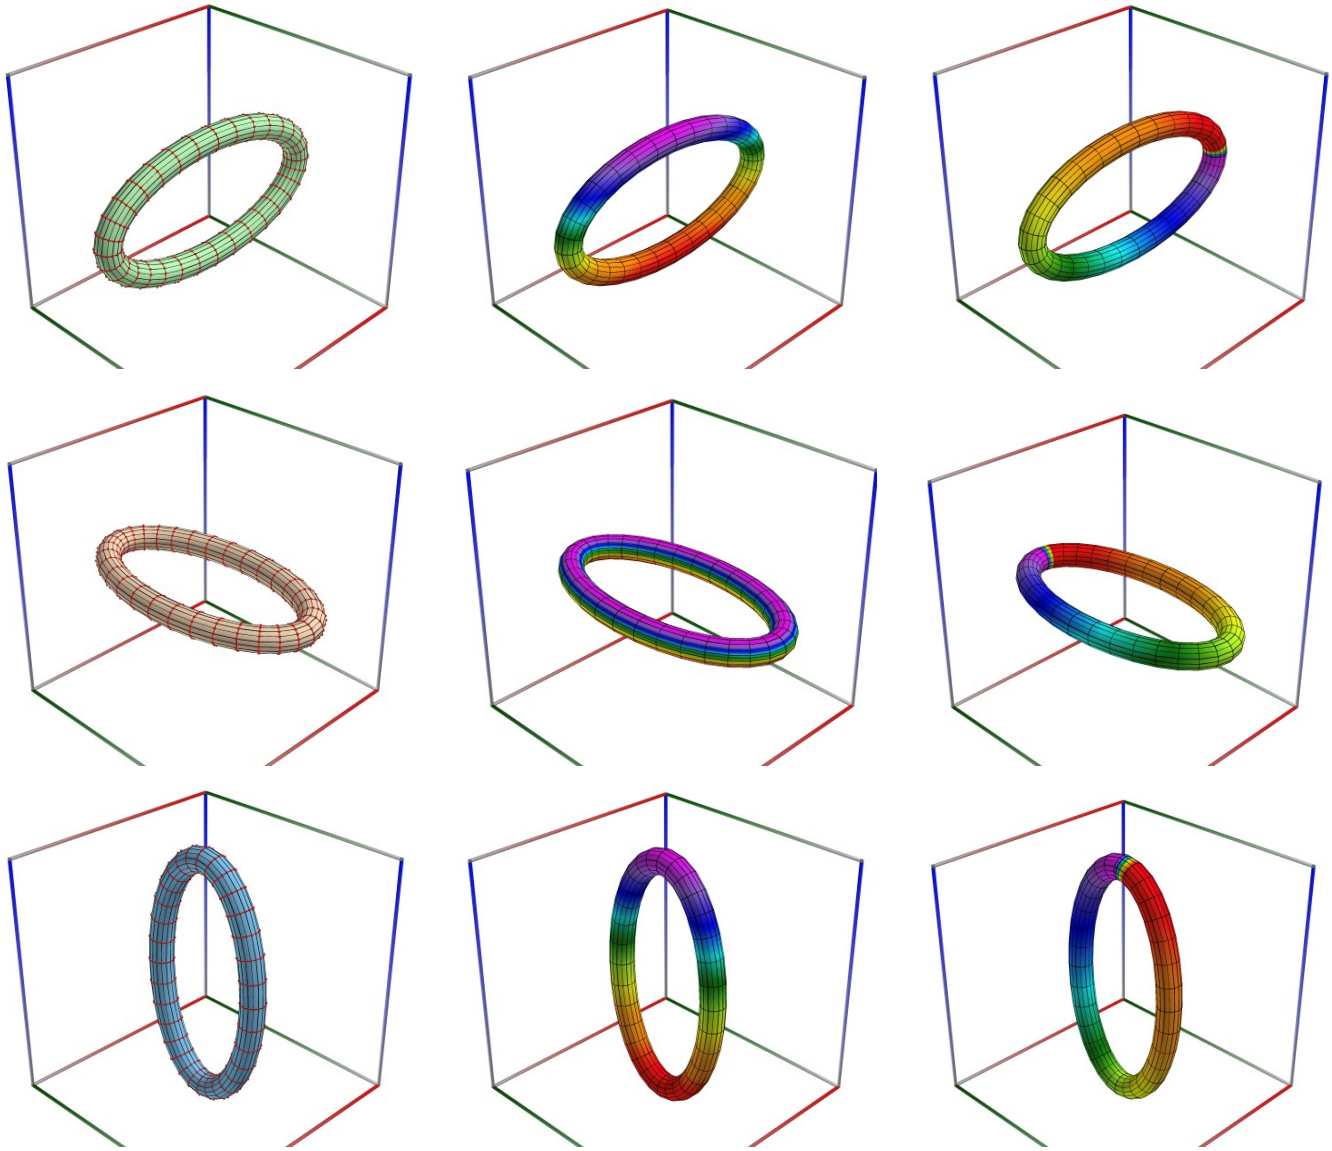
The example below uses the following code in C#, for A, B, C

```
var x = 2 * Math.Cos(t);
var y = Math.Sin(t);
var z = 0.0;
```

For A, the final rotations are: X=0, Y=0, Z=0.

For B, the final rotations are: X=90, Y=0, Z=90.

For C, the final rotations are: X=0, Y=90, Z=90.



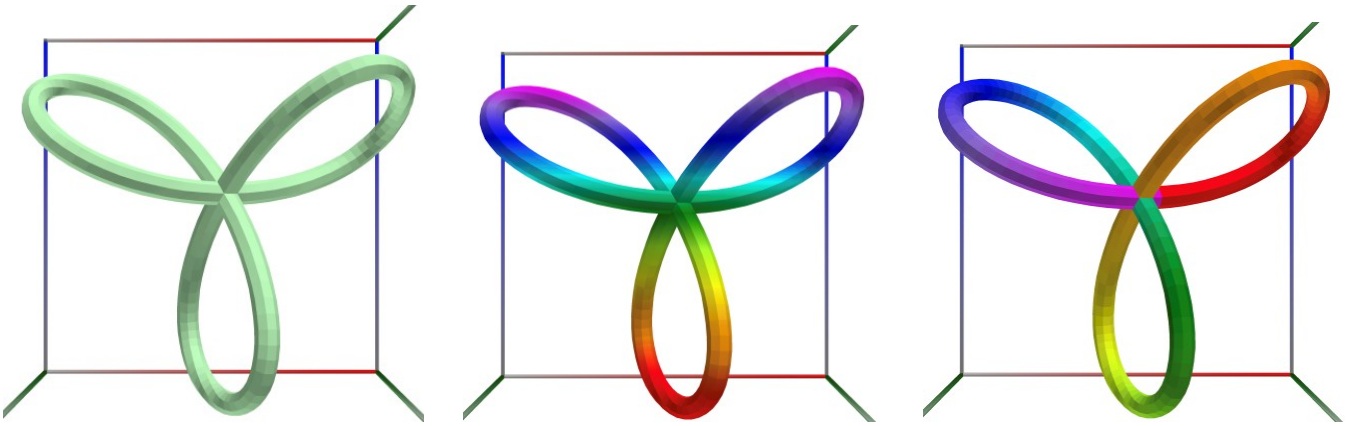
24.1.3 Trefoil 2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_Trefoil02.3D.xml (D01a-c).

Some text explaining the importance of building the mesh in x-direction.

The example below uses the following code in C#, for A, B, C

```
var D = 2.0; //  D = 1.0;  D = 2.0;
var x = D * Math.Sin(t) + 2 * Math.Sin(2 * t);
var y = D * Math.Cos(t) - 2 * Math.Cos(2 * t);
var z = -D * Math.Sin(3 * t);
```



24.1.4 Formatting options for path surfaces, Trefoil 5

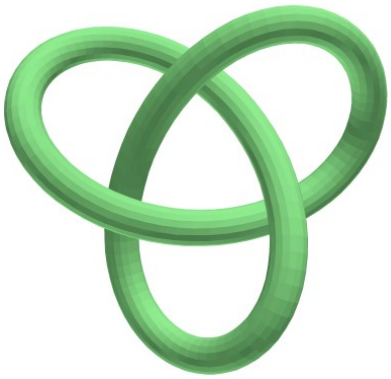
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Trefoil05.3D.xml (D01a-f).

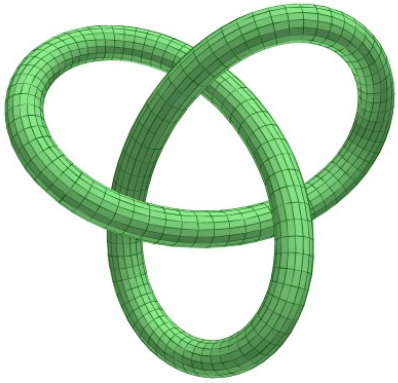
These are the rough versions

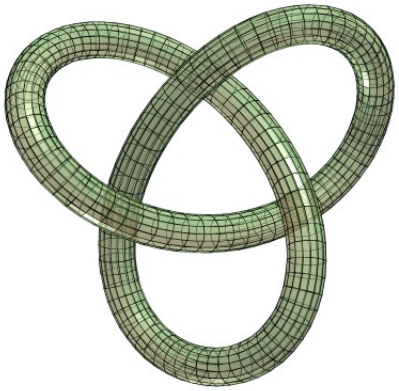
The example below uses the following code in C#, for A, B, C

```
var D = 1.0; //  D = 1.0;  D = 2.0;
var x = D * Math.Sin(t) + 2 * Math.Sin(2 * t);
var y = D * Math.Cos(t) - 2 * Math.Cos(2 * t);
var z = -D * Math.Sin(3 * t);
```

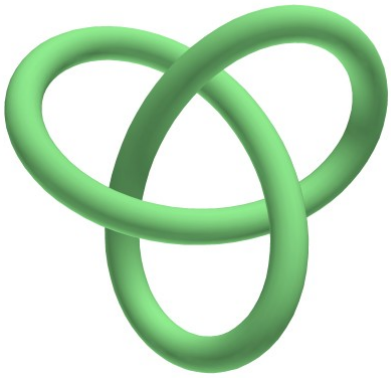
These are the rough versions

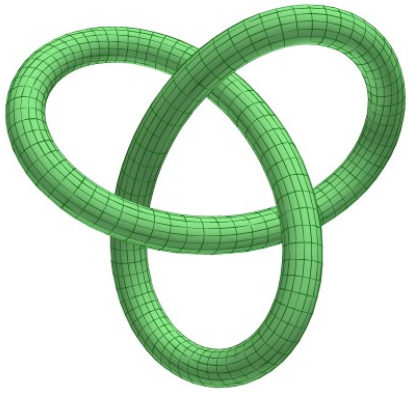


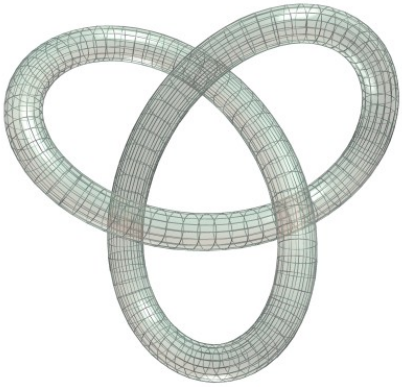




These are the smooth versions







24.2 Functions with real input and complex results

24.2.1 Expj (Cis) function

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_Func_Expj_2Dx.3D.xml (D01a-e).

Returns $e^{iz} = \cos(z) + i\sin(z)$. See also Wikipedia [1376], MathWorld [1021].

The example below uses the following code in C#, for real part only

```
var y = Math.Sin(t);
var x = t;
var z = 0;
```

The example below uses the following code in C#, for imaginary part only

```
var z = -Math.Cos(t);
var x = t;
var y = 0;
```

The example below uses the following code in C#, for real and imaginary part combined

```
var x = Math.Sin(t);
var y = -Math.Cos(t);
var z = t;
```

Some text

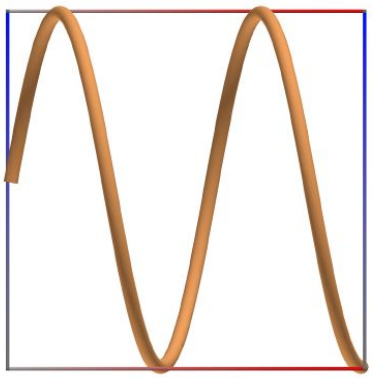
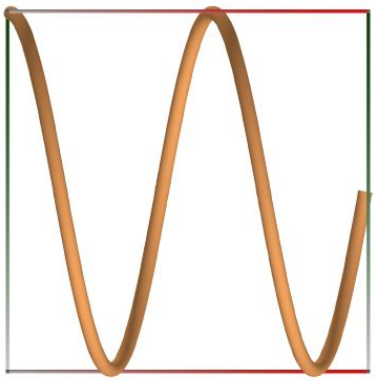
Middle figure: Expj (Cis) function, imaginary part only. Orthographic camera.

Right figure: Expj (Cis) function as full 3D curve. Orthographic camera.





24.2.2 Hankel function of the first kind $H_{1,\nu}(x)$

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Func_Hankel1_2Dx.3D.xml (D02a-c).

Returns the Hankel function of the first kind, defined as $H_\nu^{(1)}(x) = J_\nu(x) + iY_\nu(x)$.

See also Wikipedia [1308], MathWorld [942], NIST [444], BoostMath [115].

The example below uses the following code in C#, for real part only

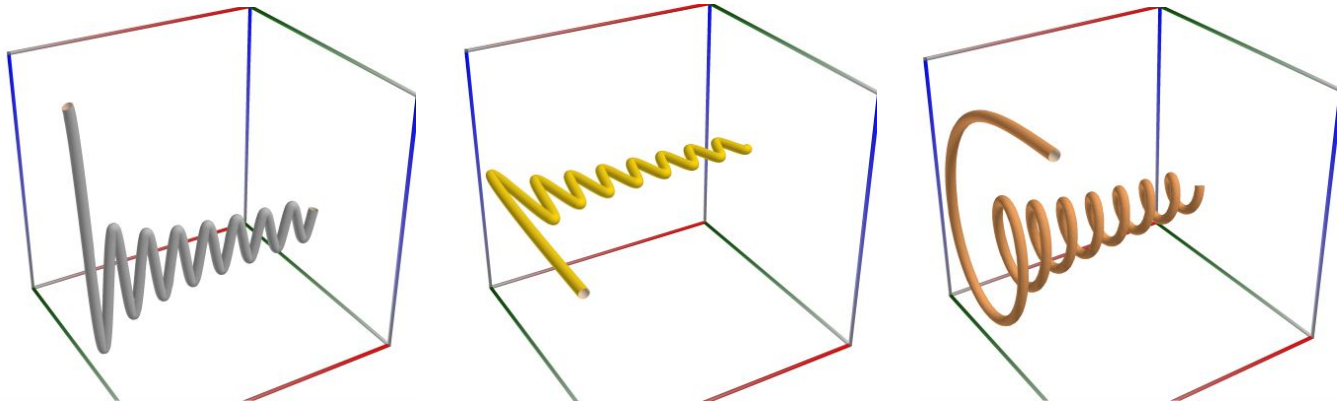
```
var y = ctx.bessel_j0(t);
var x = t;
var z = 0;
```

The example below uses the following code in C#, for imaginary part only

```
var z = -ctx.bessel_y0(t);
var x = t;
var y = 0;
```

The example below uses the following code in C#, for real and imaginary part combined

```
var z = ctx.bessel_j0(t);
var y = -ctx.bessel_y0(t);
var x = t;
```



Left figure: Hankel function of the first kind $H_{1,\nu}(x)$, real part only. Orthographic camera.

Middle figure: Hankel function of the first kind $H_{1,\nu}(x)$, imaginary part only. Orthographic camera.

Right figure: Hankel function of the first kind $H_{1,\nu}(x)$, as full 3D curve. Orthographic camera.

24.2.3 Hankel function of the second kind $H_{2,\nu}(x)$

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_Func_Hankel2_2Dx.3D.xml (D03a-c).

Returns the Hankel function of the second kind, defined as $H_\nu^{(2)}(x) = J_\nu(x) - iY_\nu(x)$.

See also Wikipedia [1308], MathWorld [943], NIST [444], BoostMath [115].

The example below uses the following code in C#, for real part only

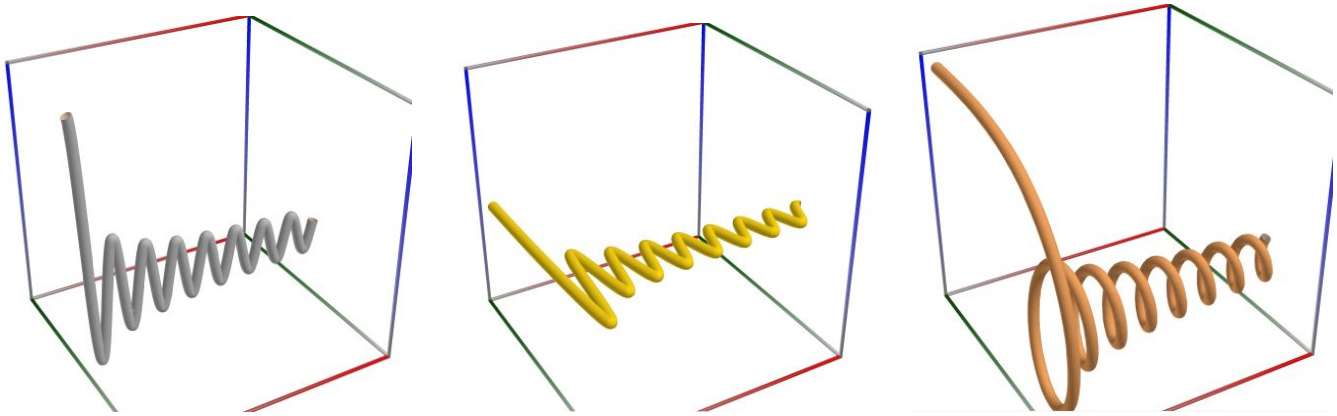
```
var y = ctx.bessel_j0(t);
var x = t;
var z = 0;
```

The example below uses the following code in C#, for imaginary part only

```
var z = ctx.bessel_y0(t);
var x = t;
var y = 0;
```

The example below uses the following code in C#, for real and imaginary part combined

```
var z = ctx.bessel_j0(t);
var y = ctx.bessel_y0(t);
var x = t;
```



Left figure: Hankel function of the second kind $H_{2,\nu}(x)$, real part only. Orthographic camera.

Middle figure: Hankel function of the second kind $H_{2,\nu}(x)$, imaginary part only. Orthographic camera.

Right figure: Hankel function of the second kind $H_{2,\nu}(x)$, as full 3D curve. Orthographic camera.

24.2.4 Kelvin functions ber and bei

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Func_KelvinBerBei_2Dx.3D.xml (D04a-c).

Returns the Kelvin functions ber bei. See also Wikipedia [1383], MathWorld [1024], NIST [445].

The following conventions are used as in Maple (with $a = \sqrt{2}/2$):

$$\text{ber}(\nu, x) + i\text{bei}(\nu, x) = J_\nu(x(-a + ia))$$

$$\text{ber}(\nu, x) - i\text{bei}(\nu, x) = J_\nu(x(-a - ia))$$

The example below uses the following code in C#, for the real part only

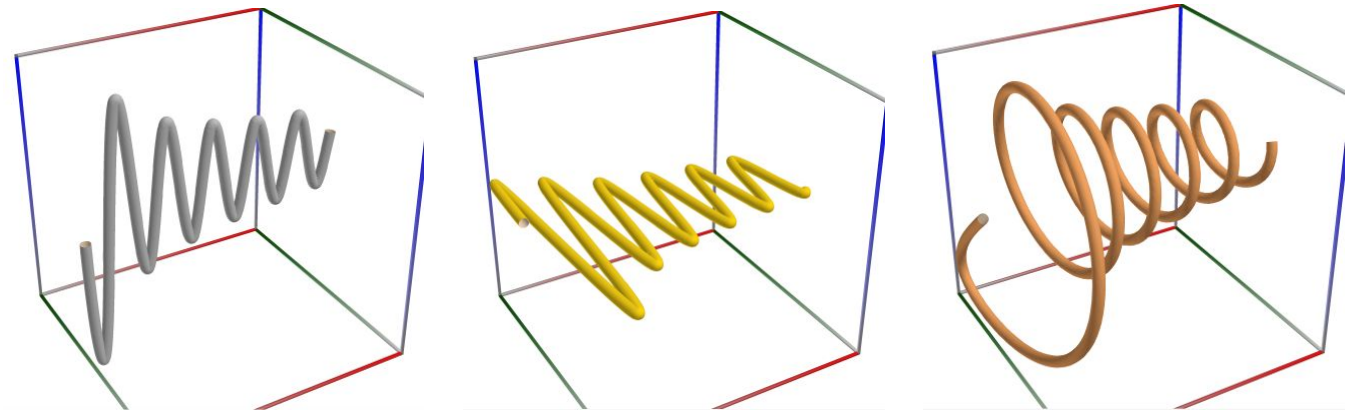
```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = 0;
var z = ctx.kelvin_ber(1,t) / a;
```

The example below uses the following code in C#, for the imaginary part only

```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = ctx.kelvin_bei(1,t) / a;
var z = 0;
```

The example below uses the following code in C#, for the real and imaginary parts combined

```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = ctx.kelvin_bei(1,t) / a;
var z = ctx.kelvin_ber(1,t) / a;
```



Left figure: Kelvin functions ber. Orthographic camera.

Middle figure: Kelvin function bei. Orthographic camera.

Right figure: Kelvin functions ber and bei, as full 3D curve. Orthographic camera.

24.2.5 Kelvin functions ker and kei

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_Func_KelvinKerKei_2Dx.3D.xml (D05a-c).

Returns the Kelvin function ker. See also Wikipedia [1385], MathWorld [1026], NIST [445].

The following conventions are used as in Maple (with $a = \sqrt{2}/2$):

$$\text{ker}(\nu, x) + i\text{kei}(\nu, x) = e^{-i\nu\pi/2} K_\nu(x(a + ia))$$

$$\text{ker}(\nu, x) - i\text{kei}(\nu, x) = e^{i\nu\pi/2} K_\nu(x(a - ia))$$

The example below uses the following code in C#, for real part only

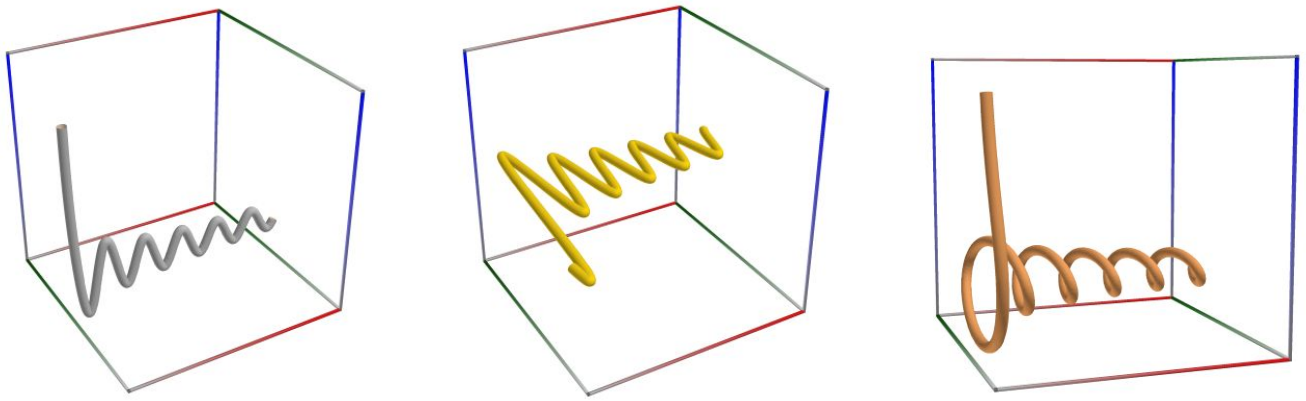
```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = 0;
var z = ctx.kelvin_ker(0,t) * a;
```

The example below uses the following code in C#, for imaginary part only

```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = ctx.kelvin_kei(0,t) * a;
var z = 0;
```

The example below uses the following code in C#, for real and imaginary part combined

```
var a = ctx.exp(t / ctx.sqrt(2));
var x = t;
var y = ctx.kelvin_kei(0,t) * a;
var z = ctx.kelvin_ker(0,t) * a;
```



Left figure: Kelvin functions ker. Orthographic camera.

Middle figure: Kelvin function kei. Orthographic camera.

Right figure: Kelvin functions ker and kei, as full 3D curve. Orthographic camera.

24.3 Characteristic functions of statistical distributions

24.3.1 Uniform distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_CfUniform.3D.xml (D01a-c).

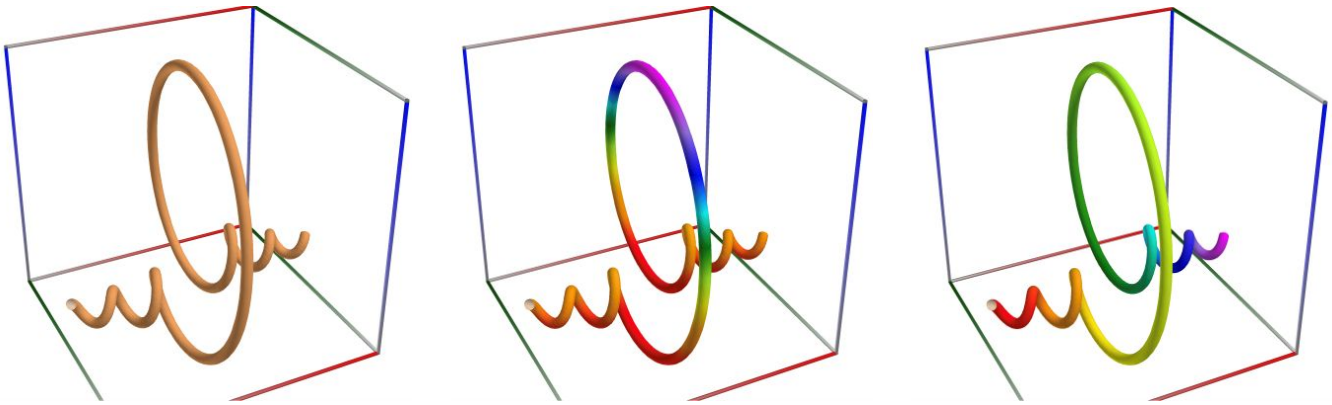
The uniform distribution is a continuous probability distribution on the support interval $[a, b]$ with finite $a < b$. See also Wikipedia [1195], MathWorld [840], BoostMath [89], Witkovský [1480], R (Statistical System) [537].

Returns $C_X(t)$, the characteristic function of a random variable X, following a uniform distribution:

$$C_X(t) = \frac{e^{itb} - e^{ita}}{it(b-a)}, \quad \text{for } t \neq 0, 0 \text{ otherwise.}$$

The example below uses the following code in C#

```
double a = 0.0;
double b = 1.0;
Complex i1 = Complex.ImaginaryOne;
Complex fz = 1.0;
if (t != 0.0)
{
    fz = Complex.Exp(i1 * t * b) - Complex.Exp(i1 * t * a);
    fz /= (i1 * t * (b - a));
}
var y = fz.Real;
var z = -fz.Imaginary;
var x = t;
```



Left figure: Characteristic function of the uniform distribution, with $a = 0.0$, $b = 1.0$, $t_0 = -20.0$ and $t_1 = 20.0$. Perspective camera.

24.3.2 Normal distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Func_CfNormal.3D.xml (D02a-c).

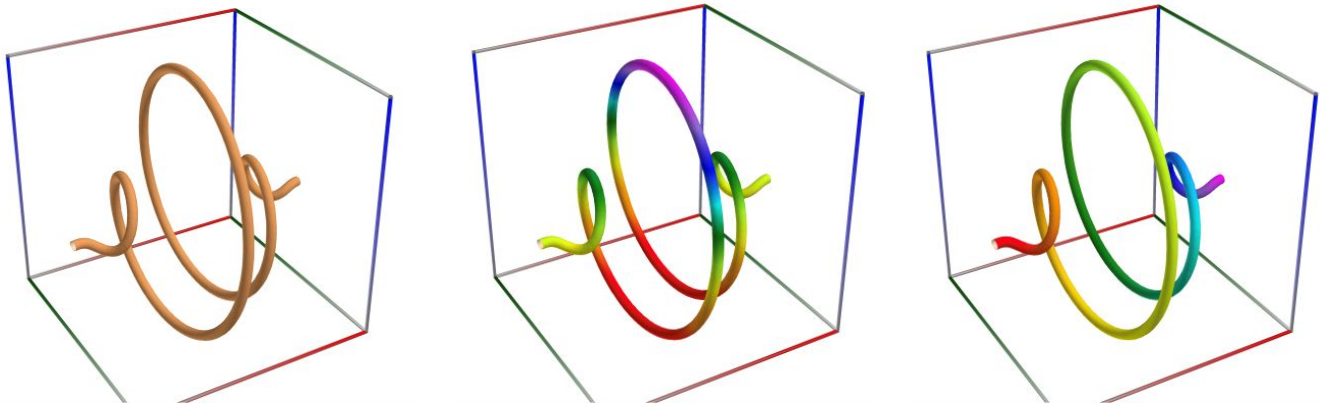
The normal distribution is a continuous probability distribution with mean $\mu \in \mathbb{R}$, standard deviation $\sigma > 0$, and the support interval $(-\infty, +\infty)$. See also Wikipedia [1168], MathWorld [835], BoostMath [67], R (Statistical System) [527], Mpmath [544], Mpmath [540].

Returns $C_X(t)$, the characteristic function of a random variable X, following a normal distribution:

$$C_X(t) = \exp\left(i\mu t - \tfrac{1}{2}\sigma^2 t^2\right).$$

The example below uses the following code in C#

```
double mu = 10.0;
double sigma = 1.0;
Complex i1 = Complex.ImaginaryOne;
Complex fz = Complex.Zero;
fz = Complex.Exp(i1 * t * mu - 0.5 * sigma * sigma * t * t);
var y = fz.Real;
var z = -fz.Imaginary;
var x = t;
```



Left figure: Characteristic function of the normal distribution, with $\mu = 10$, $\sigma = 1$, $t_0 = -2.0$ and $t_1 = 2.0$. Perspective camera.

24.3.3 Chi-squared distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_Func_CfChiSquared.3D.xml (D03a-c).

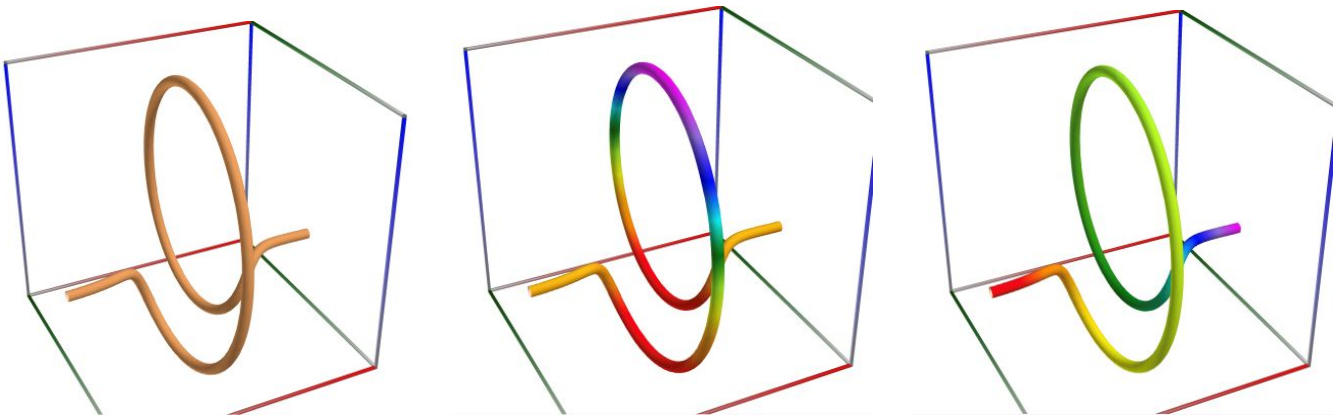
The chi-squared distribution is a continuous probability distribution with $n > 0$ degrees of freedom and the support interval $(0, +\infty)$. See also Wikipedia [1150], MathWorld [798], BoostMath [53], Witkovský [1466], R (Statistical System) [522].

Returns $C_X(t)$, the characteristic function of a random variable X, following a chi-squared distribution:

$$C_X(t) = (1 - 2it)^{-n/2}.$$

The example below uses the following code in C#

```
double nu = 100.0;
Complex i1 = Complex.ImaginaryOne;
Complex fz = Complex.Zero;
fz = Complex.Pow(1 - 2 * i1 * t, -nu / 2);
var x = fz.Real;
var y = -fz.Imaginary;
var z = t;
```



Left figure: Characteristic function of the chi-squared distribution, with $n = 100$, $t_0 = -0.2$ and $t_1 = 0.2$. Perspective camera.

24.3.4 Beta distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Func_CfBeta.3D.xml (D04a-c).

The beta distribution is a continuous probability distribution with parameters $a > 0$, $b > 0$, and the support interval $(0, 1)$. See also Wikipedia [1148], MathWorld [797], BoostMath [51], Witkovský [1465], R (Statistical System) [520].

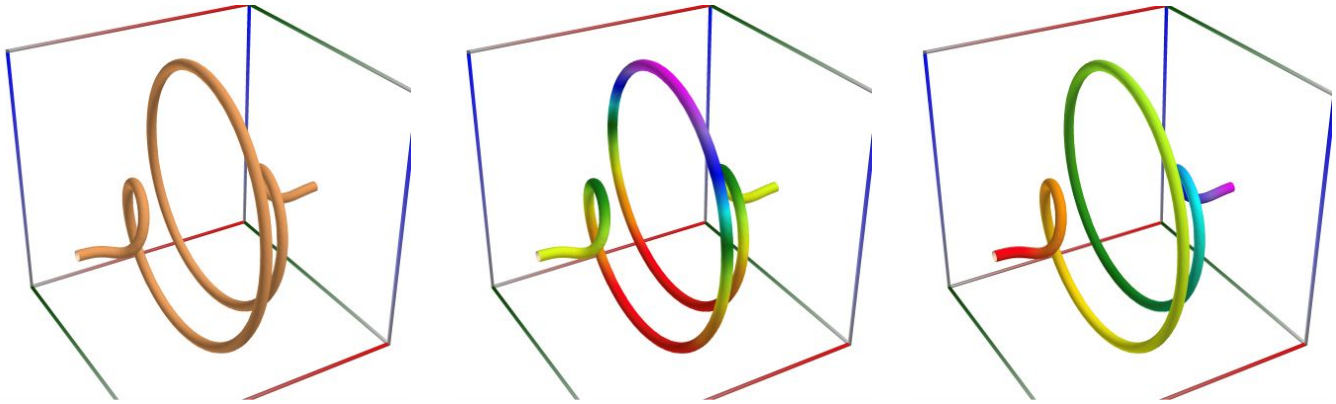
Returns $C_X(t)$, the characteristic function of a random variable X, following a beta distribution:

$$C_X(t) = {}_1F_1(a, a + b; it).$$

where ${}_1F_1()$ is Kummer's confluent hypergeometric function (of the first kind).

The example below uses the following code in C#

```
double a = 10.0;
double b = 20.0;
Complex i1 = Complex.ImaginaryOne;
var fz = dcplx.zero();
fz = cmath53.hyperg_1f1(a, a + b, i1 * t);
var y = fz.Real;
var z = -fz.Imaginary;
var x = t;
```



Left figure: Characteristic function of the beta distribution, with $a = 10$, $b = 20$, $t_0 = -40.0$ and $t_1 = 40.0$. Perspective camera.

24.3.5 F distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_Func_CfFisherF.3D.xml (D05a-c).

The Fisher F-distribution is a continuous probability distribution with $m > 0$ and $n > 0$ degrees of freedom, and the support interval $(0, +\infty)$. See also Wikipedia [1153], MathWorld [801], BoostMath [56], Witkovský [1468], R (Statistical System) [524], Abramowitz and Stegun. [3], Butler and Paolella [166], Chattamvelli and Jones [175], Witkovský [1462].

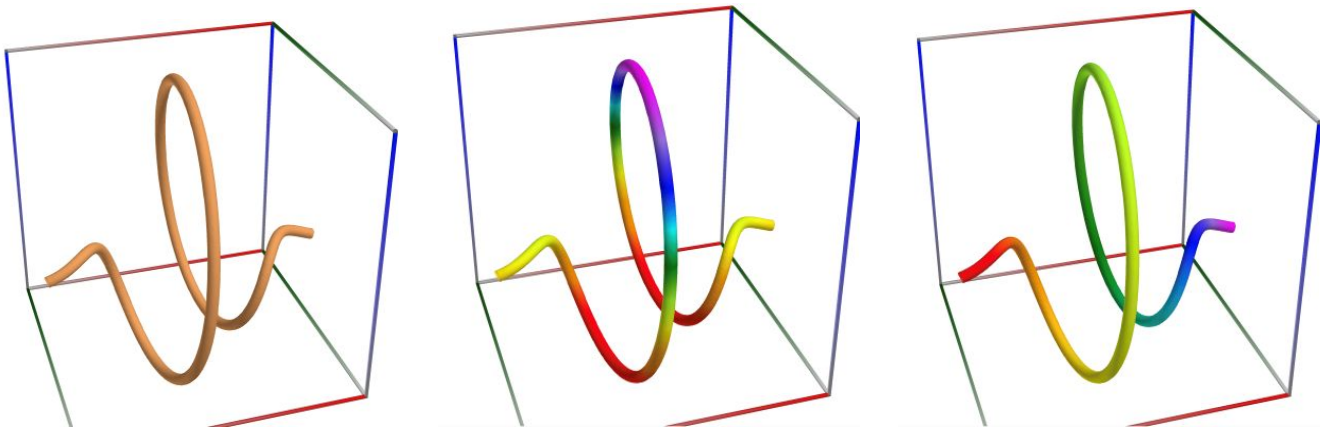
Returns $C_X(t)$, the characteristic function of a random variable X, following a central Fisher F distribution:

$$C_X(t) = \int_0^\infty e^{itx} \text{pdf}_X(x) \text{d}x = \frac{\Gamma(m/2 + n/2)}{\Gamma(n/2)} U\left(\frac{m}{2}, 1 - \frac{n}{2}, -\frac{n}{m} it\right)$$

where $U(\cdot)$ denotes the confluent hypergeometric function of the second kind.

The example below uses the following code in C#

```
double nu = 21.0;
double mu = 40.0;
double G = ctx.gamma(mu / 2 + nu / 2) / ctx.gamma(nu / 2);
Complex i1 = Complex.ImaginaryOne;
var fz = dcplx.zero();
fz = G * cmath53.hyperg_u(mu / 2, 1 - nu / 2, -(nu / mu) * i1 * t);
var y = fz.Real;
var z = -fz.Imaginary;
var x = t;
```



Left figure: Characteristic function of the Fisher F-distribution, with $m = 40$, $n = 20$, $t_0 = -20.0$ and $t_1 = 20.0$. Perspective camera.

24.3.6 Non-central Chi-squared distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Path_Func_CfChiSquaredNc.3D.xml (D06a-c).

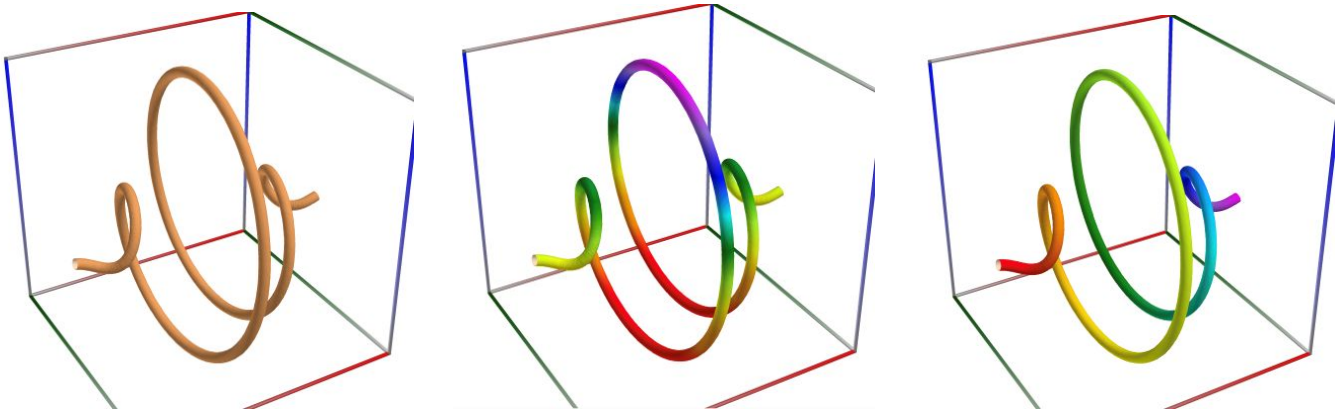
The noncentral chi-square distribution is a continuous probability distribution with degrees of freedom $n > 0$, noncentrality parameter λ_1, and support interval $(0, \infty)$. See also Wikipedia [1166], MathWorld [810], Patnaik [465], Penev and Raykov [467], Wang and Gray [795], Winterbottom [1456], BoostMath [64], Witkovský [1476], Johansson [386], R (Statistical System) [517], Yu [1500].

Returns $C_X(t)$, the characteristic function of a random variable X, following a non-central chi-squared distribution:

$$C_X(t) = \exp\left(\frac{i\lambda t}{1-2it}\right)(1-2it)^{-n/2}.$$

The example below uses the following code in C#

```
double nu = 10.0;
double lambda1 = 50.0;
Complex i1 = Complex.ImaginaryOne;
Complex fz = Complex.Zero;
fz = Complex.Pow(1 - 2 * i1 * t, -nu / 2);
fz *= Complex.Exp((i1 * t * lambda1) / (1 - 2 * i1 * t));
var y = fz.Real;
var z = -fz.Imaginary;
var x = t;
```



Left figure: Characteristic function of the noncentral chi-square distribution, with $\lambda = 50$, $n = 10$, $t_0 = -0.2$ and $t_1 = 0.2$. Perspective camera.

24.3.7 Binomial distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Path_Func_CfBinomial.3D.xml (D07a-c).

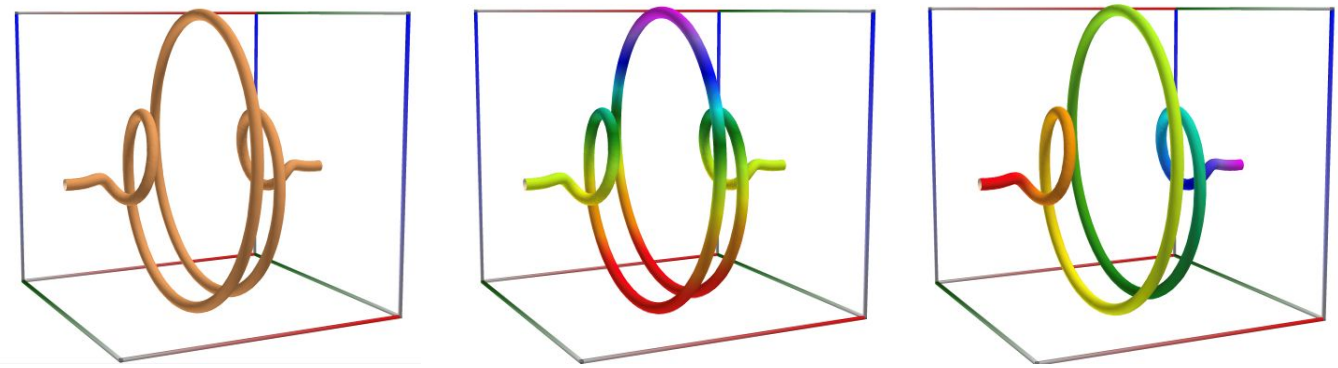
The binomial distribution is a discrete (lattice) probability distribution with number of trials $n \geq 0$ and success probability $0 \leq p \leq 1$. See also Wikipedia [1175], MathWorld [818], BoostMath [71], Witkovský [1484], R (Statistical System) [531].

Returns $C_X(t)$, the characteristic function of a random variable X, following an binomial distribution:

$$C_X(t) = \left(Pe^{it} + Q\right)^n .$$

The example below uses the following code in C#

```
double n1 = 20.0;
double p = 0.5;
Complex i1 = Complex.ImaginaryOne;
Complex fz = Complex.Zero;
fz = Complex.Pow(1 - p + p * Complex.Exp(i1 * t), n1);
var x = fz.Real;
var y = -fz.Imaginary;
var z = t;
```



Left figure: Characteristic function of the binomial distribution, with $p = 0.5$, $n = 20$, $t_0 = -2.0$ and $t_1 = 2.0$. Perspective camera.

24.3.8 Hypergeometric distribution

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Path_Func_CfHypergeo.3D.xml (D08a-c).

The hypergeometric distribution is a discrete (lattice) probability distribution with k successes (random draws for which the object drawn has a specified feature) in $n \in \{0, 1, 2, \ldots, N\}$ draws, without replacement, from a finite population of size $N \in \{0, 1, 2, \ldots\}$‘ that contains exactly $K \in \{0, 1, 2, \ldots, N\}$ objects with that feature, wherein each draw is either a success or a failure, and the support interval $(\max(0, n + K - N), \min(K, n))$. See also Wikipedia [1181], MathWorld [826], BoostMath [78], R (Statistical System) [533], Berkopec [31], Johnson *et al.* [389] page 251.

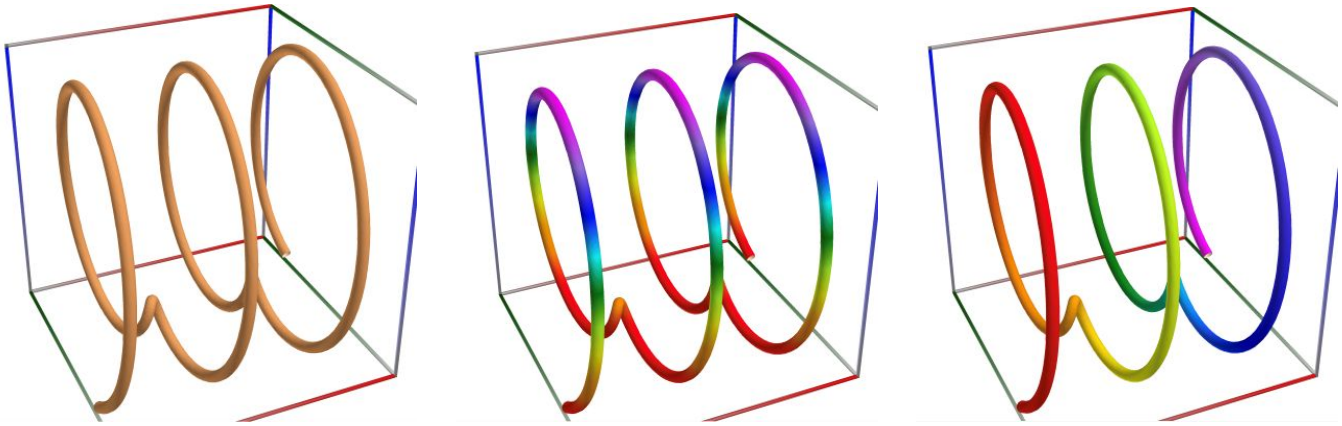
Returns $C_X(t)$, the characteristic function of a random variable X, following an hypergeometric distribution:

$$C_X(t) = {}_2F_1(-n, -K; N - K - n + 1; e^{it}) \binom{N-K}{n} \Big/ \binom{N}{n}.$$

where ${}_2F_1(\cdot)$ is the Gauss hypergeometric function.

The example below uses the following code in C#

```
int N = 50;
int K = 16;
int n1 = 12;
Complex i1 = Complex.ImaginaryOne;
var fz = dcplx.zero();
fz = cmath53.hyperg_2f1(-n1, -K, N - K - n1 + 1, cmath53.exp(i1 * t));
fz = fz * ctx.binomial(N - K, n1) / ctx.binomial(N, n1);
var x = fz.Real;
var y = -fz.Imaginary;
var z = t;
```



Left figure: Characteristic function of the hypergeometric distribution, with $N = 50$, $K = 16$, $n = 12$, $t_0 = -10.0$ and $t_1 = 10.0$. Perspective camera.

24.4 Helices and related curves traced on cylinders, cones and spheres

See also: https://en.wikipedia.org/wiki/Helix

See also: https://mathworld.wolfram.com/Helix.html

See also: https://mathcurve.com/courbes3d.gb/helice/helice.shtml

The helices are the curves the tangents of which form a constant angle a with respect to a fixed plane (P0), or a fixed direction d (orthogonal to (P0)). Therefore, the notion of helix in mathematics is more connected to a mountain road with constant slope than to the helix of a boat!

Examples (note that the helices are described by their base or the surface on which they are traced):

- the straight line (lines on a surface are therefore helices of this surface)
- the cylindrical helix (base = circle)
- the conical helix (traced on a vertical cone of revolution, base = logarithmic spiral)
- the elliptic helix (base = ellipse)
- the spherical helix (traced on a sphere, base = epicycloid)
- the helix of the paraboloid (base = involute of a circle).
- the helix of the one-sheeted hyperboloid (traced on the one-sheeted hyperboloid)
- the striction line of the milk carton

NOTE: the item “H. Stop of y, v [STOP2]” determines the diameter of the helix.

24.4.1 Cylindrical helix

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_SpiralCylindrical.3D.xml (D01a-f).

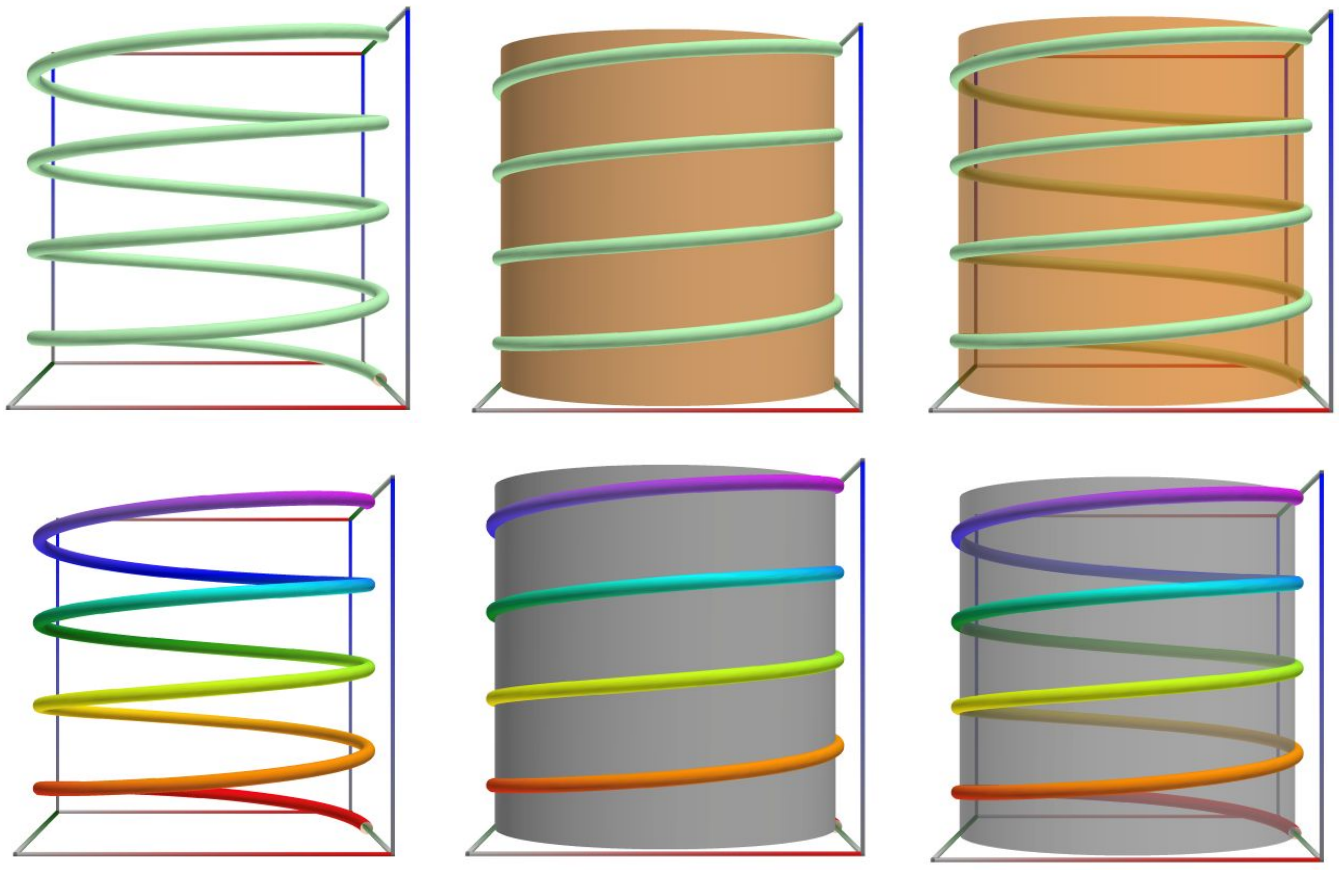
See also: https://mathcurve.com/courbes3d.gb/helicecirculaire/helicecirculaire.shtml

The cylindrical helix can be defined as a helix traced on a vertical cylinder of revolution, or a rhumb line of this cylinder (i.e., in both cases, a curve forming a constant angle with respect to the axis of the cylinder), or a geodesic of this cylinder (in other words, a curve that becomes a line when the cylinder is developed) or a solenoid with linear bore. Intrinsic characterization: constant curvature and torsion.

The radius of the helix is a, and its shift is (it is the distance between two consecutive coils) and b is sometimes called reduced shift of the helix. The angle of the helix is the constant angle (equal to) formed by its tangent with respect to any plane orthogonal to Oz. The helix is right-handed when e = 1 (it "goes up" counterclockwise and an observer located outside of it sees it going up from left to right) and left-handed when e = - 1 (it "goes up" clockwise).

The example below uses the following code in C#

```
double a = 0.2;
// double b = 1.0;
double b = 0.2;
var x = a * Math.Cos(t);
var y = a * Math.Sin(t);
var z = b * t;
```



24.4.2 Conical helix based on Archimedes spiral (spiral of Pappus)

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_SpiralAConical.3D.xml (D02a-f).

See also: https://en.wikipedia.org/wiki/Conical_spiral

See also: https://mathworld.wolfram.com/ConicalSpiral.html

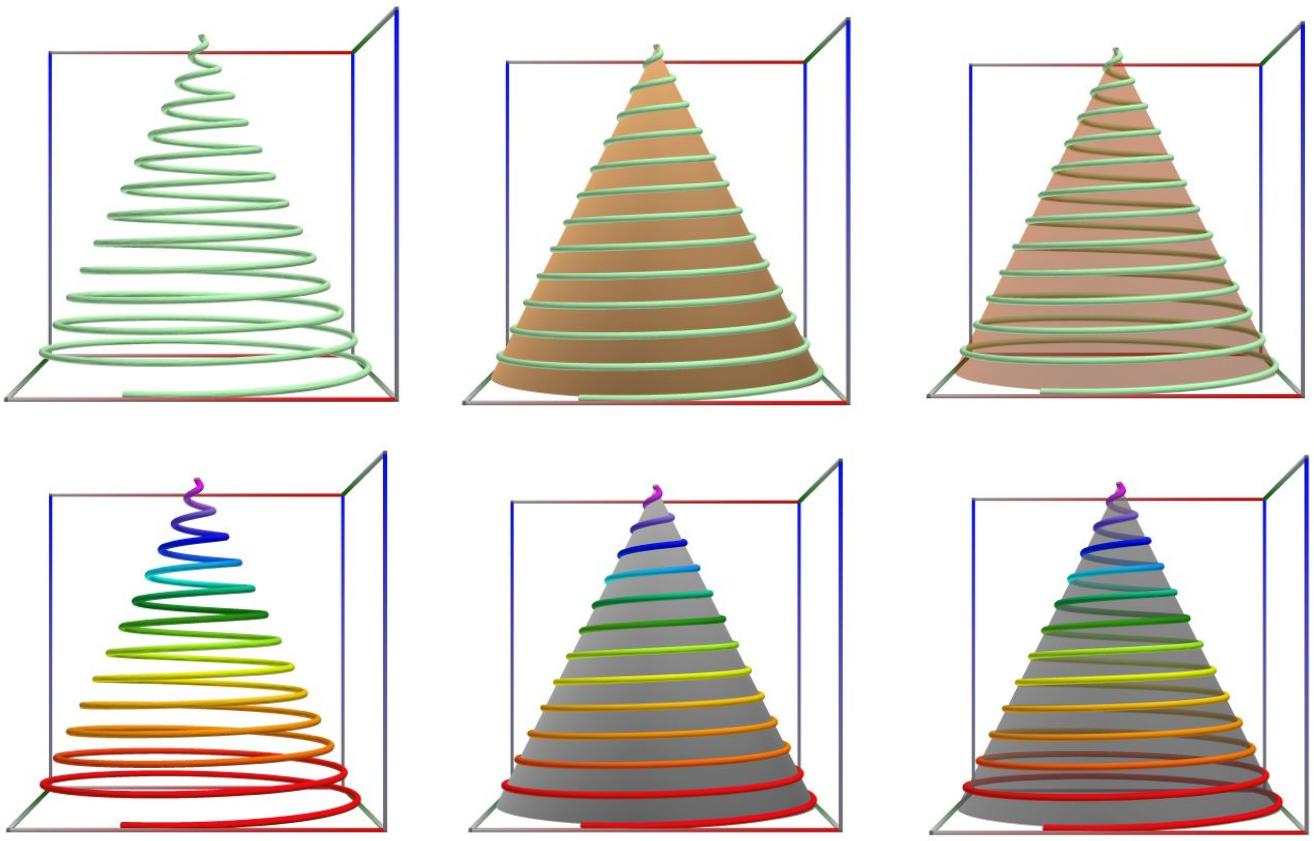
See also: https://mathcurve.com/courbes3d.gb/helicecirculaire/helicecirculaire.shtml

The conical helix can be defined as a helix traced on a cone of revolution (i.e. a curve forming a constant angle with respect to the axis of the cone), or a rhumb line of this cone (i.e. a curve forming a constant angle with the meridians); it is not a geodesic of the cone. In concrete terms, we get a conical helix when we trace a path with constant slope on a cone placed vertically.

The projection on xOy is a logarithmic spiral (), which is also the locus of the intersection between the tangents and xOy; the curve obtained by developing the cone is also a logarithmic spiral. As for all helices, it is a geodesic of the vertical cylinder based on the aforementioned spiral, projection of the curve on xOy. The principal normal is always perpendicular to Oy. The radii of curvature and torsion are proportional to z. The helix is right-handed when (it "goes up" clockwise) and left-handed when (it "goes up" counterclockwise).

The example below uses the following code in C#

```
double a = 1.0;
double phi = t * Math.PI;
double rphi = a * phi;
var x = (rphi * Math.Cos(phi));
var y = (rphi * Math.Sin(phi));
//var z = (0.2 * t);
var z = (1.2 * t);
```



24.4.3 Conical helix based on Fermat's spiral

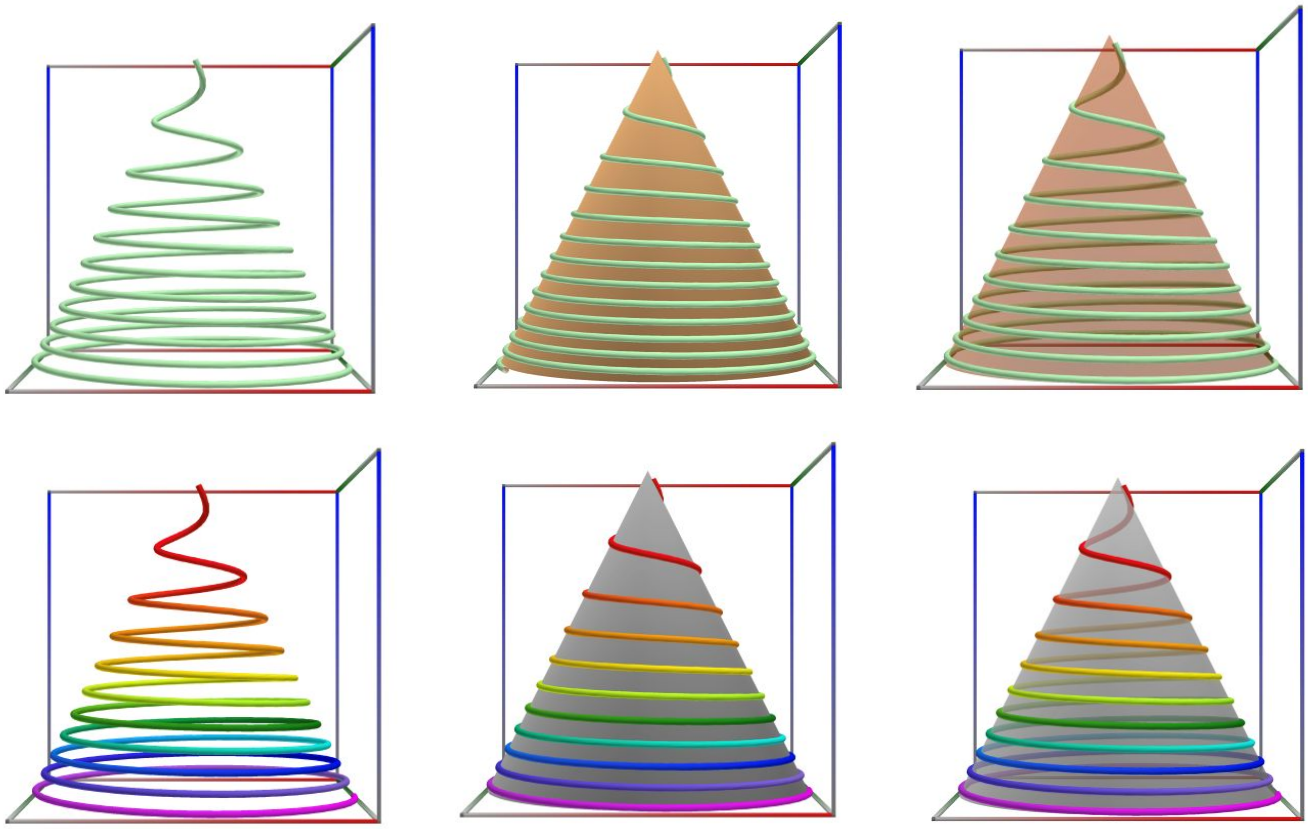
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_SpiralFConical.3D.xml (D03a-f).

See also: https://en.wikipedia.org/wiki/Conical_spiral

Conical helix based on Fermat's spiral

The example below uses the following code in C#

```
double a = 1.0;
double m = 0.2 / Math.PI;
double phi = t * Math.PI;
double rphi = a * Math.Sqrt(phi);
var x = (rphi * Math.Cos(phi));
var y = (rphi * Math.Sin(phi));
var z = (m * rphi);
```



24.4.4 Conical helix based on the logarithmic spiral (Concho-Spiral)

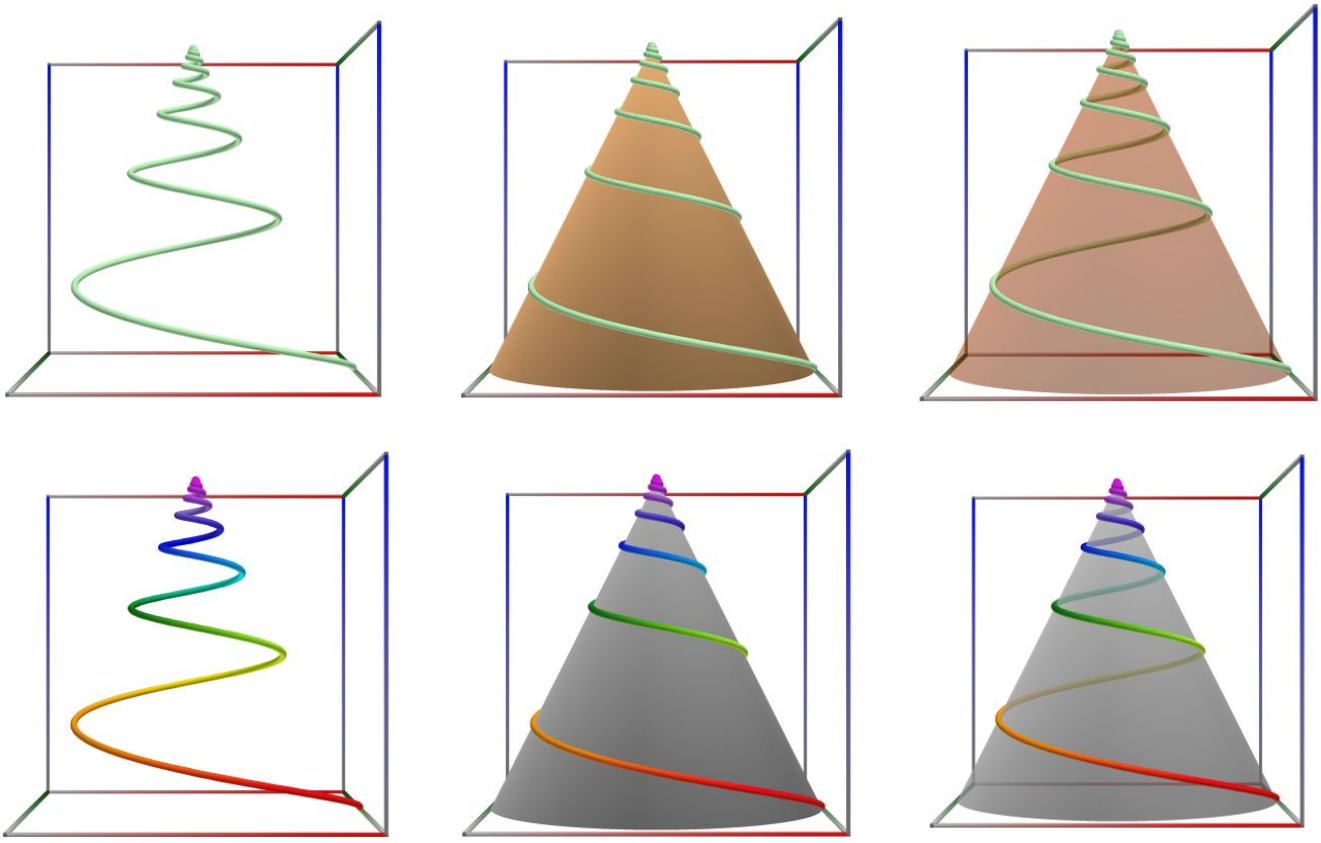
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_SpiralLConical.3D.xml (D04a-f).

See also: https://mathworld.wolfram.com/Concho-Spiral.html

See also: https://en.wikipedia.org/wiki/Conchospiral

The example below uses the following code in C#

```
double k = 0.1;
double a = 1.0;
double m = 0.2 / Math.PI;
double phi = t * Math.PI;
double rphi = a * Math.Exp(k * phi);
var x = (rphi * Math.Cos(phi));
var y = (rphi * Math.Sin(phi));
var z = (m * rphi);
```



24.4.5 Rhumb line of the sphere

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_SphericalRhumbline.3D.xml (D05a-f).

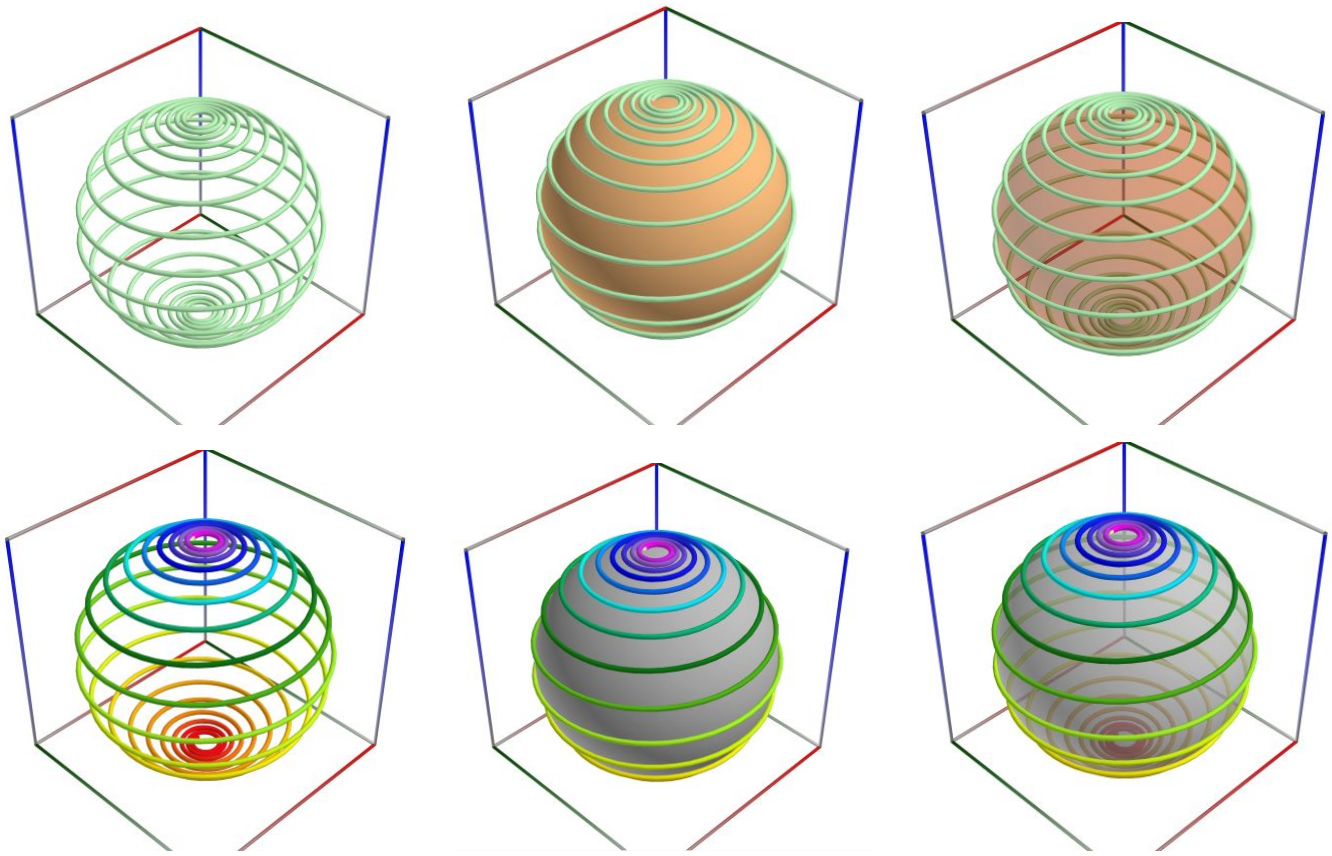
See also: https://mathcurve.com/courbes3d.gb/loxodromie/sphereloxodromie.shtml

The rhumb lines of the sphere, associated to a given axis, are the curves that form a constant angle with the parallel (or the meridians). Do not mistake the rhumb lines for the spherical helices, that form a constant angle with the equatorial plane, nor for the clelias.

The rhumb lines correspond to the straight lines in Mercator coordinates ; in other words, on the maps of the Earth that use the Mercator projection, the rhumb lines are represented by straight lines. The angle a that the images of the rhumb lines form on the map with respect to the horizontal is the same as the angle they form on the sphere with respect to the parallels. If we know the geographic coordinates and of two points, the angle a associated to the shortest rhumb line joining these two points is obtained by the formula: and the length is given by: . The notion of rhumb line is opposed to that of geodesic, shortest path joining two points on the sphere, which is an arc of a great circle.

The example below uses the following code in C#

```
double R = 1.0;
double alpha = 0.05;
double k = Math.Tan(alpha);
var x = R * Math.Cos(t) / Math.Cosh(k * t);
var y = R * Math.Sin(t) / Math.Cosh(k * t);
var z = R * Math.Tanh(k * t);
```



24.4.6 Clelia

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Path_SphericalClelia.3D.xml (D06a-f).

See also: https://mathcurve.com/courbes3d.gb/clelie/clelie.shtml

See also: https://en.wikipedia.org/wiki/Cl%C3%A9lie

The clelias are the loci of a point M on a meridian of a sphere rotating at constant speed w around the polar axis, the point M also moving at constant speed nw along this meridian. Therefore, physically, we obtain a clelia when peeling an orange or when rewinding regularly a spherical wool ball.

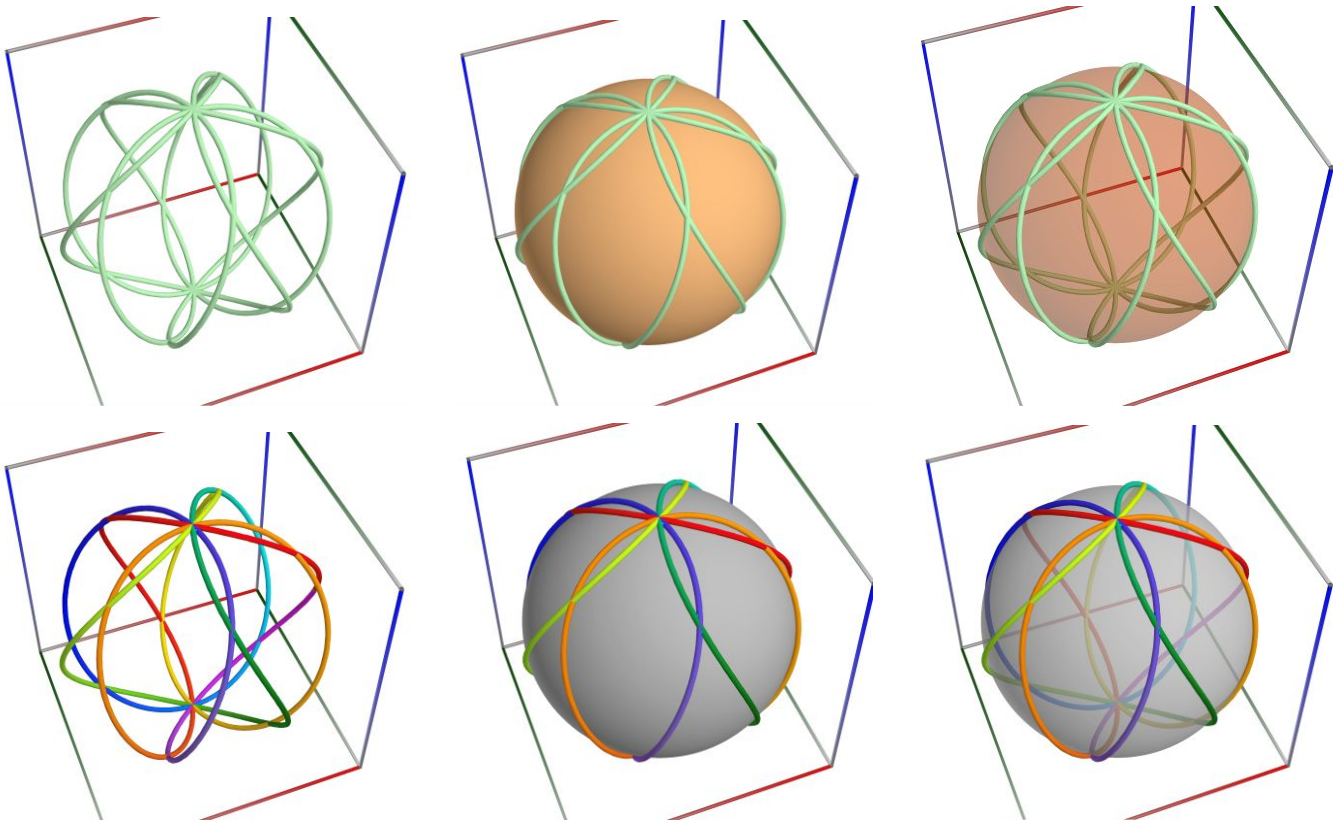
When n is rational with numerator p and denominator q:

In this case, the curve is composed of 2p patterns, obtained from the base pattern by rotations of axis Oz and angles $2k\pi/n$ and $p + 2k\pi/n$.

When p and q are odd, the curve is composed of p patterns, obtained from the base pattern by rotations of axis Oz and angles $2k\pi/n$.

The example below uses the following code in C#

```
double R = 1.0;
double n1 = 5.0 / 2.0;    // Example 1
var x = R * Math.Cos(n1 * t) * Math.Cos(t);
var y = R * Math.Cos(n1 * t) * Math.Sin(t);
var z = R * Math.Sin(n1 * t);
```



24.4.7 Spherical helix

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Path_SphericalHelix.3D.xml (D07a-f).

See also: https://mathworld.wolfram.com/SphericalSpiral.html

See also: https://mathworld.wolfram.com/SphericalHelix.html

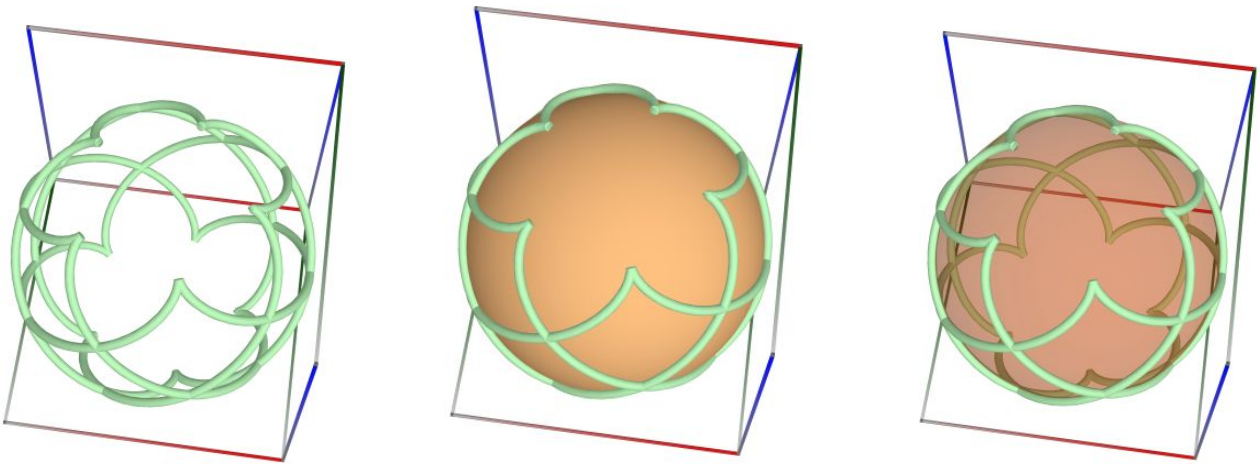
See also: https://mathcurve.com/courbes3d.gb/helicespheric/helicespheric.shtml

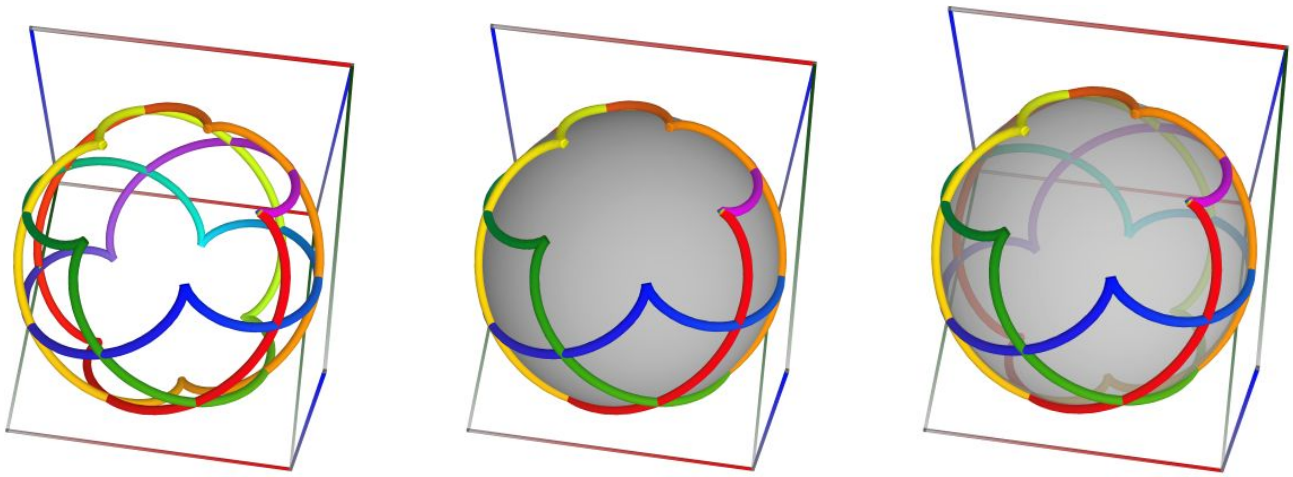
A spherical cycloid is the locus of a point on a circle rolling without slipping on a fixed circle, the angle between the two circles remaining constant equal to ; here, a is the radius of the fixed circle, that of the moving circle, and xOy the plane where lies the fixed circle.

When = 0, we get the hypocycloid, and when = , the epicycloid; apart from these two cases, the cycloid is traced on the sphere corresponding to both the base and the rolling circles, hence its name of spherical cycloid. The center W of this sphere is the point on Oz at height and its radius is . Therefore, the spherical cycloid is a roulette of the motion of a sphere over a sphere.

The example below uses the following code in C#

```
double q = 5.0 / 2.0;    // Example 1
//double q = 2.0 / 5.0;    // Example 2
//double q = 1.0 / 5.0;    // Example 3
double R = 1.0;
double k = q / (q + 2);
var x = R * (k * Math.Cos(t) * Math.Cos(k * t) + Math.Sin(t) * Math.Sin(k * t));
var y = R * (k * Math.Sin(t) * Math.Cos(k * t) - Math.Cos(t) * Math.Sin(k * t));
var z = R * Math.Sqrt(1 - k * k) * Math.Cos(k * t);
```





24.4.8 Satellite curve

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Path_SphericalSatellite.3D.xml (D08a-f).

See also: https://mathcurve.com/courbes3d.gb/satellite/satellite.shtml

See also: https://mathcurve.com/courbes3d.gb/capareda/capareda.shtml

The satellite curves are the various trajectories of a point M on a given great circle of a sphere rotating around one of its axes, while M has a uniform motion along the circle. These curves can also be seen as the trajectories of points on a circle in uniform rotation around an axis, this axis being itself in uniform rotation around an axis passing by the center of the circle.

The name of satellite curve comes from the fact that the trajectory, in the frame associated to the Earth, of a satellite in uniform circular rotation around the center of the Earth is such a curve: see for example this book (pages 177 to 181).

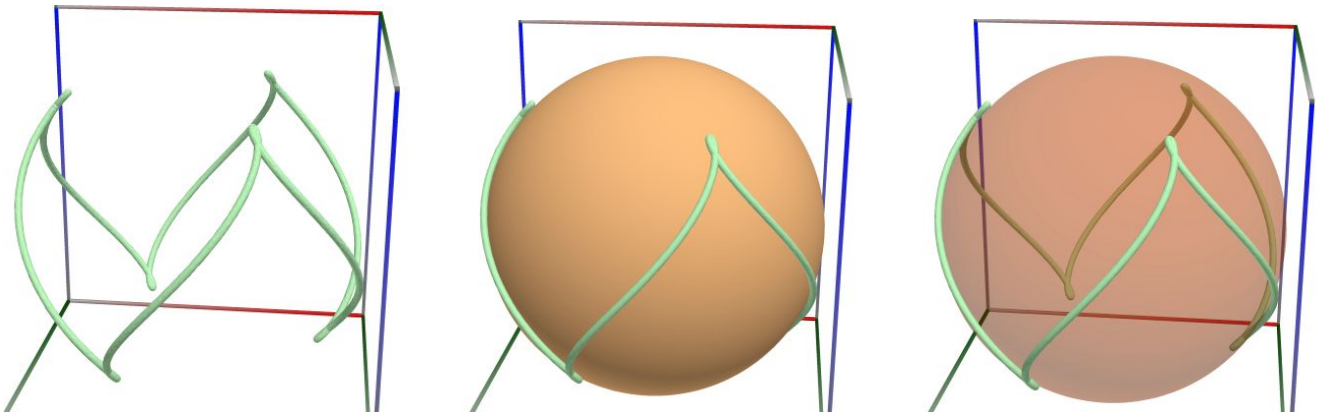
In the above parametrization, the sphere centered on O turns around Oz and the plane of the circle forms an angle with respect to xOy; k is the ratio of the speed of rotation of M on the circle over the speed of rotation of the sphere around its axis.

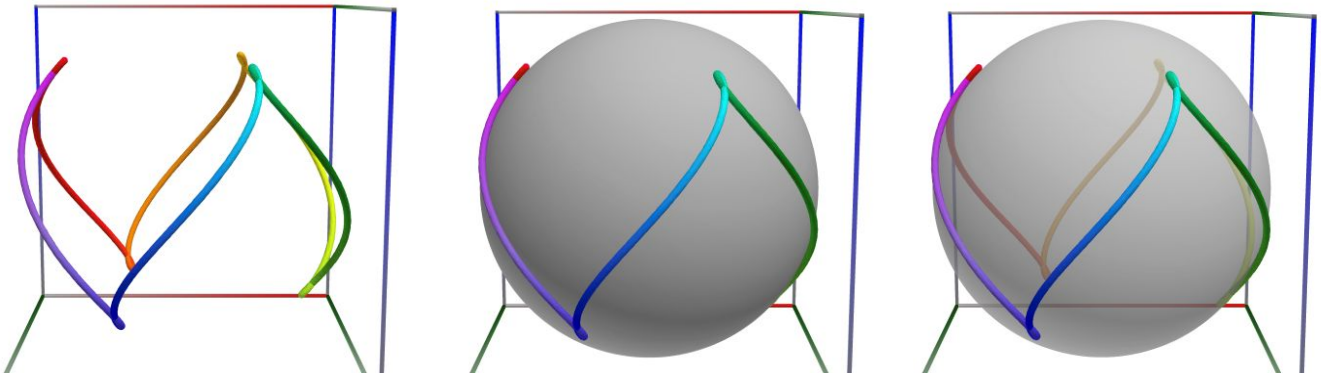
Special cases of satellite curves include:

- the clelias when the great circle meets the axis of rotation of the sphere ().
- the spherical helices when (in the second definition above, the circle rolls without slipping on a fixed circle); it is the case where the curve has cuspidal points.

The example below uses the following code in C#

```
double R = 1.0;
//double alpha = 1 * Math.PI / 2;  // This corresponds to clelias
double alpha = 3 * Math.PI / 4;
double k = 3.0 / 4.0;
//double k = -Math.Cos(alpha);  // This corresponds to spherical helices
var x = R * (Math.Cos(alpha) * Math.Cos(t) * Math.Cos(k * t) - Math.Sin(t) * Math.Sin(k * t));
var y = R * (Math.Cos(alpha) * Math.Sin(t) * Math.Cos(k * t) + Math.Cos(t) * Math.Sin(k * t));
var z = R * Math.Sin(alpha) * Math.Cos(k * t);
```





24.5 (Coil) springs

See also: https://en.wikipedia.org/wiki/Coil_spring

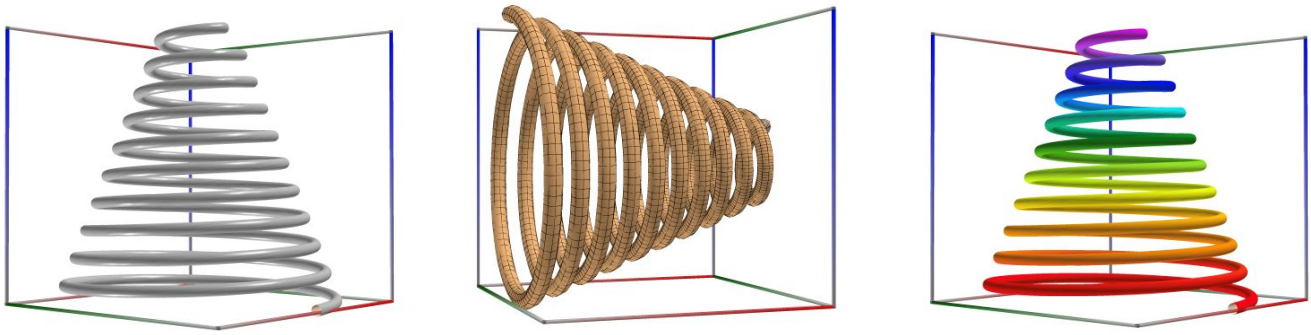
See also: https://en.wikipedia.org/wiki/Spring_(device)

24.5.1 Spring 1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_Spring1.3D.xml (D01a-c).

The example below uses the following code in C#

```
var x = ((-3.75 * t + 100) * Math.Sin(t * Math.PI)) / 100;
var z = (20 * t) / 100;
var y = ((-3.75 * t + 100) * Math.Cos(t * Math.PI)) / 100;
```

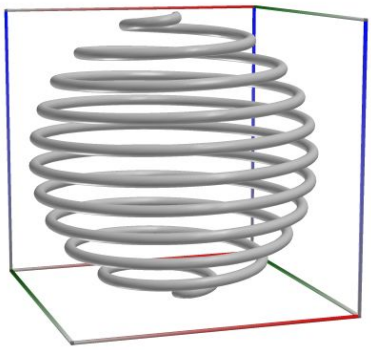


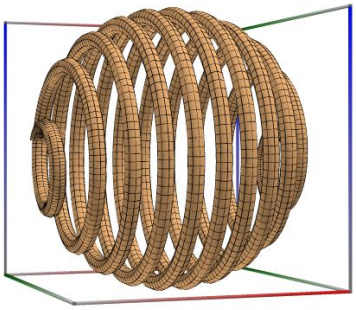
24.5.2 Spring 2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Spring2.3D.xml (D02a-b).

The example below uses the following code in C#

```
var x = (Math.Sqrt(10000 - 100 * t * t) * Math.Sin(t * Math.PI)) / 100;
var z = (20 * t) / 100;
var y = (Math.Sqrt(10000 - 100 * t * t) * Math.Cos(t * Math.PI)) / 100;
```



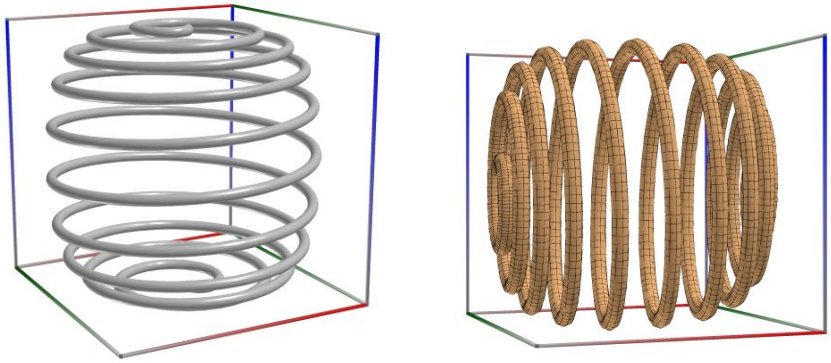


24.5.3 Spring 3

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Spring4.3D.xml (D04a-b).

The example below uses the following code in C#

```
var x = (Math.Sqrt(10000 - 100 * t * t) * Math.Sin(t * Math.PI)) / 100;
var z = 209.22 * (Math.Tanh(0.1896 * t)) / 100;
var y = (Math.Sqrt(10000 - 100 * t * t) * Math.Cos(t * Math.PI)) / 100;
```

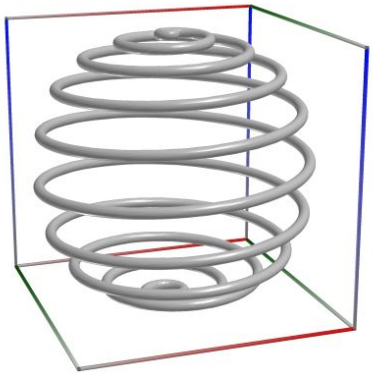


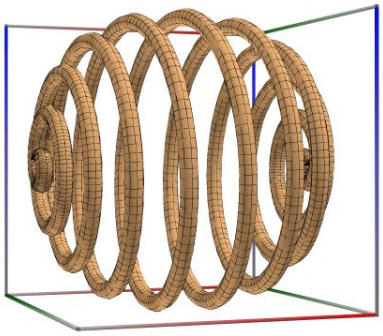
24.5.4 Spring 4

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Spring4.3D.xml (D04a-b).

The example below uses the following code in C#

```
var x = (200 * Math.Cos(0.05 * t * Math.PI) * Math.Sin(t * Math.PI)) / 100;
var z = 209.22 * (Math.Tanh(0.1896 * t)) / 100;
var y = (200 * Math.Cos(0.05 * t * Math.PI) * Math.Cos(t * Math.PI)) / 100;
```



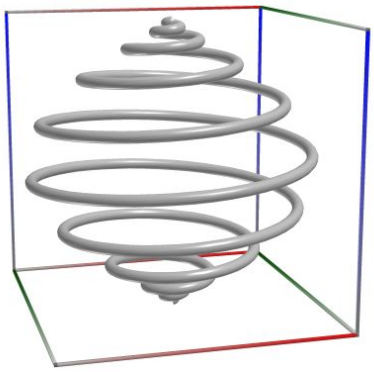


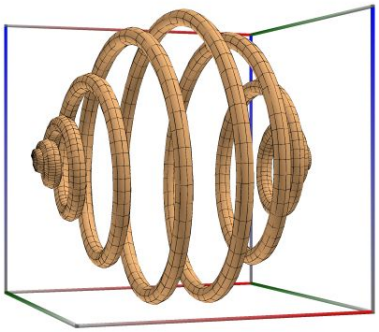
24.5.5 Spring 5

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_Spring5.3D.xml (D05a-b).

The example below uses the following code in C#

```
double e = Math.Exp(-(0.2 * t) * (0.2 * t));
var x = (200 * e * Math.Sin(t * Math.PI)) / 100;
var z = 209.22 * (Math.Tanh(0.1896 * t)) / 100;
var y = (200 * e * Math.Cos(t * Math.PI)) / 100;
```



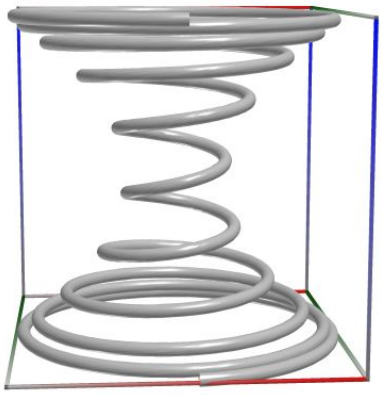


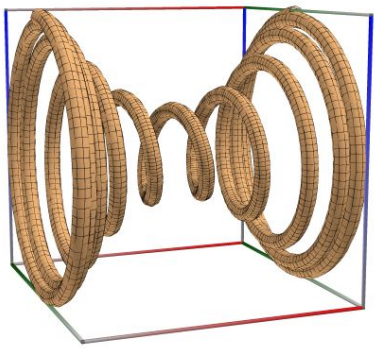
24.5.6 Spring 6

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Path_Spring6.3D.xml (D06a-b).

The example below uses the following code in C#

```
double e = Math.Exp(-(0.2 * t) * (0.2 * t));
var x = ((200 - 140 * e) * Math.Sin(t * Math.PI)) / 100;
var z = 207.46 * (Math.Tanh(0.2 * t)) / 100;
var y = ((200 - 140 * e) * Math.Cos(t * Math.PI)) / 100;
```



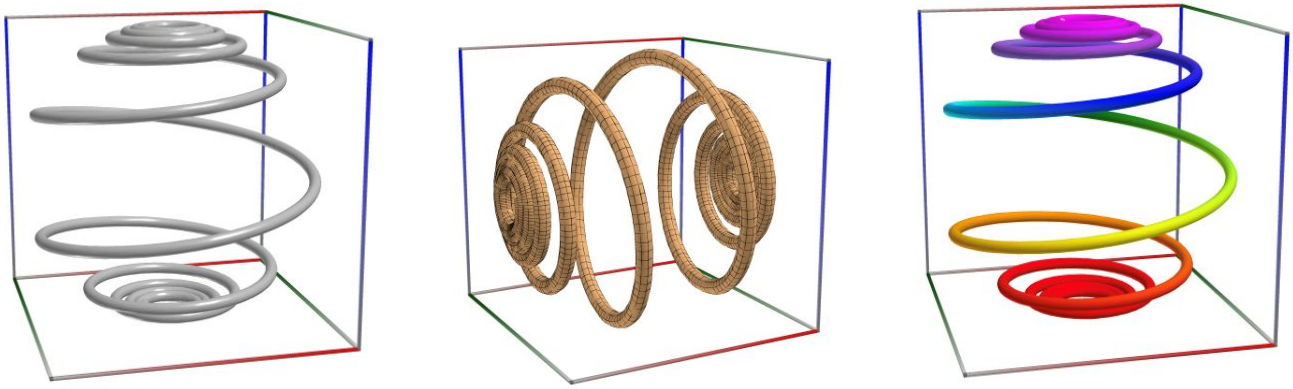


24.5.7 Spring 7

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Path_Spring7.3D.xml (D07a-b).

The example below uses the following code in C#

```
var x = (200 * Math.Cos(t) * Math.Cos(Math.Atan(0.15 * t))) / 100;
var z = -200 * Math.Sin(Math.Atan(0.15 * t)) / 100;
var y = (200 * Math.Sin(t) * Math.Cos(Math.Atan(0.15 * t))) / 100;
```

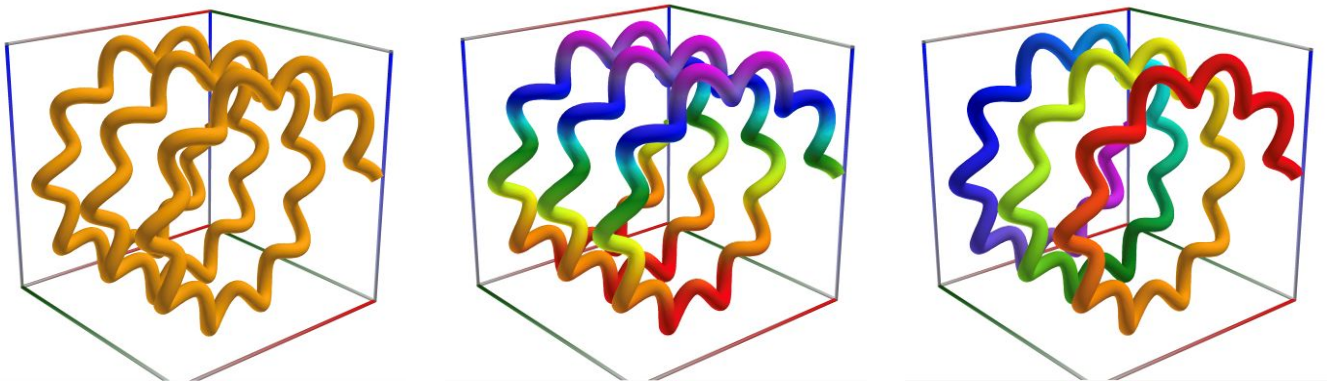


24.5.8 Spring 8

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Path_Spring8.3D.xml (D08a-b).

The example below uses the following code in C#

```
double R = 100.0;
double G = 160.0;
double D = 15.0;
double N = 10.0;
var x = (Math.Cos(t * Math.PI) * R + Math.Cos(t * Math.PI) * D * Math.Cos(N * t * Math.PI)) / 100;
var y = (D * Math.Sin(N * t * Math.PI) + 0.5 * G * t) / 100;
var z = (Math.Sin(t * Math.PI) * R + Math.Sin(t * Math.PI) * D * Math.Cos(N * t * Math.PI)) / 100;
```



24.6 General knots

24.6.1 Trefoil A

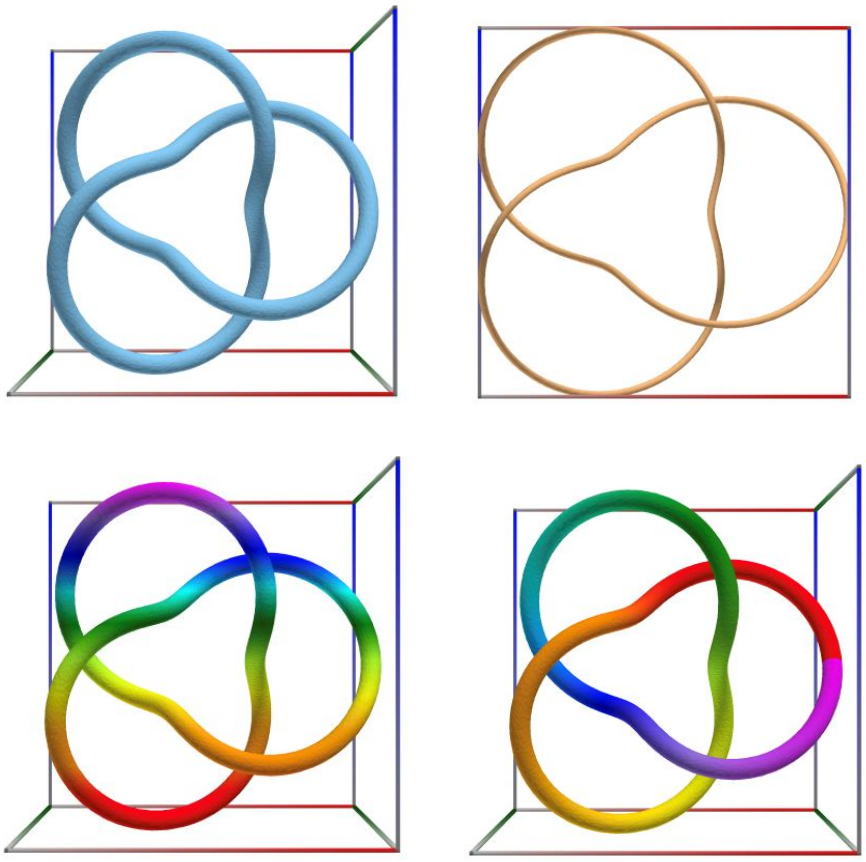
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_Trefoil_Knoten_A.3D.xml (D01a-d).

See also: https://en.wikipedia.org/wiki/Trefoil_knot

See also: https://katlas.org/wiki/T(3,2)

The example below uses the following code in C#

```
var x = (2 + Math.Cos(3 * t)) * Math.Cos(2 * t);
var y = (2 + Math.Cos(3 * t)) * Math.Sin(2 * t);
var z = Math.Sin(3 * t);
```



24.6.2 Trefoil B

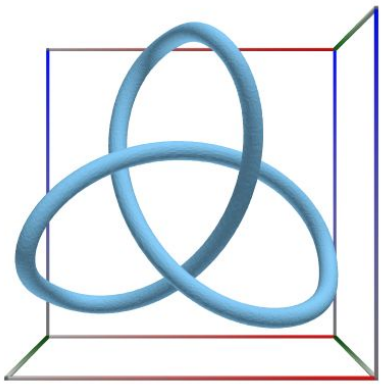
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Trefoil_Knoten_B.3D.xml (D02a-d).

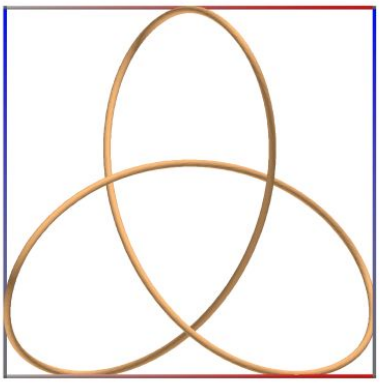
See also: https://en.wikipedia.org/wiki/Trefoil_knot

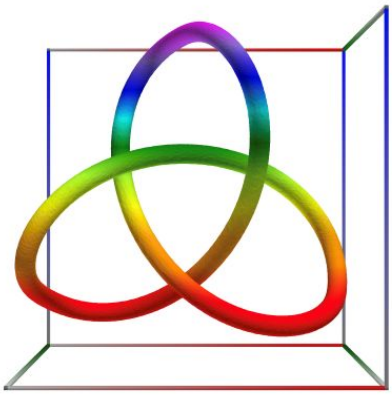
See also: https://katlas.org/wiki/T(3,2)

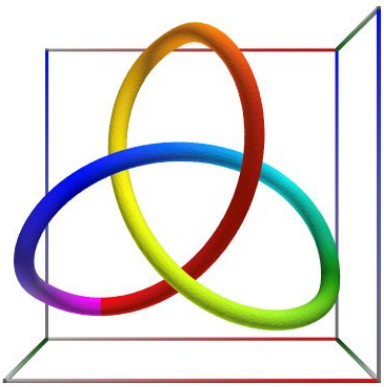
The example below uses the following code in C#

```
var x = (-10 * Math.Cos(t) - 2 * Math.Cos(5 * t) + 15 * Math.Sin(2 * t)) / 10;
var y = (-15 * Math.Cos(2 * t) + 10 * Math.Sin(t) - 2 * Math.Sin(5 * t)) / 10;
var z = (10 * Math.Cos(3 * t)) / 10;
```









24.6.3 Square knot

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_SquareKnotP_P90T90.3D.xml (D03a-f).

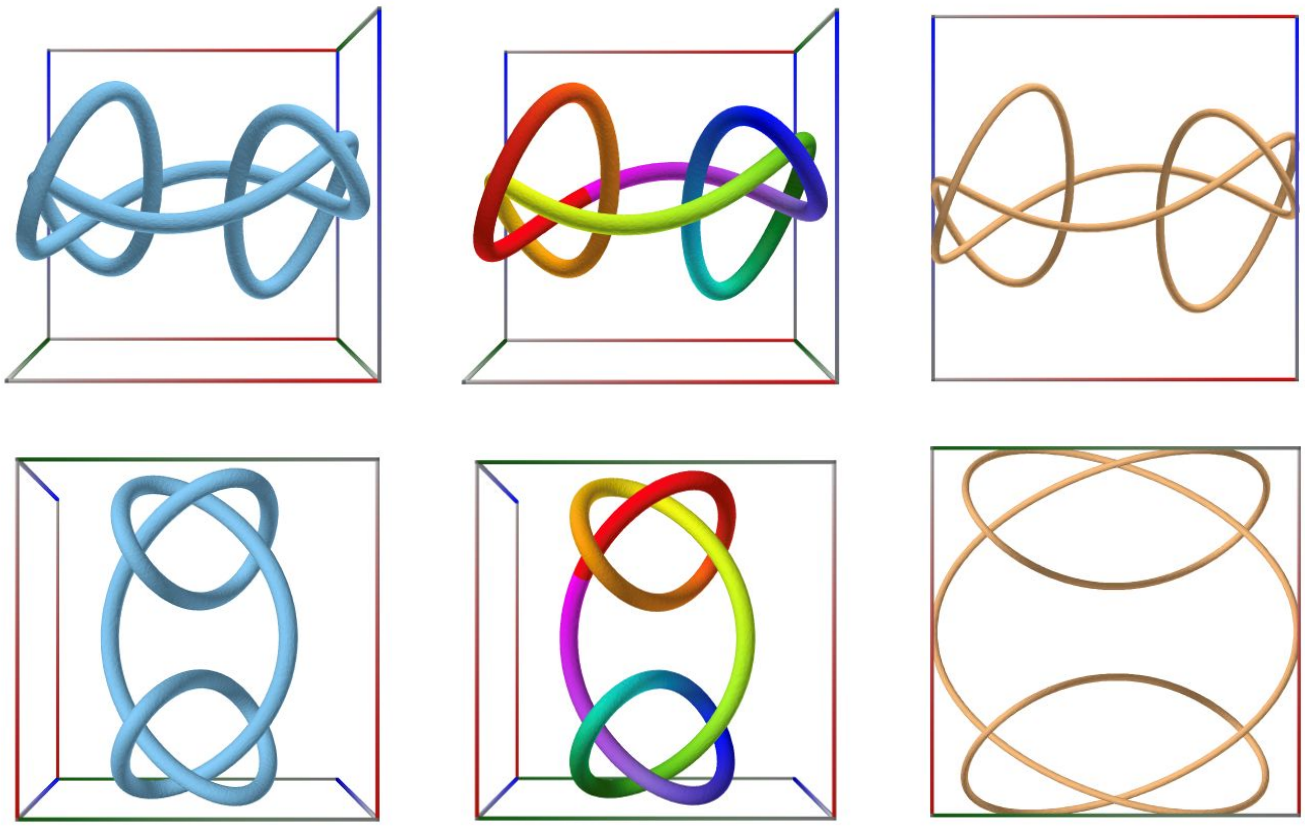
See also: https://en.wikipedia.org/wiki/Square_knot_(mathematics)

See also: https://mathworld.wolfram.com/SquareKnot.html

See also: https://mathcurve.com/courbes3d.gb/plat.vache/plat_vache.shtml

The example below uses the following code in C#

```
var x = (-22 * Math.Cos(t) - 128 * Math.Sin(t) - 44 * Math.Cos(3 * t) - 78 * Math.Sin(3 * t)) / 10;
var y = (11 * Math.Cos(t) - 43 * Math.Cos(3 * t) + 34 * Math.Cos(5 * t) - 39 * Math.Sin(5 * t)) / 10;
var z = (70 * Math.Cos(3 * t) - 40 * Math.Sin(3 * t) + 8 * Math.Cos(5 * t) - 9 * Math.Sin(5 * t)) / 10;
```



24.6.4 Granny knot

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_GrannyKnot.3D.xml (D04a-f).

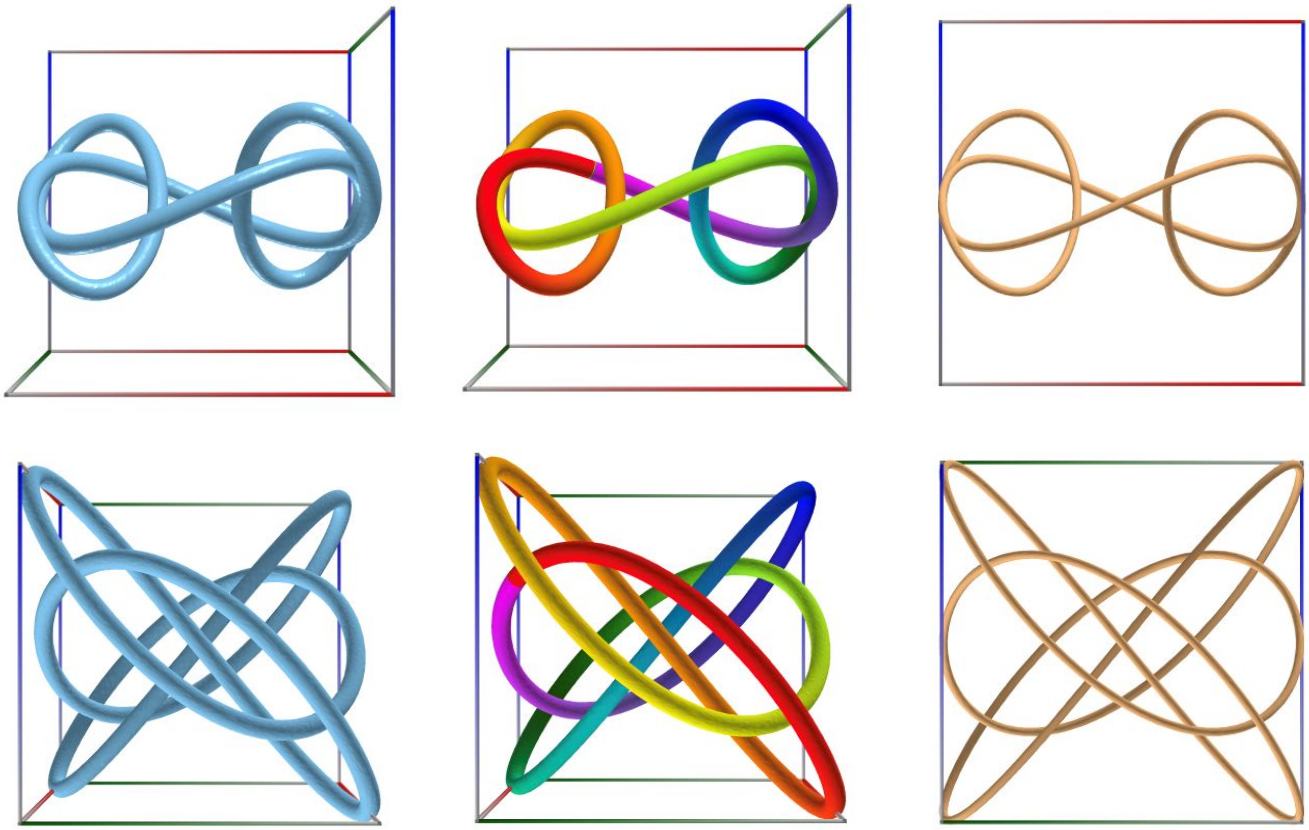
See also: https://en.wikipedia.org/wiki/Granny_knot_(mathematics)

See also: https://mathworld.wolfram.com/GrannyKnot.html

See also: https://mathcurve.com/courbes3d.gb/plat.vache/plat_vache.shtml

The example below uses the following code in C#

```
var x = (-22 * Math.Cos(t) - 128 * Math.Sin(t) - 44 * Math.Cos(3 * t) - 78 * Math.Sin(3 * t)) / 10;
var y = (-10 * Math.Cos(2 * t) - 27 * Math.Sin(2 * t) + 38 * Math.Cos(4 * t) + 46 * Math.Sin(4 * t)) / 10;
var z = (70 * Math.Cos(3 * t) - 40 * Math.Sin(3 * t)) / 10;
```



24.6.5 Cinquefoil Knot

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_CinquefoilKnot.3D.xml (D05a-d).

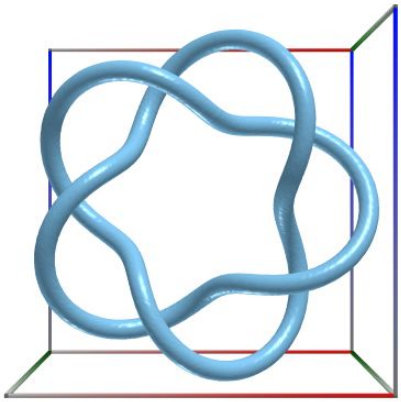
See also: https://en.wikipedia.org/wiki/Cinquefoil_knot

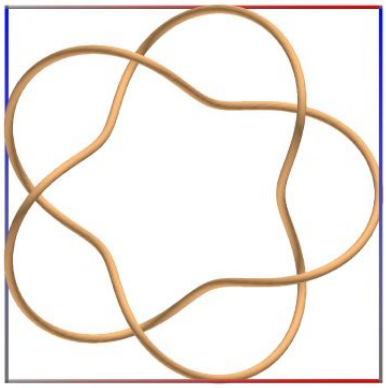
See also: https://katlas.org/wiki/T(5,2)

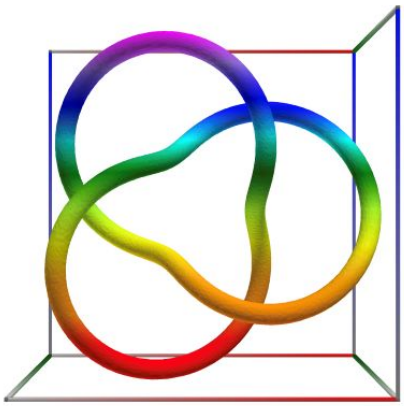
Cinquefoil Knot: https://home.adelphi.edu/~stemkoski/knotgallery/

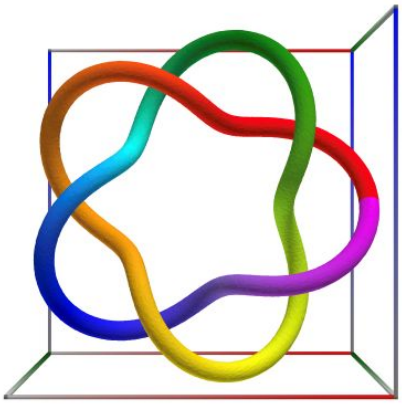
The example below uses the following code in C#

```
var x = Math.Cos(2 * t) * (3 + Math.Cos(5 * t)) / 10;
var y = Math.Sin(2 * t) * (3 + Math.Cos(5 * t)) / 10;
var z = Math.Sin(5 * t) / 10;
```









24.6.6 74 Knot

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Path_74Knot.3D.xml (D06a-f).

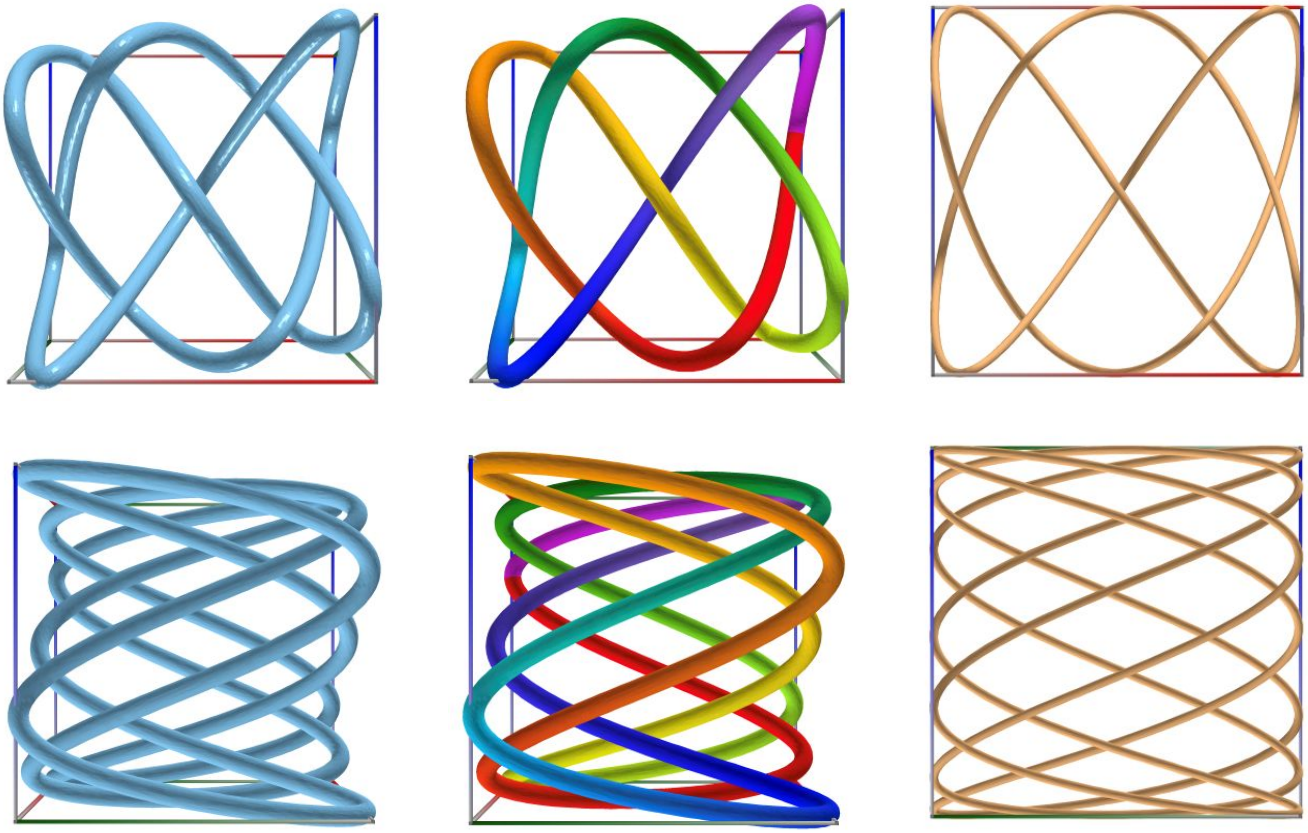
See also: https://en.wikipedia.org/wiki/74_knot

This is a Lissajous knot.

See also: https://katlas.org/wiki/7_4

The example below uses the following code in C#

```
var x = Math.Cos(2 * t + 0.22) / 10;
var y = Math.Cos(3 * t + 1.10) / 10;
var z = Math.Cos(7 * t) / 10;
```



24.6.7 Figure-eight knot

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Path_FigureEightKnot.3D.xml (D07a-f).

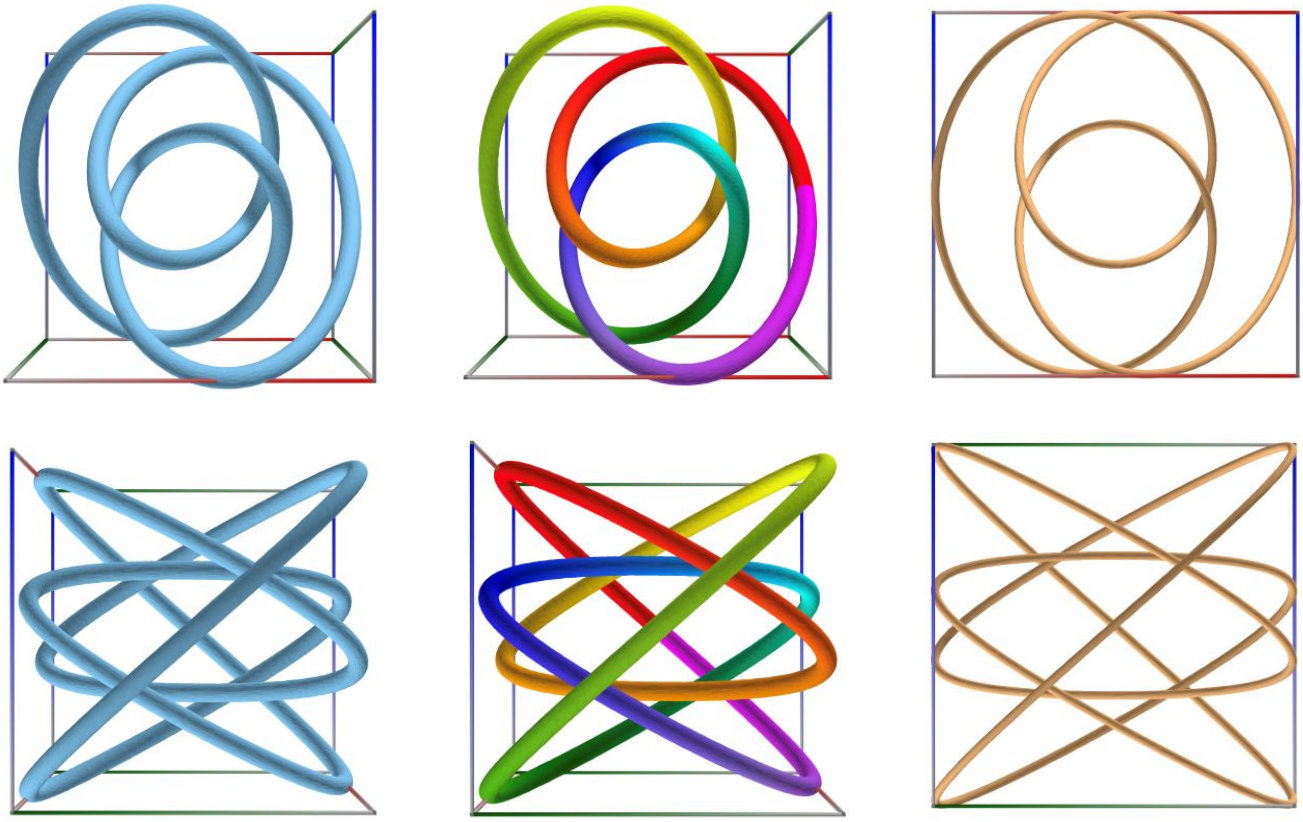
See also: https://mathcurve.com/courbes3d.gb/noeuds/noeudenhuit.shtml

See also: https://en.wikipedia.org/wiki/Figure-eight_knot_(mathematics)

See also: https://katlas.org/wiki/4_1

The example below uses the following code in C#

```
var x = ((2 + Math.Cos(2 * t)) * Math.Cos(3 * t)) / 10;
var y = ((2 + Math.Cos(2 * t)) * Math.Sin(3 * t)) / 10;
var z = (Math.Sin(4 * t)) / 10;
```



24.7 Torus knots

See also: https://katlas.org/wiki/36_Torus_Knots

24.7.1 Torus knot 3:2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_TorusKnotp3q2.3D.xml (D01a-f).

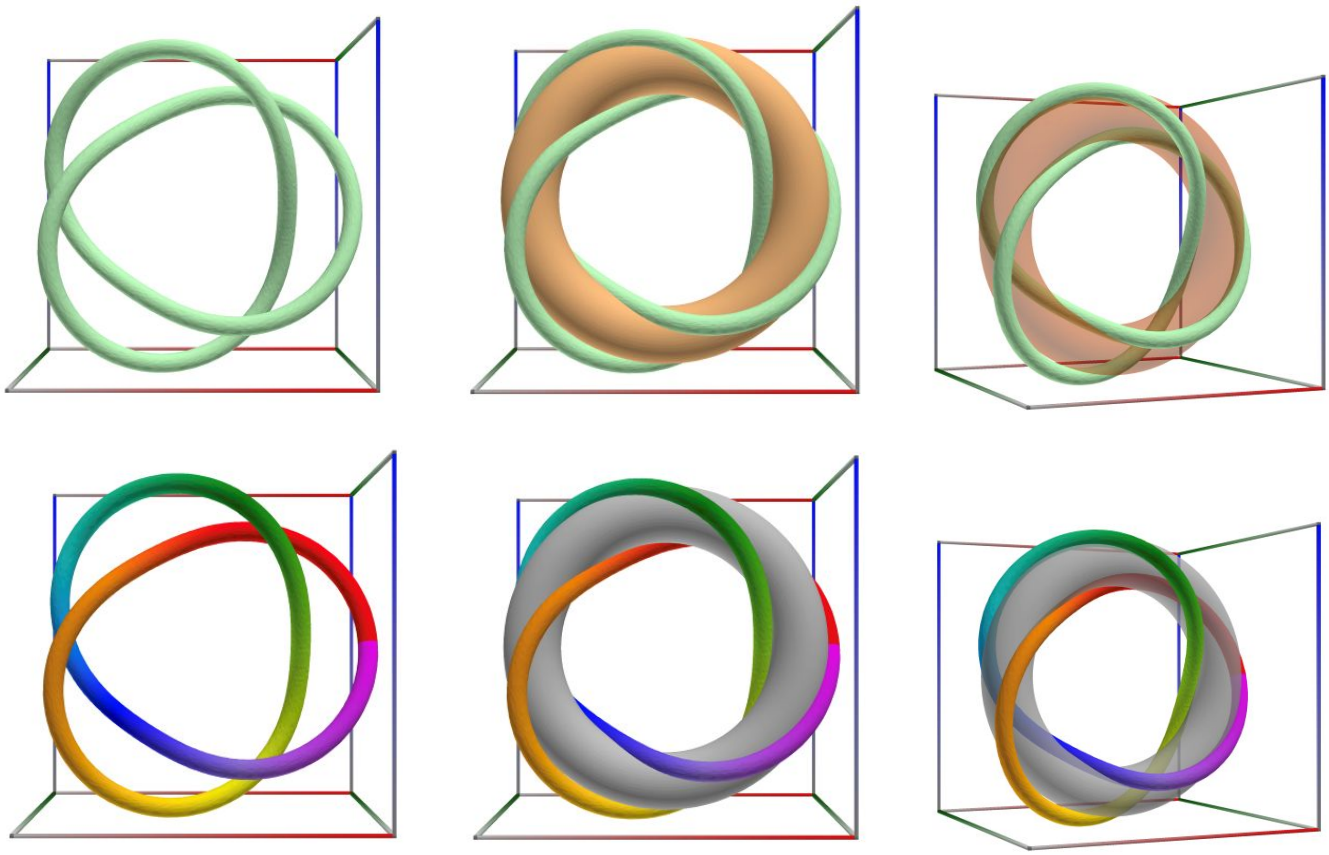
Some text

See also: https://mathworld.wolfram.com/TrefoilKnot.html

See also: https://katlas.org/wiki/T(3,2)

The example below uses the following code in C#

```
double R = 100;
double r = 25;
double p = 3;
double q = 2;
var x = ((R + r * Math.Cos(p * t)) * Math.Cos(q * t)) / 50;
var y = ((R + r * Math.Cos(p * t)) * Math.Sin(q * t)) / 50;
var z = (r * Math.Sin(p * t)) / 50;
```



24.7.2 Torus knot 5:2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_TorusKnotp5q2.3D.xml (D02a-f).

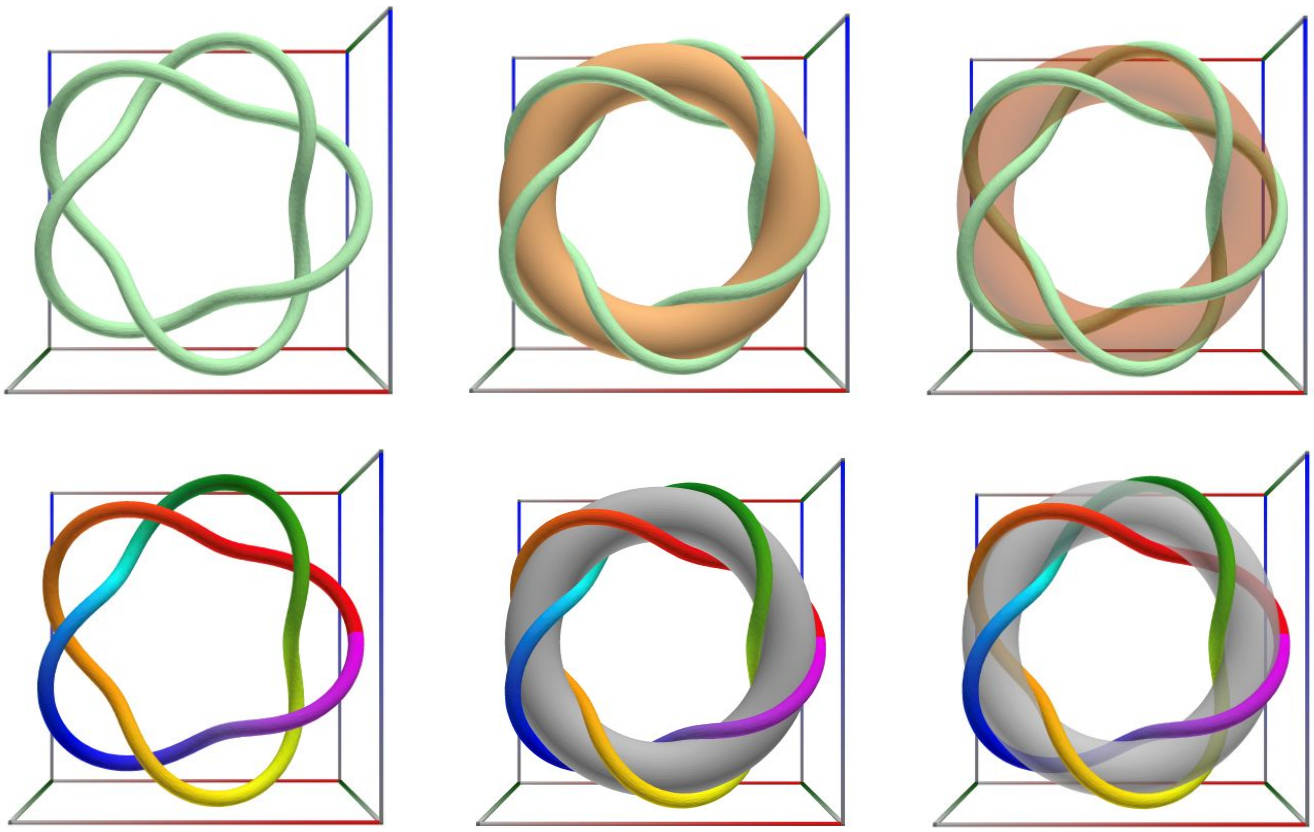
Some text

See also: https://en.wikipedia.org/wiki/Cinquefoil_knot

See also: https://katlas.org/wiki/T(5,2)

The example below uses the following code in C#

```
double R = 100;
double r = 25;
double p = 5;
double q = 2;
var x = ((R + r * Math.Cos(p * t)) * Math.Cos(q * t)) / 50;
var y = ((R + r * Math.Cos(p * t)) * Math.Sin(q * t)) / 50;
var z = (r * Math.Sin(p * t)) / 50;
```



24.7.3 Torus knot 7:2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_TorusKnotp7q2.3D.xml (D03a-f).

Some text

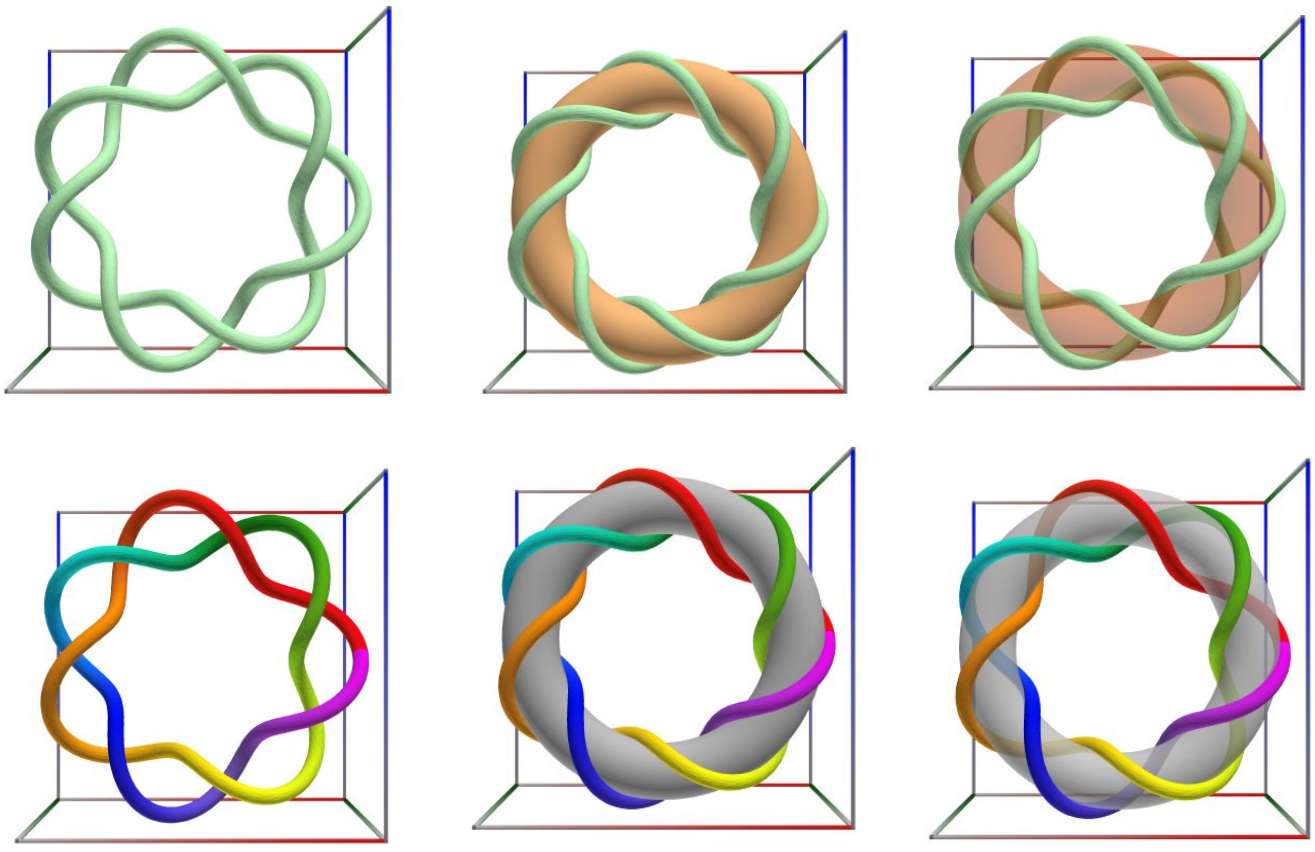
See also: https://en.wikipedia.org/wiki/71_knot

See also: https://katlas.org/wiki/T(7,2)

See also: https://katlas.org/wiki/7_1

The example below uses the following code in C#

```
double R = 100;
double r = 25;
double p = 7;
double q = 2;
var x = ((R + r * Math.Cos(p * t)) * Math.Cos(q * t)) / 50;
var y = ((R + r * Math.Cos(p * t)) * Math.Sin(q * t)) / 50;
var z = (r * Math.Sin(p * t)) / 50;
```



24.7.4 Torus knot 7:3

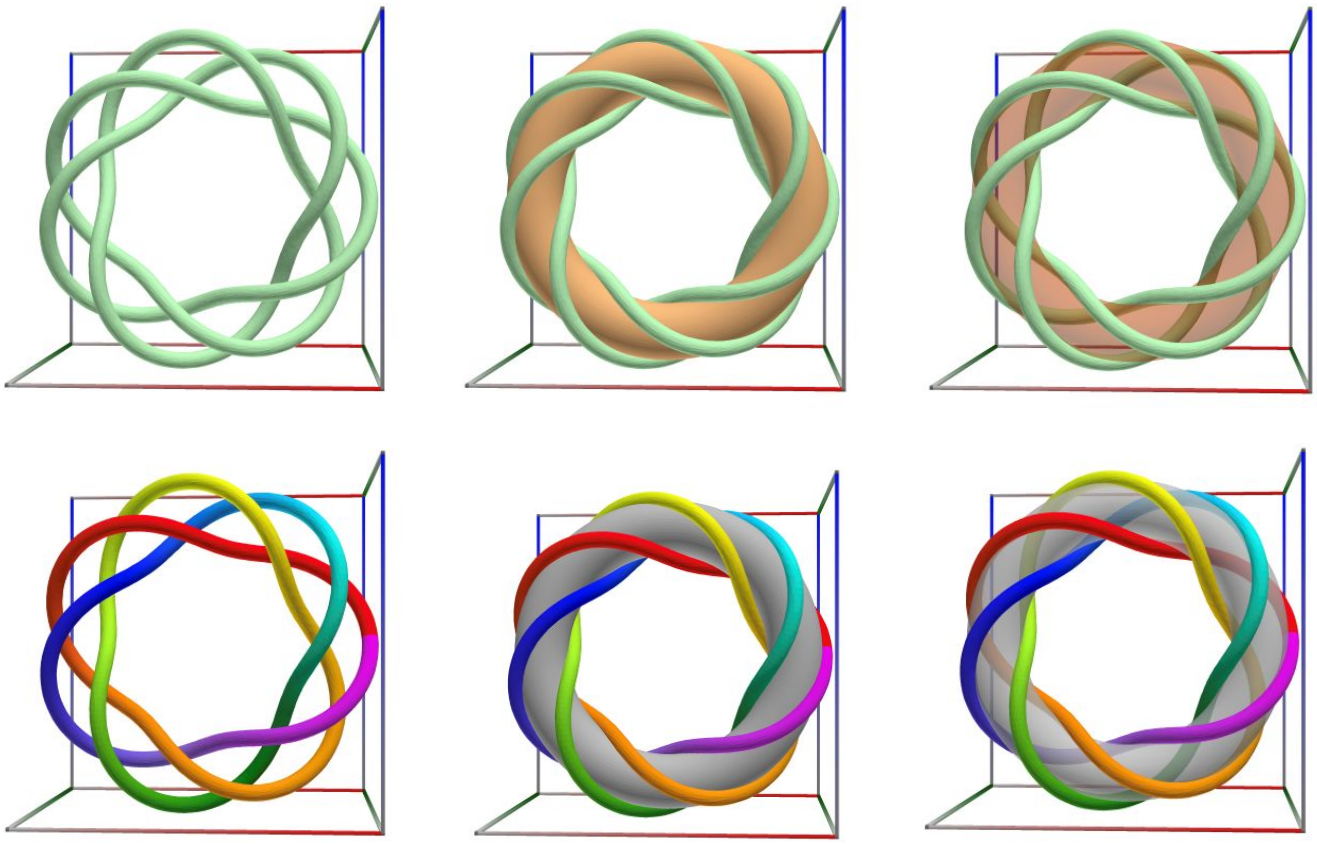
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_TorusKnotp7q3.3D.xml (D04a-f).

Some text

See also: https://katlas.org/wiki/T(7,3)

The example below uses the following code in C#

```
double R = 100;
double r = 25;
double p = 7;
double q = 3;
var x = ((R + r * Math.Cos(p * t)) * Math.Cos(q * t)) / 50;
var y = ((R + r * Math.Cos(p * t)) * Math.Sin(q * t)) / 50;
var z = (r * Math.Sin(p * t)) / 50;
```



24.7.5 Torus knot 15:2

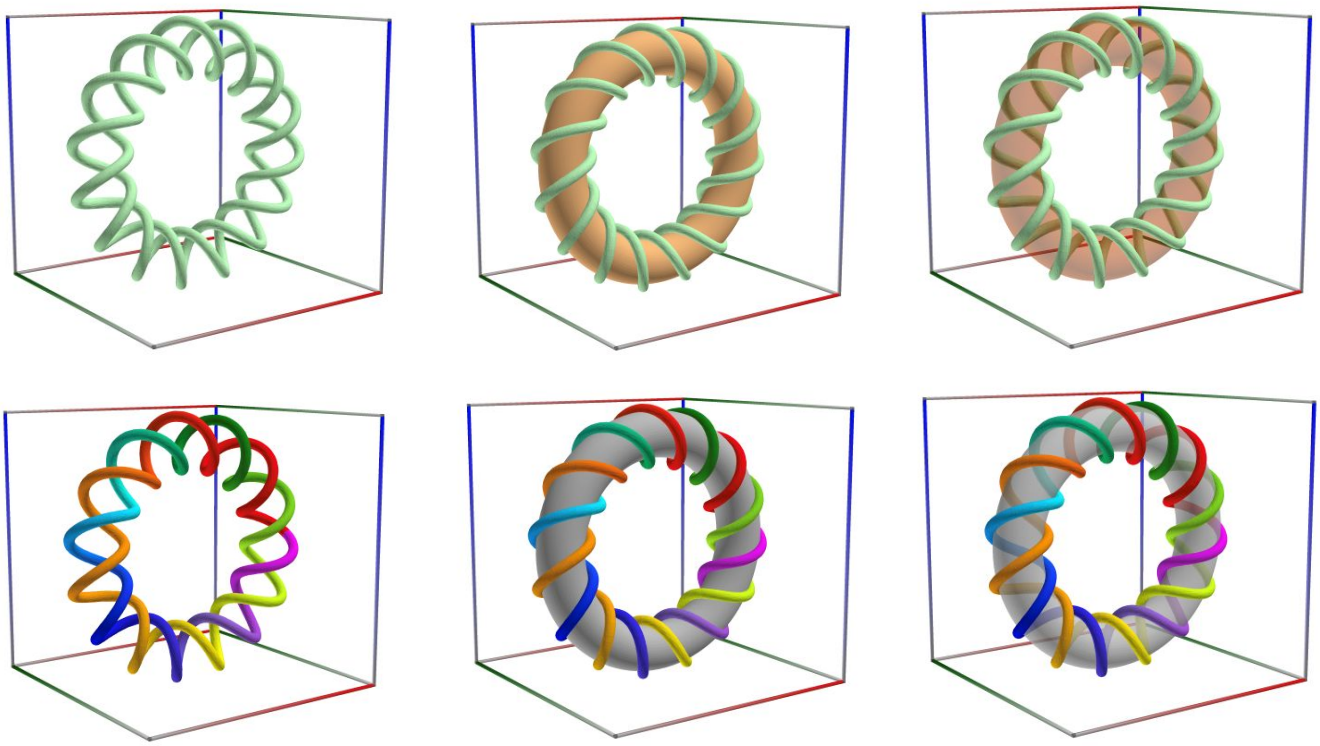
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_TorusKnotp15q2.3D.xml (D05a-f).

Some text

See also: https://katlas.org/wiki/T(15,2)

The example below uses the following code in C#

```
double R = 100;
double r = 25;
double p = 15;
double q = 2;
var x = ((R + r * Math.Cos(p * t)) * Math.Cos(q * t)) / 50;
var y = ((R + r * Math.Cos(p * t)) * Math.Sin(q * t)) / 50;
var z = (r * Math.Sin(p * t)) / 50;
```



24.8 Lissajous knots

See also: https://en.wikipedia.org/wiki/Lissajous_knot

See also: https://mathcurve.com/courbes3d.gb/lissajous3d/noeudlissajous.shtml

See also: https://knotplot.com/manual/LissajousParams.html

The Lissajous knots are the knots associated to the 3D Lissajous curves when they are closed and without double point.

As is proved in the above article by Jones and Przytycki, they also are the knots associated to the trajectories of a ball (not subject to gravity) in a parallelepipedic billiard, or even a cubic one (imagine a glass box).

It can be proved that for all values of p, q, r, there exist values of j and y such that the knot is trivial, and that certain knots such as the trefoil knot are not Lissajous knots.

See also: https://mathcurve.com/courbes3d.gb/lissajous3d/lissajous3d.shtml

The 3D Lissajous curves are the trajectories of a point in space the rectangular components of which have a sinusoidal motion. The projections on the 3 coordinate planes are the classic 2D Lissajous curves.

For n = 1 or n = m, we get a cylindrical sine wave. We get a closed curve if and only if n and m are rational.

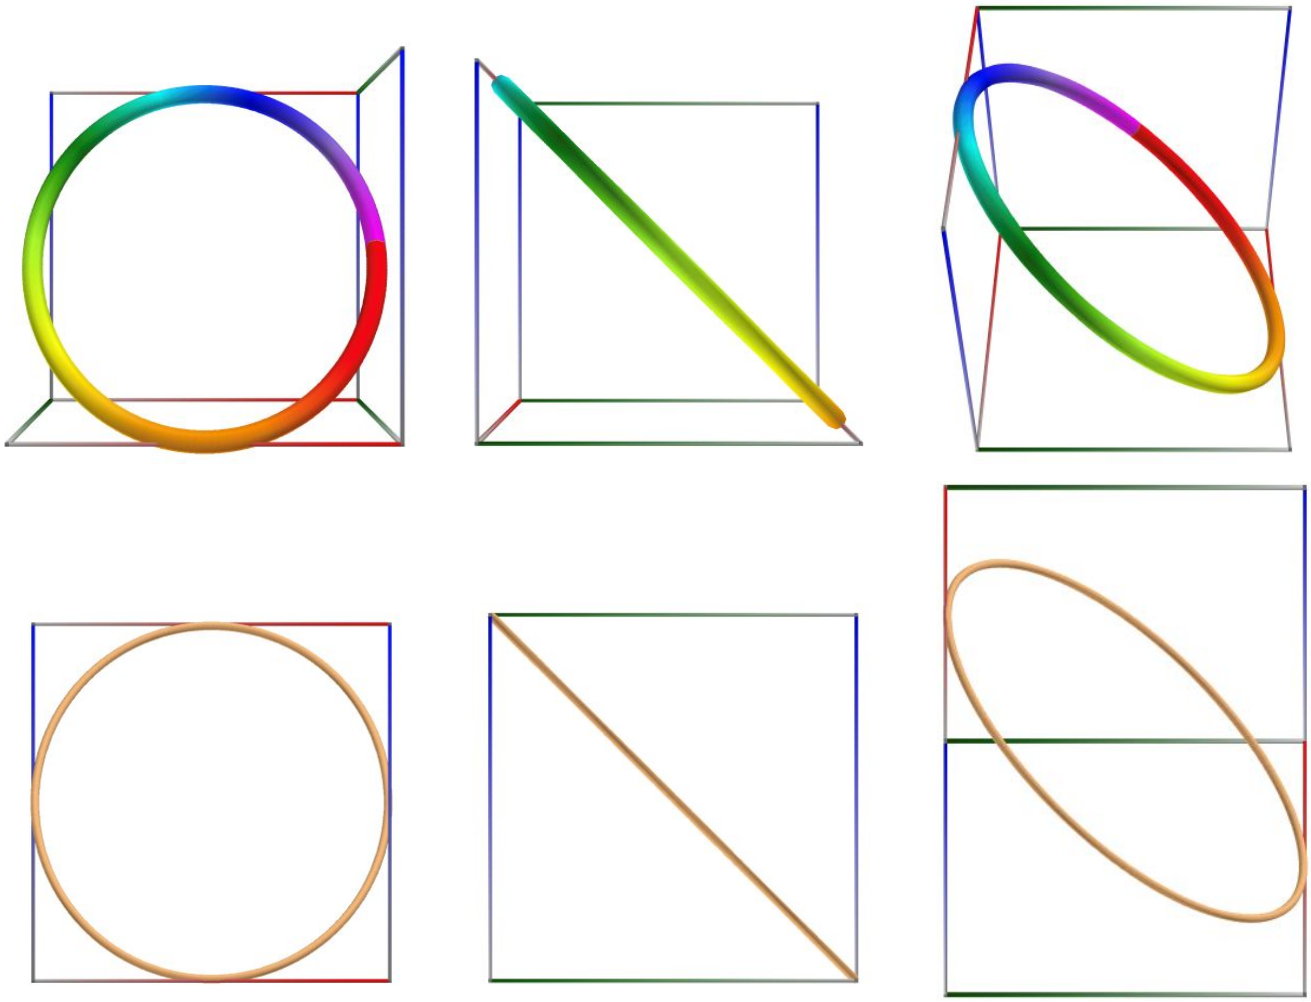
When the curve does not have double points, nor a cusp, it forms a knot in space, called Lissajous knot, equivalent to a cubic billiard knot.

24.8.1 Lissajous knot 1-1-1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_111_LKnot_P090T090.3D.xml (D01a-f).

The example below uses the following code in C#

```
double pi = Math.PI;
double a1, k1, l1;
double a2, k2, l2;
double a3, k3, l3;
a1 = 100; k1 = 1; l1 = 0;
a2 = 100; k2 = 1; l2 = pi / 2;
a3 = 100; k3 = 1; l3 = pi / 2;
var x = (a1 * Math.Cos(k1 * t + l1)) / 50;
var y = (a3 * Math.Cos(k3 * t + l3)) / 50;
var z = (a2 * Math.Cos(k2 * t + l2)) / 50;
```

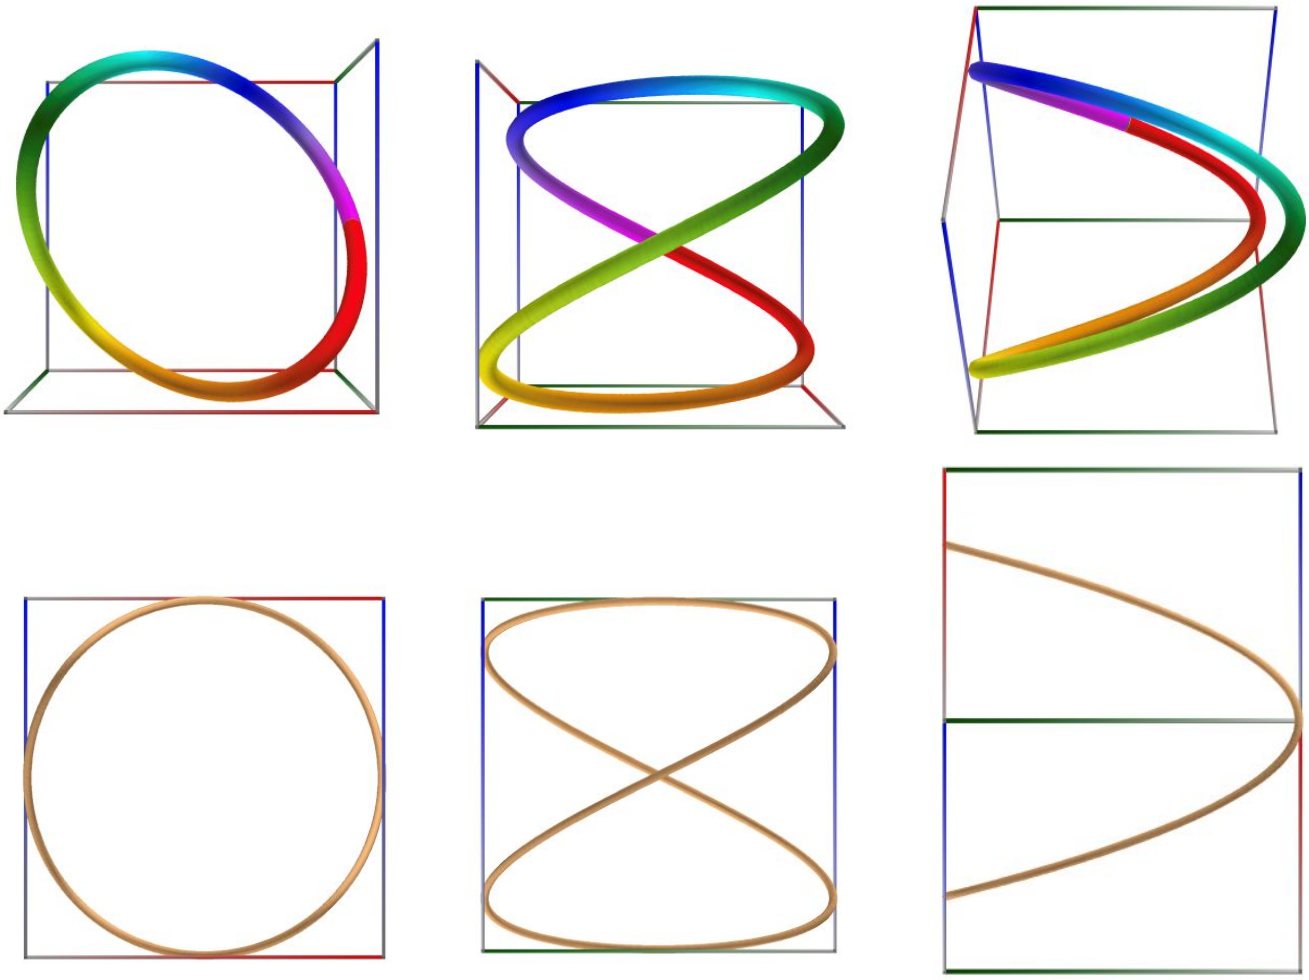


24.8.2 Lissajous knot 1-2-1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_121_LKnot_P090T090.3D.xml (D02a-f).

The example below uses the following code in C#

```
double pi = Math.PI;
double a1, k1, l1;
double a2, k2, l2;
double a3, k3, l3;
a1 = 100; k1 = 1; l1 = 0;
a2 = 100; k2 = 2; l2 = pi / 2;
a3 = 100; k3 = 1; l3 = pi / 2;
var x = (a1 * Math.Cos(k1 * t + l1)) / 50;
var y = (a3 * Math.Cos(k3 * t + l3)) / 50;
var z = (a2 * Math.Cos(k2 * t + l2)) / 50;
```

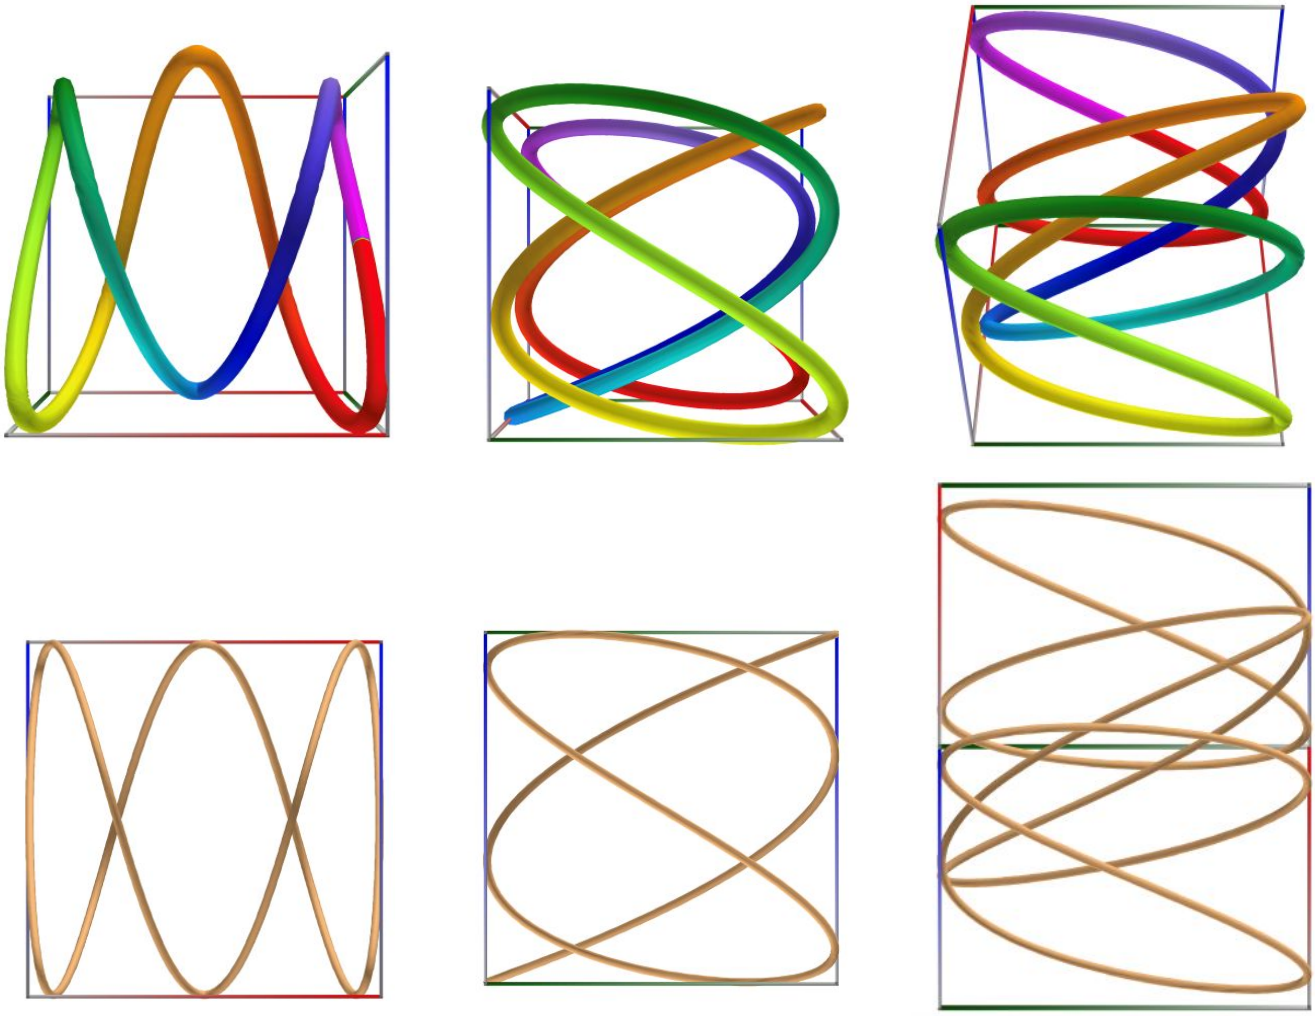


24.8.3 Lissajous knot 1-5-3

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_153_LKnot_P090T090.3D.xml (D03a-f).

The example below uses the following code in C#

```
double pi = Math.PI;
double a1, k1, l1;
double a2, k2, l2;
double a3, k3, l3;
a1 = 100; k1 = 1; l1 = 0;
a2 = 100; k2 = 5; l2 = pi / 2;
a3 = 100; k3 = 3; l3 = pi / 2;
var x = (a1 * Math.Cos(k1 * t + l1)) / 50;
var y = (a3 * Math.Cos(k3 * t + l3)) / 50;
var z = (a2 * Math.Cos(k2 * t + l2)) / 50;
```

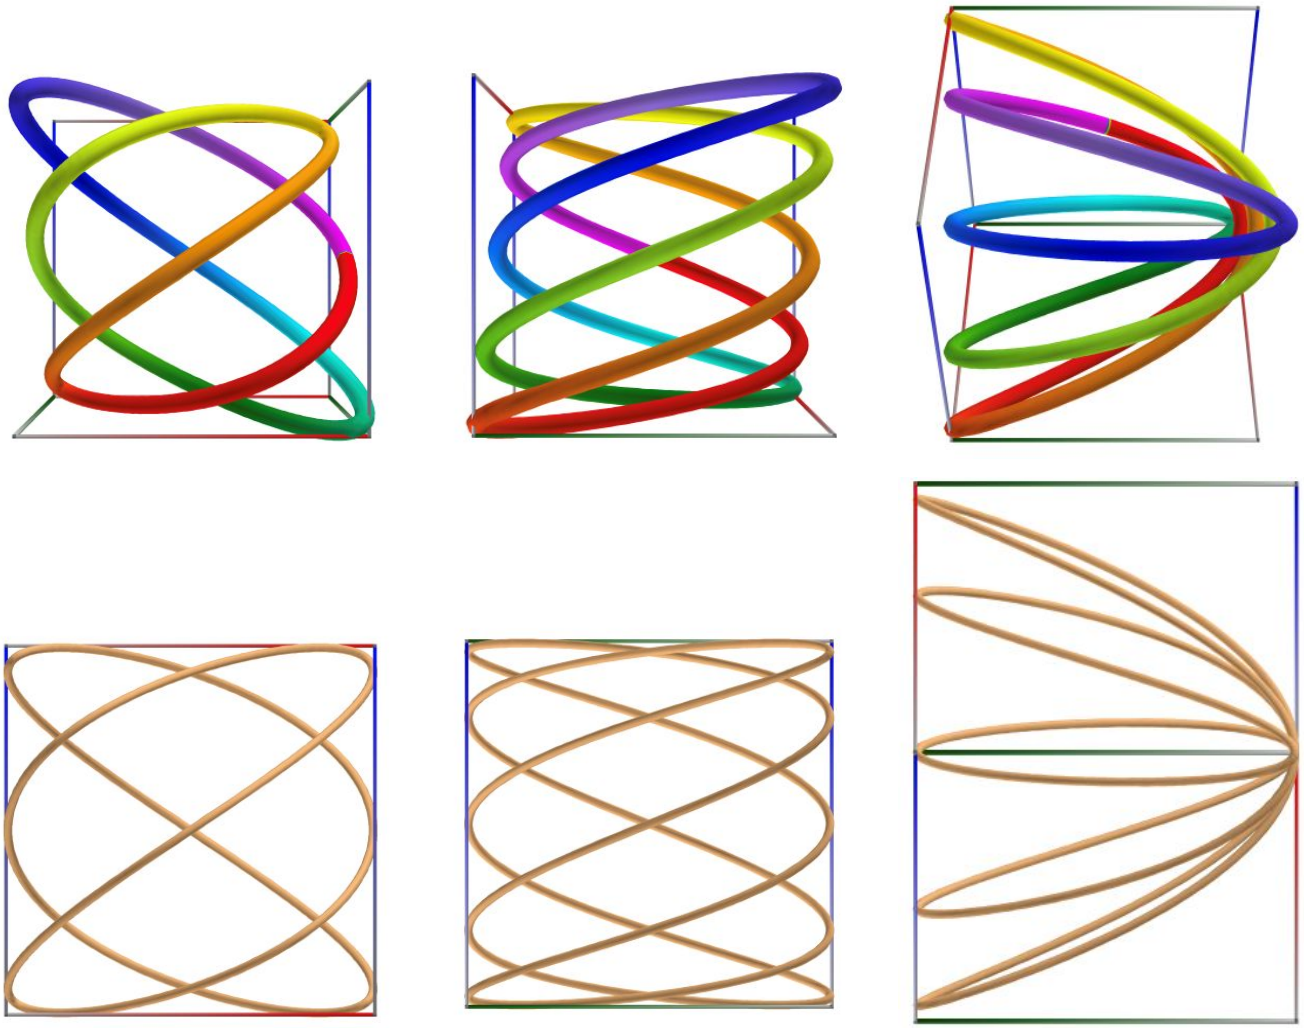


24.8.4 Lissajous knot 3-5-2

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_352_LKnot_P090T090.3D.xml (D04a-f).

The example below uses the following code in C#

```
double pi = Math.PI;
double a1, k1, l1;
double a2, k2, l2;
double a3, k3, l3;
a1 = 100; k1 = 3; l1 = 0;
a2 = 100; k2 = 5; l2 = pi / 2;
a3 = 100; k3 = 2; l3 = pi / 2;
var x = (a1 * Math.Cos(k1 * t + l1)) / 50;
var y = (a3 * Math.Cos(k3 * t + l3)) / 50;
var z = (a2 * Math.Cos(k2 * t + l2)) / 50;
```

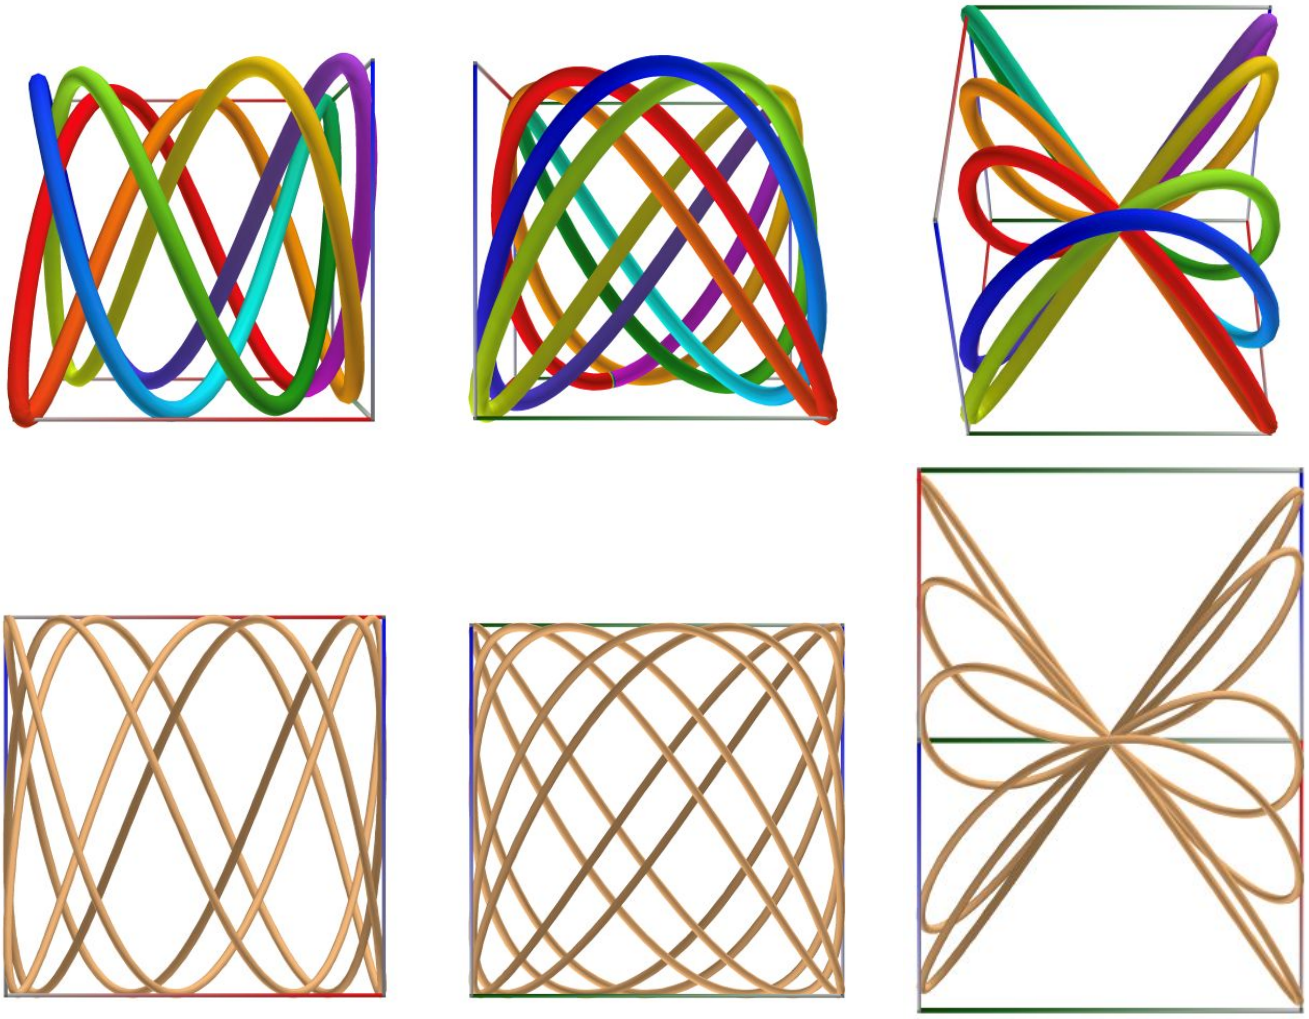


24.8.5 Lissajous knot 3-5-7

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_357_LKnot_P090T090.3D.xml (D05a-f).

The example below uses the following code in C#

```
double pi = Math.PI;
double a1, k1, l1;
double a2, k2, l2;
double a3, k3, l3;
a1 = 100; k1 = 3; l1 = 7;
a2 = 100; k2 = 5; l2 = 5;
a3 = 100; k3 = 7; l3 = 3;
var x = (a1 * Math.Cos(k1 * t + l1)) / 50;
var y = (a3 * Math.Cos(k3 * t + l3)) / 50;
var z = (a2 * Math.Cos(k2 * t + l2)) / 50;
```



24.9 Polynomial knots

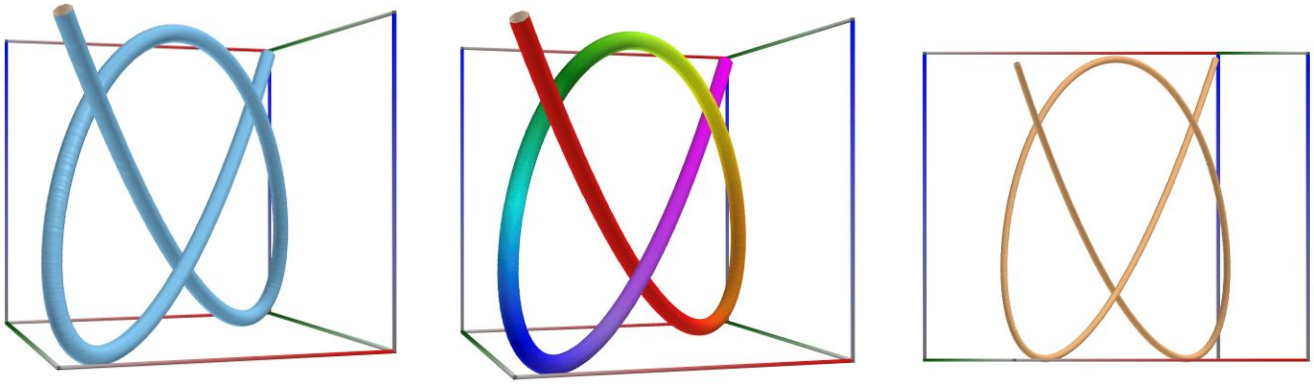
See also: https://home.adelphi.edu/~stemkoski/knotgallery/

24.9.1 Polynomial knot 3-1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Path_Poly31Knot.3D.xml (D01a-c).

Polynomial Knot. https://home.adelphi.edu/~stemkoski/knotgallery/poly3.html

```
double t2 = t * t;
double t3 = t2 * t;
double t4 = t3 * t;
double t5 = t4 * t;
var x = (t3 - 3 * t) / 10;
var y = (t4 - 4 * t2) / 10;
var z = (t5 / 5 - 2 * t) / 10;
```

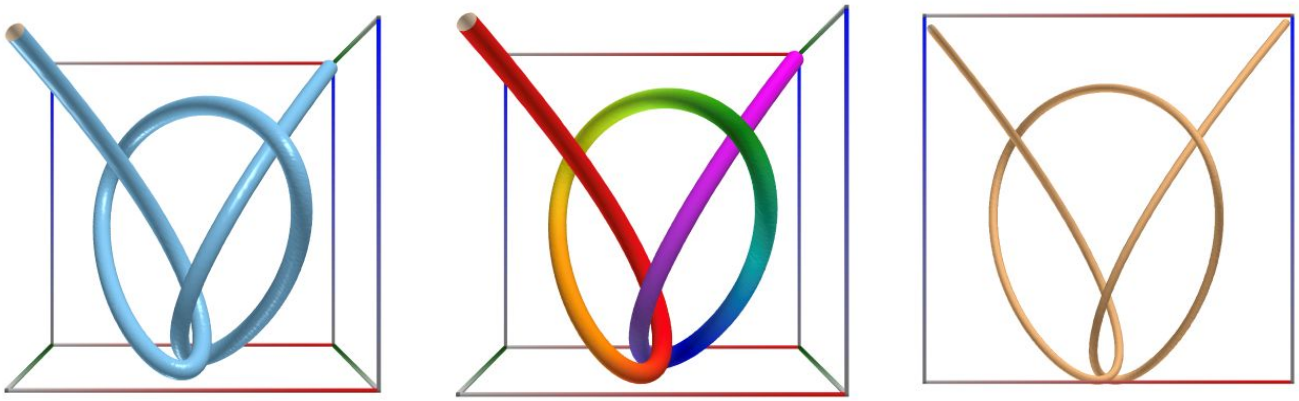


24.9.2 Polynomial knot 4-1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_Path_Poly41Knot.3D.xml (D02a-c).

Figure-Eight (41) Polynomial Knot. https://home.adelphi.edu/~stemkoski/knotgallery/poly3.html

```
double t2 = t * t;
double t4 = t2 * t2;
var x = (2.0 / 5.0) * t * (t2 - 7) * (t2 - 10) / 10;
var y = (t4 - 13 * t2) / 10;
var z = (1.0 / 10.0) * t * (t2 - 4) * (t2 - 9) * (t2 - 12) / 10;
```

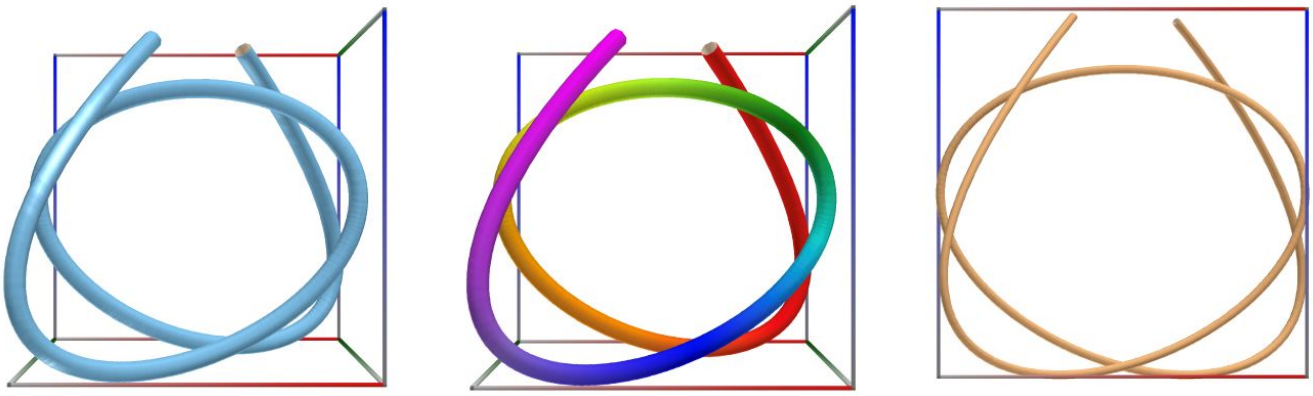


24.9.3 Polynomial knot 5-1

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_Path_Poly51Knot.3D.xml (D03a-c).

Cinquefoil (51) Polynomial Knot. https://home.adelphi.edu/~stemkoski/knotgallery/poly3.html

```
double t2 = t * t;
double t3 = t2 * t;
double t4 = t3 * t;
double t5 = t4 * t;
double t6 = t5 * t;
double t7 = t6 * t;
var x = (1.0 / 5.0) * (t5 - 36 * t3 + 260 * t) / 10;
var y = (1.0 / 2.0) * (t4 - 24 * t2) / 10;
var z = (1.0 / 100.0) * (t7 - 31 * t5 + 164 * t3 - 560 * t) / 10;
```

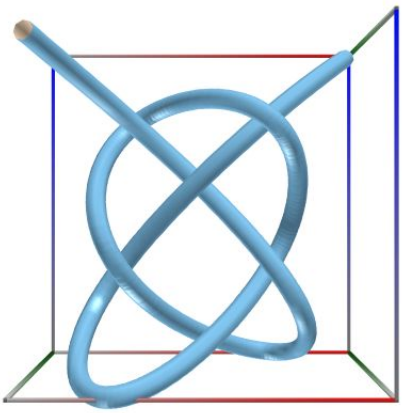


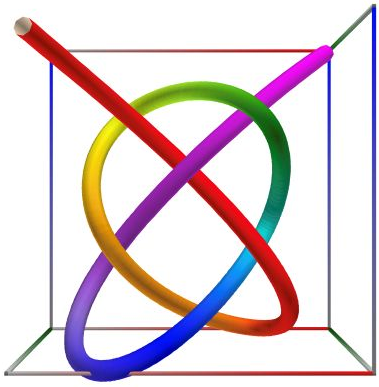
24.9.4 Polynomial knot 6-2

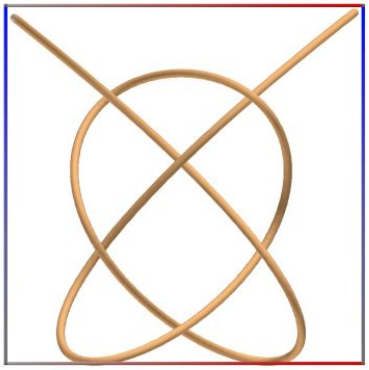
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Path_Poly62Knot.3D.xml (D04a-c).

Six-Crossing (62) Polynomial Knot. https://home.adelphi.edu/~stemkoski/knotgallery/poly3.html

```
double t2 = t * t;
double t3 = t2 * t;
double t4 = t3 * t;
var x = (3.0 / 4.0) * t * (t2 - 4) * (t2 - 11) / 10;
var y = (t4 - 12 * t2) / 10;
var z = (1.0 / 200.0) * t * (t2 - 1) * (t2 - 3) * (t2 - 9) * (t2 - 10) * (t2 - 12) / 10;
```





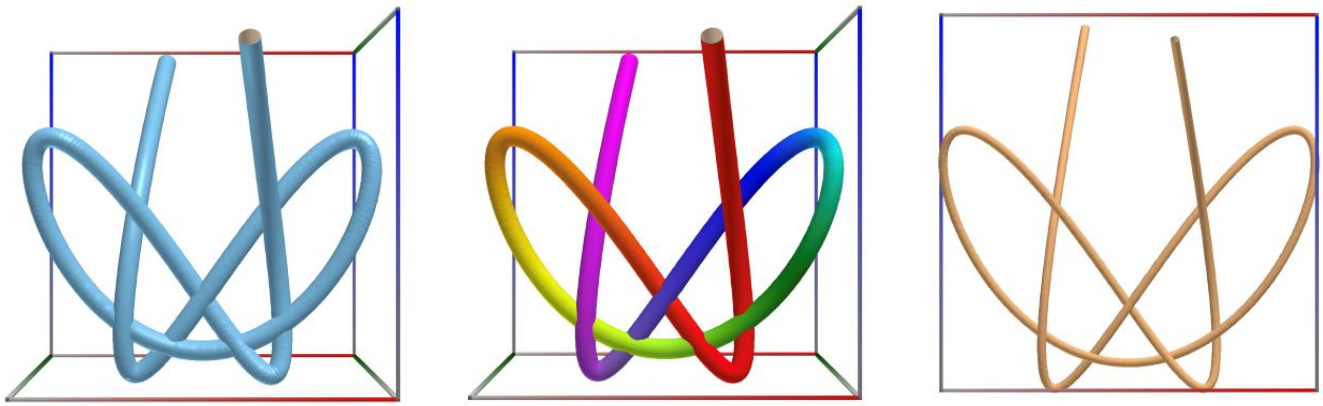


24.9.5 Polynomial knot 7-4

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Path_Poly74Knot.3D.xml (D05a-c).

Seven-Crossing (74) Polynomial Knot. https://home.adelphi.edu/~stemkoski/knotgallery/poly3.html

```
double t2 = t * t;
double t3 = t2 * t;
double t4 = t3 * t;
double t5 = t4 * t;
var x = (4.0 / 5.0) * t * (t2 - 6) * (t2 - 12) / 10;
var y = t2 * (t2 - 7) * (t2 - 9) / 10;
var z = (1.0 / 200.0) * t * (t2 - 0.2) * (t2 - 1) * (t2 - 5) * (t2 - 6.5) * (t2 - 9) * (t2 - 10) / 10;
```



CHAPTER

TWENTYFIVE

WPF: BUILT-IN 3D OBJECTS

Some general text regarding Built-in 3D objects.

25.1 Builtin solids with support for textures

25.1.1 Sphere

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_Sphere.3D.xml (D01a-f).

A sphere is a geometrical object that is a three-dimensional analogue to a two-dimensional circle.

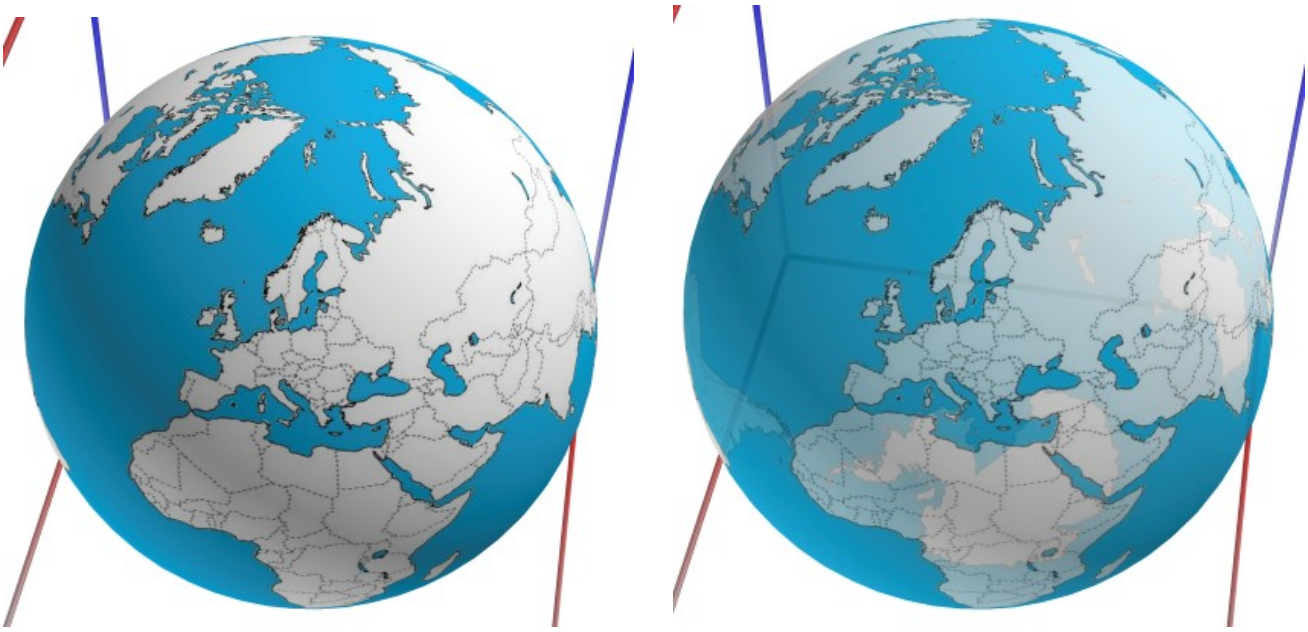
See also: https://en.wikipedia.org/wiki/Sphere

See also: https://mathworld.wolfram.com/Sphere.html

See also: https://mathcurve.com/surfaces.gb/sphere/sphere.shtml

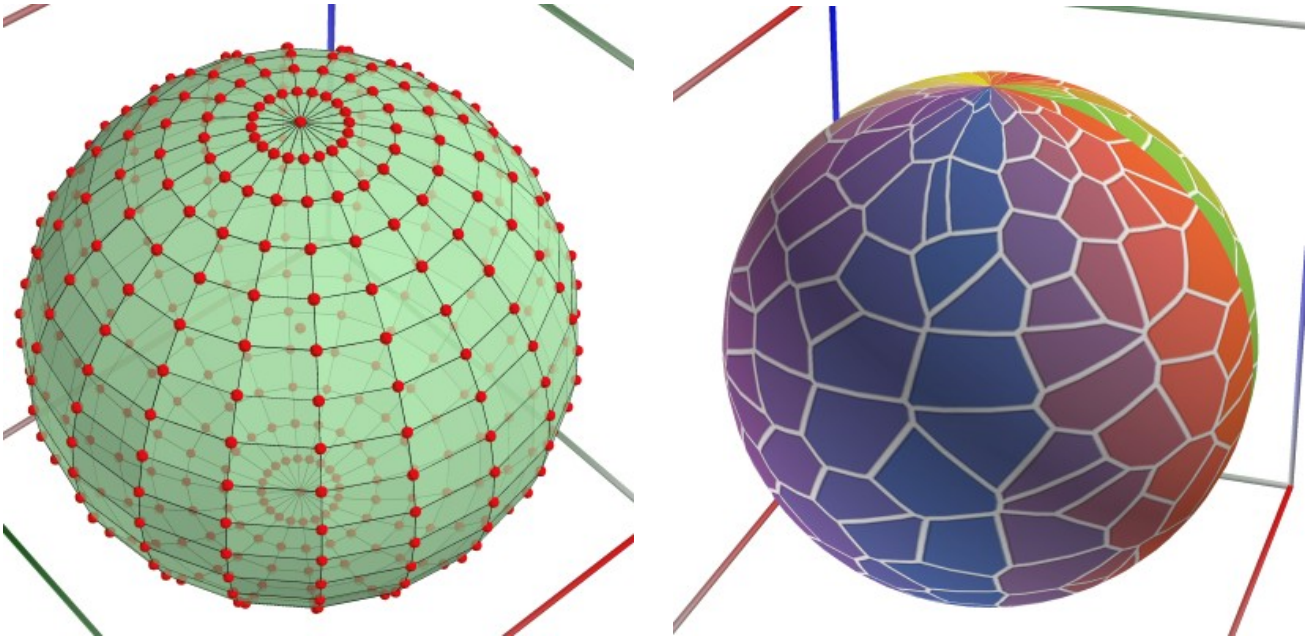
The example below uses the following code in C#

```
var radius = 1.0;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetSphere(radius, numTheta, numPhi);
```



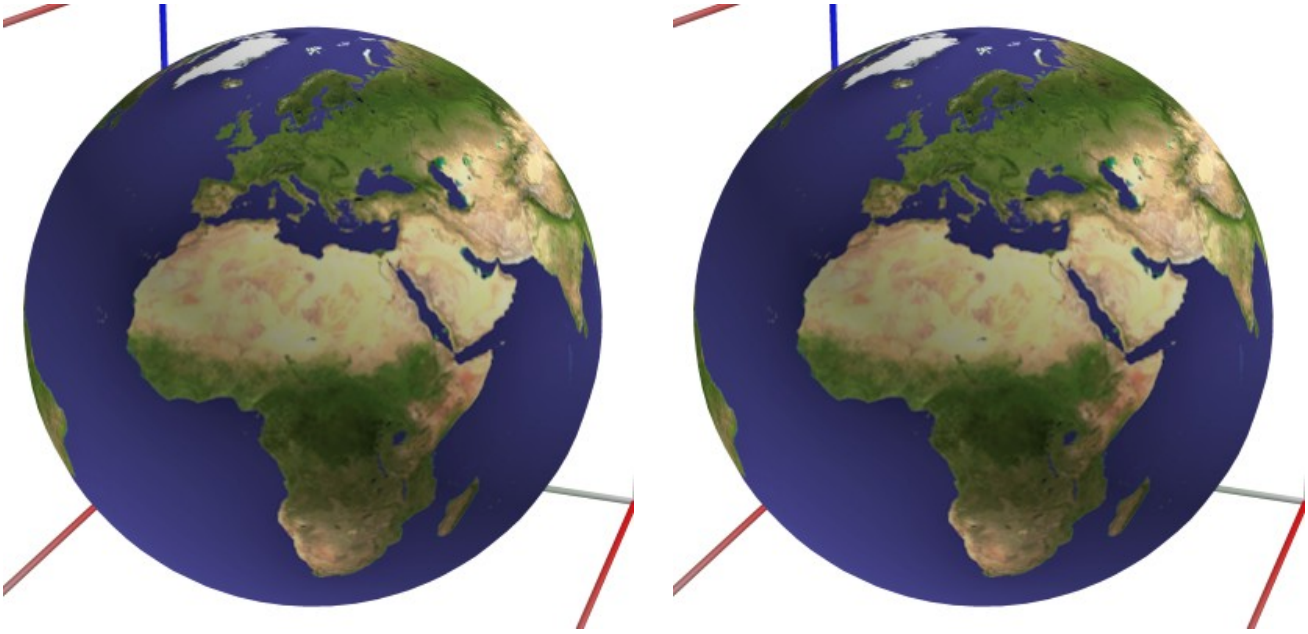
The example below uses the following code in C#

```
var radius = 1.0;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetSphere(radius, numTheta, numPhi);
```



The example below uses the following code in C#

```
var radius = 1.0;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetSphere(radius, numTheta, numPhi);
```



25.1.2 Prolate Spheroid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_PSpheroid.3D.xml (D02a-b).

See also: https://mathworld.wolfram.com/ProlateSpheroid.html

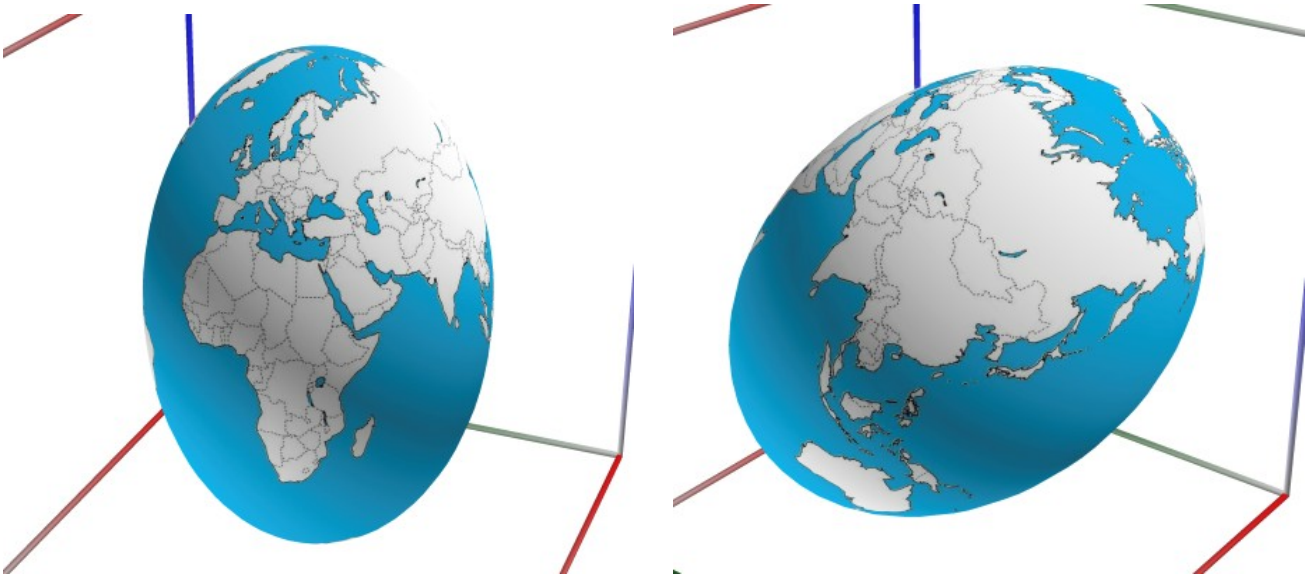
See also: https://mathworld.wolfram.com/Spheroid.html

See also: https://en.wikipedia.org/wiki/Spheroid#Prolate_spheroids

See also: https://en.wikipedia.org/wiki/Spheroid#

The example below uses the following code in C#

```
var radius = 1.0;
var factor1 = 1.5;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetProlateSpheroid(radius, factor1, numTheta, numPhi);
```



25.1.3 Oblate Spheroid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_OSpheroid.3D.xml (D03a-d).

See also: https://mathworld.wolfram.com/OblateSpheroid.html

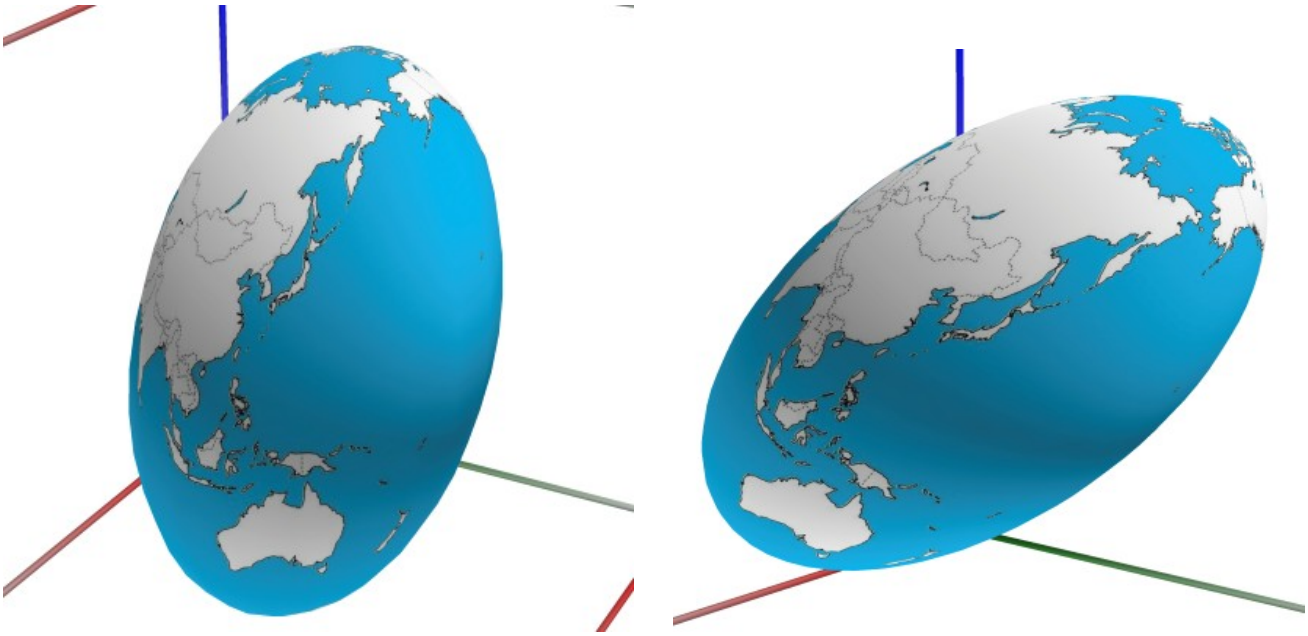
See also: https://mathworld.wolfram.com/Spheroid.html

See also: https://en.wikipedia.org/wiki/Spheroid#Oblate_spheroids

See also: https://en.wikipedia.org/wiki/Spheroid#

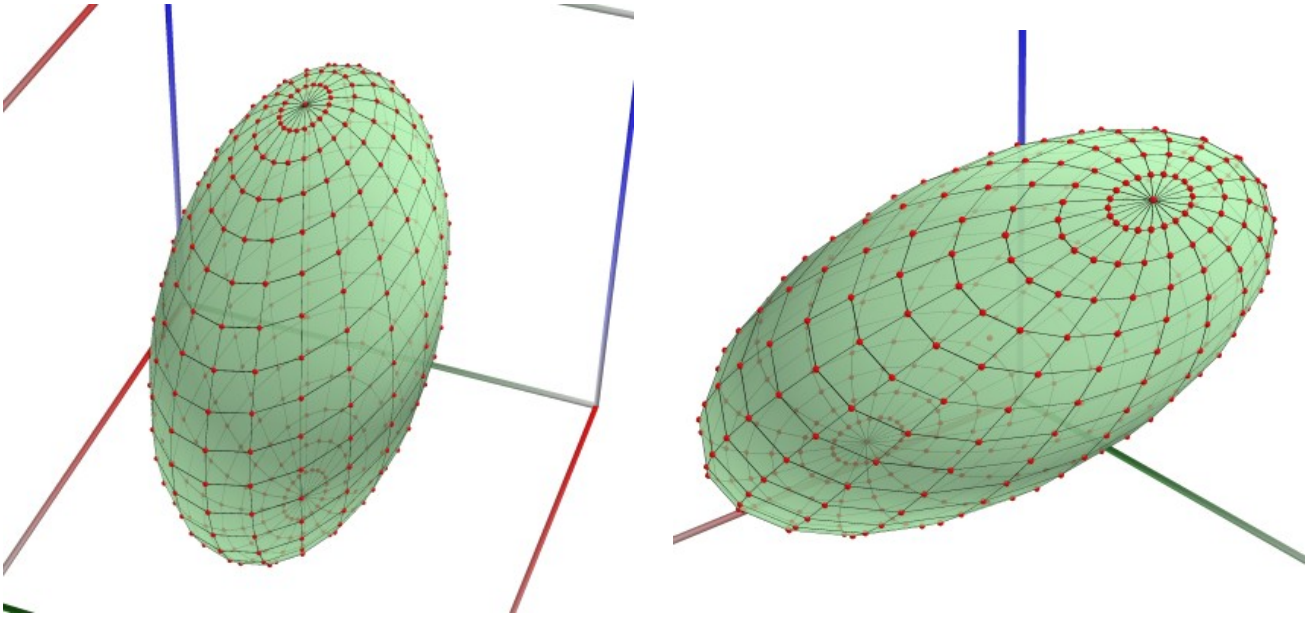
The example below uses the following code in C#

```
var radius = 1.0;
var factor2 = 0.5;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetOblateSpheroid(radius, factor2, numTheta, numPhi);
```



The example below uses the following code in C#

```
var radius = 1.0;
var factor2 = 0.5;
var numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetOblateSpheroid(radius, factor2, numTheta, numPhi);
```



25.1.4 Ellipsoid

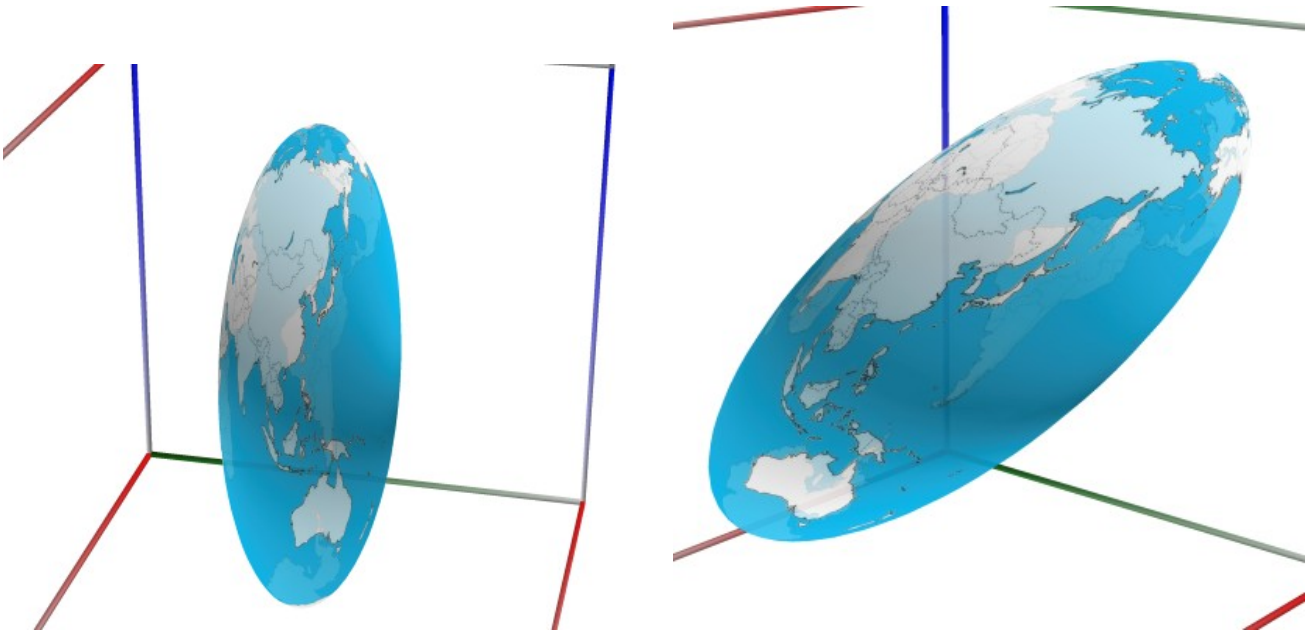
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_Ellipsoid.3D.xml (D04a-b).

See also: https://mathworld.wolfram.com/Ellipsoid.html

See also: https://en.wikipedia.org/wiki/Ellipsoid

The example below uses the following code in C#

```
var radius = 1.0;
var factor1 = 1.5;
var factor2 = 0.5;
numTheta = 20;
var numPhi = 20;
var proc = BuiltIn.SetEllipsoid(radius, factor1, factor2, numTheta, numPhi);
```



25.1.5 Torus

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D05a_Torus.3D.xml (D05a-b).

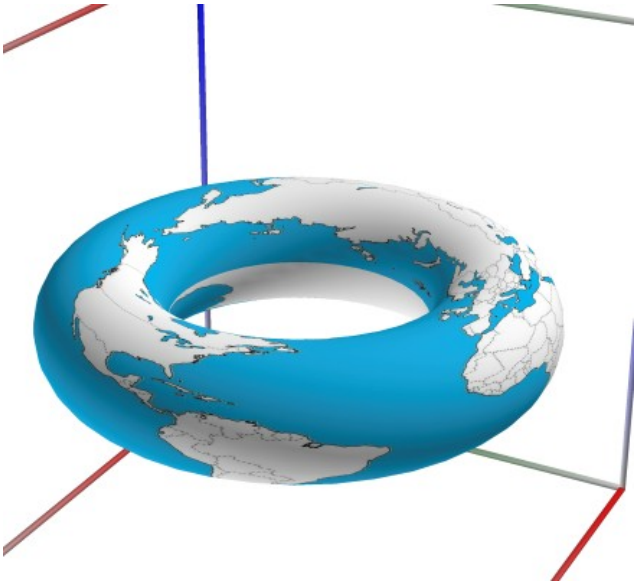
A torus is a surface of revolution generated by revolving a circle in three-dimensional space one full revolution about an axis that is coplanar with the circle. The main types of toruses include ring toruses, horn toruses, and spindle toruses. A ring torus is sometimes colloquially referred to as a donut or doughnut.

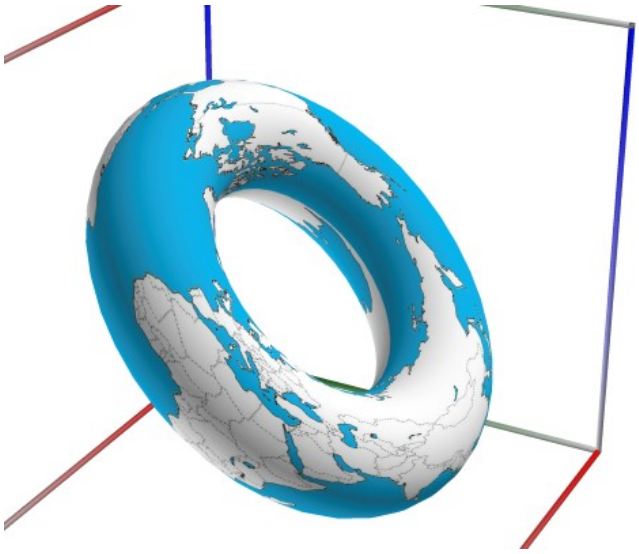
See also: https://en.wikipedia.org/wiki/Torus

See also: https://mathworld.wolfram.com/Torus.html

See also: https://mathcurve.com/surfaces.gb/tore/tore.shtml

```
var Radius = 0.6;
var radius = 0.2;
var numTheta = 40;
var numPhi = 40;
var proc = BuiltIn.SetTorus(Radius, radius, numTheta, numPhi);
```





25.1.6 Rectangular cuboid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Cuboid.3D.xml (D06a-b).

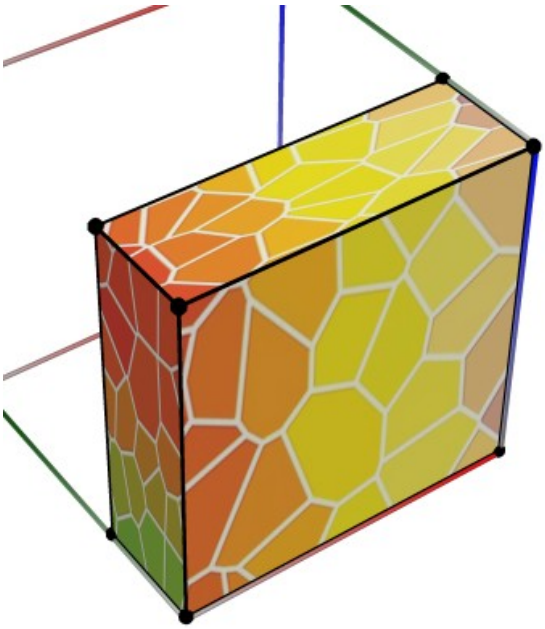
A rectangular cuboid is a special case of a cuboid with rectangular faces in which all of its dihedral angles are right angles. This shape is also called rectangular parallelepiped or orthogonal parallelepiped.

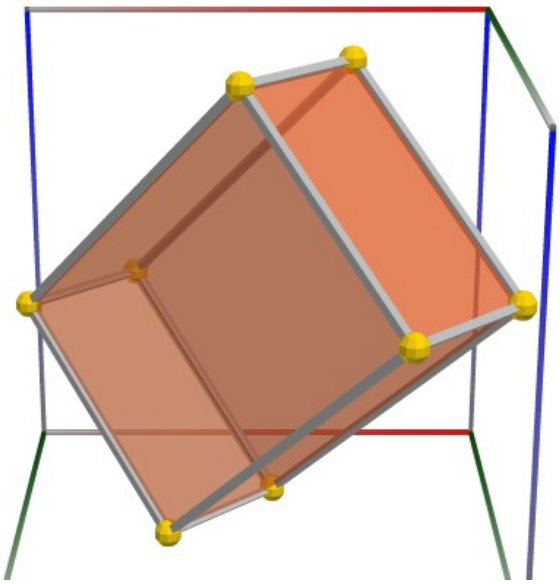
See also: https://en.wikipedia.org/wiki/Rectangular_cuboid

See also: https://mathworld.wolfram.com/Cuboid.html

The example below uses the following code in C#

```
var a = 1.0;
var b = 3.0;
var c = 2.0;
var proc = BuiltIn.SetCuboid(a, b, c);
```





25.1.7 Rhombohedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D07a_Rhombohedron_60.3D.xml (D07a-c).

A rhombohedron is a parallelepiped bounded by six rhombi such that opposite faces are congruent. Special cases include the cube, acute golden rhombohedron, and obtuse golden rhombohedron.

See also: https://en.wikipedia.org/wiki/Rhombohedron

See also: https://mathworld.wolfram.com/Rhombohedron.html

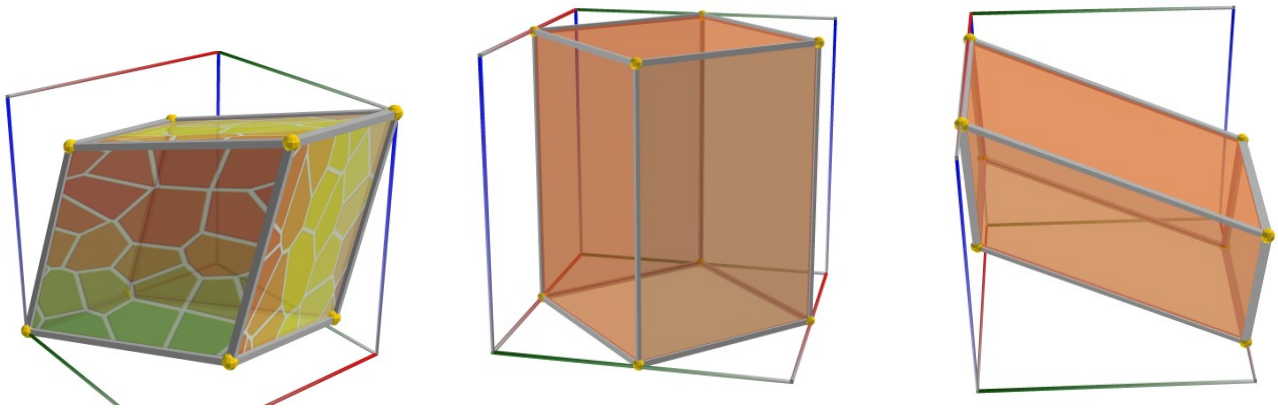
See also: https://mathworld.wolfram.com/GoldenRhombohedron.html

See also: https://mathworld.wolfram.com/AcuteGoldenRhombohedron.html

See also: https://mathworld.wolfram.com/ObtuseGoldenRhombohedron.html

The example below uses the following code in C#

```
var theta = 60.0;
var proc = BuiltIn.SetRhombohedron(theta);
```



25.1.8 Parallelepiped

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D08a_Parallelepiped.3D.xml (D08a-b).

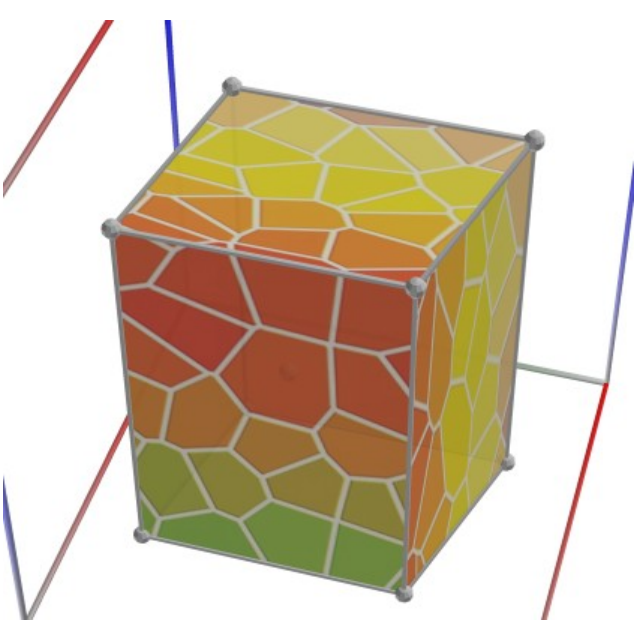
See also: https://en.wikipedia.org/wiki/Parallelepiped

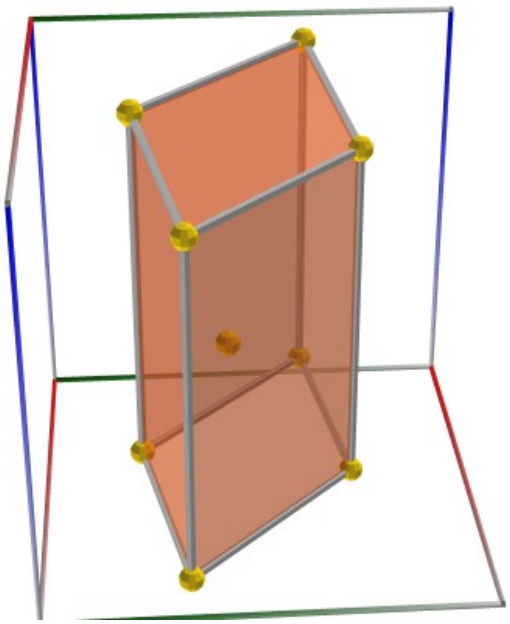
See also: https://mathworld.wolfram.com/Parallelepiped.html

The example below uses the following code in C#

```
var a = 1.0;
var b = 3.0;
var c = 2.0;
var alpha = 90.0;
var beta = 90.0;

var proc = BuiltIn.SetParallelepiped(a, b, c, alpha, beta);
```





25.2 Builtin solids without support for textures

See also: https://mathworld.wolfram.com/topics/Prisms.html

See also: https://en.wikipedia.org/wiki/Prism_(geometry)

A prism is a polyhedron comprising an n-sided polygon base, a second base which is a translated copy (rigidly moved without rotation) of the first, and n other faces, necessarily all parallelograms, joining corresponding sides of the two bases. All cross-sections parallel to the bases are translations of the bases. Prisms are named after their bases, e.g. a prism with a pentagonal base is called a pentagonal prism.

25.2.1 Triangular Prism

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D01a_TriangularPrism.3D.xml (D01a-b).

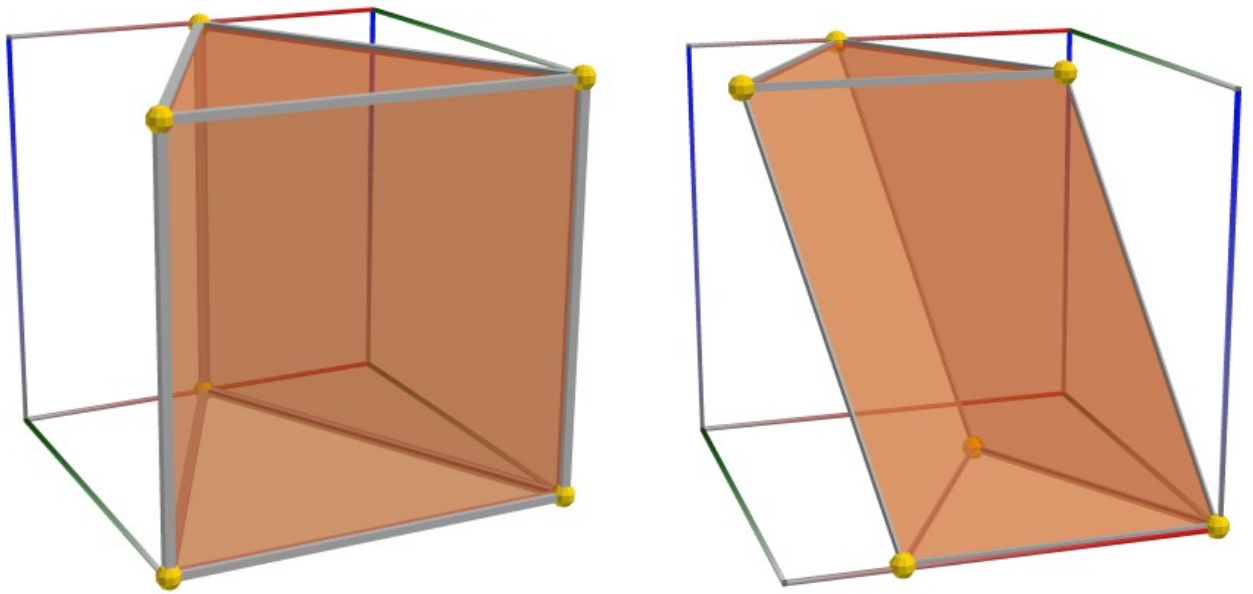
A triangular prism or trigonal prism[1] is a prism with 2 triangular bases. If the edges pair with each triangle's vertex and if they are perpendicular to the base, it is a right triangular prism.

See also: https://mathworld.wolfram.com/TriangularPrism.html

See also: https://en.wikipedia.org/wiki/Triangular_prism

The example below uses the following code in C#

```
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetTriangularPrism(a, b, height, 0,0);
```



25.2.2 Square prism

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D02a_SquarePrism.3D.xml (D02a-b).

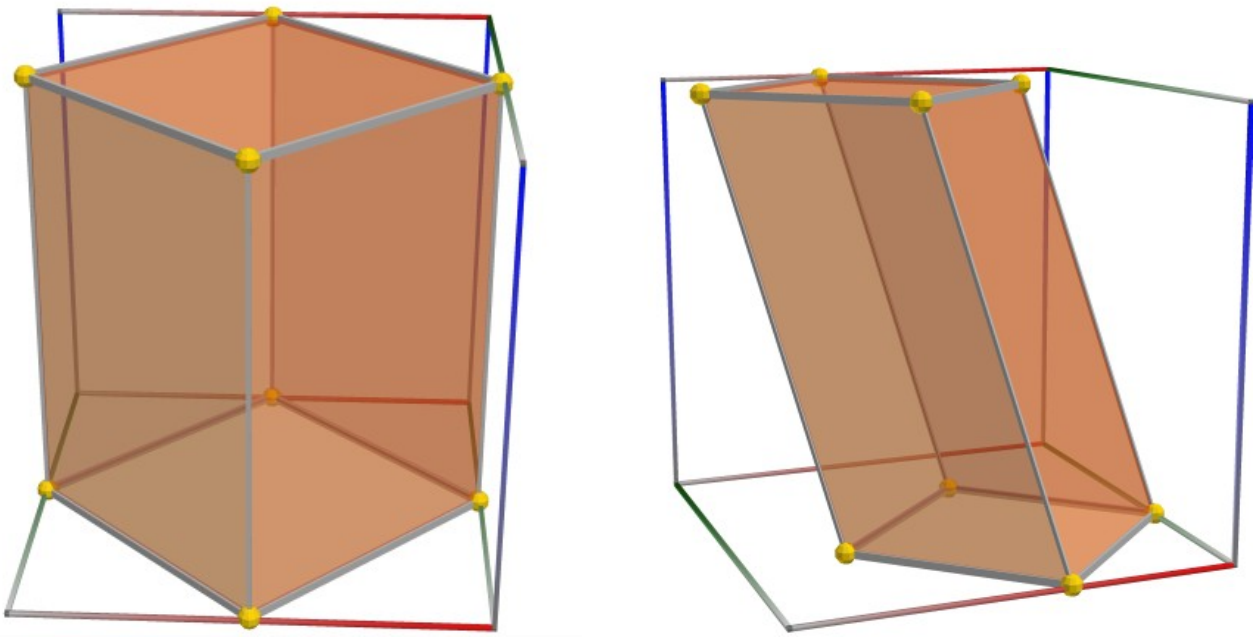
See also: https://mathworld.wolfram.com/Cube.html

See also: https://en.wikipedia.org/wiki/Cuboid

Cuboids have different types. A special case of a cuboid is a rectangular cuboid, with six rectangle faces and adjacent faces meeting at right angles. When all of the rectangular cuboid's edges are equal in length, it results in a cube, with six square faces and adjacent faces meeting at right angles.[1][3] Along with the rectangular cuboids, parallelepiped is a cuboid with six parallelogram. Rhombohedron is a cuboid with six rhombus faces. A square frustum is a frustum with a square base, but the rest of its faces are quadrilaterals.

The example below uses the following code in C#

```
var a = 0.50;
var b = 0.50;
var height = 0.55;
var proc = BuiltIn.SetSquarePrism(a, b, height, 0,0);
```



25.2.3 Hexagonal prism

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D03a_HexagonalPrism.3D.xml (D03a-b).

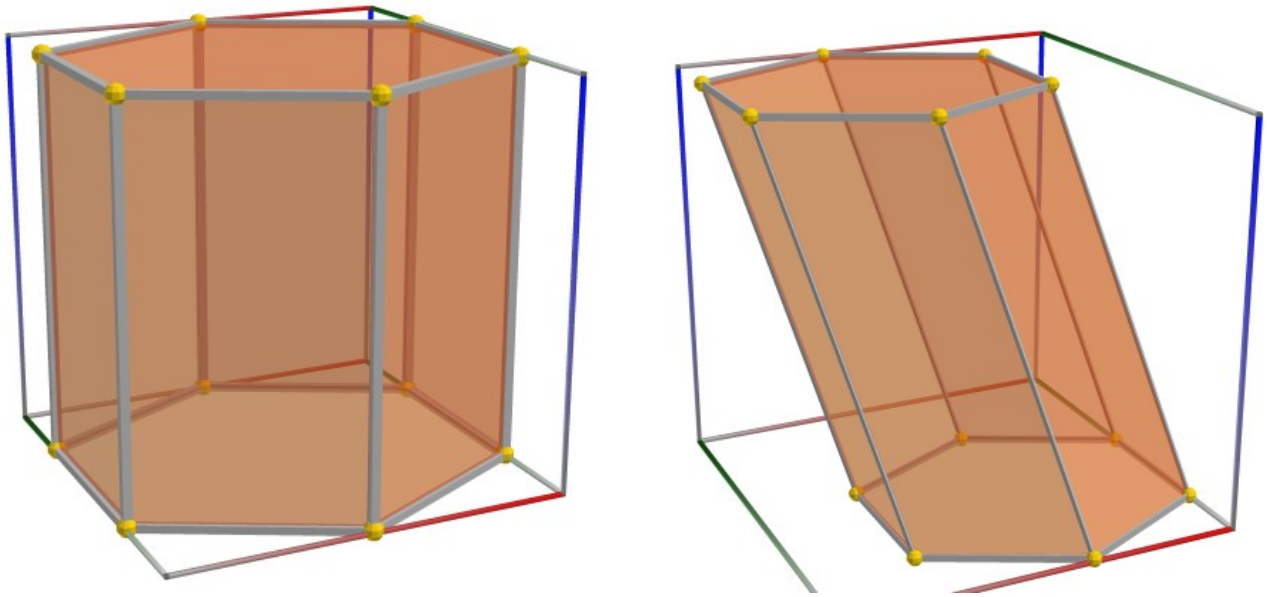
The hexagonal prism is a prism with hexagonal base. Prisms are polyhedrons; this polyhedron has 8 faces, 18 edges, and 12 vertices.

See also: https://mathworld.wolfram.com/HexagonalPrism.html

See also: https://en.wikipedia.org/wiki/Hexagonal_prism

The example below uses the following code in C#

```
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetHexagonalPrism(a, b, height, 0,0);
```



25.2.4 Octagonal prism

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D04a_OctagonalPrism.3D.xml (D04a-b).

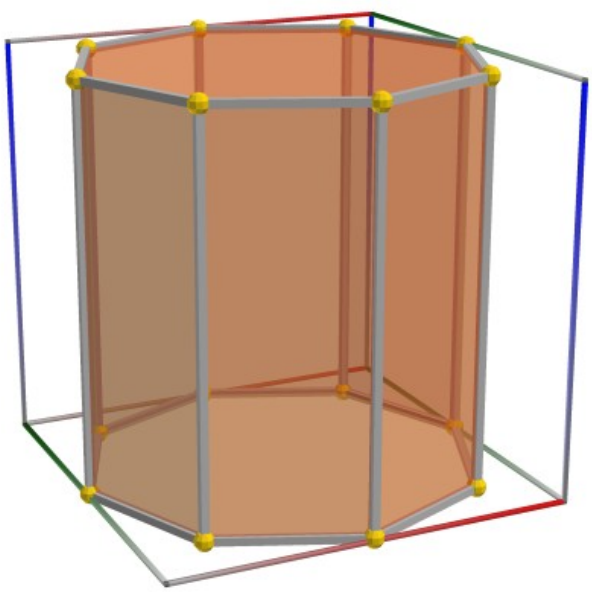
The octagonal prism is a prism comprising eight rectangular sides joining two regular octagon caps.

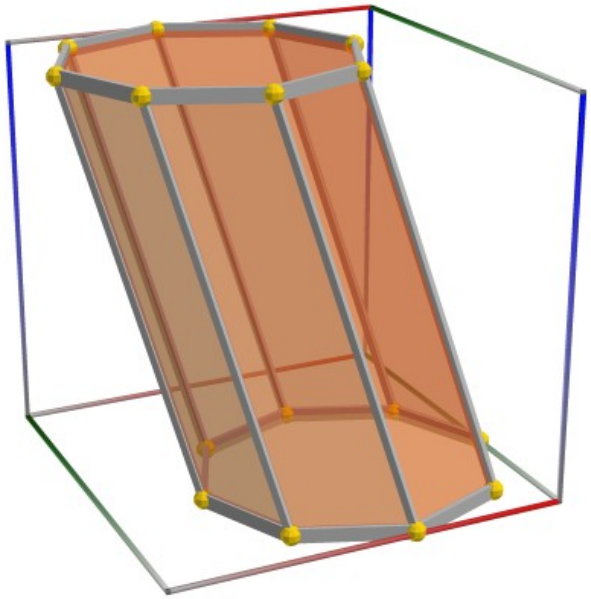
See also: https://mathworld.wolfram.com/OctagonalPrism.html

See also: https://en.wikipedia.org/wiki/Octagonal_prism

The example below uses the following code in C#

```
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetOctagonalPrism(a, b, height, 0,0);
```





25.2.5 Cylinder

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05a_Cylinder.3D.xml.

A cylinder is considered a prism with a circle as its base. The cylinder obtained by rotating a line segment about a fixed line that it is parallel to is a cylinder of revolution. A cylinder of revolution is a right circular cylinder.

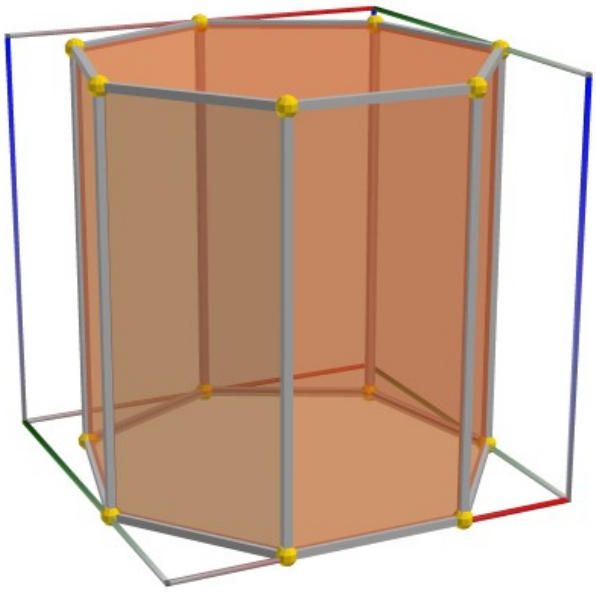
See also: https://en.wikipedia.org/wiki/Cylinder

See also: https://en.wikipedia.org/wiki/Right_circular_cylinder

See also: https://mathworld.wolfram.com/Cylinder.html

The example below uses the following code in C#

```
var numSides = 7;
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetCylinder(numSides, a, b, height, 0,0);
```



25.2.6 Cylinder, truncated by an inclined plane

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the files D06a_Cylinder_Tilted.3D.xml (D06a-b).

A cylinder is considered a prism with a circle as its base. The cylinder obtained by rotating a line segment about a fixed line that it is parallel to is a cylinder of revolution. A cylinder of revolution is a right circular cylinder.

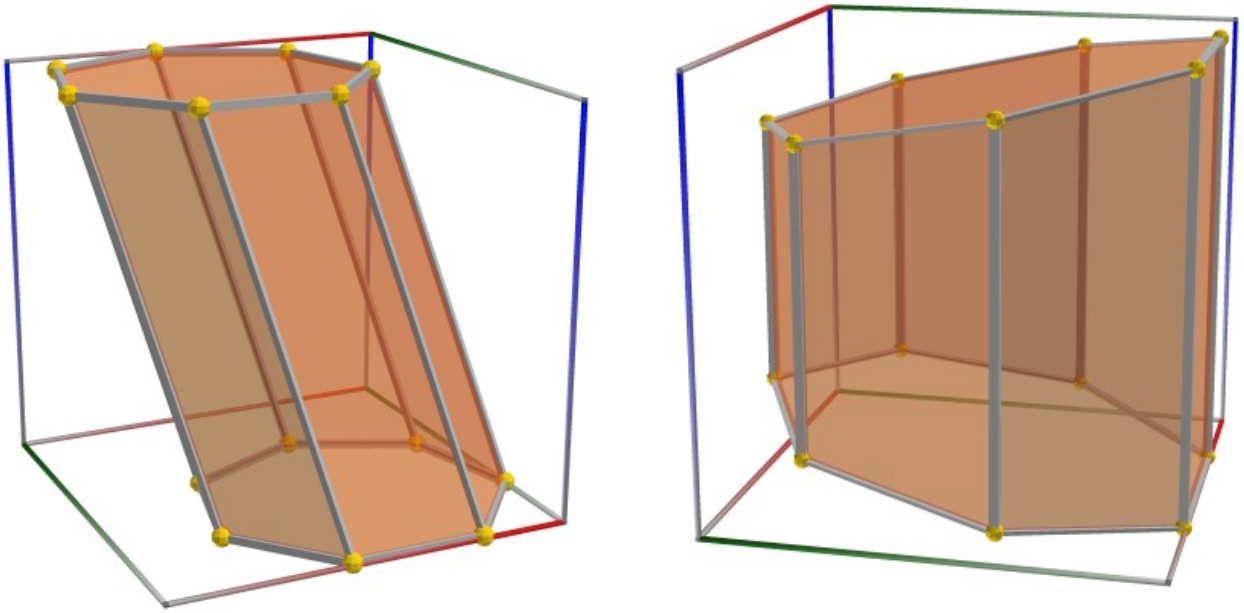
See also: https://en.wikipedia.org/wiki/Cylinder

See also: https://en.wikipedia.org/wiki/Right_circular_cylinder

See also: https://mathworld.wolfram.com/Cylinder.html

The example below uses the following code in C#

```
var numSides = 7;
var a = 0.50;
var b = 0.50;
var height = 1.0;
var cutslope1 = -0.5;
var cutslope2 = 0.5;
var proc = BuiltIn.SetCylinder2CP(numSides, a, b, height, cutslope1, cutslope2);
```



25.2.7 Pyramid

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_Pyramid.3D.xml.

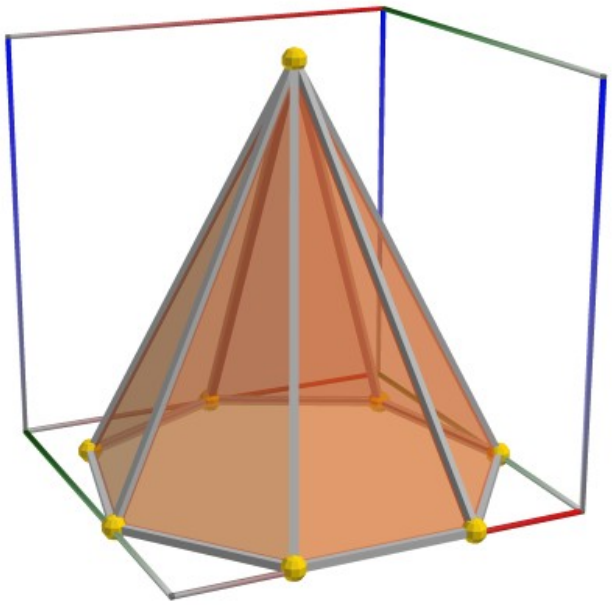
A pyramid is a polyhedron formed by connecting a polygonal base and a point, called the apex. Each base edge and apex form a triangle, called a lateral face. It is a conic solid with a polygonal base. Many types of pyramids can be found by determining the shape of bases, or cutting off the apex.

See also: https://en.wikipedia.org/wiki/Pyramid_(geometry)

See also: https://mathworld.wolfram.com/Pyramid.html

The example below uses the following code in C#

```
var numSides = 7;
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetPyramid(numSides, a, b, height);
```



25.2.8 Pyramid frustum

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08a_Frustum.3D.xml.

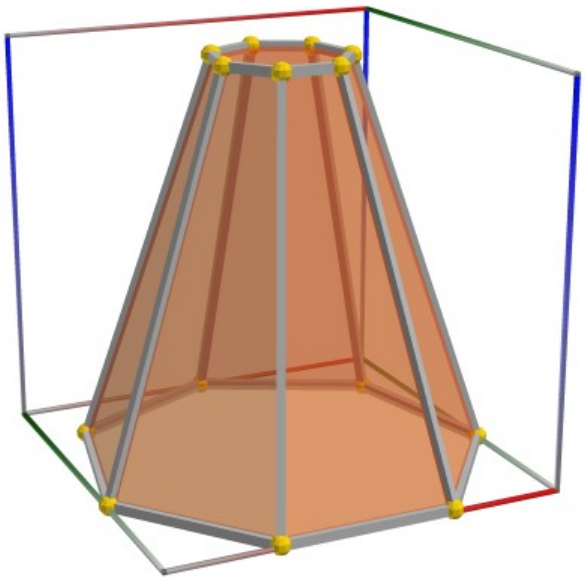
A frustum of a pyramid is the portion of the pyramid that lies between two parallel planes cutting the pyramid. In a truncated pyramid, the truncation plane is not necessarily parallel to the pyramid's base (as in a frustum), i.e. it is inclined.

See also: https://en.wikipedia.org/wiki/Frustum

See also: https://mathworld.wolfram.com/PyramidalFrustum.html

The example below uses the following code in C#

```
var numSides = 7;
var a = 0.50;
var b = 0.50;
var height = 1.2;
var cutheight = 0.8;
var cutslope = 0.0;
var proc = BuiltIn.SetFrustum(numSides, a, b, height, cutheight, cutslope);
```



25.2.9 Pyramid, truncated by an inclined plane

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09a_Frustum_Inclined.3D.xml.

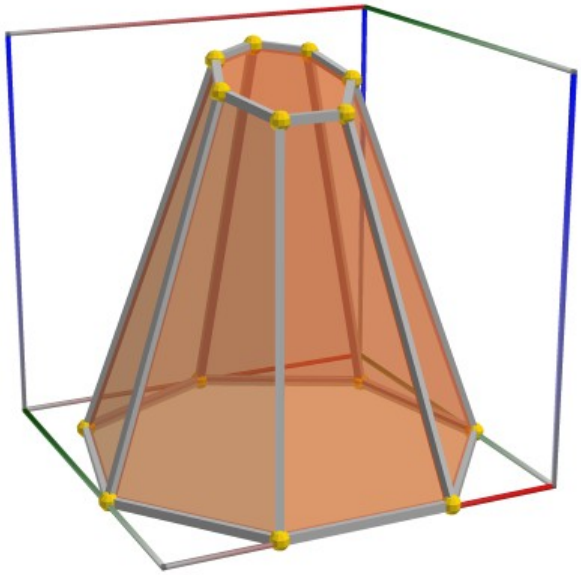
A frustum of a pyramid is the portion of the pyramid that lies between two parallel planes cutting the pyramid. In a truncated pyramid, the truncation plane is not necessarily parallel to the pyramid's base (as in a frustum), i.e. it is inclined.

See also: https://en.wikipedia.org/wiki/Frustum

See also: https://mathworld.wolfram.com/PyramidalFrustum.html

The example below uses the following code in C#

```
var numSides = 7;
var a = 0.50;
var b = 0.50;
var height = 1.2;
var cutheight = 0.8;
var cutslope = 0.3;
var proc = BuiltIn.SetFrustum(numSides, a, b, height, cutheight, cutslope);
```



25.2.10 Cone

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10a_Cone.3D.xml.

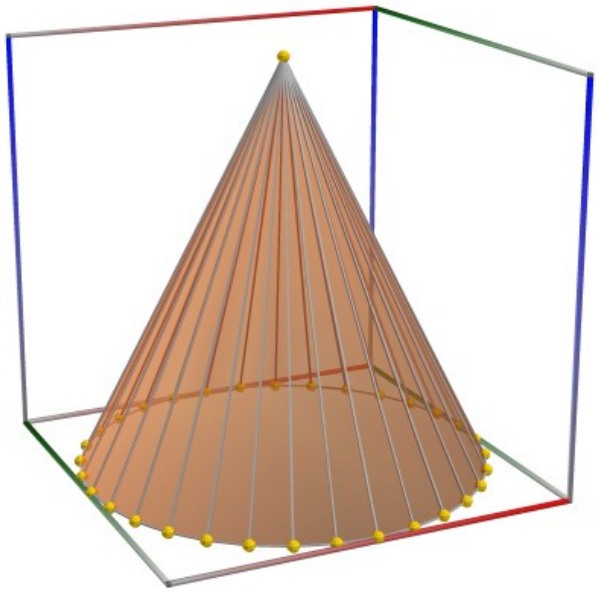
A cone is a three-dimensional geometric shape that tapers smoothly from a flat base (frequently, though not necessarily, circular) to a point called the apex or vertex. A cone with a polygonal base is called a pyramid.

See also: https://en.wikipedia.org/wiki/Cone

See also: https://mathworld.wolfram.com/Cone.html

The example below uses the following code in C#

```
var numSides = 32;
var a = 0.50;
var b = 0.50;
var height = 1.0;
var proc = BuiltIn.SetCone(numSides, a, b, height);
```



25.2.11 Cone Frustum

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11a_ConeFrustum.3D.xml.

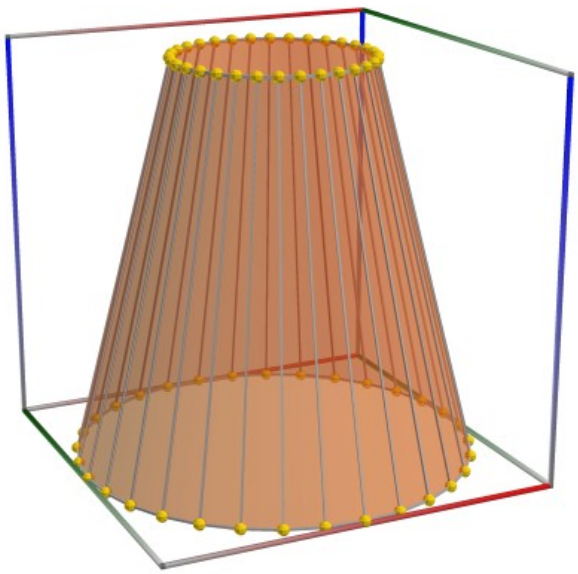
A cone is a three-dimensional geometric shape that tapers smoothly from a flat base (frequently, though not necessarily, circular) to a point called the apex or vertex. A cone with a polygonal base is called a pyramid.

See also: https://en.wikipedia.org/wiki/Frustum

See also: https://mathworld.wolfram.com/ConicalFrustum.html

The example below uses the following code in C#

```
var numSides = 32;
var a = 0.50;
var b = 0.50;
var height = 1.2;
var cutheight = 0.6;
var cutslope = 0.0;
var proc = BuiltIn.SetConeFrustum(numSides, a, b, height, cutheight, cutslope);
```



25.2.12 Cone, truncated by an inclined plane

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12a_ConeFrustum_Inclined.3D.xml.

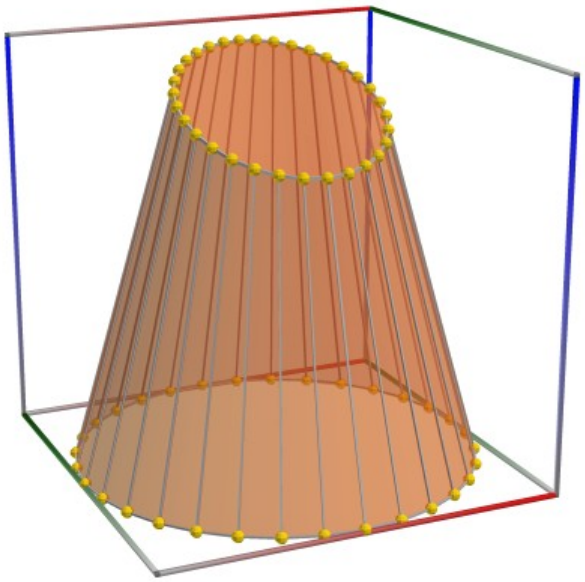
A cone is a three-dimensional geometric shape that tapers smoothly from a flat base (frequently, though not necessarily, circular) to a point called the apex or vertex. A cone with a polygonal base is called a pyramid.

See also: https://en.wikipedia.org/wiki/Frustum

See also: https://mathworld.wolfram.com/ConicalFrustum.html

The example below uses the following code in C#

```
var numSides = 32;
var a = 0.50;
var b = 0.50;
var height = 1.2;
var cutheight = 0.6;
var cutslope = 0.3;
var proc = BuiltIn.SetConeFrustum(numSides, a, b, height, cutheight, cutslope);
```



25.3 Platonic solids, and related solids

A Platonic solid is a convex, regular polyhedron in three-dimensional Euclidean space. Being a regular polyhedron means that the faces are congruent (identical in shape and size) regular polygons (all angles congruent and all edges congruent), and the same number of faces meet at each vertex.

See also: https://en.wikipedia.org/wiki/Platonic_solid

See also: https://mathworld.wolfram.com/PlatonicSolid.html

Augmentation is the operation of replacing the faces of a polyhedron with pyramids of height h (where h may be positive, zero, or negative) having the face as the base. Augmentation with $h = 0$ gives a triangulated version of the original solid.

See also: https://mathworld.wolfram.com/Augmentation.html

25.3.1 Tetrahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D01a_Tetrahedron.3D.xml.

A regular tetrahedron is a tetrahedron in which all four faces are equilateral triangles. In other words, all of its faces are the same size and shape (congruent) and all edges are the same length.

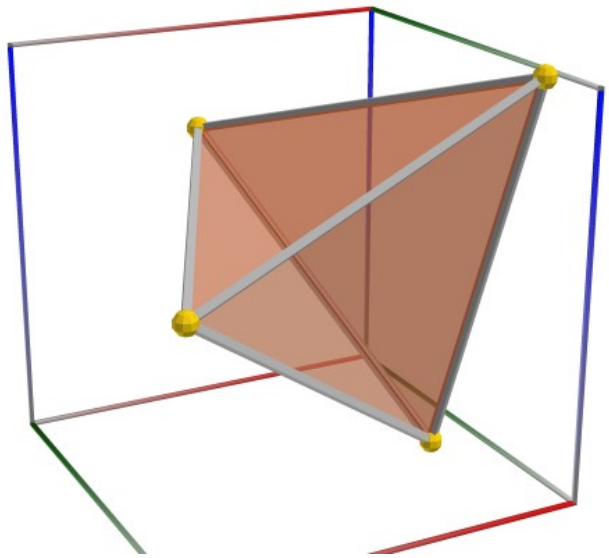
See also: https://en.wikipedia.org/wiki/Tetrahedron#Regular_tetrahedron

See also: https://mathworld.wolfram.com/RegularTetrahedron.html

See also: https://mathcurve.com/polyedres/tetraedre/tetraedre.shtml

The example below uses the following code in C#

```
var proc = BuiltIn.SetTetrahedron();
```



25.3.2 Cube

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D02a_Cube.3D.xml.

A cube is a three-dimensional solid object bounded by six square faces. It has twelve edges and eight vertices. It can be represented as a rectangular cuboid with six square faces, or a parallelepiped with equal edges.

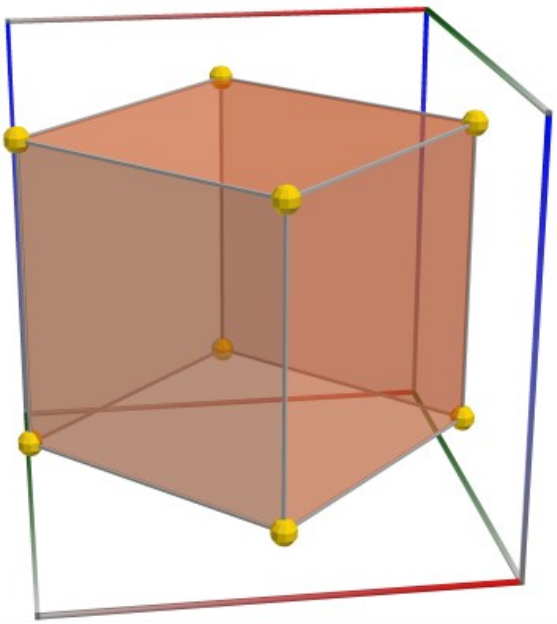
See also: https://en.wikipedia.org/wiki/Cube

See also: https://mathworld.wolfram.com/Cube.html

See also: https://mathcurve.com/polyedres/cube/cube.shtml

The example below uses the following code in C#

```
var proc = BuiltIn.SetCube();
```



25.3.3 Octahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D03a_Octahedron.3D.xml.

A regular octahedron is an octahedron that is a regular polyhedron. All the faces of a regular octahedron are equilateral triangles of the same size, and exactly four triangles meet at each vertex. A regular octahedron is convex, meaning that for any two points within it, the line segment connecting them lies entirely within it.

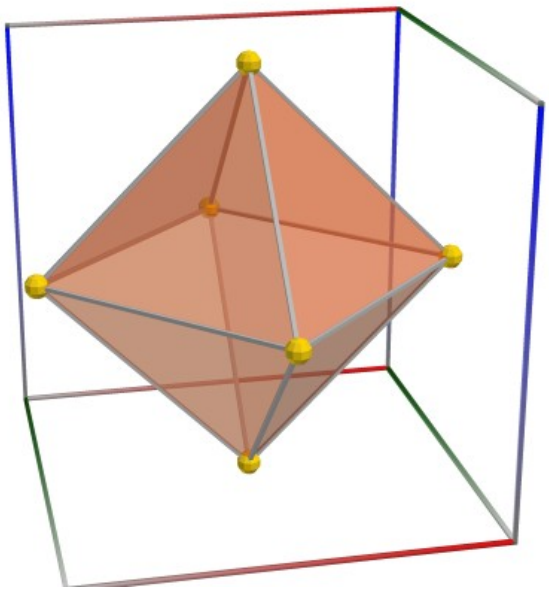
See also: https://en.wikipedia.org/wiki/Octahedron#Regular_octahedron

See also: https://mathworld.wolfram.com/RegularOctahedron.html

See also: https://mathcurve.com/polyedres/octaedre/octaedre.shtml

The example below uses the following code in C#

```
var proc = BuiltIn.SetOctahedron();
```



25.3.4 Dodecahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D04a_Dodecahedron.3D.xml.

A regular dodecahedron or pentagonal dodecahedron is a dodecahedron composed of regular pentagonal faces, three meeting at each vertex.

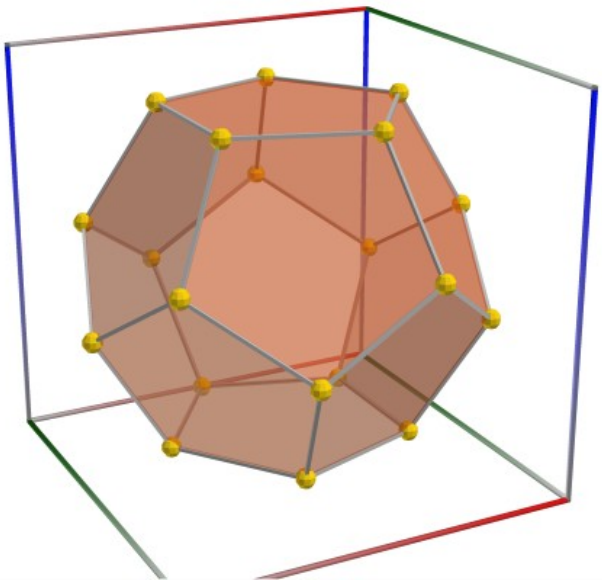
See also: https://en.wikipedia.org/wiki/Regular_dodecahedron

See also: https://mathworld.wolfram.com/RegularDodecahedron.html

See also: https://mathcurve.com/polyedres/dodecaedre/dodecaedre.shtml

The example below uses the following code in C#

```
var proc = BuiltIn.SetDodecahedron();
```



25.3.5 Icosahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D05a_Icosahedron.3D.xml.

A regular icosahedron (or simply icosahedron) is a convex polyhedron that can be constructed from pentagonal antiprism by attaching two pentagonal pyramids with regular faces to each of its pentagonal faces, or by putting points onto the cube.

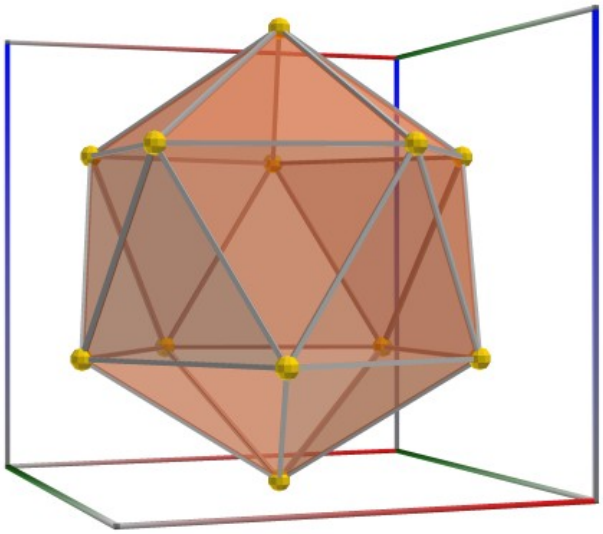
See also: https://en.wikipedia.org/wiki/Regular_icosahedron

See also: https://mathworld.wolfram.com/RegularIcosahedron.html

See also: https://mathcurve.com/polyedres/icosaedre/icosaedre.shtml

The example below uses the following code in C#

```
var proc = BuiltIn.SetIcosahedron();
```



25.3.6 Geodesic sphere

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D06a_Geodesic_Sphere1.3D.xml (D06a-f).

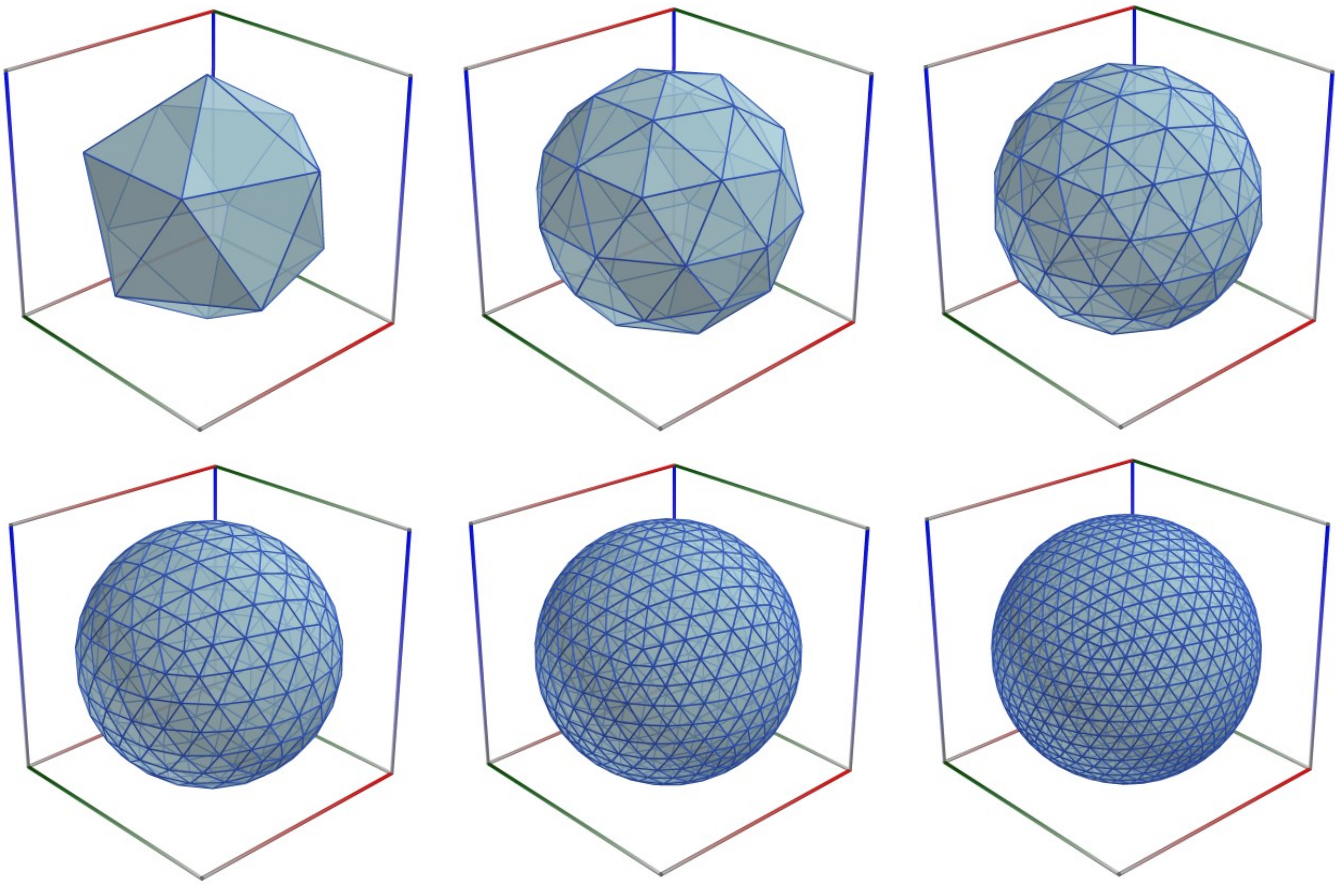
A spherical polyhedron or spherical tiling is a tiling of the sphere in which the surface is divided or partitioned by great arcs into bounded regions called spherical polygons

See also: https://en.wikipedia.org/wiki/Geodesic_polyhedron

See also: https://en.wikipedia.org/wiki/Spherical_polyhedron

The example below uses the following code in C#

```
var radius = 1.0;
var numDiv = 1;
var proc = BuiltIn.SetGeodesicSphere(radius, numDiv);
```



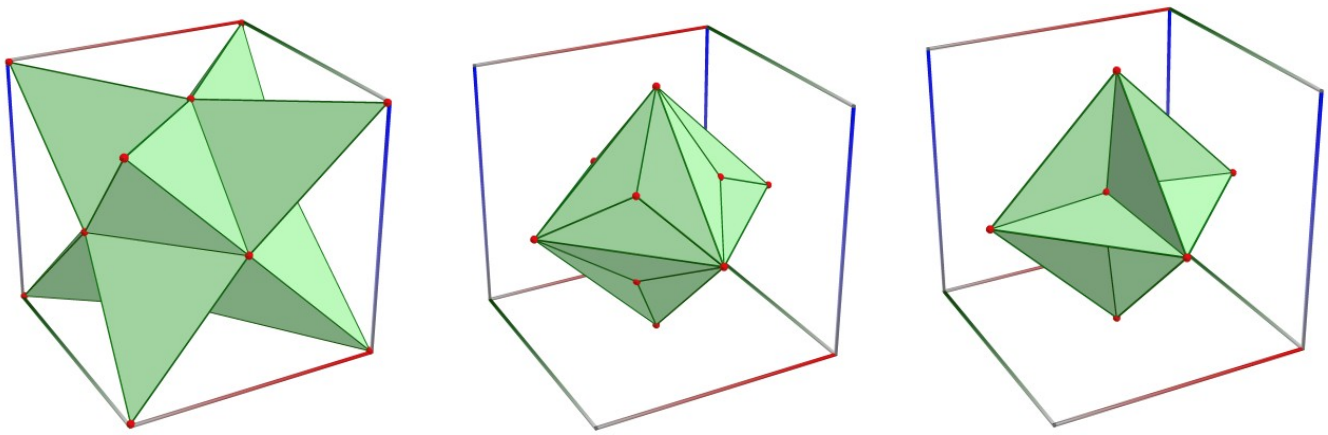
25.3.7 Augmented Octahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07a_Augm_Octahedron_a.3D.xml (D07a-c).

Returns the augmented Octahedron.

The example below uses the following code in C#

```
var starRadius = 3.0;
var proc = BuiltIn.SetAugmentedOctahedron(starRadius );
```



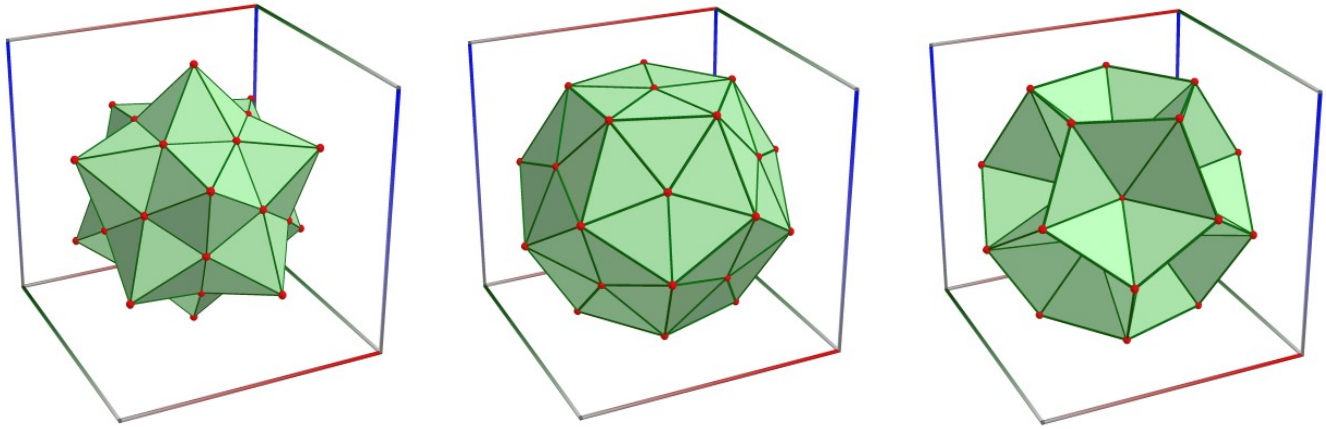
25.3.8 Augmented Dodecahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08a_Augm_Dodecahedron_a.3D.xml (D08a-c).

Returns the augmented Dodecahedron.

The example below uses the following code in C#

```
var starRadius = 6.0;
var proc = BuiltIn.SetAugmentedDodecahedron(starRadius );
```



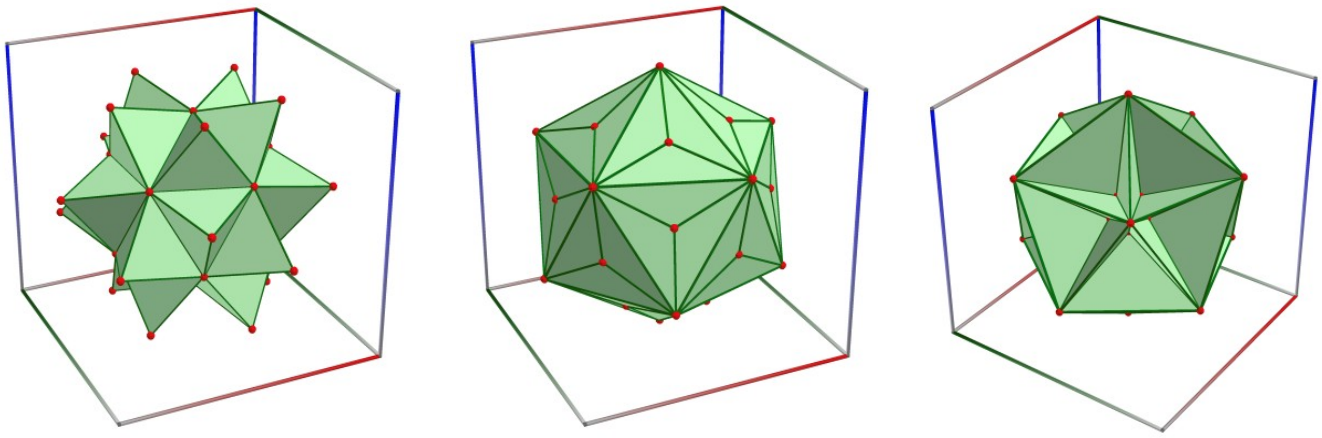
25.3.9 Augmented Icosahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D09a_Augm_Icosahedron_a.3D.xml (D09a-c).

Returns the augmented Dodecahedron.

The example below uses the following code in C#

```
var starRadius = 2.0;
var proc = BuiltIn.SetAugmentedIcosahedron(starRadius );
```



25.3.10 Augmented Geodesic Sphere

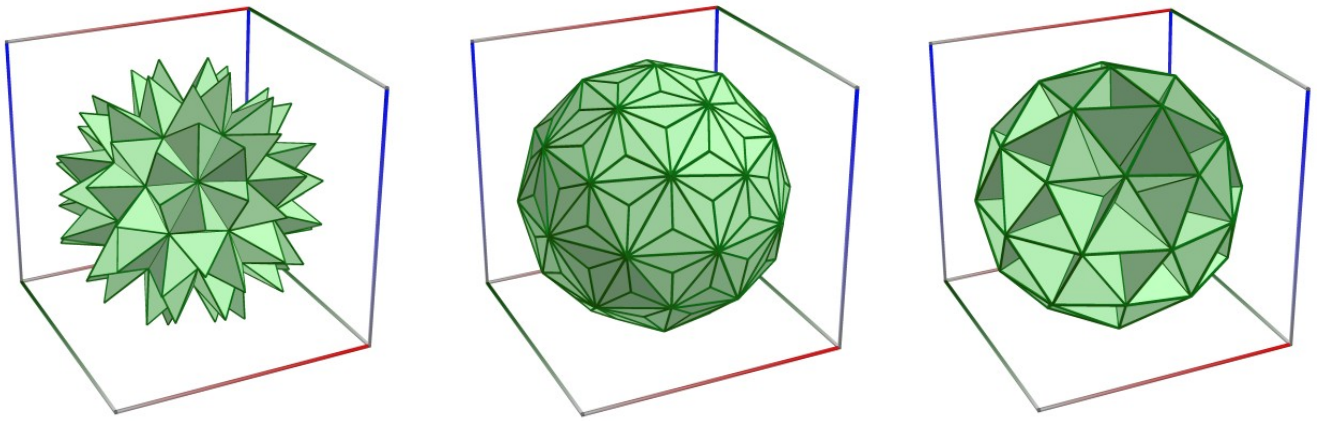
The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D10a_Augm_Geodesic_a.3D.xml (D10a-c).

Returns augmented versions of the Geodesic.

See also: https://mathworld.wolfram.com/IcosahedronStellations.html

The example below uses the following code in C#

```
var starRadius = 2.0;
var numDiv = 2;
var proc = BuiltIn.SetAugmentedGeodesic(starRadius, numDiv);
```



25.3.11 Stella Octangula

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D11a_StellaOctangula.3D.xml (D10a-c).

The stella octangula is a polyhedron compound composed of a tetrahedron and its dual (a second tetrahedron rotated 180 degrees with respect to the first). The stella octangula is also (incorrectly) called the augmented tetrahedron, and is the only stellation of the octahedron.

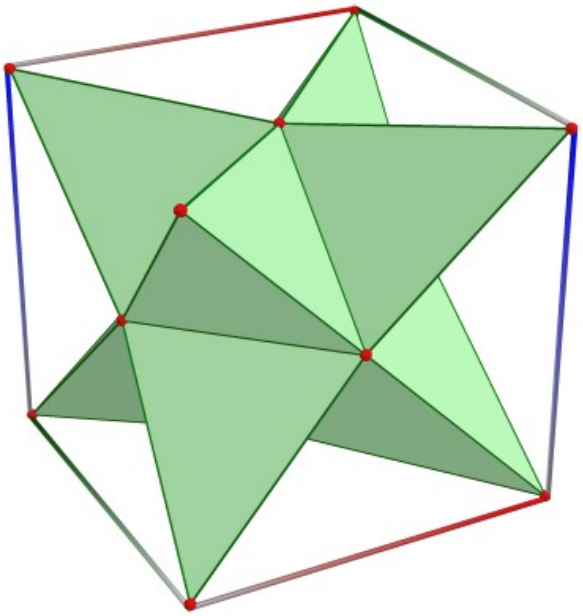
It can be constructed from a regular octahedron by augmentation with $h = \sqrt{6}/3$.

See also: https://mathworld.wolfram.com/StellaOctangula.html

See also: https://en.wikipedia.org/wiki/Stellated_octahedron

The example below uses the following code in C#

```
var starRadius = 2.0;
var proc = BuiltIn.SetAugmentedOctahedron(starRadius );
```



25.3.12 Small stellated Dodecahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D12a_SmallStellatedDodecahedron.3D.xml (D10a-c).

The small stellated dodecahedron is the Kepler-Poinsot polyhedra whose dual polyhedron is the great dodecahedron.

It can be constructed from a regular dodecahedron by augmentation with $h = \sqrt{(5 + 2\sqrt{5})/5}$.

See also: https://mathworld.wolfram.com/SmallStellatedDodecahedron.html

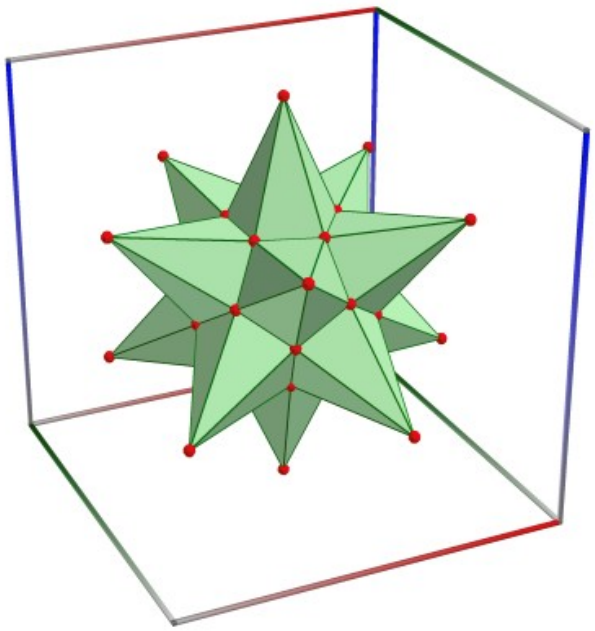
See also: https://mathworld.wolfram.com/Augmentation.html

See also: https://en.wikipedia.org/wiki/Small_stellated_dodecahedron

See also: https://mathworld.wolfram.com/Kepler-PoinsotPolyhedron.html

The example below uses the following code in C#

```
var starRadius = 6.0;
var proc = BuiltIn.SetAugmentedDodecahedron(starRadius );
```



25.3.13 Great Dodecahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D13a_GreatDodecahedron.3D.xml (D10a-c).

The great dodecahedron is the Kepler-Poinsot polyhedron whose dual is the small augmented dodecahedron.

It can be constructed from a regular icosahedron by augmentation with $h = (\sqrt{3}(\sqrt{5} - 3))/6$.

See also: https://mathworld.wolfram.com/GreatDodecahedron.html

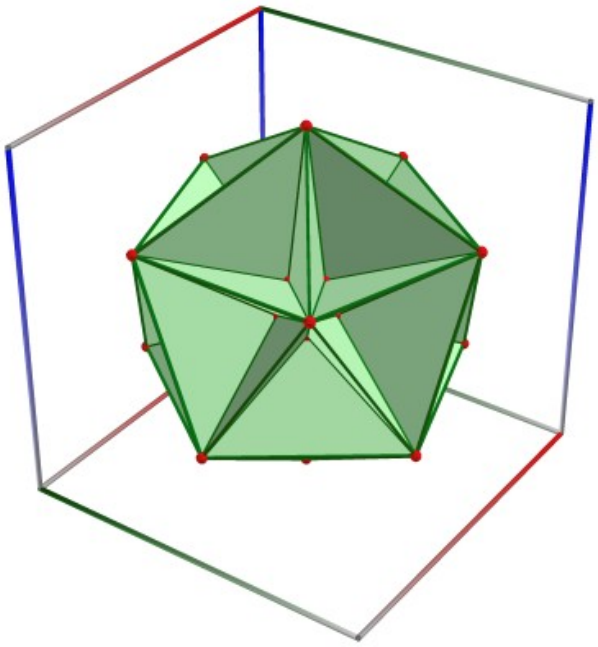
See also: https://mathworld.wolfram.com/Augmentation.html

See also: https://en.wikipedia.org/wiki/Great_dodecahedron

See also: https://mathworld.wolfram.com/Kepler-PoinsotPolyhedron.html

The example below uses the following code in C#

```
var starRadius = 0.25;
var proc = BuiltIn.SetAugmentedIcosahedron(starRadius );
```



25.3.14 Great stellated Dodecahedron

The XML code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D14a_GreatStellatedDodecahedron.3D.xml (D10a-c).

The great augmented dodecahedron is one of the Kepler-Poinsot polyhedra.

It can be constructed from a regular icosahedron by augmentation with $h = (\sqrt{3}(3 + \sqrt{5}))/6$.

See also: https://mathworld.wolfram.com/GreatStellatedDodecahedron.html

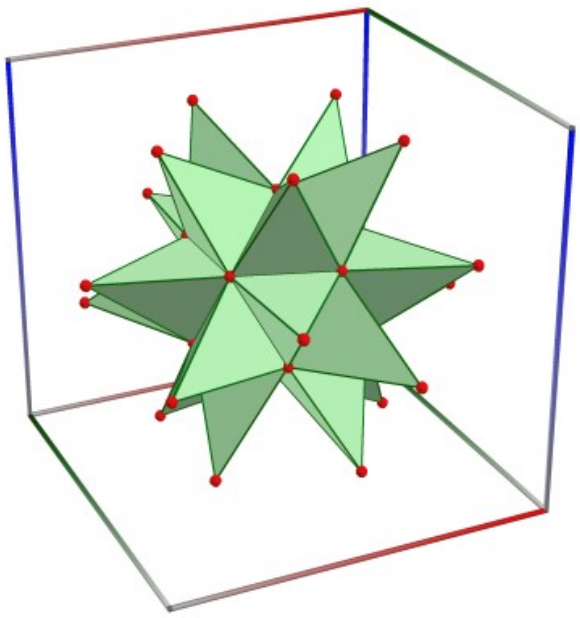
See also: https://mathworld.wolfram.com/Augmentation.html

See also: https://en.wikipedia.org/wiki/Great_stellated_dodecahedron

See also: https://mathworld.wolfram.com/Kepler-PoinsotPolyhedron.html

The example below uses the following code in C#

```
var starRadius = 2.0;
var proc = BuiltIn.SetAugmentedIcosahedron(starRadius );
```



Part VI

Additional functions in double precision

CHAPTER

TWENTYSIX

REAL ELEMENTARY FUNCTIONS

26.1 Root, exponential, logarithmic and power functions

26.1.1 Auxiliary function $\mathrm{sqrt1pmx}(x) = \sqrt{1+x^2} - x$

`math53.sqrt1pmx(`x`)`

Returns $\sqrt{1+x^2} - x$, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Sqrt1pmx(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Sqrt1pmx('0.51')
ereal('5.351847902755998475 4E-1')
```

26.1.2 Bring radical

`math53.bring(`x`)`

Returns the Bring radical $b = \mathrm{BR}(x)$ of x, i.e. the unique real b with $b^5 + b + x = 0$. The function can be used (together with standard radicals) to solve a class of quintic equations in closed form.

See also: https://en.wikipedia.org/wiki/Bring_radical, Ehrhardt [297] (3.10.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Bring(3)
ereal('5.235987755982988730 7E-1')
>>> ereal.Bring(13)
ereal('5.351847902755998475 4E-1')
```

26.1.3 Auxiliary function $\mathrm{expmx2h}(x) = \exp(-x^2/2)$

`math53.expmx2h(`x`)`

Returns $\exp(-x^2/2)$ with damped error amplification.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Expmx2h(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Expmx2h('0.51')
ereal('5.351847902755998475 4E-1')
```

26.1.4 Relative error exponential $\mathrm{exprel}(x) = (\exp(x) - 1)/x$

`math53.exprel(`x`)`

where `ctx` is `math53`, `ctxcpp` or `ctxflint`.

Returns exprel(x) = $(\exp(x) - 1)/x$, 1 for $x = 0$.

$$\mathrm{exprel}(x) = \begin{cases} (\exp(x) - 1)/x = \mathrm{expm1}(x)/x, & \text{if } x \neq 0 \\ 1, & \text{if } x = 0. \end{cases}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Exprel(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Exprel('0.51')
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '1.0E-100'
>>> \mathrm{d}x = dec.exprel(x); mx = mpm.exprel(x); ix = ipm.exprel(x)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  1.0000000000000000000000000000000000000000E+0
mpm:  1.0000000000000000000000000000000000000000e+0
ipm:  1.0000000000000000000000000000000000000000e+0 (3.444e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '1.0E-100'
>>> fx = fpm.exprel(x); gx = gmp.exprel(x); ax = apm.exprel(x)
>>> mpm.show([fx, gx, ax])
fpm:  1.0
gmp:  1.0000000000000000000000000000000000000000E+00
apm:  1.0000000000000000000000000000000000000000e+0 (2.87e-39%)
```

The following example with complex input shows that the relative error can be high in double precision:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 20; z = '1.0E-100 + 1.57079632679489j'
>>> \mathrm{d}z = dec.exprel(z); mz = mpm.exprel(z); iz = ipm.exprel(z)
>>> mpm.show([\mathrm{d}z, mz, iz], aligned=True)
dec: 6.3661977236758402575E-1              + 6.3661977236757981182E-1j
mpm: 6.3661977236758402575e-1              + 6.3661977236757981182e-1j
ipm: 6.3661977236758402575e-1 (2.661e-19%) + 6.3661977236757981182e-1 (3.992e-19%)j

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 20; z = '1.0E-100 + 1.57079632679489j'
>>> fz = fpm.exprel(z); gz = gmp.exprel(z); az = apm.exprel(z)
>>> mpm.show([fz, gz, az], aligned=True)
fpm: 6.36619772367584E-01                  + 6.36619772367580E-01j
gmp: 6.3661977236758402575E-01             + 6.3661977236757981182E-01j
apm: 6.3661977236758402575e-1 (3.326e-19%) + 6.3661977236757981182e-1 (3.992e-19%)j
```

26.1.5 Auxiliary function $\mathrm{expx2}(x) = \exp(x \cdot |x|)$

`math53.`**`expx2`**`(`x`)`

Returns $\exp(x \cdot |x|)$ with damped error amplification.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Expx2(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Expx2('0.51')
ereal('5.3518479027559984754E-1')
```

26.1.6 Auxiliary function $\mathrm{logistic}(x) = 1/(1 + \exp(-x))$

`math53.`**`logistic`**`(`x`)`

Returns $\mathrm{logistic}(x) = 1/(1 + \exp(-x))$. See also Wikipedia [1350], MathWorld [1010].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logistic(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Logistic('0.51')
ereal('5.351847902755998475 4E-1')
```

26.1.7 Einstein functions

`math53.einstein`(n, x)

Returns the Einstein function E_n for $n = 1, 2, 3, 4$, with $E_1(x) = \dfrac{x^2 e^x}{(e^x - 1)^2}$, $E_2(x) = \dfrac{x}{e^x - 1}$, $E_3(x) = \log(1 - e^{-x}), x > 0$, $E_4(x) = \dfrac{x}{e^x - 1} - \log(1 - e^{-x}), x > 0$.

See also https://mathworld.wolfram.com/EinsteinFunctions.html

See also: Abramowitz and Stegun. [4] table 27.3, Ehrhardt [297] (3.10.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Einstein(1,3)
ereal('5.235987755982988730 7E-1')
>>> ereal.Einstein(2,13)
ereal('5.351847902755998475 4E-1')
```

26.1.8 Auxiliary function $\mathrm{log1mexp}(x) = \log(1 - \exp(-|x|))$

`math53.log1mexp`(x)

Returns $\log(1 - \exp(-|x|))$, calculated in an accurate and efficient way. See also Mächler [421].

$$\mathrm{log1mexp}(x) = \begin{cases} (\log(-\mathrm{expm1}(-x)), & \text{if } 0 < |x| < \log(2) \\ \mathrm{log1p}(-\exp(-x)) & \text{if } |x| > \log(2). \end{cases}$$

See also *expm1()* and *log1p()*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Log1mexp(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Log1mexp('0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '0.6'
>>> \mathrm{d}x = dec.log1mexp(x); mx = mpm.log1mexp(x); ix = ipm.log1mexp(x)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  -7.9587036834631956071968417821499658668 67E-1
mpm:  -7.9587036834631956071968417821499658668 67e-1
ipm:  -7.9587036834631956071968417821499658668 67e-1 (-2.164e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '0.6'
>>> fx = fpm.log1mexp(x); gx = gmp.log1mexp(x); ax = apm.log1mexp(x)
>>> mpm.show([fx, gx, ax])
fpm:  -7.95870368346320E-01
gmp:  -7.9587036834631956071968417821499658668 67E-01
apm:  -7.9587036834631956071968417821499658668 67e-1 (-9.375e-39%)
```

A example with complex input (the output is always real)

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; z = '0.6 + 0.1j'
>>> \mathrm{d}z = dec.log1mexp(z); mz = mpm.log1mexp(z); iz = ipm.log1mexp(z)
>>> mpm.show([\mathrm{d}z, mz, iz], aligned=True)
dec: -7.8589485399261416920173666653185505230 32E-1
mpm: -7.8589485399261416920173666653185505230 32e-1
ipm: -7.8589485399261416920173666653185505230 32e-1 (-4.382e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; z = '0.6 + 0.1j'
>>> fz = fpm.log1mexp(z); gz = gmp.log1mexp(z); az = apm.log1mexp(z)
>>> mpm.show([fz, gz, az], aligned=True)
fpm: -7.85894853992614E-01
gmp: -7.8589485399261416920173666653185505230 32E-01
apm: -7.8589485399261416920173666653185505230 31e-1 (-9.494e-39%)
```

26.1.9 Auxiliary function $\mathrm{log1pexp}(x) = \log(1 + \exp(x))$

`math53.log1pexp`(x)

Returns $\mathrm{ln1pexp}(x)) = \log(1 + \exp(x)) = \mathrm{log1p}(\exp(x))$. See also *log1p()*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Log1pexp(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Log1pexp('0.51')
ereal('5.3518479027559984754E-1')
```

26.1.10 Auxiliary function $\mathrm{log1pmx}(x) = \log(1 + x) - x$

`math53.log1pmx`(x)

Returns $\mathrm{ln1pmx}(x)) = \log(1 + x) - x = \mathrm{log1p}(x) - x$, accurate also for $-0.5 \leq x \leq 0.5$. See also *log1p()*.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Log1pmx(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Log1pmx('0.51')
ereal('5.3518479027559984754E-1')
```

26.1.11 Auxiliary function $\mathrm{logaddexp}(x, y) = \log[\exp(x) + \exp(y)]$

`math53.logaddexp`(x, y)

Accurately compute ln[exp(x) + exp(y)].

See also: https://www.boost.org/doc/libs/latest/libs/math/doc/html/math_toolkit/powers/logaddexp.html

See also: https://nhigham.com/2021/01/05/what-is-the-log-sum-exp-function/

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logaddexp(0.5, 2)
ereal('5.2359877559829887307E-1')
>>> ereal.Logaddexp('0.51', 2)
ereal('5.3518479027559984754E-1')
```

26.1.12 Auxiliary function $\mathrm{logsubexp}(x, y) = \log[\exp(x) - \exp(y)]$

`math53.logsubexp`(x, y)

Accurately compute $\log[\exp(x) - \exp(y)], x > y$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logsubexp(20.5, 4)
ereal('5.2359877559829887307E-1')
>>> ereal.Logsubexp(20.5, 4)
ereal('5.351847902755998475 4E-1')
```

26.1.13 Auxiliary function $\mathrm{logit}(x) = \log(x/(1.0 - x))$

`math53.logit`(x)

Returns $\mathrm{logit}(x) = \log(x/(1.0 - x))$, accurate also near $x = 0.5$. See also Wikipedia [1351], MathWorld [1011].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logit(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Logit('0.51')
ereal('5.351847902755998475 4E-1')
```

26.1.14 Wright ω function

`math53.wright_omega`(x)

Returns the Wright $\omega(x)$ function, which is defined as the unique solution of $\omega(x) + \log(\omega(x)) = x$. For real x it can be written in terms of the Lambert W function as $\omega(x) = W(e^x)$

See also: Ehrhardt [297] (3.10.26).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.WrightOmega(2,3)
ereal('5.2359877559829887307E-1')
>>> ereal.WrightOmega(4,13)
ereal('5.351847902755998475 4E-1')
```

26.1.15 Auxiliary function $\mathrm{compound}(x, n) = (1 + x)^n$

`ctx.compound`(a, b)

Returns $(1 + x)^n$, computed accurately also when x is very close to 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Compound(0.5, 2)
ereal('5.2359877559829887307E-1')
>>> ereal.Compound('0.51', 2)
ereal('5.351847902755998475 4E-1')
```

26.1.16 Auxiliary function $\mathrm{comprel}(x, n) = (1 + x)^n - 1$

`ctx.comprel`(x, n)

Returns $(1 + x)^n - 1$, computed accurately also when x is very close to 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Comprel(0.5, 2)
ereal('5.235987755982988730 7E-1')
>>> ereal.Comprel('0.51', 2)
ereal('5.351847902755998475 4E-1')
```

26.1.17 Auxiliary function $\mathrm{hypot3}(x, y, z) = \sqrt{x^2 + y^2 + z^2}$

`math53.hypot3`(x, y, z)

Returns $\mathrm{hypot3}(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ in a way which avoids undue underflow and overflow. See also BoostMath [122], Wikipedia [1288].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Hypot3(0.5, 3, 5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Hypot3(0.5, 3, 5)
ereal('5.351847902755998475 4E-1')
```

26.1.18 Fibonacci polynomials, $\mathrm{fibpoly}(n, x)$

`math53.fibpoly`(n, x)

where `ctx` is `math53`, `ctxcpp` or `ctxflint`.

Returns $F_n(x)$, the Fibonacci polynomial of index $n \in \mathbb{Z}$. See also Wikipedia [1344], Wikipedia [1345], Jin [383], MathWorld [1004], MathWorld [1005], Ehrhardt [297] (3.10.11).

https://en.wikipedia.org/wiki/Fibonacci_polynomials#Properties

https://functions.wolfram.com/HypergeometricFunctions/Fibonacci2General/26/03/01/0002/

For any non-negative integer n, the Fibonacci polynomials $\{F_n(x)\}$ are defined by the second order linear recursive formula $F_{n+2}(x) = xF_{n+1}(x) + F_n(x)$ with $F_0(x) = 0$, $F_1(x) = 1$, $L_0(x) = 2$, and $L_1(x) = x$. The general terms of $F_n(x)$ are given by

$$F_n(x) = \frac{1}{\sqrt{x^2+4}}\left[\left(\frac{x+\sqrt{x^2+4}}{2}\right)^n - \left(\frac{x-\sqrt{x^2+4}}{2}\right)^n\right]$$

An example with real input:

```
>>> from mpaddin import dec, mpm, ipm
>>> mpm.dps = 40; n = '10'; x = '20.4'
>>> \mathrm{d}x = dec.fibpoly(n, x); mx = mpm.fibpoly(n, x); ix = ipm.fibpoly(n, x)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  6.2372430049660685414400000000000000000000E+11
mpm:  6.2372430049660685414400000000000000000001e+11
ipm:  6.2372430049660685414400000000000000000000e+11 (2.327e-38%)

>>> from mpaddin import mpm, fpm, gmp, apm
>>> mpm.dps = 40; n = '10'; x = '20.4'
>>> fx = fpm.fibpoly(n, x); gx = gmp.fibpoly(n, x); ax = apm.fibpoly(n, x)
>>> mpm.show([fx, gx, ax])
```

(continues on next page)

(continued from previous page)

```
fpm:  6.23724300496606E+11
gmp:  6.2372430049660685414400000000000000000001E+11
apm:  6.2372430049660685414400000000000000000000e+11 (2.226e-38%)
```

26.1.19 Lucas polynomials, $\mathrm{lucaspoly}(n, x)$

`math53.lucaspoly`(n, x)

where `ctx` is `math53`, `ctxcpp` or `ctxflint`.

Returns $L_n(x)$, the Lucas polynomial of index $n \in \mathbb{Z}$. See also Ehrhardt [297] (3.10.18), Wikipedia [1352], Wikipedia [1353], Jin [383], MathWorld [1012], MathWorld [1013].

For any non-negative integer n, Lucas polynomials $\{L_n(x)\}$ are defined by the second order linear recursive formulas $L_{n+2}(x) = xL_{n+1}(x) + L_n(x)$, $L_0(x) = 2$, and $L_1(x) = x$. For negative indices we have $L_{-n}(x) = (-1)^n L_n(x)$. The general terms of $L_n(x)$ are given by

$$L_n(x) = \left(\frac{x + \sqrt{x^2+4}}{2}\right)^n + \left(\frac{x - \sqrt{x^2+4}}{2}\right)^n.$$

An example with real input:

```
>>> from mpaddin import dec, mpm, ipm
>>> mpm.dps = 40; n = '10'; x = '20.4'
>>> \mathrm{d}x = dec.lucaspoly(n, x); mx = mpm.lucaspoly(n, x); ix = ipm.lucaspoly(n, x)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  1.27849789359653243672576000000000000000E+13
mpm:  1.27849789359653243672576000000000000000e+13
ipm:  1.27849789359653243672576000000000000000e+13 (1.895e-38%)

>>> from mpaddin import mpm, fpm, gmp, apm
>>> mpm.dps = 40; n = '10'; x = '20.4'
>>> fx = fpm.lucaspoly(n, x); gx = gmp.lucaspoly(n, x); ax = apm.lucaspoly(n, x)
>>> mpm.show([fx, gx, ax])
fpm:  1.27849789359653E+13
gmp:  1.27849789359653243672576000000000000000E+13
apm:  1.27849789359653243672576000000000000000e+13 (1.895e-38%)
```

26.1.20 Fibonacci function, $F_\nu(x)$, of real index ν

`math53.fibfun`(ν, x)

Returns $F_\nu(x) = \dfrac{2^{-\nu}(x + \sqrt{x^2+4})^\nu - \cos(\pi\nu) \cdot 2^\nu (x + \sqrt{x^2+4})^{-\nu}}{\sqrt{x^2+4}}$, the general Fibonacci function of real index ν.

See also Ehrhardt [297] (3.10.12) , https://en.wikipedia.org/wiki/Fibonacci_polynomials.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Fibfun(3, 4)
ereal('5.2359877559829887307E-1')
>>> ereal.Fibfun(3, 12)
ereal('5.3518479027559984754E-1')
```

26.2 Trigonometric functions

26.2.1 Sine, x in degrees, $\mathrm{sind}(x)$

math53.**sind**(x)

Returns the sine of x, with x in degrees, $\mathrm{sind}(x)$. See also Wikipedia [1246], MathWorld [876], NIST [493].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Sind(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Sind('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.2 Inverse sine, input in degrees, $\mathrm{asind}(x)$

math53.**asind**(x)

where ctx is math53, mathc53, ctxcpp, ctxflint.

Returns the inverse sine of x, $\mathrm{asin}(x)$. See also Wikipedia [1262], MathWorld [873], NIST [488], Ehrhardt [297] (4.2.13), Mpmath [579].

26.2.3 Cosine, x in degrees, $\mathrm{cosd}(x)$

math53.**cosd**(x)

Returns the cosine of x, with x in degrees, $\mathrm{cosd}(x)$. See also Wikipedia [1249], MathWorld [861], NIST [493].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cosd(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Cosd('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.4 Inverse cosine, input in degrees, $\mathrm{acosd}(x)$

math53.**acosd**(x)

where ctx is math53, mathc53, ctxcpp, ctxflint.

Returns the inverse cosine of x, $\mathrm{acos}(x)$. See also Wikipedia [1262], MathWorld [870], NIST [488], Ehrhardt [297] (4.2.3), Flint [745], Flint [735], Mpmath [570].

26.2.5 Tangent, with x in degrees, $\mathrm{tand}(x)$

math53.**tand**(x)

Returns the tangent of x, with x in degrees, $\mathrm{tand}tan(x)$. See also Wikipedia [1249], MathWorld [877], NIST [493].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Tand(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Tand('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.6 Inverse tangent, input in degrees, $\mathrm{atand}(x)$

`math53.atand`(x)

where `ctx` is `math53`, `mathc53`, `ctxcpp` or `ctxflint`.

Returns the inverse tangent of x, $\mathrm{atan}(x)$. See also Wikipedia [1262], MathWorld [874], NIST [488], Ehrhardt [297] (4.2.15), Flint [745], Flint [735], Mpmath [580].

26.2.7 Cotangent, with x in degrees, $\mathrm{cotd}(x)$

`math53.cotd`(x)

Returns the cotangent of x, with x in degrees, $\mathrm{cotd}(x)$. See also Wikipedia [1249], MathWorld [862], NIST [493].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cotd(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Cotd('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.8 Inverse cotangent, input in degrees, $\mathrm{acotd}(x)$

`math53.acotd`(x)

Returns the inverse cotangent of x, $\mathrm{acot}(x)$. See also Wikipedia [1262], MathWorld [871], NIST [488], Ehrhardt [297] (4.2.5).

26.2.9 Auxiliary function, $\mathrm{acos}(1-x)$

`math53.acos1m`(x)

Returns $\mathrm{acos}(1-x)$, $0 \le x \le 2$, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Acos1m(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Acos1m('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.10 Haversine function $\mathrm{hav}(x) = (1-\cos(x))/2$

`math53.hav`(x)

Returns the haversine function $\mathrm{hav}(x) = (1-\cos(x))/2 = \sin^2(x/2)$. See also MathWorld [985], Wikipedia [1347].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Haversine(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Haversine('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.11 Inverse haversine function $\mathrm{archav}(x) = \mathrm{acos}(1-2x)$

math53.**archav**(z)

Returns the inverse haversine function $\text{archav}(x) = \text{acos}(1-2x) = 2\text{asin}(\sqrt{x})$, $0 \leq x \leq 1$. See also MathWorld [989], Wikipedia [1349].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ArcHaversine(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.ArcHaversine('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.12 Versine function $\text{vers}(x) = 1 - \cos(x)$

math53.**vers**(x)

Returns the versine function $\text{vers}(x) = 1 - \cos(x)$.

See also: https://en.wikipedia.org/wiki/Versine#Haversine

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Versine(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Versine('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.13 Coversine, $\text{covers}(x) = 1 - \sin(x)$

math53.**covers**(x)

Returns the $\text{covers}(x) = 1 - \sin(x)$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Covers(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Covers('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.14 Versint function $\text{versint}(x) = x - \sin(x)$

math53.**versint**(x)

Returns $\text{versint}(x) = \int_0^x \text{vers}(t)\text{d}t = x - \sin(x)$, accurate also near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Versint(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Versint('0.51')
ereal('5.351847902755998475 4E-1')
```

26.2.15 Integral of cos powers, $\text{cosint}(n, x)$

math53.**cosint**(n, x)

Returns $\mathrm{IC}_n(x) = \int_0^x \cos^n(t)\,\mathrm{d}t$, the integral of the nth cos power, for $n \geq 0$.

See also Ehrhardt [297] (3.10.13).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CosInt(3, 4)
ereal('5.235987755982988730 7E-1')
>>> ereal.CosInt(3, 12)
ereal('5.351847902755998475 4E-1')
```

26.2.16 Integral of sin powers, $\mathrm{sinint}(n, x)$

math53.**sinint**(n, x)

Returns sinint(n,x) = integral(sin(t)^n, t=0..x), n >= 0

Returns $\mathrm{IS}_n(x) = \int_0^x \sin^n(t)\,\mathrm{d}t$, the integral of the nth sin power, for $n \geq 0$.

See also Ehrhardt [297] (3.10.14).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SinInt(3, 4)
ereal('5.235987755982988730 7E-1')
>>> ereal.SinInt(3, 12)
ereal('5.351847902755998475 4E-1')
```

26.3 Hyperbolic functions

26.3.1 Cardinal hyperbolic sine, $\mathrm{sinhc}(x) = \sinh(x)/x$

math53.**sinhc**(x)

Returns $\mathrm{sinhc}(x) = \sinh(x)/x$, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Sinhc(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Sinhc('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.2 Auxiliary function, $\mathrm{sinhmx}(x) = \sinh(x) - x$

math53.**sinhmx**(x)

Returns sinh(x)-x, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Sinhmx(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Sinhmx('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.3 Auxiliary function, $\mathrm{coshm1}(x) = \cosh(x) - 1$

math53.**coshm1**(x)

Returns $\cosh(x) - 1$, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Coshm1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Coshm1('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.4 Auxiliary function $\mathrm{acosh}(1 + x)$

math53.**acosh1p**(z)

Returns $\mathrm{acosh}(1 + x), x \geq 0$, accurate also for x near 0.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Acosh1p(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Acosh1p('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.5 Auxiliary function $\log(\cosh(x))$

math53.**logcosh**(x)

Returns ln(cosh(x)), accurate for x ~ 0 and without overflow for large x

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logcosh(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Logcosh('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.6 Auxiliary function $\log(\sinh(x))$

math53.**logsinh**(x)

Returns ln(sinh(x)), x > 0, accurate for x ~ 0 and without overflow for large x

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Logsinh(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Logsinh('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.7 Gudermannian function $\mathrm{gd}(x) = \mathrm{asin}(\tanh(x))$

math53.**gd**(x)

Returns the Gudermannian function $\mathrm{gd}(x) = \mathrm{asin}(\tanh(x))$. See also Wikipedia [1346], MathWorld [984].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Gudermann(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Gudermann('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.8 Inverse Gudermannian function $\mathrm{arcgd}(x) = \mathrm{atanh}(\sin(x))$

math53.**arcgd**(z)

Returns the inverse Gudermannian function $\mathrm{arcgd}(x) = \mathrm{atanh}(\sin(x)), |x| < \pi/2$.

See also Wikipedia [1348], MathWorld [988].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ArcGd(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.ArcGd('0.51')
ereal('5.351847902755998475 4E-1')
```

26.3.9 Langevin function, $L(x)$

math53.**langevin_l**(x)

Returns the Langevin function $L(x)$, defined as $L(x) = \coth(x) - 1/x$ for $x \neq 0$, and $L(0) = 0$ for $x = 0$.

See also Ehrhardt [297] (3.10.16).

https://en.wikipedia.org/wiki/Brillouin_and_Langevin_functions

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LangevinL(0.2)
ereal('5.235987755982988730 7E-1')
>>> ereal.LangevinL(0.21)
ereal('5.351847902755998475 4E-1')
```

26.3.10 Inverse Langevin function, $L^{-1}(x)$

math53.**langevin_l_inv**(x)

Returns the functional inverse L^{-1} of the Langevin function, i.e. $L(L^{-1}(x)) = x$, $|x| < 1$.

See also Ehrhardt [297] (3.10.17).

https://en.wikipedia.org/wiki/Brillouin_and_Langevin_functions

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LangevinLInv(0.2)
ereal('5.235987755982988730 7E-1')
>>> ereal.LangevinLInv(0.21)
ereal('5.351847902755998475 4E-1')
```

26.3.11 Solutions of Kepler's equation, $\mathrm{kepler}(M, e)$

math53.**kepler**(M, e)

Returns the solutions (eccentric anomaly x) of Kepler's equation from the mean anomaly M and the eccentricity e, more precisely the solutions x of

$$M = \begin{cases} x - e\sin(x), & e < 1, \\ x + x^3/3, & e = 1 \text{ (Barker's equation)}, \\ e\sinh(x) - x, & e > 1. \end{cases}$$

See also Ehrhardt [297] (3.10.23).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Kepler(3, 0.44)
ereal('5.235987755982988730 7E-1')
>>> ereal.Kepler(3, 0.14404)
ereal('5.351847902755998475 4E-1')
```

26.4 Gamma functions

26.4.1 Sign of the gamma function

`math53.signgamma(`x`)`

Returns the sign of $\Gamma(x)$, which is $+1$ if $x > 0$ or if $\lfloor x \rfloor$ is even, -1 otherwise, and meaningless for 0 or negative integers.

See also Wikipedia [1260], MathWorld [886], NIST [22], BoostMath [101], Ehrhardt [297] (3.5.1.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SignGamma(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.SignGamma('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.2 Logarithm and sign of the gamma function

`math53.lgamma_s(`x, s`)`

Returns (as a tuple) the logarithm and sign of the gamma function.

See also Wikipedia [1260], MathWorld [886], NIST [22], BoostMath [101], Ehrhardt [297] (3.5.1.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogGammaS(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogGammaS('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.3 Logarithm of $\Gamma(1 + x)$

`math53.lgamma1p(`x`)`

Returns $\log|\Gamma(1 + x)|$ with increased accuracy for x near 0.

See also Wikipedia [1271], MathWorld [894], BoostMath [102], Ehrhardt [297] (3.5.1.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogGamma1p(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogGamma1p('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.4 Logarithm of factorials: $\log(x!)$

`math53.logfactorial(`n`)`

Returns $\log(x!) = \log(\Gamma(x + 1))$. See also Wikipedia [1258], MathWorld [884], BoostMath [99], Ehrhardt [297] (3.5.4.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogFactorial(3)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogFactorial('0.51')
ereal('5.351847902755998475 4E-1')
```

26.4.5 Logarithm of the binomial coefficient

`math53.logbinomial`(n, k)

Returns the logarithm of the binomial coefficient, $\log \binom{n}{k} = \log \left(\frac{n!}{k!(n-k)!} \right)$, for $n \geq k \geq 0$.

See also Wikipedia [1255], MathWorld [883], NIST [485], BoostMath [96], Ehrhardt [297] (3.5.4.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogBinomial(13, 7)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogBinomial(12.6, '4.51')
ereal('5.351847902755998475 4E-1')
```

26.4.6 Log-Beta function

`math53.logbeta`(a, b)

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the logarithm of $B(a, b)$

See also Wikipedia [1254], MathWorld [882], NIST [21], BoostMath [95], Ehrhardt [297] (3.5.3.2), Mpmath [587].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogBeta(3.1, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogBeta(3.4, '0.51')
ereal('5.351847902755998475 4E-1')
```

26.4.7 Inverse of the gamma function, $\Gamma^{-1}(y)$

`math53.gamma_inv`(y)

Returns $\Gamma^{-1}(y)$, the functional inverse of the gamma function, i.e. it returns x with $\Gamma(x) = y$, $y \geq 0.8857421875$.

See also Wikipedia [1260], MathWorld [886], NIST [22], BoostMath [101], Ehrhardt [297] (3.5.1.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.GammaInv(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.GammaInv('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.8 Inverse of the logarithm of the gamma function, $\log \Gamma^{-1}(y)$

`math53.lgamma_inv`(y)

Returns the functional inverse of $\log \Gamma(x)$, i.e. it returns $x = \log \Gamma^{-1}(y)$ with $\log \Gamma(x) = y$ for $y \geq -0.12142 > y_m$ (the minimum of $\log \Gamma(x)$ for positive arguments). The result is greater than $x_m = 1.46163\ldots$ (the positive zero of the ψ function).

See also Wikipedia [1271], MathWorld [894], BoostMath [102], Ehrhardt [297] (3.5.1.6).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LogGammaInv(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.LogGammaInv('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.9 Temme's regulated gamma function, $\Gamma^*(x)$

`math53.gammastar(`x`)`

Returns Temme's $\Gamma^*(x)$, defined by $\Gamma(x) = \sqrt{2\pi}e^{-x}x^{x-1/2}\Gamma^*(x)$.

See also Wikipedia [1260], MathWorld [886], NIST [22], BoostMath [101], Ehrhardt [297] (3.5.1.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.GammaStar(1.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.GammaStar('1.51')
ereal('5.351847902755998475 4E-1')
```

26.4.10 Relative Pochhammer symbol, $((a)_x - 1)/x$

`math53.poch1(`a, x`)`

Returns $\dfrac{(a)_x - 1}{x}$, accurate also for small $|x|$. For $x = 0$ the value $\psi(a)$ is returned.

See also Ehrhardt [297] (3.5.4.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Poch1(13, 7)
ereal('5.235987755982988730 7E-1')
>>> ereal.Poch1(12.6, '4.51')
ereal('5.351847902755998475 4E-1')
```

26.4.11 Catalan function $C(x)$

`math53.catalan_c(`x`)`

where `ctx` is `math53`, `ctxcpp`, `ctxboost` or `ctxflint`.

Returns the Catalan function $C(x) = \dfrac{1}{x+1}\binom{2x}{x} = \dfrac{\Gamma(2x+1)}{(x+1)\Gamma(x+1)^2}$.

See also: MathWorld [973], Wikipedia [1340], Ehrhardt [297] (3.10.5).

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '10.5'
>>> \mathrm{d}x = dec.catalan(x); mx = mpm.catalan(x); ix = ipm.catalan(x)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  3.13757603365031768131841171250789097219 4E+4
mpm:  3.13757603365031768131841171250789097219 4e+4
ipm:  3.13757603365031768131841171250789097219 4e+4 (3.597e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '10.5'
>>> fx = fpm.catalan(x); gx = gmp.catalan(x); ax = apm.catalan(x)
```

(continues on next page)

(continued from previous page)

```
>>> mpm.show([fx, gx, ax])
fpm:  3.13757603365032E+04
gmp:  3.13757603365031768131841171250789097219 4E+04
apm:  3.13757603365031768131841171250789097219 4e+4 (3.597e-39%)
```

CHAPTER

TWENTYSEVEN

REAL ELLIPTIC FUNCTIONS

27.1 Conversions of parameters of elliptic functions

27.1.1 Elliptic nome $q(k)$ (DAMath)

math53.**elliptic_nome**(z)

Returns the elliptic nome $q(k)$ as a function of the modulus $|k| < 1$:. See also Wikipedia [1362], MathWorld [1002], Ehrhardt [297] (3.2.8).

$$q(k) = \exp\left(-\pi \frac{K'(k)}{K(k)}\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticNome(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticNome('0.51')
ereal('5.351847902755998475 4E-1')
```

27.1.2 Elliptic modulus $k(q)$ (DAMath)

math53.**elliptic_modulus**(q)

Returns the elliptic modulus k. as a function of the nome $|q|$ le 1. See also MathWorld [1001], Ehrhardt [297] (3.2.9).The modulus k is often used as argument of elliptic integrals and Jacobi elliptic functions, the nome q is used with Jacobi theta functions. $k(q)$ is explicitly given by

$$k(q) = \frac{\theta_2^2(q)}{\theta_3^2(q)}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticModulus(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticModulus('0.51')
ereal('5.351847902755998475 4E-1')
```

27.1.3 Jacobi amplitude, $\mathrm{am}(x, k)$ (DAMath)

math53.**jacobi_amplitude**(x, k)

Returns the Jacobi amplitude function $\mathrm{am}(x, k)$ for a given modulus k. This is the inverse function of Legendre's elliptic function of the first kind: $\mathrm{am}(F(x, k), k) = x$. When $|k| < 1, \mathrm{am}(x, k)$ is a monotone quasi-periodic function NIST [478], 22.16.2: $\mathrm{am}(x + 2K(k), k) = \mathrm{am}(x, k) + \pi$, with the special case $\mathrm{am}(x, 0) = x$. When $|k| > 1, \mathrm{am}(x, k)$ is periodic with period $4K(1/k)/k$, and if $|k| = 1$, then it is equal to the Gudermannian function $\mathrm{am}(x, \pm 1) = \mathrm{gd}(x)$.

See also MathWorld [1007], NIST [478], Ehrhardt [297] (3.2.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiAmplitude(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiAmplitude(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.2 Elliptic integrals

27.2.1 Legendre complete elliptic integral $B(k)$

`math53.elliptic_b(`k`)`

Returns the Legendre complete elliptic integral $B(k) = \int_0^{\pi/2} \frac{\cos^2(t)\mathrm{d}t}{\sqrt{1-k^2\sin^2(t)}} = \frac{E(k)-\sqrt{1-k^2}K(k)}{k^2}$. See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.1.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CompEllintB(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CompEllintB(0.5)
ereal('5.351847902755998475 4E-1')
```

27.2.2 Legendre complete elliptic integral $D(k)$

`math53.elliptic_d(`k`)`

Returns the Legendre complete elliptic integral $D(k) = \int_0^{\pi/2} \frac{\sin^2(t)\mathrm{d}t}{\sqrt{1-k^2\sin^2(t)}} = \frac{K(k)-E(k)}{k^2}$. See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.1.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CompEllintD(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CompEllintD(0.5)
ereal('5.351847902755998475 4E-1')
```

27.2.3 Legendre incomplete elliptic integral $B(\phi, k)$

`math53.elliptic_b_inc(`*phi*, k`)`

Returns the Legendre complete elliptic integral , $B(k) = \int_0^{\phi} \frac{\cos^2(t)\mathrm{d}t}{\sqrt{1-k^2\sin^2(t)}} = \frac{E(\phi,k)-\sqrt{1-k^2}F(\phi,k)}{k^2}$. See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [137], Ehrhardt [297] (3.2.1.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllintB(0.12, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllintB(0.12, 0.5)
ereal('5.351847902755998475 4E-1')
```

27.2.4 Legendre incomplete elliptic integral $D(\phi, k)$

`math53.elliptic_d_inc(`*phi*, k`)`

Returns the Legendre complete elliptic integral , $D(k) = \int_0^{\phi} \frac{\sin^2(t)\mathrm{d}t}{\sqrt{1-k^2\sin^2(t)}} = \frac{F(\phi,k)-E(\phi,k)}{k^2}$. See also Wikipedia [1303], MathWorld [954], NIST [171], BoostMath [134], Ehrhardt [297] (3.2.1.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllintD(0.12, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllintD(0.12, 0.5)
ereal('5.351847902755998475 4E-1')
```

27.2.5 Heuman's Lambda function, $\Lambda_0(\phi, k)$

math53.**heuman_lambda**(*phi*, *k*)

Returns Heuman's Lambda function $\Lambda_0(\phi, k)$. See also MathWorld [960], BoostMath [141], Ehrhardt [297] (3.2.6).

$$\Lambda_0(\phi, k) = \frac{F(\phi, \sqrt{1-k^2})}{K(\sqrt{1-k^2})} + \frac{2}{\pi} K(k) Z(\phi, \sqrt{1-k^2}), \quad |k| \le 1.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.HeumanLambda(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.HeumanLambda(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; phi = '0.3'; m = '0.7'
>>> \mathrm{d}x = dec.heuman_lambda(phi, m); mx = mpm.heuman_lambda(phi, m); gx = gmp.heuman_lambda(phi, m)
>>> fx = fpm.heuman_lambda(phi, m); ax = apm.heuman_lambda(phi, m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  2.3467062057959891472661650891616797155226E-1
mpm:  2.3467062057959891472661650891616797155226e-1
gmp:  2.3467062057959891472661650891616797155226E-01
fpm:  2.34670620579599E-01
apm:  2.3467062057959891472661650891616797156135e-1 (4.07e-34%)
```

An example with complex input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; phi = '7.0 + 3.0j'; m = '11.0 + 3.0j'
>>> \mathrm{d}z = dec.heuman_lambda(phi, m); mz = mpm.heuman_lambda(phi, m); gz = gmp.heuman_lambda(phi, m)
>>> fz = fpm.heuman_lambda(phi, m); az = apm.heuman_lambda(phi, m)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az], aligned=True)
dec: -1.13459202864821407 53E+1               - 6.3944316931048323564E+0j
mpm: -1.13459202864821407 53e+1               - 6.3944316931048323564e+0j
gmp: -1.13459202864821407 53E+01              - 6.3944316931048323564E+00j
fpm: -1.13459202864821E+01                    - 6.39443169310483E+00j
apm: -1.1345920286482157538e+1 (-5.813e-13%) - 6.3944316931048395085e+0 (-5.749e-13%)j
```

27.2.6 Jacobi Zeta function, $Z(\phi, k)$

math53.**jacobi_zeta**(*phi*, *k*)

Returns the Jacobi Zeta function $Z(\phi, k)$. See also MathWorld [968], BoostMath [152], Ehrhardt [297] (3.2.7).

$$Z(\phi, k) = E(\phi, k) - \frac{E(k)}{K(k)} F(\phi, k), \quad |k| \le 1.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiZeta(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiZeta(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; phi = '0.3'; m = '0.7'
>>> \mathrm{d}x = dec.jacobi_zeta(phi, m); mx = mpm.jacobi_zeta(phi, m); gx = gmp.jacobi_zeta(phi, m)
>>> fx = fpm.jacobi_zeta(phi, m); ax = apm.jacobi_zeta(phi, m)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  1.154857111268923923475571636423888535609E-1

```

27.3 Bulirsch elliptic integrals

See Carlson (1994)

Bulirsch elliptic integrals can be calculated by

$$\mathrm{cel1}(k_c) = \mathrm{cel}(k_c, 0, a, 0) = aR_F\left(0, k_c^2, 1\right)$$

$$\mathrm{cel2}(k_c) = \mathrm{cel}(k_c, 0, a, b) = aR_F\left(0, k_c^2, 1\right) + \frac{b}{3}R_J\left(0, k_c^2, 1, 0\right)$$

$$\mathrm{cel}(k_c, p, a, b) = aR_F\left(0, k_c^2, 1\right) + \frac{1}{3}(b - pa)R_J\left(0, k_c^2, 1, p\right)$$

$$\mathrm{el1}(x, k_c) = xR_F\left(1, 1 + k_c^2x^2, 1 + x^2\right)$$

$$\mathrm{el2}(x, k_c, a, b) = axR_F\left(1, 1 + k_c^2x^2, 1 + x^2\right) + (b - a)\frac{x^3}{3}R_D\left(1, 1 + k_c^2x^2, 1 + x^2\right)$$

$$\mathrm{el3}(x, k_c, p) = xR_F\left(1, 1 + k_c^2x^2, 1 + x^2\right) + (1 - p)\frac{x^3}{3}R_J\left(1, 1 + k_c^2x^2, 1 + x^2, 1 + px^2\right)$$

27.3.1 Complete elliptic integral of the 1st kind $\mathrm{cel1}(k_c)$

`math53.cel1`(*kc*)

Returns Bulirsch's complete elliptic integral of the first kind. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.1).

$$\mathrm{cel1}(k_c) = \int_0^\infty \frac{\mathrm{d}t}{\sqrt{(1 + t^2)(1 + k_c^2t^2)}}$$

with the complementary modulus $K_c \neq 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cel1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Cel1('0.51')
ereal('5.351847902755998475 4E-1')
```

27.3.2 Complete elliptic integral of the 2nd kind $\mathrm{cel2}(k_c, a, b)$

`math53.cel2`(*kc*, *a*, *b*)

Returns Bulirsch's complete elliptic integral of the second kind. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.2).

$$\mathrm{cel2}(k_c, a, b) = \int_0^\infty \frac{a + bt^2}{(1 + t^2)\sqrt{(1 + t^2)(1 + k_c^2t^2)}}\mathrm{d}t$$

with the complementary modulus $k_c \neq 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cel2(0.5, 3, 4)
ereal('5.235987755982988730 7E-1')
>>> ereal.Cel2('0.51', 3, 4)
ereal('5.351847902755998475 4E-1')
```

27.3.3 General complete elliptic integral $\mathrm{cel}(k_c, p, a, b)$

`math53.cel`(*kc*, *p*, *a*, *b*)

Returns Bulirsch's general complete elliptic integral. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.3).

$$\mathrm{cel}(k_c, p, a, b) = \int_0^\infty \frac{a + bt^2}{(1 + pt^2)\sqrt{(1 + t^2)(1 + k_c^2 t^2)}} \mathrm{d}t$$

with the complementary modulus $k_c \neq 0$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cel(0.5, 2, 3, 4)
ereal('5.2359877559829887307E-1')
>>> ereal.Cel('0.51', 2, 3, 4)
ereal('5.351847902755998475 4E-1')
```

27.3.4 Incomplete elliptic integral of the 1st kind $\mathrm{el1}(x, k_c)$

`math53.el1`(*x*, *kc*)

Returns Bulirsch's incomplete elliptic integral of the first kind. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.4).

$$\mathrm{el1}(x, k_c) = \int_0^x \frac{\mathrm{d}t}{\sqrt{(1 + t^2)(1 + k_c^2 t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.El1(2, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.El1(2, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.3.5 Incomplete elliptic integral of the 2nd kind $\mathrm{el2}(x, k_c, a, b)$

`math53.el2`(*x*, *kc*, *a*, *b*)

Returns Bulirsch's incomplete elliptic integral of the second kind. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.5).

$$\mathrm{el2}(x, k_c, a, b) = \int_0^x \frac{a + bt^2}{(1 + t^2)\sqrt{(1 + t^2)(1 + k_c^2 t^2)}} \mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.El2(2, 0.5, 3, 4)
ereal('5.2359877559829887307E-1')
>>> ereal.El2(2, '0.51', 3, 4)
ereal('5.351847902755998475 4E-1')
```

27.3.6 Incomplete elliptic integral of the 3rd kind $\mathrm{el3}(x, k_c, p)$

math53.**el3**(x, kc, p)

Returns Bulirsch's incomplete elliptic integral of the third kind. See also Bulirsch [162], See also Bulirsch [163], NIST [173], Wikipedia [1300], Ehrhardt [297] (3.2.3.6).

$$\mathrm{el3}(x, k_c, p) = \int_0^x \frac{1 + t^2}{(1 + pt^2)\sqrt{(1 + t^2)(1 + k_c^2 t^2)}} \mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.El3(2, 0.5, 3)
ereal('5.2359877559829887307E-1')
>>> ereal.El3(2, '0.51', 3)
ereal('5.3518479027559984754E-1')
```

27.4 Maple style elliptic integrals

27.4.1 Complete integral of the 1st kind, $\mathrm{EllipticK}(k)$

`math53.EllipticK`(k)

Returns the complete elliptic integral of the first kind K(k) and the real part if $|k| > 1$. See also Maplesoft [367], Ehrhardt [297] (3.2.4.1).

$$\mathrm{EllipticK}(k) = \int_0^1 \frac{\mathrm{d}t}{\sqrt{(1-t^2)(1-k^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticK(0.5)
ereal('5.235987755982988730E-1')
>>> ereal.EllipticK('0.51')
ereal('5.351847902755998475E-1')
```

27.4.2 Complete integral of the 1st kind for imaginary modulus, $\mathrm{EllipticKim}(k)$

`math53.EllipticKim`(k)

Returns the complete elliptic integral of the first kind for the imaginary modulus ik with $k \in \mathbb{R}$. See also Maplesoft [367], Ehrhardt [297] (3.2.4.2).

$$\mathrm{EllipticKim}(k) = \int_0^1 \frac{\mathrm{d}t}{\sqrt{(1-t^2)(1+k^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticKim(0.5)
ereal('5.235987755982988730E-1')
>>> ereal.EllipticKim('0.51')
ereal('5.351847902755998475E-1')
```

27.4.3 Complementary complete integral of the 1st kind, $\mathrm{EllipticCK}(k) = K'(k)$

`math53.EllipticCK`(k)

Returns the complementary complete elliptic integral of the first kind with $k \neq 0$. See also Maplesoft [367], Ehrhardt [297] (3.2.4.3), Ehrhardt [297] (4.2.28).

$$\mathrm{EllipticCK}(k) = \mathrm{EllipticK}(k_c) = \int_0^1 \frac{\mathrm{d}t}{\sqrt{(1-t^2)(1-k_c^2t^2)}}$$

Note: the complex version is called Ellck(z) in Amath.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticCK(0.5)
ereal('5.235987755982988730E-1')
>>> ereal.EllipticCK('0.51')
ereal('5.351847902755998475E-1')
```

27.4.4 Complete integral of the 2nd kind, $\mathrm{EllipticEC}(k)$

`math53.EllipticEC(`k`)`

Returns the complete elliptic integral of the second kind $E(k)$ and the real part if $|k| > 1$. See also Maplesoft [366], Ehrhardt [297] (3.2.4.4).

$$\mathrm{EllipticEC}(k) = \int_0^1 \frac{\sqrt{(1-k^2t^2)}}{\sqrt{(1-t^2)}}\mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticEC(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticEC('0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.5 Complete integral of the 2nd kind for imaginary modulus, $\mathrm{EllipticECim}(k)$

`math53.EllipticECim(`k`)`

Returns the complete elliptic integral of the second kind for the imaginary modulus ik with $k \in \mathbb{R}$. See also Maplesoft [366], Ehrhardt [297] (3.2.4.5).

$$\mathrm{EllipticECim}(k) = E(ik) = \int_0^1 \frac{\sqrt{(1+k^2t^2)}}{\sqrt{(1-t^2)}}\mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticECim(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticECim('0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.6 Complementary complete integral of the 2nd kind, $\mathrm{EllipticCE}(k)$

`math53.EllipticCE(`k`)`

Returns the complementary complete elliptic integral of the second kind. See also Maplesoft [366], Ehrhardt [297] (3.2.4.6).

$$\mathrm{EllipticEC}(k) = \mathrm{EllipticEC}(k_c) = \int_0^1 \frac{\sqrt{(1-k_c^2t^2)}}{\sqrt{(1-t^2)}}\mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticCE(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticCE('0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.7 Complete integral of the 3rd kind, $\mathrm{EllipticPiC}(\nu, k)$

`math53.EllipticPiC(`*nu*, k`)`

Returns the complete elliptic integral of the third kind with $|k| \neq 1, \nu \neq 1$ (or its real part if $|k| > 1$). See also Maplesoft [368], Ehrhardt [297] (3.2.4.7).

$$\mathrm{EllipticPiC}(\nu, k) = \int_0^1 \frac{\mathrm{d}t}{(1-\nu t^2)\sqrt{(1-t^2)(1-k^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticPiC(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticPiC(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.8 Complete integral of the 3rd kind for imaginary modulus, $\mathrm{EllipticPiCim}(\nu, k)$

`math53.EllipticPiCim(nu, k)`

Returns the complementary complete elliptic integral of the third kind with $\nu \neq 1$. See also Maplesoft [366], Ehrhardt [297] (3.2.4.8).

$$\mathrm{EllipticPiCim}(\nu, k) = \mathrm{EllipticPiC}(\nu, k) = \int_0^1 \frac{\mathrm{d}t}{(1-\nu t^2)\sqrt{(1-t^2)(1+k^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticPiCim(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticPiCim(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.9 Complementary complete integral of the 3rd kind, $\mathrm{EllipticCPi}(\nu, k)$

`math53.EllipticCPi(nu, x)`

Returns the complementary complete elliptic integral of the third kind with $|k| \neq 0, \nu \neq 1$. See also Maplesoft [366], Ehrhardt [297] (3.2.4.9).

$$\mathrm{EllipticCPi}(\nu, k) = \mathrm{EllipticPiC}(\nu, k_c) = \int_0^1 \frac{\mathrm{d}t}{(1-\nu t^2)\sqrt{(1-t^2)(1-k_c^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticCPi(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticCPi(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.10 Incomplete integral of the 1st kind, $\mathrm{EllipticF}(z, k)$

`math53.EllipticF(z, k)`

Returns the incomplete elliptic integral of the first kind with $|z| \leq 1, |kz| \leq 1$. See also Maplesoft [367], Ehrhardt [297] (3.2.4.10).

$$\mathrm{EllipticF}(z, k) = \int_0^z \frac{\mathrm{d}t}{\sqrt{(1-t^2)(1-k^2t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticF(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticF(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.11 Incomplete integral of the 2nd kind, $\mathrm{EllipticE}(z, k)$

`math53.EllipticE`(z, k)

Returns the incomplete elliptic integral of the second kind with $|z| \leq 1, |kz| \leq 1$. See also Maplesoft [366], Ehrhardt [297] (3.2.4.11).

$$\mathrm{EllipticE}(z, k) = \int_0^z \frac{\sqrt{(1 - k^2 t^2)}}{\sqrt{(1 - t^2)}} \mathrm{d}t$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticE(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticE(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.4.12 Incomplete integral of the 3rd kind, $\mathrm{EllipticPi}(z, \nu, k)$

`math53.EllipticPi`(z, *nu*, k)

Returns the incomplete elliptic integral of the third kind with $|z| \leq 1, |kz| \leq 1$. See also Maplesoft [368], Ehrhardt [297] (3.2.4.12).

$$\mathrm{EllipticPi}(z, \nu, k) = \int_0^z \frac{\mathrm{d}t}{(1 - \nu t^2)\sqrt{(1 - t^2)(1 - k_c^2 t^2)}}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EllipticPi(0.6, 0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EllipticPi(0.6, 0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.5 Jacobi theta functions at $x = 0$ for $0 \leq q < 1$

27.5.1 Jacobi theta function $\theta_1'(q)$

math53.**jacobi_theta1p**(q)

Returns the Jacobi theta function $\theta_1'(q) = \partial\theta_1(x,q)/\partial x$ at $x = 0$ for $0 \leq q < 1$. See also Wikipedia [1320], MathWorld [967], MathWorld [278], NIST [479], Ehrhardt [297] (3.2.14.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiTheta1p(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiTheta1p('0.51')
ereal('5.351847902755998475 4E-1')
```

27.5.2 Jacobi theta function $\theta_2(q)$

math53.**jacobi_theta02**(q)

Returns the Jacobi theta function $\theta_2(q) = \theta_2(0,q)$ for $0 \leq q < 1$. See also Wikipedia [1320], MathWorld [967], NIST [479], Ehrhardt [297] (3.2.14.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiTheta2(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiTheta2('0.51')
ereal('5.351847902755998475 4E-1')
```

27.5.3 Jacobi theta function $\theta_3(q)$

math53.**jacobi_theta03**(q)

Returns the Jacobi theta function $\theta_3(q) = \theta_3(0,q)$ for $0 \leq q < 1$. See also Wikipedia [1320], MathWorld [967], NIST [479], Ehrhardt [297] (3.2.14.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiTheta3(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiTheta3('0.51')
ereal('5.351847902755998475 4E-1')
```

27.5.4 Jacobi theta function $\theta_4(q)$

math53.**jacobi_theta04**(q)

Returns the Jacobi theta function $\theta_4(q) = \theta_4(0,q)$ for $-1 < q < 1$. See also Wikipedia [1320], MathWorld [967], NIST [479], Ehrhardt [297] (3.2.14.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiTheta4(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.JacobiTheta4('0.51')
ereal('5.351847902755998475 4E-1')
```

27.6 Inverse Jacobi elliptic functions

The inverse Jacobi elliptic functions can be defined like the inverse trigonometric functions: e.g. if $\mathrm{sn}(y,k)=x$ then $y=\mathrm{arcsn}(x,k)$; they are multivalued and their principal values are returned. The functions can be represented as elliptic integrals [30, §22.15(ii)] and they are computed with the incomplete elliptic integral $F(.,k)$ using the table from Abramowitz and Stegun [1, p.596].

27.6.1 Inverse Jacobi elliptic function $\mathrm{arcsn}(x,k)$

`math53.jacobi_arcsn`(x, k)

Returns the inverse Jacobi elliptic function $\mathrm{arcsn}(x,k)$ for $|x|\le 1$ and $|kx|\le 1$. See also NIST [477], Ehrhardt [297] (3.2.12.1).

$$\mathrm{arcsn}(x,k)=F(\arcsin(x),k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcSN(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcSN(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.2 Inverse Jacobi elliptic function $\mathrm{arccn}(x,k)$

`math53.jacobi_arccn`(x, k)

Returns the inverse Jacobi elliptic function $\mathrm{arccn}(x,k)$ for $|x|<1$ if $k\le 1$, and $x^2>1-1/k^2$ if $k>1$. See also NIST [477], Ehrhardt [297] (3.2.12.2).

$$\mathrm{arccn}(x,k)=F(\arccos(x),k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcCN(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcCN(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.3 Inverse Jacobi elliptic function $\mathrm{arcdn}(x,k)$

`math53.jacobi_arcdn`(x, k)

Returns the inverse Jacobi elliptic function $\mathrm{arcdn}(x,k)$ for $0\le x\le 1$ and $k^2+x^2>1$ if $|k|<1$; and $|x|\le 1$ if $|k|>1$. See also NIST [477], Ehrhardt [297] (3.2.12.3).

$$\mathrm{arcdn}(x,k)=F\left(\arcsin\left(\sqrt{\frac{1-x^2}{k^2}}\right),k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcDN(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcDN(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.4 Inverse Jacobi elliptic function $\operatorname{arccd}(x, k)$

`math53.jacobi_arccd`(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arccd}(x, k)$ for $|x| \leq 1$ if $|k| < 1$; and $|x| \geq 1$ if $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.4).

$$\operatorname{arccd}(x, k) = F\left(\arcsin\left(\sqrt{\frac{1 - x^2}{1 - k^2 x^2}}\right), k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcCD(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcCD(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.5 Inverse Jacobi elliptic function $\operatorname{arcsd}(x, k)$

`math53.jacobi_arcsd`(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcsd}(x, k)$ for $x \in \mathbb{R}$ if $|k| \geq 1$ and $|x| < 1/\sqrt{1 - k^2}$ otherwise. See also NIST [477], Ehrhardt [297] (3.2.12.5).

$$\operatorname{arcsd}(x, k) = F\left(\arcsin\left(\sqrt{\frac{x^2}{1 + k^2 x^2}}\right), k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcSD(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcSD(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.6 Inverse Jacobi elliptic function $\operatorname{arcnd}(x, k)$

`math53.jacobi_arcnd`(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcnd}(x, k)$ for $x \geq 1$ and $x^2 \leq k^2/(1 - k^2)$ if $|k| < 1$. See also NIST [477], Ehrhardt [297] (3.2.12.6).

$$\operatorname{arcnd}(x, k) = F\left(\arcsin\left(\sqrt{\frac{x^2 - 1}{k^2 x^2}}\right), k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcND(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcND(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.7 Inverse Jacobi elliptic function $\operatorname{arcdc}(x, k)$

math53.**jacobi_arcdc**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcdc}(x,k)$ for $|x| \geq 1$ if $|k| < 1$; and $|x| \leq 1$ if $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.7).

$$\operatorname{arcdc}(x,k) = F\left(\arcsin\left(\sqrt{\frac{1-x^2-1}{k^2-x^2}}\right), k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcDC(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcDC(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.8 Inverse Jacobi elliptic function $\operatorname{arcnc}(x,k)$

math53.**jacobi_arcnc**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcnc}(x,k)$ for $x \geq 1$, and $x^2 \leq k^2/(k^2-1)$ for $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.8).

$$\operatorname{arcnc}(x,k) = F(\operatorname{arcsec}(x), k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcNC(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcNC(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.9 Inverse Jacobi elliptic function $\operatorname{arcsc}(x,k)$

math53.**jacobi_arcsc**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcsc}(x,k)$ for $x \in \mathbb{R}$ if $|k| \leq 1$ and $|x| \leq 1/\sqrt{k^2-1}$ if $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.9).

$$\operatorname{arcsc}(x,k) = F(\arctan(x), k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcSC(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcSC(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.10 Inverse Jacobi elliptic function $\operatorname{arcns}(x,k)$

math53.**jacobi_arcns**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcns}(x,k)$ for $|x| \geq 1$ if $|k| < 1$ and $|x| \geq |k|$ if $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.10).

$$\operatorname{arcns}(x,k) = F(\operatorname{arccsc}(x), k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcNS(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcNS(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.11 Inverse Jacobi elliptic function $\operatorname{arcds}(x, k)$

`math53.`**`jacobi_arcds`**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arcds}(x, k)$ for $x \in \mathbb{R}$ if $|k| > 1$ and $|x| \geq \sqrt{1 - k^2}$ if $|k| < 1$. See also NIST [477], Ehrhardt [297] (3.2.12.11).

$$\operatorname{arcds}(x, k) = F\left(\arcsin\left(\sqrt{\frac{1}{k^2 + x^2}}\right), k\right).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcDS(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcDS(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.6.12 Inverse Jacobi elliptic function $\operatorname{arccs}(x, k)$

`math53.`**`jacobi_arccs`**(x, k)

Returns the inverse Jacobi elliptic function $\operatorname{arccs}(x, k)$ for $x \in \mathbb{R}$ if $|k| < 1$ and $|x| \geq \sqrt{k^2 - 1}$ if $|k| > 1$. See also NIST [477], Ehrhardt [297] (3.2.12.12).

$$\operatorname{arccs}(x, k) = F(\operatorname{arccot}(x), k).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.JacobiArcCS(0.8, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.JacobiArcCS(0.8, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.7 Lemniscate functions

27.7.1 Lemniscate sine function, $\operatorname{sinlemn}(x)$

`math53.sinlemn(`x`)`

Returns the lemniscate sine function $\operatorname{sinlemn}(x) = \frac{\sqrt{2}}{2}\operatorname{sd}\left(x\sqrt{2}, \frac{\sqrt{2}}{2}\right)$, where $\operatorname{sd}(\cdot)$ is a Jacobi elliptic function.

See also: Wikipedia [1331], MathWorld [970], Ehrhardt [297] (3.2.16.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SinLemniscate(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.SinLemniscate(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.7.2 Lemniscate cosine function, $\operatorname{coslemn}(x)$

`math53.coslemn(`x`)`

Returns the lemniscate cosine function $\operatorname{coslemn}(x) = \operatorname{cn}\left(x\sqrt{2}, \frac{\sqrt{2}}{2}\right)$, where $\operatorname{cn}(\cdot)$ is a Jacobi elliptic function.

See also: Wikipedia [1331], MathWorld [970], Ehrhardt [297] (3.2.16.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CosLemniscate(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.CosLemniscate(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.7.3 Inverse lemniscate sine function, $\operatorname{arcsl}(x)$

`math53.arcsl(`x`)`

Returns the inverse lemniscate sine function $\operatorname{arcsl}(x) = \frac{1}{\sqrt{2}}\operatorname{arcsd}\left(x\sqrt{2}, \frac{\sqrt{2}}{2}\right), |x| \leq 1$, where $\operatorname{arcsd}(\cdot)$ is an inverse Jacobi elliptic function.

See also: Wikipedia [1331], MathWorld [970], Ehrhardt [297] (3.2.16.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AcosLemniscate(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AcosLemniscate(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

27.7.4 Inverse lemniscate cosine function, $\operatorname{arccl}(x)$

`math53.arccl(`x`)`

Returns the inverse lemniscate cosine function $\operatorname{arccl}(x) = \frac{1}{\sqrt{2}}\operatorname{arccn}\left(x\sqrt{2}, \frac{\sqrt{2}}{2}\right), |x| \leq 1$, where $\operatorname{arccn}(\cdot)$ is an inverse Jacobi elliptic function.

See also: Wikipedia [1331], MathWorld [970], Ehrhardt [297] (3.2.16.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.AsinLemniscate(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.AsinLemniscate(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

CHAPTER

TWENTYEIGHT

REAL FUNCTIONS RELATED TO LERCHS PHI

28.1 Polygamma, and related functions

28.1.1 Pentagamma function $\psi'''(x)$

`math53.pentagamma(x)`

Returns the pentagamma function $\psi'''(x), \quad x \neq 0, -1, -2, \ldots$ The function returns the Hurwitz zeta value $6\zeta(4, x)$ if x is positive; for $x < 0$ it returns $\psi'''(x) = -2\pi^4 \left(1 + 4\cot^2(\pi x) + 3\cot^4(\pi x)\right) - 6\zeta(4, 1 - x)$.

See also Wikipedia [1269], MathWorld [895], NIST [23], BoostMath [109], Ehrhardt [297] (3.5.6.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Pentagamma(7)
ereal('5.235987755982988730 7E-1')
>>> ereal.Pentagamma('4.51')
ereal('5.351847902755998475 4E-1')
```

28.1.2 Tetragamma function, $\psi''(x)$

`math53.tetragamma(x)`

Returns the tetragamma function $\psi''(x), \quad x \neq 0, -1, -2, \ldots$ The function returns the Hurwitz zeta value $-2\zeta(3, x)$ if x is positive; for $x < 0$ it returns $\psi''(x) = -2\pi^3 \cot(\pi x)\left(1 + \cot^2(\pi x)\right) - 2\zeta(3, 1 - x)$.

See also Wikipedia [1269], MathWorld [895], NIST [23], BoostMath [109], Ehrhardt [297] (3.5.6.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Tetragamma(7)
ereal('5.235987755982988730 7E-1')
>>> ereal.Tetragamma('4.51')
ereal('5.351847902755998475 4E-1')
```

28.1.3 Auxiliary function $\psi^*(x)$

`math53.psistar(x)`

Returns $\psi^*(x) = \psi(x) - \log(x), x > 0$. The function is useful when computing differences of ψ functions, because it can avoid cancellation for larger x values. See also Ehrhardt [297] (3.5.6.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.PsiStar(7)
ereal('5.235987755982988730 7E-1')
>>> ereal.PsiStar('4.51')
ereal('5.351847902755998475 4E-1')
```

28.1.4 Inverse digamma function $\psi^{-1}(y)$

`math53.psi_inv(y)`

Returns $\psi^{-1}(y)$, the functional inverse of of the digamma function, i.e. it returns x with $\psi(x) = y$.

See also Wikipedia [1277], MathWorld [919], NIST [23], BoostMath [117], Ehrhardt [297] (3.5.6.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.PsiInv(7.1)
ereal('5.235987755982988730 7E-1')
>>> ereal.PsiInv('4.51')
ereal('5.351847902755998475 4E-1')
```

28.1.5 Bateman function $G(x)$

math53.**bateman_g**(x)

Returns the Bateman function $G(x) = \psi((x+1)/2) - \psi(x/2); x \neq 0, -1, -2, \ldots$ See also Ehrhardt [297] (3.5.6.8).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BatemanG(7.1)
ereal('5.235987755982988730 7E-1')
>>> ereal.BatemanG('4.51')
ereal('5.351847902755998475 4E-1')
```

28.2 Polylogarithm, and related functions

28.2.1 Polylogarithm of integer order, $\mathrm{Li}_n(x)$

`math53.polylog_i(n, x)`

Returns the polylogarithm of integer order n, $\mathrm{Li}_n(x) = \sum_{k=1}^{\infty} \frac{x^k}{k^n}, \quad n \in \mathbb{Z}, |x| < 1$, or its analytic continuation; for $n > 0$, $x > 1$ the real part of $\mathrm{Li}_n(x)$ is returned.

See also Wikipedia [1334], MathWorld [971], NIST [18], Ehrhardt [297] (3.6.11).

Returns the polylogarithm function of integer order n.

This function returns the polylogarithm function of integer order n

$$\mathrm{Li}_n(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^n}, \quad n \in \mathbb{Z}, |z| < 1.$$

or its analytic continuation; for $n > 0$ there is the arguments restriction $x \leq 1$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Polylog(2, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Polylog(2, '0.1')
ereal('5.351847902755998475 4E-1')
```

28.2.2 Fermi-Dirac integrals of integer order, $F_n(x)$

`math53.fermi_dirac_i(n, x)`

Returns the Fermi-Dirac integral of integer order n, $F_s(x) = \frac{1}{\Gamma(n+1)} \int_0^{\infty} \frac{t^n}{e^{t-x}+1} = -\mathrm{Li}_{n+1}(-e^x)$.

See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.2).

This function returns the complete Fermi-Dirac integrals $F_n(x)$ of integer order. They are defined for real orders $s > -1$ by

$$F_s(x) = \frac{1}{\Gamma(s+1)} \int_0^{\infty} \frac{t^s}{e^{t-x}+1} \mathrm{d}t$$

and by analytic continuation for $s \leq -1$ using polylogarithms

$$F_s(x) = -\mathrm{Li}_{s+1}(-e^x).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDirac(2,5)
ereal('5.235987755982988730 7E-1')
>>> ereal.FermiDirac(2,'51')
ereal('5.351847902755998475 4E-1')
```

28.2.3 Fermi-Dirac integral $F_{-1/2}(x)$

`math53.fermi_dirac_m05(x)`

Returns the Fermi-Dirac integral $F_{-1/2}(x)$. See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDiracm05(2,5)
ereal('5.2359877559829887307E-1')
>>> ereal.FermiDiracm05('5.1')
ereal('5.351847902755998475 4E-1')
```

28.2.4 Fermi-Dirac integral $F_{1/2}(x)$

math53.**fermi_dirac_p05**(x)

Returns the Fermi-Dirac integral $F_{1/2}(x)$. See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDiracp05(2,5)
ereal('5.2359877559829887307E-1')
>>> ereal.FermiDiracp05('5.1')
ereal('5.351847902755998475 4E-1')
```

28.2.5 Fermi-Dirac integral $F_{3/2}(x)$

math53.**fermi_dirac_p15**(x)

Returns the Fermi-Dirac integral $F_{3/2}(x)$. See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDiracp15(2,5)
ereal('5.2359877559829887307E-1')
>>> ereal.FermiDiracp15('5.1')
ereal('5.351847902755998475 4E-1')
```

28.2.6 Fermi-Dirac integral $F_{5/2}(x)$

math53.**fermi_dirac_p25**(x, s)

Returns the Fermi-Dirac integral $F_{5/2}(x)$. See also: Wikipedia [1321], MathWorld [959], Ehrhardt [297] (3.6.8.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FermiDiracp25(2,5)
ereal('5.2359877559829887307E-1')
>>> ereal.FermiDiracp25('5.1')
ereal('5.351847902755998475 4E-1')
```

28.2.7 Inverse tangent integral, $\mathrm{Ti}_2(x)$

math53.**tangent_int_2**(x)

Returns the inverse tangent integral $\mathrm{Ti}_2(x) = \int_0^x \frac{\arctan(t)}{t}\,\mathrm{d}t$.

See also: Wikipedia [1335], MathWorld [965], Ehrhardt [297] (3.6.16).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.TangentInt2(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.TangentInt2('0.1')
ereal('5.351847902755998475 4E-1')
```

28.2.8 Lobachevsky's log-cos integral, $L(x)$

`math53.lobachevsky_c(`x`)`

Returns Lobachevsky's log-cos integral $L(x) = \int_0^x \log|\cos(t)|\,\mathrm{d}t$. See also: Ehrhardt [297] (3.6.18).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LobachevskyC(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.LobachevskyC('0.1')
ereal('5.351847902755998475 4E-1')
```

28.2.9 Lobachevsky's log-sin integral, $\Lambda(x)$

`math53.lobachevsky_s(`x, s`)`

Returns Lobachevsky's log-sin integral $\Lambda(x) = \int_0^x \log|2\sin(t)|\,\mathrm{d}t$. See also: Ehrhardt [297] (3.6.19).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LobachevskyS(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.LobachevskyS('0.1')
ereal('5.351847902755998475 4E-1')
```

28.2.10 Debye functions, $\mathrm{D}_n(x)$

`math53.debye(`n, x`)`

Returns the Debye function $\mathrm{D}_n(x) = \frac{n}{x^n}\int_0^x \frac{t^n}{e^t-1}\,\mathrm{d}t, \quad n>0, x\geq 0.$

See also: Wikipedia [1342], MathWorld [998], Abramowitz and Stegun. [4] section 27.1, Ehrhardt [297] (3.10.6), Dubinov and Dubinova [289].

This routine returns the Debye functions

$$\mathrm{D}_n(x) = \frac{n}{x^n}\int_0^x \frac{t^n}{e^t-1}\mathrm{d}t \quad (n>0, x\geq 0).$$

$$\mathrm{D}_n^{(1)}(x) = \int_0^x \frac{t^n}{e^t-1}\mathrm{d}t = n!\zeta(n+1) - n!Z_{n+1}(z).$$

$$\mathrm{D}_n^{(2)}(x) = \int_x^\infty \frac{t^n}{e^t-1}\mathrm{d}t = n!Z_{n+1}(z).$$

$$\mathrm{D}_n^{(2)}(x) = \Gamma(n+1)\zeta(n+1) - \mathrm{D}_n^{(1)}(x).$$

$$\mathrm{D}_n^{(1)}(x) = n!\zeta(n+1) - \mathrm{D}_n^{(2)}(x).$$

$$Z_{n+1}(z) = \sum_{k=0}^{n} \mathrm{Li}_{n-k+1}(e^{-z}) \frac{z^k}{k!} \quad (n = 1, 2, 3, \ldots).$$

In terms of the incomplete zeta functions or "Debye functions" (Abramowitz & Stegun 1972, § 27.1):

$$Z_n(z) = \frac{1}{(n-1)!} \int_z^\infty \frac{t^{n-1}}{e^t - 1} \mathrm{d}t \qquad (n = 1, 2, 3, \ldots),$$

the polylogarithm Lin(z) for positive integer n may be expressed as the finite sum (Wood 1992, § 16):

$$\mathrm{Li}_n(e^\mu) = \sum_{k=0}^{n-1} Z_{n-k}(-\mu) \frac{\mu^k}{k!} \qquad (n = 1, 2, 3, \ldots).$$

A remarkably similar expression relates the "Debye functions" Zn(z) to the polylogarithm:

$$Z_n(z) = \sum_{k=0}^{n-1} \mathrm{Li}_{n-k}(e^{-z}) \frac{z^k}{k!} \qquad (n = 1, 2, 3, \ldots).$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Debye(1,3)
ereal('5.235987755982988730 7E-1')
>>> ereal.Debye(2,13)
ereal('5.351847902755998475 4E-1')
```

28.2.11 Transport integral, $\mathrm{J}_n(x)$

`math53.transport_jn(`n, x`)`

Returns the transport function $\mathrm{J}_n(x) = \int_0^x \frac{t^n e^t}{(e^t - 1)^2} \, \mathrm{d}t, \quad n \geq 2, x \geq 0.$

See also: Ehrhardt [297] (3.10.24).

A.J. MacLeod, The numerical computation of transport integrals, 1992, Computer Physics Communications, 69, pp. 229-234, https://doi.org/10.1016/0010-4655(92)90162-R,

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.TransportJn(2,3)
ereal('5.235987755982988730 7E-1')
>>> ereal.TransportJn(4,13)
ereal('5.351847902755998475 4E-1')
```

28.3 Riemann zeta, and related functions

28.3.1 Riemann $\zeta(n)$ for integer arguments

`math53.zeta_i(n)`

Returns the Riemann zeta function $\zeta(n)$ for integer arguments $n \neq 1$. For $n > 63$ the result is 1, for $0 \leq n \leq 63$ the value is taken from a table, otherwise the Bernoulli numbers are used: $\zeta(n) = B_{1-n}/(n-1)$ for $n < 0$.

See also Wikipedia [1336], MathWorld [972], NIST [19], BoostMath [158], Ehrhardt [297] (3.6.1.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ZetaInt(5)
ereal('5.2359877559829887307E-1')
>>> ereal.ZetaInt('51')
ereal('5.351847902755998475 4E-1')
```

28.3.2 Riemann $\zeta(1+x)$

`math53.zeta1p(x)`

Returns the Riemann zeta function $\zeta(1+x)$ for $x \neq 0$. Normally used with $|x| \ll 1$ for increased accuracy near the pole of $\zeta(s)$ at $s = 1$.

See also Wikipedia [1336], MathWorld [972], NIST [19], BoostMath [158], Ehrhardt [297] (3.6.1.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Zeta1p(0.004)
ereal('5.2359877559829887307E-1')
>>> ereal.Zeta1p('0.0001')
ereal('5.351847902755998475 4E-1')
```

28.3.3 Dirichlet eta function for integer argument, $\eta(n)$

`math53.dirichlet_eta_i(n)`

Returns the Dirichlet eta function $\eta(n)$ for integer arguments. For $n > 64$ the result is 1, for $0 \leq n \leq 64$ the value is taken from a table, otherwise for $n < 0$ the Bernoulli numbers are used: $\eta(n) = (2^{1-n} - 1)B_{1-n}/(1-n)$.

See also: MathWorld [999], Ehrhardt [297] (3.6.3.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.DirichletEtaInt(5)
ereal('5.2359877559829887307E-1')
>>> ereal.DirichletEtaInt('51')
ereal('5.351847902755998475 4E-1')
```

28.3.4 Prime zeta function

`math53.prime_zeta(s)`

Returns for $x > 0.2$ the prime zeta function $P(x) = \sum_{p \text{ prime}} p^{-x}$, or its real part for $x < 1$.

See also Ehrhardt [297] (3.6.2).

An example in Python

```
>>> from mpfebnet import XReal
>>> XReal.PrimeZeta(12)
XReal('5.235987755982988730 7E-1')
>>> XReal.PrimeZeta('10.0001')
XReal('5.351847902755998475 4E-1')
```

An example in Visual Basic

```
>>> from mpfebnet import Gpr
>>> Gpr.PrimeZeta(12)
Gpr('5.235987755982988730 7E-1')
>>> Gpr.PrimeZeta('10.0001')
Gpr('5.351847902755998475 4E-1')
```

28.3.5 Riemann prime counting function, $R(x)$

`math53.riemann_r(`x`)`

Returns $R(x) = \sum_{n=1}^{\infty} \frac{\mu(n)}{n} \mathrm{li}(x^{1/n}) 1 + \sum_{k=1}^{\infty} \frac{\log^k x}{k k! \zeta(k+1)}$, the Riemann prime counting function, for $x > 0$.

See also Wikipedia [1291], Wikipedia [1292], MathWorld [933], Wikipedia [1290], MathWorld [934], Ehrhardt [297] (3.10.20).

An example in Python

```
>>> from mpfebnet import XReal
>>> XReal.RiemannR(44)
XReal('5.235987755982988730 7E-1')
>>> XReal.RiemannR(4440.4)
XReal('5.351847902755998475 4E-1')
```

An example in Visual Basic

```
>>> from mpfebnet import Gpr
>>> Gpr.RiemannR(44)
Gpr('5.235987755982988730 7E-1')
>>> Gpr.RiemannR(4440.4)
Gpr('5.351847902755998475 4E-1')
```

28.3.6 Inverse of the Riemann prime counting function, $R^{-1}(x)$

`math53.riemann_r_inv(`x`)`

Returns the functional inverse of the Riemann prime counting function, i.e. $R(R^{-1}(x)) = x$, for $x \geq 1.125$.

See also Ehrhardt [297] (3.10.21).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.RiemannRInv(44)
ereal('5.235987755982988730 7E-1')
>>> ereal.RiemannRInv(4440.4)
ereal('5.351847902755998475 4E-1')
```

28.3.7 Rogers-Ramanujan continued fraction

`math53.rogers_ramanujan_cf(`q`)`

Returns $R(q) = \frac{q^{1/5}}{1+} \frac{q}{1+} \frac{q^2}{1+} \frac{q^3}{1+} \frac{q^5}{1+}$, the Rogers-Ramanujan continued fraction, for $|q| < 1$.

See also Ehrhardt [297] (3.10.22).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.RogersRamanujanCF(0.44)
ereal('5.235987755982988730 7E-1')
>>> ereal.RogersRamanujanCF(0.14404)
ereal('5.351847902755998475 4E-1')
```

28.3.8 Moebius function, $\mu(n)$

`math53.moebius(n)`

Returns $\mu(n)$, the Möbius function.

For integer n, the Moebius μ function $\mu(n)$ equals 0 if n has repeated integer factors. Otherwise, if n is the product of k distinct primes, the Moebius μ function $\mu(n)$ equals $(-1)^k$.

https://en.wikipedia.org/wiki/M%C3%B6bius_function

An example in Python

```
>>> from mpfebnet import XReal
>>> XReal.Moebius(3)
XReal('5.235987755982988730 7E-1')
>>> XReal.Moebius)
XReal('5.351847902755998475 4E-1')
```

An example in Visual Basic

```
>>> from mpfebnet import Gpr
>>> Gpr.Moebius(3)
Gpr('5.235987755982988730 7E-1')
>>> Gpr.Moebius)
Gpr('5.351847902755998475 4E-1')
```

28.3.9 q-Pochhammer Euler function, $(q)_\infty$

`math53.euler_q(n, x)`

Returns $\phi(q) = (q)_\infty = \prod_{k=1}^{\infty} \left(1 - q^k\right)$, the q-Pochhammer Euler function, for $-1 \leq q \leq 1$.

See also: MathWorld [1030], Wikipedia [1398], Ehrhardt [297] (3.10.19).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EulerQ(-0.4)
ereal('5.235987755982988730 7E-1')
>>> ereal.EulerQ(0.4)
ereal('5.351847902755998475 4E-1')
```

28.4 Miscellaneous functions

28.4.1 Log-series distribution, pmf

math53.**logseries_pmf**(*k*, *mu*)

Returns pmf(x), the value of the probability mass function (*Pmf*) of the log-series distribution with mean mu and the support interval $(0, +\infty)$, and $0 \le q \le 1$.

See also Wikipedia [1227], MathWorld [830], Johnson *et al.* [389], Ehrhardt [297] (3.9.17).

$$\text{pmf}(x) = \frac{-1}{\ln(1-p)} \frac{p^k}{k}.$$

The following example shows both forms of the syntax:

```
>>> from xlcalcnet import *
>>> a = 0; b = 1; t = 0.3; x = 0.6;
>>> print ("LogseriesPdf(x, a, b): ", LogseriesPdf(x, a, b))
>>> print ("dist_logseries(a, b).pdf(x): ", dist_logseries(a, b).pdf(x))
6.35635234625645256156156145613560E+00
```

28.4.2 Log-series distribution, cdf

math53.**logseries_cdf**(*k*, *mu*)

Returns cdf(x), the value of the cumulative distribution function (*Cdf*) of the log-series distribution with mean mu and the support interval $(0, +\infty)$, and $0 \le q \le 1$.

See also Wikipedia [1227], MathWorld [830], Johnson *et al.* [389], Ehrhardt [297] (3.9.17).

$$\text{cdf}(x) = 1 + \frac{B(p; k+1, 0)}{\ln(1-p)}.$$

The following example shows both forms of the syntax:

```
>>> from xlcalcnet import *
>>> a = 0; b = 1; t = 0.3; x = 0.6;
>>> print ("LogseriesCdf(x, a, b): ", LogseriesCdf(x, a, b))
>>> print ("dist_logseries(a, b).cdf(x): ", dist_logseries(a, b).cdf(x))
6.35635234625645256156156145613560E+00
```

28.4.3 Zeta distribution, pmf

math53.**zeta_pmf**(*k*, *r*)

Returns pmf(x), the value of the probability mass function (*Pmf*) of the zeta distribution with parameter r, and $0 \le q \le 1$.

See also Wikipedia [1231], Rinne [481], Johnson *et al.* [389] page 527, Ehrhardt [297] (3.9.34).

$$\text{pmf}_X(k) = \frac{k^{-(r+1)}}{\zeta(r+1)}.$$

The following example shows both forms of the syntax:

```
>>> from xlcalcnet import *
>>> a = 0; b = 1; t = 0.3; x = 0.6;
>>> print ("ZetaPdf(x, a, b): ", ZetaPdf(x, a, b))
>>> print ("dist_zeta(a, b).pdf(x): ", dist_zeta(a, b).pdf(x))
6.35635234625645256156156145613560E+00
```

28.4.4 Zeta distribution, cdf

math53.**zeta_cdf**(k, r)

Returns cdf(x), the value of the cumulative distribution function (*Cdf*) of the zeta distribution:

$$\text{cdf}(x) = \frac{H_k^{r+1}}{\zeta(r+1)} = 1 - \frac{\zeta(r+1, k+1)}{\zeta(r+1)}.$$

The following example shows both forms of the syntax:

```
>>> from xlcalcnet import *
>>> a = 0; b = 1; t = 0.3; x = 0.6;
>>> print ("ZetaCdf(x, a, b): ", ZetaCdf(x, a, b))
>>> print ("dist_zeta(a, b).cdf(x): ", dist_zeta(a, b).cdf(x))
6.3563523462564525615615615614561356E+00
```

CHAPTER

TWENTYNINE

REAL FUNCTIONS RELATED TO ${}_0F_1$

29.1 Bessel functions of integer order

29.1.1 Bessel function of the 1st kind, order 0, $J_0(x)$

`math53.bessel_j0`(x)

where `ctx` is `math53` or `ctxcpp`.

Returns $J_0(x)$, the Bessel function of the 1st kind, order zero. See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], Ehrhardt [297] (3.1.1.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJ0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselJ0('0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.2 Bessel function of the 1st kind, order 1, $J_1(x)$

`math53.bessel_j1`(x)

where `ctx` is `math53` or `ctxcpp`.

Returns $J_1(x)$, the Bessel function of the 1st kind, order one. See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], Ehrhardt [297] (3.1.1.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJ1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselJ1('0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.3 Bessel function of the 1st kind, integer order n, $J_n(x)$

`math53.bessel_jn`(n, x)

where `ctx` is `math53` or `ctxcpp`.

Returns $J_n(x)$, the Bessel function of the 1st kind, order n. See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], Ehrhardt [297] (3.1.1.1).

$$J_n(x) = \left(\tfrac{1}{2}x\right)^n \sum_{k=0}^{\infty} (-1)^k \frac{(x^2/4)^k}{k!\Gamma(n+k+1)}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJn(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselJn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.4 Bessel function of the 2nd kind, order $0, Y_0(x)$

`math53.bessel_y0`(x)

where `ctx` is `math53` or `ctxcpp`.

Returns $Y_0(x)$, the Bessel function of the 2nd kind, order zero, $x > 0$. See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], Ehrhardt [297] (3.1.1.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselY0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselY0('0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.5 Bessel function of the 2nd kind, order $1, Y_1(x)$

`math53.bessel_y1`(x)

where `ctx` is `math53` or `ctxcpp`.

Returns $Y_1(x)$, the Bessel function of the 2nd kind, order one, $x > 0$. See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], Ehrhardt [297] (3.1.1.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselY1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselY1('0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.6 Bessel function of the 2nd kind, integer order $n, Y_n(x)$

`math53.bessel_yn`(x)

where `ctx` is `math53` or `ctxcpp`.

Returns $Y_n(x)$, the Bessel function of the 2nd kind, order n, $x > 0$. See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], Ehrhardt [297] (3.1.1.1).

$$Y_n(z) = -\frac{\left(\frac{z}{2}\right)^{-n}}{\pi}\sum_{k=0}^{n-1}\frac{(n-k-1)!}{k!}\left(\frac{z^2}{4}\right)^k + \frac{2}{\pi}J_n(z)\log\frac{z}{2} - \frac{\left(\frac{z}{2}\right)^n}{\pi}\sum_{k=0}^{\infty}(\psi(k+1)+\psi(n+k+1))\frac{\left(-\frac{z^2}{4}\right)^k}{k!(n+k)!}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselYn(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselYn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example in double precision (32 bit version of xlcalcnet)

```
>>> from xlcalcnet import ereal
>>> ereal.BesselYn(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselYn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

29.1.7 Bessel Lambda function, $\Lambda(\nu, x)$

math53.**bessel_lambda**(ν, x)

Returns the Bessel $\Lambda_\nu(x)$ function, defined for $x, \nu \geq 0$ as

$$\Lambda(\nu, x) = \Gamma(\nu + 1)\frac{J_\nu(x)}{(x/2)^\nu}$$

See also: Ehrhardt [297] (3.1.3.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselLambda(3, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.BesselLambda(3, '0.51')
ereal('5.3518479027559984754E-1')
```

29.2 Modified Bessel functions of integer order

29.2.1 Modified Bessel function of the 1st kind, order 0, $I_0(x)$

`math53.bessel_i0`(x)

Returns I0(x), the modified Bessel function of the 1st kind, order zero. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.2.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI0('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.2 Modified Bessel function of the 1st kind, order 1, $I_1(x)$

`math53.bessel_i1`(x)

Returns I1(x), the modified Bessel function of the 1st kind, order one. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.2.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI1('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.3 Modified Bessel function of the 1st kind, integer order n, $I_n(x)$

`math53.damath_bessel_in`(x)

Returns I_n(x), the modified Bessel function of the 1st kind, order n. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.2.5).

$$I_\nu\left(z\right) = \left(\tfrac{1}{2}z\right)^\nu \sum_{k=0}^{\infty} \frac{\left(\frac{1}{4}z^2\right)^k}{k!\Gamma\left(\nu+k+1\right)}.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselIn(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselIn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.4 Modified Bessel function of the 2nd kind, order 0, $K_0(x)$

`math53.bessel_k0`(x)

Returns K0(x), the modified Bessel function of the 2nd kind, order zero, x>0. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.2.6).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselK0('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.5 Modified Bessel function of the 2nd kind, order $1, K_1(x)$

`math53.bessel_k1`(x)

Returns K1(x), the modified Bessel function of the 2nd kind, order one, x>0. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.2.8).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselK1('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.6 Modified Bessel function of the 2nd kind, integer order $n, K_n(x)$

`math53.bessel_kn`(x)

Returns K_n(x), the modified Bessel function of the 2nd kind, order n, x > 0. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.2.10).

$$\begin{aligned} K_n\left(z\right) &= \tfrac{1}{2}(\tfrac{1}{2}z)^{-n}\sum_{k=0}^{n-1}\frac{(n-k-1)!}{k!}(-\tfrac{1}{4}z^2)^k + (-1)^{n+1}\log\left(\tfrac{1}{2}z\right)I_n\left(z\right) \\ &+ (-1)^n\tfrac{1}{2}(\tfrac{1}{2}z)^n\sum_{k=0}^{\infty}\left(\psi\left(k+1\right)+\psi\left(n+k+1\right)\right)\frac{(\frac{1}{4}z^2)^k}{k!(n+k)!} \end{aligned} \tag{29.1}$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselKn(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselKn(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.7 Exponentially scaled modified Bessel function of the 1st kind, order $0, I_{0,e}(x)$

`math53.bessel_i0e`(x)

Returns I0(x)*exp(-|x|), the exponentially scaled modified Bessel function of the 1st kind, order zero. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.2.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI0e(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI0e('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.8 Exponentially scaled modified Bessel function of the 1st kind, order 1, $I_{1,e}(x)$

math53.**bessel_i1e**(x)

Returns I1(x)*exp(-|x|), the exponentially scaled modified Bessel function of the 1st kind, order one. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.2.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI1e(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI1e('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.9 Exponentially scaled modified Bessel function of the 2nd kind, order 0, $K_{0,e}(x)$

math53.**bessel_k0e**(x)

Returns K0(x)*exp(x), the exponentially scaled modified Bessel function of the 2nd kind, order zero, x>0. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.2.7).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK0e(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselK0e('0.51')
ereal('5.351847902755998475 4E-1')
```

29.2.10 Exponentially scaled modified Bessel function of the 2nd kind, order 1, $K_{1,e}(x)$

math53.**bessel_k1e**(x)

Returns K1(x)*exp(x), the exponentially scaled modified Bessel function of the 2nd kind, order one, x>0. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.2.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK1e(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselK1e('0.51')
ereal('5.351847902755998475 4E-1')
```

29.3 Integrals of zero-order Bessel functions

29.3.1 Integral of I_0

math53.**bessel_i0_int**(x)

Returns the integral $\int_0^x I_0(t)\mathrm{d}t$. See also Wikipedia [1266], MathWorld [909], NIST [446], BoostMath [108], Ehrhardt [297] (3.1.5.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselI0Int(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselI0Int('0.51')
ereal('5.351847902755998475 4E-1')
```

29.3.2 Integral of J_0

math53.**bessel_j0_int**(x)

Returns the integral $\int_0^x J_0(t)\mathrm{d}t$. See also Wikipedia [1252], MathWorld [880], NIST [441], BoostMath [94], Ehrhardt [297] (3.1.5.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselJ0Int(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselJ0Int('0.51')
ereal('5.351847902755998475 4E-1')
```

29.3.3 Integral of K_0

math53.**bessel_k0_int**(x)

Returns the integral $\int_0^x K_0(t)\mathrm{d}t, \quad x \geq 0$. See also Wikipedia [1266], MathWorld [910], NIST [447], BoostMath [108], Ehrhardt [297] (3.1.5.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselK0Int(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselK0Int('0.51')
ereal('5.351847902755998475 4E-1')
```

29.3.4 Integral of Y_0

math53.**bessel_y0_int**(x)

Returns the integral $\int_0^x Y_0(t)\mathrm{d}t, \quad x \geq 0$. See also Wikipedia [1253], MathWorld [881], NIST [442], BoostMath [94], Ehrhardt [297] (3.1.5.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.BesselY0Int(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.BesselY0Int('0.51')
ereal('5.351847902755998475 4E-1')
```

29.4 Kelvin functions of order 0

29.4.1 Kelvin function $\mathrm{ber}0(x)$

math53.**kelvin_ber0**(x)

Returns the Kelvin function ber. See also Wikipedia [1383], MathWorld [1024], NIST [445], Mpmath [710].

Returns the Kelvin function $\mathrm{ber}_0(x)$, defined as

$$\mathrm{ber}_0(x) = \sum_{k=0}^{\infty} (-1)^k \frac{\left(\frac{1}{4}x^2\right)^{2k}}{((2k)!)^2}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinber(n, x); mx = mpm.kelvinber(n, x); gx = gmp.kelvinber(n, x)
>>> fx = fpm.kelvinber(n, x); ax = apm.kelvinber(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: -2.213802495986938888682464345899509922321E-1
mpm: -2.213802495986938888682464345899509922321e-1
gmp: -2.213802495986938888682464345899509922321E-01
fpm: -2.21380249598694E-01
apm: -2.213802495986938888682464345899509922332e-1 (-1.283e-37%)
```

29.4.2 Kelvin function $\mathrm{bei}0(x)$

math53.**kelvin_bei0**(x)

Returns the Kelvin function bei. See also Wikipedia [1382], MathWorld [1023], NIST [445], Mpmath [709].

Returns the Kelvin function $\mathrm{bei}_0(x)$ is defined as

$$\mathrm{bei}_0(x) = \sum_{k=0}^{\infty} (-1)^k \frac{\left(\frac{1}{4}x^2\right)^{2k+1}}{((2k+1)!)^2}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinbei(n, x); mx = mpm.kelvinbei(n, x); gx = gmp.kelvinbei(n, x)
>>> fx = fpm.kelvinbei(n, x); ax = apm.kelvinbei(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: 1.937586785266042766896808122272260201255E+0
mpm: 1.937586785266042766896808122272260201255e+0
gmp: 1.937586785266042766896808122272260201255E+00
fpm: 1.93758678526604E+00
apm: 1.937586785266042766896808122272260201256e+0 (1.54e-38%)
```

29.4.3 Kelvin function $\mathrm{ker}0(x)$

math53.**kelvin_ker0**(x)

Returns the Kelvin function ker. See also Wikipedia [1385], MathWorld [1026], NIST [445], Mpmath [712].

The Kelvin function $\mathrm{ker}_0(x)$ is defined as

$$\mathrm{ker}_0(x) = -\log\left(\tfrac{1}{2}x\right)\mathrm{ber}_0(x) + \tfrac{1}{4}\pi\,\mathrm{bei}_0(x) + \sum_{k=0}^{\infty} (-1)^k \frac{\psi(2k+1)\left(\frac{1}{4}x^2\right)^{2k}}{((2k)!)^2}.$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinker(n, x); mx = mpm.kelvinker(n, x); gx = gmp.kelvinker(n, x)
>>> fx = fpm.kelvinker(n, x); ax = apm.kelvinker(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: -6.702923330379869775199782194748322134382E-2
mpm: -6.702923330379869775199782194748322134382e-2
gmp: -6.702923330379869775199782194748322134382E-02
fpm: -6.70292333037987E-02
apm: -6.702923330379869775199782194748322134370e-2 (-8.669e-36%)
```

29.4.4 Kelvin function $\mathrm{kei0}(x)$

math53.**kelvin_kei0**(x)

Returns the Kelvin function kei. See also Wikipedia [1384], MathWorld [1025], NIST [445], Mpmath [711].

The Kelvin function $\mathrm{kei}_0(x)$ is defined as

$$\mathrm{kei}_0(x) = -\log\left(\tfrac{1}{2}x\right)\mathrm{ber}_0(x) - \tfrac{1}{4}\pi\,\mathrm{bei}_0(x) + \sum_{k=0}^{\infty}(-1)^k\frac{\psi(2k+2)\left(\frac{1}{4}x^2\right)^{2k+1}}{((2k+1)!)^2}$$

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = 0; x = 3
>>> \mathrm{d}x = dec.kelvinkei(n, x); mx = mpm.kelvinkei(n, x); gx = gmp.kelvinkei(n, x)
>>> fx = fpm.kelvinkei(n, x); ax = apm.kelvinkei(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax],  aligned=True)
dec: -5.112188404598678140246687753930501705762E-2
mpm: -5.112188404598678140246687753930501705762e-2

apm: -5.112188404598678140246687753930501705753e-2 (-9.353e-36%)
```

29.4.5 First derivative of the Kelvin function $\mathrm{ber0}, \mathrm{ber0}'(x)$

math53.**kelvin_ber0_prime**(x)

Returns the Kelvin function ber'(x), x >= 0

See also: Ehrhardt [297] (3.1.8.8).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.KelvinBerPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.KelvinBerPrime('0.51')
ereal('5.3518479027559984754E-1')
```

29.4.6 First derivative of the Kelvin function $\mathrm{bei0}, \mathrm{bei0}'(x)$

math53.**kelvin_bei0_prime**(x)

Returns the Kelvin function bei'(x), x >= 0

See also: Ehrhardt [297] (3.1.8.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.KelvinBeiPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.KelvinBeiPrime('0.51')
ereal('5.351847902755998475 4E-1')
```

29.4.7 First derivative of the Kelvin function $\mathrm{ker}0, \mathrm{ker}0'(\nu, x)$

math53.**kelvin_ker0_prime**(x)

Returns the Kelvin function ker'(x), x > 0

See also: Ehrhardt [297] (3.1.8.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.KelvinKerPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.KelvinKerPrime('0.51')
ereal('5.351847902755998475 4E-1')
```

29.4.8 First derivative of the Kelvin function $\mathrm{kei}0, \mathrm{kei}0'(x)$

math53.**kelvin_kei0_prime**(x)

Returns the Kelvin function kei'(x), x >= 0

See also: Ehrhardt [297] (3.1.8.11).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.KelvinKeiPrime(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.KelvinKeiPrime('0.51')
ereal('5.351847902755998475 4E-1')
```

29.5 Synchrotron functions

29.5.1 First synchrotron function $F(x)$

math53.**synchrotron_f**(x)

Returns the first synchrotron function $F(x)$ for $x \geq 0$, $F(x) = x \int_x^\infty K_{5/3}(t)\mathrm{d}t$.

See also: Ehrhardt [297] (3.1.11.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SynchF(2.25)
ereal('5.235987755982988730 7E-1')
>>> ereal.SynchF(12.25)
ereal('5.351847902755998475 4E-1')
```

29.5.2 Second synchrotron function $G(x)$

math53.**synchrotron_g**(x)

Returns the second synchrotron function $G(x) = xK_{2/3}(x)$ for $x \geq 0$.

See also: Ehrhardt [297] (3.1.11.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SynchG(2.25)
ereal('5.235987755982988730 7E-1')
>>> ereal.SynchG(12.25)
ereal('5.351847902755998475 4E-1')
```

CHAPTER

THIRTY

REAL FUNCTIONS RELATED TO ${}_1F_1$

30.1 Incomplete gamma functions

30.1.1 Truncated exponential function, $e_n(x)$

`math53.expn(`n, x`)`

Returns $e_n(x) = \sum_{k=0}^{n} \frac{x^k}{k!} = \frac{\Gamma(n+1,x)}{\Gamma(n+1)} e^x$, the truncated exponential sum function, for $n > 0$.

See also: Ehrhardt [297] (3.10.25).

https://mathworld.wolfram.com/ExponentialSumFunction.html

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Expn(2,3)
ereal('5.2359877559829887307E-1')
>>> ereal.Expn(4,13)
ereal('5.3518479027559984754E-1')
```

30.1.2 Relative exponential, $\mathrm{exprel}_n(x)$

`math53.expreln(`n, x`)`

Returns $\mathrm{exprel}_n(x) = \frac{n!}{x^n}\left(e^x - \sum_{k=0}^{n-1} \frac{x^k}{k!}\right) = e^x x^{-n}\left(\Gamma(1+n) - n\Gamma(n,x)\right) = {}_1F_1(1, 1+n, x)$.

See also Ehrhardt [297] (3.10.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Expreln(3, 4)
ereal('5.2359877559829887307E-1')
>>> ereal.Expreln(3, 12)
ereal('5.3518479027559984754E-1')
```

30.2 Coulomb wave functions

Coulomb wave functions are solutions of the Coulomb wave equation

$$y'' + \left(1 - \frac{2\eta}{z} - \frac{\ell(\ell+1)}{z^2}\right) y = 0$$

which is the radial Schrödinger equation for a charged particle in a Coulomb potential $1/z$, where ℓ is the orbital angular momentum and η is the Sommerfeld parameter. The standard solutions are named $F_\ell(\eta, z)$ (regular at the origin $z = 0$) and $G_\ell(\eta, z)$ (irregular at the origin). The irregular solutions $H_\ell^{\pm}(\eta, z) = G_\ell(\eta, z) \pm iF_\ell(\eta, z)$ are also used. The redundant functions $H^{\pm}$ are provided explicitly since taking the linear combination of F and G suffers from cancellation in parts of the complex plane.

Coulomb wave functions are special cases of confluent hypergeometric functions. The normalization constants and connection formulas are discussed in Dzieciol *et al.* [296], Gaspard [342], Michel [414] and chapter 33 in NIST [784]. In this implementation, we define the analytic continuations of all the functions so that the branch cut with respect to z is placed on the negative real axis.

30.2.1 Normalizing Gamow constant for Coulomb wave functions

`math53.coulomb_cl`(*l*, *eta*)

Returns the normalizing Gamow constant for Coulomb wave functions. See also Wikipedia [1370], MathWorld [1031], NIST [784], Thompson and Barnett [785], Michel [414], Ehrhardt [297] (3.1.10.1), Mpmath [719].

Gives the normalizing Gamow constant for Coulomb wave functions,

$$C_l(\eta) = 2^l \exp\left(-\pi\eta/2 + [\log\Gamma(1 + l + i\eta) + \log\Gamma(1 + l - i\eta)]/2 - \log\Gamma(2l + 2)\right),$$

where the log gamma function with continuous imaginary part away from the negative half axis is implied.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CoulombCL(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CoulombCL(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'
>>> \mathrm{d}x = dec.coulombc(l, eta); mx = mpm.coulombc(l, eta); gx = gmp.coulombc(l, eta)
>>> fx = fpm.coulombc(l, eta); ax = apm.coulombc(l, eta)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])
dec:  4.2816496261265795621632016101181570 25275E-13
mpm:  4.2816496261265795621632016101181570 25275e-13
gmp:  4.2816496261265795621632016101181570 25275E-13
fpm:  4.28164962612658E-13
apm:  4.2816496261265795621632016101181570 25382e-13 (1.141e-35%)
```

An example with complex input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; l = '10'; eta = '3 + 4j'
>>> \mathrm{d}z = dec.coulombc(l, eta); mz = mpm.coulombc(l, eta); gz = gmp.coulombc(l, eta)
>>> fz = fpm.coulombc(l, eta); az = apm.coulombc(l, eta)
>>> mpm.show([\mathrm{d}z, mz, gz, fz, az],  aligned=True)
dec: 3.4717690236181999723E-13              - 8.0361659919956253403E-13j
mpm: 3.4717690236181999723e-13              - 8.0361659919956253403e-13j
gmp: 3.4717690236181999723E-13              - 8.0361659919956253403E-13j
fpm: 3.47176902361820E-13                   - 8.03616599199563E-13j
apm: 3.4717690236182000026e-13 (1.386e-15%) - 8.0361659919956253696e-13 (-9.468e-16%)j
```

30.2.2 Coulomb phase shift $\sigma_L(\eta)$

math53.**coulomb_sl**(*L*, *eta*)

Returns the Coulomb phase shift for Coulomb wave functions.

See also: Ehrhardt [297] (3.1.10.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CoulombSL(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.CoulombSL(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

30.2.3 Regular Coulomb wave functions $F_l(\eta, x), F_l'(\eta, x)$

math53.**coulomb_f_fprime**(*L*, *eta*, *x*)

Returns the Coulomb wave function F. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.3), Flint [773], Flint [766], Mpmath [716].

Calculates the regular Coulomb wave function

$$F_l(\eta, z) = C_l(\eta) z^{l+1} e^{-iz} \, {}_1F_1(l + 1 - i\eta, 2l + 2, 2iz)$$

Calculates the regular Coulomb wave function

$$F_l(\eta, z) = C_l(\eta) z^{l+1} e^{-iz} \, {}_1F_1(l + 1 - i\eta, 2l + 2, 2iz)$$

where the normalization constant $C_l(\eta)$ is as calculated by *coulombc()*. This function solves the differential equation

$$f''(z) + \left(1 - \frac{2\eta}{z} - \frac{l(l+1)}{z^2}\right) f(z) = 0.$$

A second linearly independent solution is given by the irregular Coulomb wave function $G_l(\eta, z)$ (see *coulombg()*) and thus the general solution is $f(z) = C_1 F_l(\eta, z) + C_2 G_l(\eta, z)$ for arbitrary constants C_1, C_2.

Physically, the Coulomb wave functions give the radial solution to the Schrodinger equation for a point particle in a $1/z$ potential; z is then the radius and l, η are quantum numbers.

The Coulomb wave functions with real parameters are defined in Abramowitz & Stegun, section 14. However, all parameters are permitted to be complex in this implementation (see references).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CoulombFFp(3, 0.5, 2.25)
ereal('5.235987755982988730 7E-1')
>>> ereal.CoulombFFp(3, 0.5, 8.25)
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.coulombf(l, eta, x); mx = mpm.coulombf(l, eta, x); gx = gmp.coulombf(l, eta, x)

```

30.2.4 Irregular Coulomb wave functions $G_l(\eta, z), x), G_l'(\eta, z)$

`math53.coulomb_g`(*L*, *eta*, *x*)

where `ctx` is `math53`` or `ctxflint`.

Returns the irregular Coulomb wave function. See also Wikipedia [1370], MathWorld [1031], NIST [784], Ehrhardt [297] (3.1.10.5), Mpmath [717].

Calculates the irregular Coulomb wave function

$$G_l(\eta, z) = \frac{F_l(\eta, z)\cos(\chi) - F_{-l-1}(\eta, z)}{\sin(\chi)}$$

where $\chi = \sigma_l - \sigma_{-l-1} - (l + 1/2)\pi$ and $\sigma_l(\eta) = (\log\Gamma(1 + l + i\eta) - \log\Gamma(1 + l - i\eta))/(2i)$.

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.CoulombGGp(3, 0.5, 2.25)
ereal('5.2359877559829887307E-1')
>>> ereal.CoulombGGp(3, 0.5, 8.25)
ereal('5.3518479027559984754E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; l = '10'; eta = '3.0'; x = '5.0'
>>> \mathrm{d}x = dec.coulombg(l, eta, x); mx = mpm.coulombg(l, eta, x); gx = gmp.coulombg(l, eta, x)

```

30.3 Error function, and related functions

30.3.1 Exponentially scaled complementary error function, $\mathrm{erfcx}(x)$

`math53.`**`erfcx`**(x)

Returns the exponentially scaled complementary error function $\mathrm{erfcx}(z) = \exp(z^2)\cdot\mathrm{erfc}(z) = w(iz)$. See also Ehrhardt [297] (3.3.6).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Erfce(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Erfce('0.51')
ereal('5.351847902755998475 4E-1')
```

30.3.2 Difference of error functions, $\mathrm{erfh}(x,h) = \mathrm{erf}(x+h) - \mathrm{erf}(x-h)$

`math53.`**`erfh`**(x, h)

Returns the difference of error functions $\mathrm{erfh}(x,h) = \mathrm{erf}(x+h) - \mathrm{erf}(x-h) = \mathrm{erfc}(x-h) - \mathrm{erfc}(x+h)$.

See also Ehrhardt [297] (3.3.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Erfh(0.5, 0.6)
ereal('5.235987755982988730 7E-1')
>>> ereal.Erfh('0.51', 0.61)
ereal('5.351847902755998475 4E-1')
```

30.3.3 Difference of error functions, $\mathrm{erf2}(x_1,x_2) = \mathrm{erf}(x_2) - \mathrm{erf}(x_1)$

`math53.`**`erf2`**$(x1, x2)$

Returns the difference of error functions $\mathrm{erf2}(x_1,x_2) = \mathrm{erf}(x_2) - \mathrm{erf}(x_1) = \mathrm{erfh}\left(\frac{1}{2}(x_2+x_1), \frac{1}{2}(x_2-x_1)\right)$.

See also Ehrhardt [297] (3.3.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Erf2(0.5, 0.6)
ereal('5.235987755982988730 7E-1')
>>> ereal.Erf2('0.51', 0.61)
ereal('5.351847902755998475 4E-1')
```

30.3.4 Probability function $Q(x) = \Phi(-x)$

`math53.`**`erfq`**(x)

Returns the integral $Q(x) = \Phi(-x) = \dfrac{1}{\sqrt{2\pi}}\displaystyle\int_x^\infty \exp(-t^2)\,\mathrm{d}t = P(-x)$.

See also: Ehrhardt [297] (3.3.12.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ErfQ(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ErfQ('0.51')
ereal('5.3518479027559984754E-1')
```

30.3.5 Inverse of the exponentially scaled complementary error function, $\mathrm{erfcx}^{-1}(x)$

`math53.erfcx_inv(`x`)`

Returns $\mathrm{erfcx}^{-1}(x)$, the functional inverse of erfcx, satisfying $\mathrm{erfcx}(\mathrm{erfcx}^{-1}(x)) = x$, for $0 \leq x \leq \infty$.

See also Ehrhardt [297] (3.3.11.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ErfceInv(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ErfceInv('0.51')
ereal('5.3518479027559984754E-1')
```

30.3.6 Inverse of the imaginary error function, $\mathrm{erfi}^{-1}(x)$

`math53.erfi_inv(`x`)`

Returns $\mathrm{erfi}^{-1}(x)$, the functional inverse of erfi, satisfying $\mathrm{erfi}(\mathrm{erfi}^{-1}(x)) = x$.

See also Ehrhardt [297] (3.3.11.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ErfiInv(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.ErfiInv('0.51')
ereal('5.3518479027559984754E-1')
```

30.3.7 Generalized Dawson integral, $F(p, x)$

`math53.dawson2(`p, x`)`

Returns the generalized Dawson integral $F(p, x) = e^{-x^p} \int_0^x e^{t^p} \mathrm{d}t, p \geq 0, x \geq 0$. See also Ehrhardt [297] (3.3.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Dawson2(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Dawson2(1.5, '0.51')
ereal('5.3518479027559984754E-1')
```

30.3.8 Generalized error function, $\mathrm{erfg}(p, x)$

`math53.erfg(`p, x`)`

Returns the generalized error function $\mathrm{erfg}(p, x) = \int_0^x e^{-t^p} \mathrm{d}t = \frac{1}{p}\gamma\left(\frac{1}{p}, x^p\right)$, where $\gamma(\cdot)$ denotes the non-normalised lower incomplete gamma function. See also Ehrhardt [297] (3.3.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Erfg(1.5, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Erfg(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

30.3.9 Expint3, $\mathrm{erfg}(3, x)$

`math53.expint3(`x`)`

Returns $\mathrm{expint3}(p, x) = \mathrm{erfg}(3, x) = \int_0^x e^{-t^3}\,\mathrm{d}t = \frac{1}{3}\gamma\left(\frac{1}{3}, x^3\right)$, where $\gamma(\cdot)$ denotes the non-normalised lower incomplete gamma function. See also Ehrhardt [297] (3.3.13).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Expint3(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Expint3('0.51')
ereal('5.351847902755998475 4E-1')
```

30.3.10 Scaled repeated integrals of the complementary error function, $i^n\mathrm{erfc}(x)$

`math53.inerfc(`n, x`)`

Returns the scaled repeated integrals of the complementary error function, defined for $n \geq -1$ using the awkward but standard notation

$$i^n\mathrm{erfc}(x) = \int_x^\infty \mathrm{erfc}(t)\,\mathrm{d}t = \frac{2}{\sqrt{\pi}}\int_x^\infty \frac{(t-x)^n}{n!}e^{-t^2}\,\mathrm{d}t, \quad (n = 0, 1, 2, ...).$$

See also Ehrhardt [297] (3.3.7), NIST [438] (eq. 7.18.10), MathWorld [979].

These functions compute the scaled repeated integrals of complementary error function, defined for $n \geq -1$ using the awkward but standard notation

$$i^n\mathrm{erfc}(x) = \int_x^\infty i^{n-1}\mathrm{erfc}(t)\mathrm{d}t = \frac{2}{\sqrt{\pi}}\int_x^\infty \frac{(t-x)^n}{n!}e^{-t^2}\mathrm{d}t, \quad (n = 0, 1, 2, \ldots)$$

$$i^{-1}\mathrm{erfc}(x) = \frac{2}{\sqrt{\pi}}e^{-x^2}, \quad i^0\mathrm{erfc}(x) = \mathrm{erfc}(x).$$

$$i^n\mathrm{erfc}(x) = -\frac{z}{n}i^{n-1}\mathrm{erfc}(x) + \frac{1}{2n}i^{n-2}\mathrm{erfc}(x.$$

We also have

$$i^n\mathrm{erfc}(x) = \frac{e^{-z^2}}{2^n\sqrt{\pi}}U\left(\tfrac{1}{2}n + \tfrac{1}{2}, \tfrac{1}{2}, z^2\right)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.InErfc(3, 0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.InErfc(3, '0.51')
ereal('5.351847902755998475 4E-1')
```

An example with real input:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; n = '4'; x = '5.0'
>>> \mathrm{d}x = dec.inerfc(n, x); mx = mpm.inerfc(n, x); gx = gmp.inerfc(n, x)
>>> fx = fpm.inerfc(n, x); ax = apm.inerfc(n, x)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

30.3.11 Fresnel auxiliary function $\mathrm{f}(x)$

`math53.`**`fresnel_f`**`(`x`)`

Returns the Fresnel auxiliary function $\mathrm{f}\left(x\right)=\left(\frac{1}{2}-S\left(x\right)\right)\cos\left(\frac{1}{2}\pi x^{2}\right)-\left(\frac{1}{2}-C\left(x\right)\right)\sin\left(\frac{1}{2}\pi x^{2}\right)$.

See also Wikipedia [1325], MathWorld [982], NIST [779], Ehrhardt [297] (3.3.15).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FresnelF(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.FresnelF('0.51')
ereal('5.351847902755998475 4E-1')
```

30.3.12 Fresnel auxiliary function $\mathrm{g}(x)$

`math53.`**`fresnel_g`**`(`x`)`

Returns the Fresnel auxiliary function $\mathrm{g}\left(x\right)=\left(\frac{1}{2}-C\left(x\right)\right)\cos\left(\frac{1}{2}\pi x^{2}\right)+\left(\frac{1}{2}-S\left(x\right)\right)\sin\left(\frac{1}{2}\pi x^{2}\right)$.

See also Wikipedia [1325], MathWorld [982], NIST [779], Ehrhardt [297] (3.3.15).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.FresnelG(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.FresnelG('0.51')
ereal('5.351847902755998475 4E-1')
```

30.3.13 Goodwin-Staton integral, $G(x)$

`math53.`**`goodwin_staton`**`(`x`)`

Returns the Goodwin-Staton integral $G(x)=\int_{0}^{\infty}\frac{e^{-t^{2}}}{t+x}\,\mathrm{d}t=\sqrt{\pi}F(x)-\frac{1}{2}e^{-x^{2}}\mathrm{Ei}(x^{2}),\quad x\neq 0.$

See also Wikipedia [1326], NIST [437], Ehrhardt [297] (3.3.16).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.GoodwinStaton(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.GoodwinStaton('0.51')
ereal('5.3518479027559984754E-1')
```

30.3.14 Voigt function U

math53.**voigt_u**(z)

Returns the Voigt function U. See also Wikipedia [1339], NIST [440].

The Voigt functions[1] U, V, and H (sometimes called the line broadening function) are defined by

$$U(x,t) + iV(x,t) = \sqrt{\frac{\pi}{4t}} e^{z^2} \operatorname{erfc}(z) = \sqrt{\frac{\pi}{4t}} w(iz),$$

$$H(a,u) = \frac{U(u/a, 1/4a^2)}{a\sqrt{\pi}},$$

where

$$z = (1 - ix)/2\sqrt{t},$$

erfc is the complementary error function, and w(z) is the Faddeeva function.

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.VoigtU(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.VoigtU('0.1')
ecplx('5.3518479027559984754E-1')
```

30.3.15 Voigt function V

math53.**voigt_v**(x, t)

Returns the Voigt function V. See also Wikipedia [1339], NIST [440].

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.VoigtV(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.VoigtV('0.1')
ecplx('5.3518479027559984754E-1')
```

30.3.16 Voigt function H

math53.**voigt_h**(x, t)

Returns the Voigt function H. See also Wikipedia [1339], NIST [440].

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.VoigtH(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.VoigtH('0.1')
ecplx('5.3518479027559984754E-1')
```

30.3.17 Voigt Profile distribution, pdf

math53.**voigt_profile_pdf**(q, a, b)

Returns pdf(x), the probability density function of a random variable X, following a Voigt Profile distribution with shape $a > 0$, scale $b > 0$, and the support interval $(0, +\infty)$. See also Wikipedia [1222].

$$\text{pdf}(x) = V(x; \sigma, \gamma) = \frac{\Re[w(z)]}{\sigma\sqrt{2\pi}}, \quad \text{where } z = \frac{x + i\gamma}{\sigma\sqrt{\pi}}.$$

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.VoigtProfilePdf(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.VoigtProfilePdf('0.1')
ecplx('5.351847902755998475 4E-1')
```

30.4 Exponential integrals, and related functions

30.4.1 Entire cosine integral $\mathrm{Cin}(x)$

`math53.cin(`z`)`

Returns the entire cosine integral of $\mathrm{Cin}(x) = \int_0^x \frac{1-\cos(t)}{t}\,\mathrm{d}t$.

See also Wikipedia [1322], MathWorld [974], NIST [783], Ehrhardt [297] (3.4.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cin(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Cin('0.51')
ereal('5.3518479027559984754E-1')
```

30.4.2 Entire hyperbolic cosine integral $\mathrm{Cinh}(x)$

`math53.cinh(`z`)`

Returns the entire hyperbolic cosine integral $\mathrm{Cinh}(x) = \int_0^x \frac{\cosh(t)-1}{t}\,\mathrm{d}t$.

See also Wikipedia [1328], MathWorld [986], NIST [780], Ehrhardt [297] (3.4.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Cinh(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Cinh('0.51')
ereal('5.3518479027559984754E-1')
```

30.4.3 Entire exponential integral $\mathrm{Ein}(x)$

`math53.ein(`x`)`

Returns the entire exponential integral $\mathrm{Ein}(x) = -\int_0^x \frac{1-e^{-t}}{t}\,\mathrm{d}t$.

See also Wikipedia [1328], MathWorld [986], NIST [780], Ehrhardt [297] (3.4.11).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Ein(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Ein('0.51')
ereal('5.3518479027559984754E-1')
```

30.4.4 Scaled exponential integral $\mathrm{e1s}(x)$

`math53.exp_integral_e1_scaled(`z`)`

Returns the scaled exponential integral $\mathrm{e1s}(x) = e^{-x}E_1(x)$ for $x \neq 0$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.6).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.E1s(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.E1s('0.51')
ereal('5.351847902755998475 4E-1')
```

30.4.5 Scaled exponential integral $\mathrm{eis}(x)$

`math53.exp_integral_ei_scaled(`x`)`

Returns the scaled exponential integral $\mathrm{eis}(x) = e^{-x}\mathrm{Ei}(x)$ for $x \neq 0$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.8).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Eis(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Eis('0.51')
ereal('5.351847902755998475 4E-1')
```

30.4.6 Scaled exponential integral $\mathrm{eisx2}(x)$

`math53.eisx2(`x`)`

Returns the scaled exponential integral $\mathrm{eisx2}(x) = e^{-x^2}\mathrm{Ei}(x^2)$ for $x \neq 0$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.9).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Eisx2(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.Eisx2('0.51')
ereal('5.351847902755998475 4E-1')
```

30.4.7 Inverse of the exponential integral, $\mathrm{Ei}^{-1}(x)$

`math53.ei_inv(`x`)`

Returns $\mathrm{Ei}^{-1}(x) = \log(\mathrm{li}^{-1}(x))$, the functional inverse of the exponential integral, i.e. $\mathrm{Ei}(\mathrm{Ei}^{-1}(x)) = x$.

See also Wikipedia [1323], MathWorld [980], NIST [778], BoostMath [154], Ehrhardt [297] (3.4.10).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.EiInv(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.EiInv('0.51')
ereal('5.351847902755998475 4E-1')
```

30.4.8 Generalized exponential integral $E_p(p, x)$

`math53.gei(`p, x`)`

Returns the generalized exponential integral of real order $E_p(x) = \int_1^\infty \frac{e^{-xt}}{t^p}\,\mathrm{d}t = x^{p-1}\Gamma(1-p,x) = x^{p-1}Q(1-p,x)\Gamma(1-p)$.

See also Wikipedia [1323], MathWorld [981], NIST [463], BoostMath [155], Ehrhardt [297] (3.4.13).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Gei(3.1, 0.5)
ereal('5.235987755982988730E-1')
>>> ereal.Gei(3.1, '0.51')
ereal('5.351847902755998475E-1')
```

30.4.9 Exponential integral $\beta_n(x)$

`math53.eibeta`(n, x)

Returns the exponential integral $\beta_n(x) = \int_1^1 t^n e^{-xt}\,\mathrm{d}t = x^{-n-1}\left(\Gamma(n+1,-x) - \Gamma(n+1,x)\right), n \geq 0$.

See also Abramowitz and Stegun. [4] (5.1.6) and (5.1.47), and Ehrhardt [297] (3.4.14).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Eibeta(3, 0.5)
ereal('5.235987755982988730E-1')
>>> ereal.Eibeta(3, '0.51')
ereal('5.351847902755998475E-1')
```

30.4.10 Inverse of the logarithmic integral, $\mathrm{li}^{-1}(x)$

`math53.log_integral_inv`(x)

Returns $\mathrm{li}^{-1}(x)$, the functional inverse of the logarithmic integral, i.e. $\mathrm{li}(\mathrm{li}^{-1}(x)) = x$.

See also Wikipedia [1332], MathWorld [991], NIST [781], Ehrhardt [297] (3.4.16).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.LiInv(0.5)
ereal('5.235987755982988730E-1')
>>> ereal.LiInv('0.51')
ereal('5.351847902755998475E-1')
```

30.4.11 Shifted sine integral $\mathrm{si}(x) = \mathrm{Si}(x) - \pi/2$

`math53.shifted_sin_integral`(x)

Returns the shifted sine integral, $\mathrm{si}(x) = \mathrm{Si}(x) - \pi/2$.

See also Wikipedia [1337], MathWorld [993], NIST [783], Ehrhardt [297] (3.4.19).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.ShiftedSi(0.5)
ereal('5.235987755982988730E-1')
>>> ereal.ShiftedSi('0.51')
ereal('5.351847902755998475E-1')
```

30.5 Struve functions

30.5.1 Struve function $\mathrm{H}_0(x)$

math53.**struve_h0**(x)

Returns the Struve function $H_0(x)$

See also: Ehrhardt [297] (3.1.9.1), Mpmath [714].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveH0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.StruveH0('0.51')
ereal('5.351847902755998475 4E-1')
```

30.5.2 Struve function $\mathrm{H}_1(x)$

math53.**struve_h1**(x)

Returns the Struve function $H_1(x)$

See also: Ehrhardt [297] (3.1.9.2), Mpmath [714].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveH1(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.StruveH1('0.51')
ereal('5.351847902755998475 4E-1')
```

30.5.3 Struve function $\mathrm{L}_0(x)$

math53.**struve_l0**(x)

Returns the Struve function $L_0(x)$

See also: Ehrhardt [297] (3.1.9.5).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveL0(0.5)
ereal('5.235987755982988730 7E-1')
>>> ereal.StruveL0('0.51')
ereal('5.351847902755998475 4E-1')
```

30.5.4 Struve function $\mathrm{L}_1(x)$

math53.**struve_l1**(x)

Returns the Struve function $\mathbf{L}_1(x)$

See also: Ehrhardt [297] (3.1.9.6).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StruveL1(0.5)
ereal('5.235987755982988730 7E-1')
```

(continues on next page)

```

CHAPTER

THIRTYONE

REAL AND COMPLEX FUNCTIONS

31.1 Additional elementary complex functions

31.1.1 Auxiliary function $\sqrt{1-z^2}$

`math53.sqrt1mz2(`z`)`

Returns the square root of $1-z^2$. For very large z (when z^2 would overflow) we have $\sqrt{1-z^2} = \pm iz$, where the sign is chosen to make $\Re\sqrt{1-z^2} \geq 0$; otherwise the result is computed from the definition.

See also Wikipedia [1235], MathWorld [844], BoostMath [97].

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.Cuberoot(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.Cuberoot('0.1')
ecplx('5.351847902755998475 4E-1')
```

31.1.2 Cube root, $\mathrm{cuberoot}(x) = \sqrt[3]{x} = y$, with $\arg(y)$ closest to $\arg(x)$

`math53.cuberoot(`z`)`

Returns the cube root of x, $x^{1/3}$ in a way which gives a negative number for negative input. See also Wikipedia [1235], MathWorld [844], BoostMath [97].

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.Cuberoot(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.Cuberoot('0.1')
ecplx('5.351847902755998475 4E-1')
```

31.1.3 Nth root, $\mathrm{surd}(x,n) = \sqrt[n]{x} = y$, with $\arg(y)$ closest to $\arg(x)$

`mathc53.surd(`x, n`)`

Returns the complex nth root $w = z^{1/n}$ with arg(w) closest to arg(z), e.g. surd(-8, 3) = -2 or surd(i, 5) = i, compared to the cnroot results $\sqrt[3]{-8} = 1 + i\sqrt{3}$ and $\sqrt[5]{i} = \cos(\pi/10) + i\sin(\pi/10)$. See Ehrhardt [297] (4.2.60).

An example in Python

```
>>> from xlcalcnet import ecplx
>>> ecplx.Surd(0.5)
ecplx('5.2359877559829887307E-1')
>>> ecplx.Surd('0.1')
ecplx('5.351847902755998475 4E-1')
```

31.1.4 Continuous inverse cotangent, $\mathrm{acotc}(x)$

`ctx.acotc(`x`)`

where `ctx` is `math53`, `mathc53`, `ctxcpp` or `ctxflint`.

Returns the continuous inverse cotangent of x, $\mathrm{acotc}(x) = \pi/2 - \mathrm{atan}(x)$. See also Wikipedia [1262], MathWorld [871], NIST [488], Mpmath [571].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Acotc(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Acotc('0.51')
ereal('5.351847902755998475 4E-1')
```

31.1.5 Continuous inverse hyperbolic cotangent, $\mathrm{acothc}(x)$

`ctx.acothc`(x)

where `ctx` is `math53`, `mathc53`, `ctxcpp` or `ctxflint`.

Returns the continuous inverse hyperbolic cotangent of x, $\mathrm{acothc}(x) = \pi/2 - \mathrm{atan}(x)$. See also Wikipedia [1262], MathWorld [871], NIST [488], Mpmath [571].

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Acotc(0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Acotc('0.51')
ereal('5.351847902755998475 4E-1')
```

31.2 Neville theta functions

31.2.1 Neville $\theta_s(x, k)$

math53.**neville_theta_s**(x, k)

Returns the Neville theta function $\theta_s(x,k) = \dfrac{2K(k)}{\pi}\dfrac{\theta_1(v,q(k))}{\theta_1'(0,q(k))}, \quad v = \dfrac{\pi x}{2K(k)}, |k| \leq 1$, and $q(k)$ is the elliptic nome.

See also: Wikipedia [1333], MathWorld [282], Ehrhardt [297] (3.2.15.1).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NevilleThetaS(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.NevilleThetaS(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

31.2.2 Neville $\theta_c(x, k)$

math53.**neville_theta_c**(x, k)

Returns the Neville theta function $\theta_c(x,k) = \dfrac{\theta_2(v,q(k))}{\theta_2(0,q(k))}, \quad v = \dfrac{\pi x}{2K(k)}, |k| \leq 1$, and $q(k)$ is the elliptic nome.

See also: Wikipedia [1333], MathWorld [279], Ehrhardt [297] (3.2.15.2).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NevilleThetaC(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.NevilleThetaC(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

31.2.3 Neville $\theta_d(x, k)$

math53.**neville_theta_d**(x, k)

Returns the Neville theta function $\theta_d(x,k) = \dfrac{\theta_3(v,q(k))}{\theta_3(0,q(k))}, \quad v = \dfrac{\pi x}{2K(k)}, |k| \leq 1$, and $q(k)$ is the elliptic nome.

See also: Wikipedia [1333], MathWorld [280], Ehrhardt [297] (3.2.15.3).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NevilleThetaD(1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.NevilleThetaD(1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

31.2.4 Neville $\theta_n(x, k)$

math53.**neville_theta_n**(x, k)

Returns the Neville theta function $\theta_n(x,k) = \dfrac{\theta_4(v,q(k))}{\theta_4(0,q(k))}, \quad v = \dfrac{\pi x}{2K(k)}, |k| \leq 1$, and $q(k)$ is the elliptic nome.

See also: Wikipedia [1333], MathWorld [281], Ehrhardt [297] (3.2.15.4).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NevilleThetaN(1.5, 0.5)
ereal('5.23598775598298873077E-1')
>>> ereal.NevilleThetaN(1.5, '0.51')
ereal('5.35184790275599847547E-1')
```

31.3 Conversions of parameters of Weierstrass $\wp$

31.3.1 Elliptic lattice roots e_1, e_2, e_3 from elliptic lattice invariants g_2, g_3

`ctx.elliptic_roots_from_g2g3(g2, g3)`

Computes the lattice roots e_1, e_2, e_3 from the lattice invariants g_2, g_3, using the equation

$$4t^3 - g_2 t - g_3 = 4(t - e_1)(t - e_2)(t - e_3) = 0.$$

See also: MathWorld [284], MathWorld [283], Flint [772].

See also: https://dlmf.nist.gov/23.2

At least one of g_2 and g_3 is complex

For $g_2 \cdot g_3 \neq 0$, the roots are determined as the roots of $4t^3 - g_2 t - g_3 = 0$ (see *CubicEquationRoots*).

In general, these roots are complex numbers e_1, e_2, e_3, with $e_1 + e_2 - e_3 = 0$. They are ordered so that the triangle with vertices e_1, e_2, e_3 is positively oriented and $[e_1, e_3]$ is its longest side (chosen arbitralily if there is more than one). In particular, if e_1, e_2, e_3 are collinear, then we label them so that e_2 is on the line segment (e_1, e_3).

In consequence, $m_1 = \dfrac{e_1 - e_3}{e_1 - e_3}$, $m_2 = \dfrac{e_2 - e_3}{e_1 - e_3}$ satisfy $\Im(m_1) \leq 0 \leq \Im(m_2)$, with strict inequality unless e_1, e_2, e_3 are collinear. Also $|m_1| \leq 1$, $|m_2| \leq 1$, and taking the principal square roots of m_1 and m_2 we obtain values that lie in the fourth and 1st quadrants, respectively.

Both g_2 and g_3 are real

The calculation proceeds depending on the value of the modular delta function $\Delta = g_2^3 - 27 g_3^2$.

For $\Delta > 0, g_2 \cdot g_3 \neq 0$, the roots are determined as the roots of $4t^3 - g_2 t - g_3 = 0$ (see *CubicEquationRoots*). All roots are real and are ordered so that $e_1 > e_2 > e_3$.

For $\Delta < 0, g_2 \cdot g_3 \neq 0$, the roots are determined as the roots of $4t^3 - g_2 t - g_3 = 0$ (see *CubicEquationRoots*). There is only one real root which is assigned to e_2 and the two other (complex conjugate) roots are assigned to e_1 and e_3, with $\Im(e_1) > 0$.

For some special cases the lattice roots can be calculated in closed form:

For $\Delta \neq 0, g_2 > 0, g_3 = 0$: $e_1 = \frac{1}{2}\sqrt{|g_2|}$, $e_2 = 0$, $e_3 = -e_1$. (Lemniscate case for $g_2 = 1$).

For $\Delta \neq 0, g_2 < 0, g_3 = 0$: $e_1 = i\frac{1}{2}\sqrt{|g_2|}$, $e_2 = 0$, $e_3 = -e_1$. (Pseudo-lemniscate case for $g_2 = -1$).

For $\Delta \neq 0, g_2 = 0, g_3 > 0$: $e_1 = e_2 \cdot c$, $e_2 = \sqrt[3]{|g_3|/4}$, $e_3 = e_2/c$, where $c = e^{2\pi i/3}$. (Equianharmonic case for $g_3 = 1$).

For $\Delta \neq 0, g_2 = 0, g_3 < 0$: $e_1 = e_2/c$, $e_2 = \sqrt[3]{|g_3|/4}$, $e_3 = e_2 \cdot c$, where $c = e^{2\pi i/3}$.

For $\Delta = 0, g_2 > 0, g_3 > 0$: $e_1 = 2c$, $e_2 = e_3 = -c$, where $c = \sqrt{g_2/12}$.

For $\Delta = 0, g_2 > 0, g_3 < 0$: $e_1 = e_2 = c$, $e_3 = -2c$, where $c = \sqrt{g_2/12}$.

For $\Delta = 0, g_2 = 0, g_3 = 0$: $e_1 = e_2 = e_3 = 0$.

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; tau = '0.0 + 0.7j'
>>> dx2, dx3 = dec.elliptic_invariants(tau); mx2, mx3 = mpm.elliptic_invariants(tau);
>>> gx2, gx3  = gmp.elliptic_invariants(tau)
>>> fx2, fx3 = fpm.elliptic_invariants(tau); ax2, ax3 = apm.elliptic_invariants(tau)
>>> print("lattice invariant g2")
>>> mpm.show([dx2, mx2, gx2, fx2, ax2], aligned=True)
>>> print("lattice invariant g3")
>>> mpm.show([dx3, mx3, gx3, fx3, ax3], aligned=True)
```

31.3.2 Elliptic half periods ω_1, ω_2 from elliptic lattice invariants g_2, g_3

`ctx.elliptic_halfperiods_from_g2g3(g2, g3)`

Computes the elliptic half periods ω_1, ω_2 from the lattice invariants g_2, g_3. Note that in general the pair (ω_1, ω_2) is not unique; depending on the input, there are up to 6 different but equivalent solutions, as explained below.

See also: MathWorld [284], MathWorld [283], Flint [772], and https://dlmf.nist.gov/23.2.

This function is intended to enable the use of real and complex elliptic lattice invariants $g_2 \neq 0$ and $g_3 \neq 0$ as parameters of *WeierstrassP()*, *WeierstrassPPrime()*, *WeierstrassPInv()*, *WeierstrassZeta()*, *WeierstrassSigma()* by providing a direct way to calculate the corresponding values of $\omega = \omega_1$ and $\tau = \omega_2/\omega_1$), which are the expected parameters of these functions.

At least one of g_2 and g_3 is complex

For $g_2 \cdot g_3 \neq 0$: we first compute the (ordered) lattice roots e_1, e_2, e_3 from the lattice invariants g_2, g_3 (see *EllipticRootsG*). Then

$$\omega_1 = \frac{F}{\operatorname{agm}(1, m_1)}, \quad \omega_2 = i\frac{F}{\operatorname{agm}(1, \sqrt{m_2})}, \quad \text{where } m_1 = \frac{e_1 - e_3}{e_1 - e_3}, \quad m_2 = \frac{e_2 - e_3}{e_1 - e_3}, \quad F = \frac{\pi}{3}\sqrt{\frac{g_2(2 + m_1 m_2)(m_2 - m_1)}{g_3(1 - m_1 m_2)}}.$$

This process yields 2 possible pairs (ω_1, ω_2), corresponding to the 2 possible choices of the square root; the solution obtained by taking the principal square root is returned.

For two special cases the elliptic half periods ω_1, ω_2 can be calculated without calculating the lattice roots first:

For $g_2 \neq 0, g_3 = 0 : \omega_1 = \dfrac{\Gamma^2(1/4)}{4\sqrt{\pi}\sqrt[4]{g_2}}, \omega_2 = i\omega_1$. There are 4 possible pairs (ω_1, ω_2), corresponding to the 4 rotations of a square lattice; the solution obtained by taking the principal root $(k = 0)$ is returned.

For $g_2 = 0, g_3 \neq 0 : \omega_1 = \dfrac{\Gamma^3(1/3)}{4\pi\sqrt[6]{g_3}}, \omega_2 = e^{-\pi i/3}\omega_1$. There are 6 possible pairs (ω_1, ω_2), corresponding to the 6 rotations of a square lattice of equilateral triangles; the solution obtained by taking the principal root $(k = 0)$ is returned.

Both g_2 and g_3 are real

The calculation proceeds depending on the value of the modular delta function $\Delta = g_2^3 - 27g_3^2$.
$K(\cdot)$ denotes the complete elliptic integral of the first kind.

For $\Delta > 0, g_2 \cdot g_3 \neq 0$: we first compute the lattice roots e_1, e_2, e_3 from the lattice invariants g_2, g_3 (see *EllipticRootsG*). Then

$$\omega_1 = \frac{K(m)}{\sqrt{e_1 - e_3}}, \quad \omega_2 = i\frac{K(1 - m)}{\sqrt{e_1 - e_3}}, \quad \text{where } m = \frac{e_2 - e_3}{e_1 - e_3}.$$

For $\Delta < 0, g_2 \cdot g_3 \neq 0$: we first compute the lattice roots e_1, e_2, e_3 from the lattice invariants g_2, g_3 (see *EllipticRootsG*). Then

$$\omega_1 = \frac{K(m)}{\sqrt{H_2}}, \quad \omega_2 = i\frac{K(1 - m)}{\sqrt{H_2}}, \quad \text{where } m = \tfrac{1}{2} - \frac{3e_2}{4H_2}, \quad H_2 = \sqrt{(e_2 - e_1)(e_2 - e_3)}.$$

For some special cases the elliptic half periods ω_1, ω_2 can be calculated without calculating the lattice roots first:

For $\Delta \neq 0, g_2 > 0, g_3 = 0 :$ $\omega_1 = \dfrac{\Gamma^2(1/4)}{4\sqrt{\pi}\sqrt[4]{|g_2|}}$, $\omega_2 = i\omega_1$. (Lemniscate case for $g_2 = 1$).

For $\Delta \neq 0, g_2 < 0, g_3 = 0 :$ $\omega_1 = \sqrt{2}\dfrac{\Gamma^2(1/4)}{4\sqrt{\pi}\sqrt[4]{|g_2|}}$, $\omega_2 = i\omega_1$. (Pseudo-lemniscate case for $g_2 = -1$).

For $\Delta \neq 0, g_2 = 0, g_3 > 0 :$ $\omega_1 = \dfrac{\Gamma^3(1/3)}{4\pi\sqrt[6]{|g_3|}}$, $\omega_2 = i\omega_1 \cdot \sqrt{3}$. (Equianharmonic case for $g_3 = 1$).

For $\Delta \neq 0, g_2 = 0, g_3 < 0 :$ $\omega_1 = \sqrt{3}\dfrac{\Gamma^3(1/3)}{4\pi\sqrt[6]{|g_3|}}$, $\omega_2 = i\omega_1/\sqrt{3}$.

For $\Delta = 0, g_2 > 0, g_3 > 0:\quad \omega_1 = \dfrac{\pi}{\sqrt[6]{216|g_3|}},\quad \omega_2 = i\infty.$

For $\Delta = 0, g_2 > 0, g_3 < 0:\quad \omega_1 = \infty,\quad \omega_2 = \dfrac{i\pi}{\sqrt[6]{216|g_3|}}.$

For $\Delta = 0, g_2 = 0, g_3 = 0:\quad \omega_1 = \infty,\quad \omega_2 = i\infty.$

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 20; tau = '0.0 + 0.7j'
>>> dx2, dx3 = dec.elliptic_invariants(tau); mx2, mx3 = mpm.elliptic_invariants(tau);
>>> gx2, gx3  = gmp.elliptic_invariants(tau)
>>> fx2, fx3 = fpm.elliptic_invariants(tau); ax2, ax3 = apm.elliptic_invariants(tau)
>>> print("lattice invariant g2")
>>> mpm.show([dx2, mx2, gx2, fx2, ax2], aligned=True)
>>> print("lattice invariant g3")
>>> mpm.show([dx3, mx3, gx3, fx3, ax3], aligned=True)

31.3.3 Elliptic half-period ω_1 and elliptic period ratio τ from elliptic lattice invariants g_2 and g_3

ctx.omega_and_tau_from_g2g3(*g2*, *g3*)

Given the (possibly complex) elliptic lattice invariants $g_2 \neq 0$ and $g_3 \neq 0$, with $\Delta = g_2^3 - 27g_3^2 \neq 0$, returns the elliptic half-period ω_1 and elliptic period ratio τ as a tuple of complex numbers (ω_1, τ) such that $g_2\omega_1^4 = g_{3,\tau}$, $g_3\omega_1^6 = g_{3,\tau}$, and $j(\tau) = 1728\dfrac{g_2^3}{g_2^3 - 27g_3^2}$, where $(g_{2,\tau}, g_{3,\tau})$ are the (g_2, g_3) values returned by calling *EllipticInvariants()* with τ as argument, and $j(\tau)$ denotes the Klein j-invariant. The returned tuple (ω_1, τ) is not unique.

See also Wikipedia [1366], MathWorld [1008], NIST [477], Flint [771].

See also: https://dlmf.nist.gov/23.22

This function is intended to enable the use of complex elliptic lattice invariants $g_2 \neq 0$ and $g_3 \neq 0$ as parameters of *WeierstrassP()*, *WeierstrassPPrime()*, *WeierstrassPInv()*, *WeierstrassZeta()*, *WeierstrassSigma()* by providing a direct way to calculate the corresponding values of ω_1 and τ, which are the expected parameters of these functions.

Note that for real elliptic lattice invariants the functions *WeierstrassPG()*, *WeierstrassPPrimeG()*, *WeierstrassPInvG()*, *WeierstrassZetaG()*, *WeierstrassSigmaG()* should be used: they are typically faster and more accurate and also support the special cases $g_2 = 0$, $g_3 = 0$ and $\Delta = 0$.

The following algorithm is used: We first calculate (by calling *CubicEquationRoots*) the 3 roots $x_k (k = 1, 2, 3)$ of the cubic equation

$$4x^3 + (G - 12)x^2 + 12x - 4 = 0, \quad \text{where } G = 27\frac{g_2^3}{g_2^3 - 27g_3^2}.$$

For each of these 3 roots x_k we then calculate (by calling *QuadraticEquationRoots*) the 2 roots $\lambda_{k,l} (l = 1, 2)$ of the quadratic equation $\lambda^2 - \lambda + x_k = 0$, resulting overall in 6 roots $\lambda_{k,l}$. Calculating

$$\tau_{k,l} = i\frac{\operatorname{agm}(1, \sqrt{1 - \lambda_{k,l}})}{\operatorname{agm}(1, \sqrt{\lambda_{k,l}})}$$

we obtain 6 values $\tau_{k,l}$ such that $j(\tau_{k,l}) = 1728\dfrac{g_2^3}{g_2^3 - 27g_3^2}$. Of these $\tau_{k,l}$ the function returns one with $g_3\omega^6 = g_{3,\tau_{k,l}}$, where $\omega = \sqrt[4]{\dfrac{g_{2,\tau_{k,l}}}{g_2}}$, and $(g_{2,\tau_{k,l}}, g_{3,\tau_{k,l}})$ are the (g_2, g_3) values returned by calling *EllipticInvariants()* with $\tau_{k,l}$ as argument.

An example with purely imaginary input, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; tau = '0.0 + 0.7j'
>>> \mathrm{d}x = dec.kleinj(tau); mx = mpm.kleinj(tau); gx = gmp.kleinj(tau)

```

31.4 Weierstrass elliptic functions, in terms of (real) lattice invariants g_2, g_3

The Weierstrass functions take real values on the real axis iff the lattice is fixed under complex conjugation, or, equivalently, when $g_2, g_3 \in \mathbb{R}$.

See also: https://gist.github.com/stla/d771e0a8c351d16d186c79bc838b6c48

31.4.1 Weierstrass function $\wp_g(z, g_2, g_3)$ (also DAMath)

`ctx.weierstrass_p_g(z, g2, g3)`

Computes Weierstrass's elliptic function $\wp_g(z; g_2, g_3)$.

We have $\wp_g(tz; t^{-4}g_2, t^{-6}g_3) = t^{-2}\wp_g(z; g_2, g_3)$ and $\wp_g(iz; g_2, g_3) = -\wp_g(z; g_2, -g_3)$.

See also MathWorld [994], Flint [772].

Returns the Weierstrass function $\wp_g(x, g_2, g_3)$ based on the lattice invariants g_2, g_3.

In AMath the computation of the Weierstass elliptic function (for real and imaginary arguments) is based on the lattice invariants g_2, g_3 or the lattice roots $e_1, e_2, e_3 = -e_1 - e_2$, if the discriminant of the cubic equation $4x^3 - g_2x - g_3 = 0$ is positive

$$\Delta = g_2^3 - 27g_3^2 = 16(e_2 - e_3)^2(e_3 - e_1)^2(e_1 - e_2)^2;$$

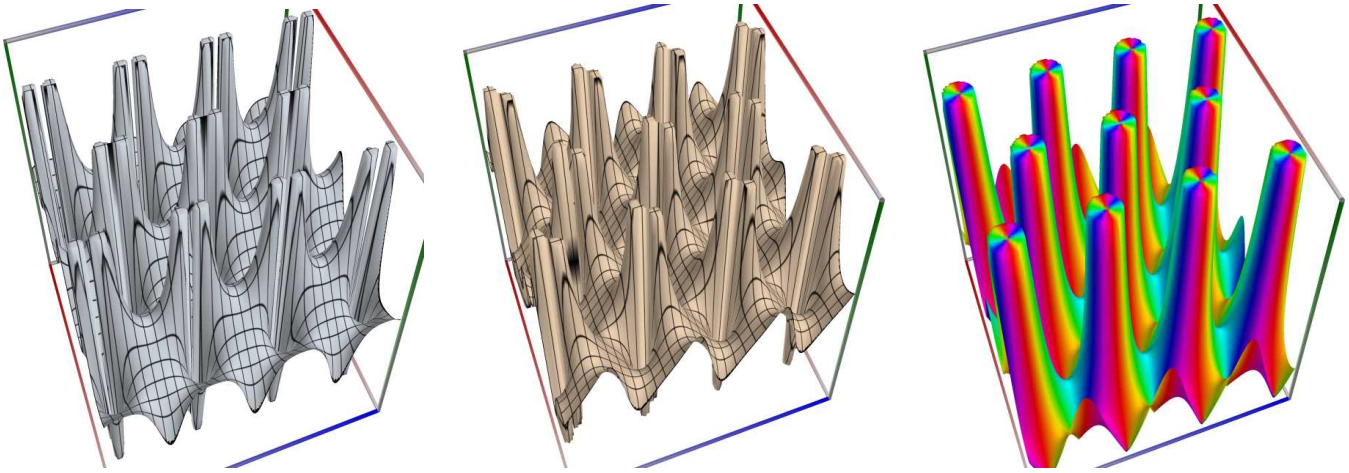
symbolically written as $\wp_g(x, g_2, g_3)$ or $\wp_e(x, e_1, e_2)$. See also

When $g_2 = 1, g_3 = 0$ the result is $\wp_l(x)$ and for $g_2 = g_3 = 0$ it is $x - 2$. If $g_2^2 - 27g_3^2 > 0$ all lattice roots are real, and $\wp'_e(x, e_1, e_2)$ is returned, otherwise the following Jacobi relation is used:

$$\wp_g(x, g_2, g_3) = e_2 + H\frac{1 + \mathrm{cn}(u, k)}{1 - \mathrm{cn}(u, k)}, \quad k = \sqrt{\tfrac{1}{2}\frac{3e_2}{4H}}, \quad u = 2x\sqrt{H}, \quad H = \sqrt{(e_2 - e_1)(e_2 - e_3)}.$$

See also Wikipedia [1357], MathWorld [994], Ehrhardt [297] (3.2.17.5).

Returns the Weierstrass function $\wp_g(iy, g_2, g_3) = -\wp_g(y, g_2, -g_3)$. See also: MathWorld [995], Ehrhardt [297] (3.2.17.7).



Left figure: real part of the Weierstrass function $\wp_g(z, g_2, g_3)$.

Middle figure: imaginary part of the Weierstrass function $\wp_g(z, g_2, g_3)$.

Right figure: absolute value of the Weierstrass function $\wp_g(z, g_2, g_3)$, with color-coded phase.

For $\Delta = g_2^3 - 27g_3^2 \neq 0$, we first compute the elliptic half periods ω_1, ω_2 from the lattice invariants g_2, g_3 (see *EllipticHalfPeriodsG*), and set $\omega = \omega_1, \tau = \omega_2/\omega_1$. Then $\wp_g(z; g_2, g_3) = \wp(z|\omega, \tau)$ (see *WeierstrassP*).

For $\Delta = 0, g_2 > 0, g_3 \neq 0$, the function $\wp_g(\cdot)$ degenerates to a simply periodic function, which can be expressed in closed form in terms of elementary functions:

For $\Delta = 0, g_2 > 0, g_3 < 0$: $\quad \wp_g(z; g_2, g_3) = c + \dfrac{3c}{\sinh^2\left(\sqrt{3c}z\right)}, \quad$ where $c = \sqrt{g_2/12}$.

For $\Delta = 0, g_2 > 0, g_3 > 0$: $\quad \wp_g(z; g_2, g_3) = c + \dfrac{3c}{\sin^2\left(\sqrt{3c}z\right)}, \quad$ where $c = \sqrt{g_2/12}$.

If both g_2 and g_3 are zero, the function $\wp_g(\cdot)$ degenerates to a function that is not periodic at all, namely $\wp_g(z; 0, 0) = z^{-2}$.

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_p(z, tau); mx = mpm.weierstrass_p(z, tau)
>>> gx = gmp.weierstrass_p(z, tau)
>>> fx = fpm.weierstrass_p(z, tau); ax = apm.weierstrass_p(z, tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

apm:  (-2.3859027427781674104e+0 (-2.038e-17%) + 2.4323666240267878020e-2 (1.982e-15%)j)
```

31.4.2 Weierstrass function, first derivative: $\wp'_g(z, g_2, g_3)$

`ctx.weierstrass_p_prime_(z, g2, g3)`

Computes the first derivative of the Weierstrass function, $\wp'_g(z, g_2, g_3)$.

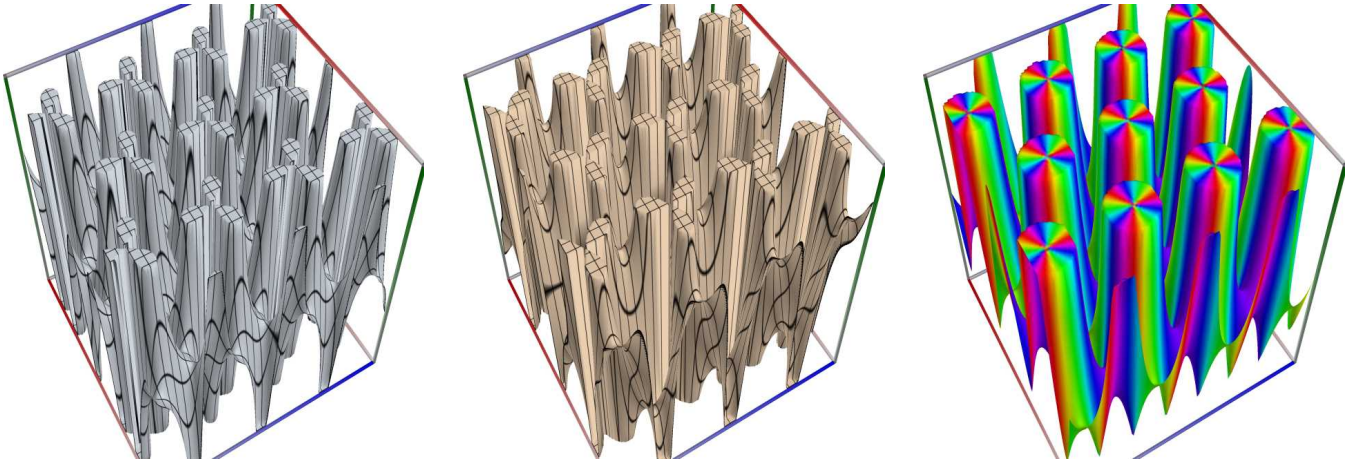
We have $\wp'_g(tz; t^{-4}g_2, t^{-6}g_3) = t^{-3}\wp'_g(z; g_2, g_3)$ and $\wp'_g(iz; g_2, g_3) = i\wp'_g(z; g_2, -g_3)$.

See also MathWorld [995], Flint [772].

Returns the Weierstrass function $\wp_g(x, g_2, g_3)$ based on the lattice invariants g_2, g_3.

$$\wp'_g(x, g_2, g_3) = -H^{3/2}\frac{\mathrm{cn}(u,k)\mathrm{dn}(u,k)}{1-\mathrm{cn}(u,k)}, \quad k = \sqrt{\frac{1}{2}\frac{3e_2}{4H}}, \quad u = 2x\sqrt{H}, \quad H = \sqrt{(e_2-e_1)(e_2-e_3)}.$$

See also: MathWorld [995], Ehrhardt [297] (3.2.17.6).



Left figure: real part of the Weierstrass function, first derivative: $\wp'_g(z, g_2, g_3)$.

Middle figure: imaginary part of the Weierstrass function, first derivative: $\wp'_g(z, g_2, g_3)$.

Right figure: absolute value of the Weierstrass function, first derivative: $\wp'_g(z, g_2, g_3)$, with color-coded phase.

For $\Delta = g_2^3 - 27g_3^2 \neq 0$, we first compute the elliptic half periods ω_1, ω_2 from the lattice invariants g_2, g_3 (see *EllipticHalfPeriodsG*), and set $\omega = \omega_1, \tau = \omega_2/\omega_1$. Then $\wp'_g(z; g_2, g_3) = \wp'(z|\omega, \tau)$ (see *WeierstrassPPrime*).

For $\Delta = 0, g_2 > 0, g_3 \neq 0$, the function $\wp'_g(\cdot)$ degenerates to a simply periodic function, which can be expressed in closed form in terms of elementary functions:

For $\Delta = 0, g_2 > 0, g_3 < 0$: $\quad \wp'_g(z; g_2, g_3) = -6\sqrt{3}c^{3/2}\coth(\sqrt{3}cz)\mathrm{csch}^2(\sqrt{3}cz)$, $\quad$ where $c = \sqrt{g_2/12}$.

For $\Delta = 0, g_2 > 0, g_3 > 0$: $\quad \wp'_g(z; g_2, g_3) = -6\sqrt{3}c^{3/2}\cot(\sqrt{3}cz)\mathrm{csc}^2(\sqrt{3}cz)$, $\quad$ where $c = \sqrt{g_2/12}$.

If both g_2 and g_3 are zero, the function $\wp'_g(\cdot)$ degenerates to a function that is not periodic at all, namely $\wp'_g(z; 0, 0) = -2z^{-3}$.

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_p_prime(z, tau); mx = mpm.weierstrass_p_prime(z, tau)

```

31.4.3 Inverse Weierstrass function $\wp_g^{-1}(z, g_2, g_3)$

ctx.**weierstrass_p_invG**(*z*, *g2*, *g3*)

Computes the Inverse Weierstrass function $\wp_g^{-1}(z, g_2, g_3)$

See also MathWorld [990], Flint [772].

$$\wp_g^{-1}(z; g_2, g_3) = \wp^{-1}(z|\tau = \omega_2/\omega_1, \omega = \omega_1)$$

Returns the functional inverse $\wp_g^{-1}$ of the Weierstrass function for $y \geq e_1$, i.e. the smallest positive x with $\wp_g^{-1}(y, g_2, g_3) = y$, if it exists. See also: MathWorld [990], Ehrhardt [297] (3.2.17.9).

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '100'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_p_inv(z, tau); mx = mpm.weierstrass_p_inv(z, tau)
>>> gx = gmp.weierstrass_p_inv(z, tau)

31.4.4 Weierstrass Zeta function $\zeta_g(z, g_2, g_3)$

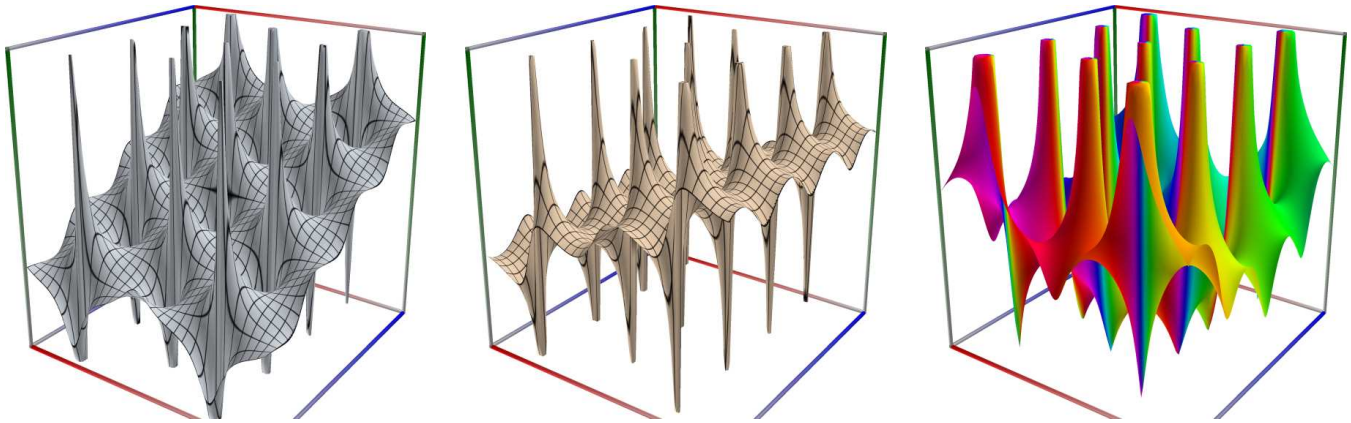
`ctx.weierstrass_zeta_g(z, g2, g3)`

Computes the Weierstrass zeta function $\zeta_g(z; g_2, g_3)$.

We have $\zeta_g(tz; t^{-4}g_2, t^{-6}g_3) = t^{-1}\zeta_g(z; g_2, g_3)$ and $\zeta_g(iz; g_2, g_3) = -i\zeta_g(z; g_2, -g_3)$.

The function is related to $\wp(z; g_2, g_3)$ by $\dfrac{d\zeta(z; g_2, g_3)}{\mathrm{d}z} = -\wp(z; g_2, g_3)$ and $\zeta(z; g_2, g_3) - z^{-1} = \displaystyle\int_0^z \left(\wp(z; g_2, g_3) - z^{-2}\right)$.

See also MathWorld [997], Flint [772].



Left figure: real part of the Weierstrass Zeta function $\zeta_g(z, g_2, g_3)$.

Middle figure: imaginary part of the Weierstrass Zeta function $\zeta_g(z, g_2, g_3)$.

Right figure: absolute value of the Weierstrass Zeta function $\zeta_g(z, g_2, g_3)$, with color-coded phase.

For $\Delta = g_2^3 - 27g_3^2 \neq 0$, we first compute the elliptic half periods ω_1, ω_2 from the lattice invariants g_2, g_3 (see *EllipticHalfPeriodsG*), and set $\omega = \omega_1, \tau = \omega_2/\omega_1$. Then $\zeta_g(z; g_2, g_3) = \zeta(z|\omega, \tau)$ (see *WeierstrassZeta*).

For $\Delta = 0, g_2 > 0, g_3 \neq 0$, the function $\zeta_g(\cdot)$ can be expressed in closed form in terms of elementary functions:

For $\Delta = 0, g_2 > 0, g_3 < 0$: $\quad \zeta_g(z; g_2, g_3) = -cz + \sqrt{3c}\coth(\sqrt{3c}z), \quad$ where $c = \sqrt{g_2/12}$.

For $\Delta = 0, g_2 > 0, g_3 > 0$: $\quad \zeta_g(z; g_2, g_3) = cz + \sqrt{3c}\cot(\sqrt{3c}z), \quad$ where $c = \sqrt{g_2/12}$.

If both g_2 and g_3 are zero, the function $\zeta_g(\cdot)$ becomes $\zeta_g(z; 0, 0) = z^{-1}$.

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_zeta(z, tau); mx = mpm.weierstrass_zeta(z, tau)
>>> gx = gmp.weierstrass_zeta(z, tau)
>>> fx = fpm.weierstrass_zeta(z, tau); ax = apm.weierstrass_zeta(z, tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

31.4.5 Weierstrass Sigma function $\sigma_g(z, g_2, g_3)$

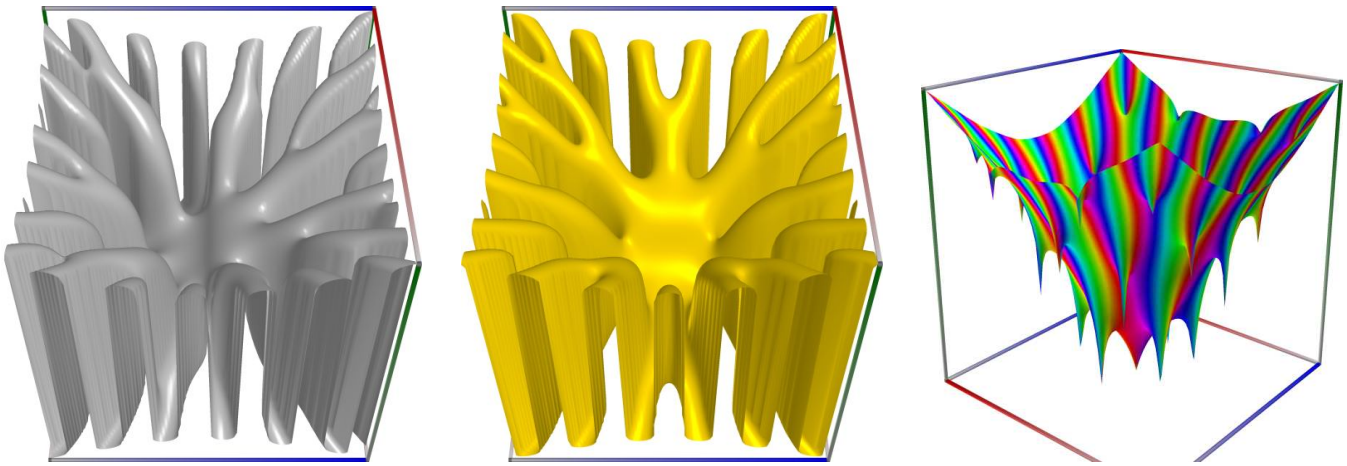
`ctx.weierstrass_sigma_g`(z, *g2*, *g3*)

Computes the Weierstrass sigma function, $\sigma_g(z; g_2, g_3)$. We have $\sigma_g(tz; t^{-4}g_2, t^{-6}g_3) = t\sigma_g(z; g_2, g_3)$.

The function is related to $\zeta(z; g_2, g_3)$ by $\dfrac{d}{dz}\log\sigma(z; g_2, g_3) = \zeta(z; g_2, g_3)$.

See also MathWorld [996], Flint [772].

See also: https://dlmf.nist.gov/23.2



Left figure: real part of the Weierstrass Sigma function $\sigma_g(z, g_2, g_3)$.

Middle figure: imaginary part of the Weierstrass Sigma function $\sigma_g(z, g_2, g_3)$.

Right figure: absolute value of the Weierstrass Sigma function $\sigma_g(z, g_2, g_3)$, with color-coded phase.

For $\Delta = g_2^3 - 27g_3^2 \neq 0$, we first compute the elliptic half periods ω_1, ω_2 from the lattice invariants g_2, g_3 (see *EllipticHalfPeriodsG*), and set $\omega = \omega_1, \tau = \omega_2/\omega_1$. Then $\sigma_g(z; g_2, g_3) = \sigma(z|\omega, \tau)$ (see *WeierstrassSigma*).

For $\Delta = 0, g_2 > 0, g_3 \neq 0$, the function $\sigma_g(\cdot)$ can be expressed in closed form in terms of elementary functions:

$$\text{For } \Delta = 0, g_2 > 0, g_3 < 0: \quad \sigma_g(z; g_2, g_3) = \frac{\sinh(\sqrt{3c}z)}{\sqrt{3c}\cdot e^{cx^2/2}}, \quad \text{where } c = \sqrt{g_2/12}.$$

$$\text{For } \Delta = 0, g_2 > 0, g_3 > 0: \quad \sigma_g(z; g_2, g_3) = \frac{\sin(\sqrt{3c}z)}{\sqrt{3c}\cdot e^{cx^2/2}}, \quad \text{where } c = \sqrt{g_2/12}.$$

If both g_2 and g_3 are zero, the function $\sigma_g(\cdot)$ becomes $\sigma_g(z; 0, 0) = z$.

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_sigma(z, tau); mx = mpm.weierstrass_sigma(z, tau)
>>> gx = gmp.weierstrass_sigma(z, tau)

```

31.5 Weierstrass elliptic functions, in terms of (real) lattice roots e_1, e_2

The Weierstrass functions take real values on the real axis iff the lattice is fixed under complex conjugation, or, equivalently, when $g_2, g_3 \in \mathbb{R}$.

31.5.1 Weierstrass function $\wp_e(x, e_1, e_2)$ (also DAMath)

`ctx.`**`weierstrass_p_e`**(*x*, *e1*, *e2*)

Returns the Weierstrass function $\wp_e(x, e_1, e_2)$ using the lattice roots and the Jacobi functions (where the equation with the smallest $e_k \geq 0$ is used). See also Wikipedia [1357], MathWorld [994], Ehrhardt [297] (3.2.17.2).

$$\wp_e(x, e_1, e_2) = e_3 + \frac{e_1 - e_3}{\mathrm{sn}^2(u,k)} = e_2 + (e_1 - e_3)\frac{\mathrm{dn}^2(u,k)}{\mathrm{sn}^2(u,k)} = e_1 + (e_1 - e_3)\frac{\mathrm{cn}^2(u,k)}{\mathrm{sn}^2(u,k)}, \quad k = \sqrt{\frac{e_2 - e_3}{e_1 - e_3}}, \quad u = x\sqrt{e_1 - e_3}.$$

Returns the the basic lemniscatic case $\wp_l(x) = \wp_g(x, 1, 0) = \wp_e\left(x, \frac{1}{2}, 0\right)$. See also Wikipedia [1357], MathWorld [994], Ehrhardt [297] (3.2.17.1).

Returns the Weierstrass function $\wp_e(iy, e_1, e_2) = -\wp_e(y, -e_1, -e_2)$. See also Wikipedia [1357], MathWorld [994], Ehrhardt [297] (3.2.17.4).

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2),$$

$$g_3 = 4e_1e_2e_3.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Wpe(2.5, 1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.Wpe(2.5, 1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

31.5.2 Weierstrass function $\wp'_e(x, e_1, e_2)$ (also DAMath)

`ctx.`**`weierstrass_pprime_e`**(*x*, *e1*, *e2*)

Returns the derivative of the Weierstrass function $\wp'_e(x, e_1, e_2)$. See also Wikipedia [1357], MathWorld [994], Ehrhardt [297] (3.2.17.3).

$$\wp'_e(x, e_1, e_2) = -2(e_1 - e_3)^{3/2}\frac{\mathrm{cn}(u,k)\mathrm{dn}(u,k)}{\mathrm{sn}^3(u,k)}, \quad k = \sqrt{\frac{e_2 - e_3}{e_1 - e_3}}, \quad u = x\sqrt{e_1 - e_3}.$$

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2),$$

$$g_3 = 4e_1e_2e_3.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.WpeDer(2.5, 1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.WpeDer(2.5, 1.5, '0.51')
ereal('5.351847902755998475 4E-1')
```

31.5.3 Inverse Weierstrass function $\wp_e^{-1}(y, e_1, e_2)$ (also DAMath)

ctx.**weierstrass_p_inv_e**(*y*, *e1*, *e2*)

Returns the functional inverse $\wp_e^{-1}$ of the Weierstrass function for $y \geq e_1$, i.e. the smallest positive x with $\wp_e(x, e_1, e_2) = y$. The result is computed with the symmetric Carlson integral,

$$\wp_e^{-1}(y, e_1, e_2) = \frac{1}{2}\int_y^\infty \frac{\mathrm{d}t}{\sqrt{(t-e_1)(t-e_2)(t-e_3)}} = R_F(y-e_1, y-e_2, y-e_3)$$

See also: MathWorld [990], Ehrhardt [297] (3.2.17.8).

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2),$$

$$g_3 = 4e_1e_2e_3.$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.WpeInv(2.5, 1.5, 0.5)
ereal('5.2359877559829887307E-1')
>>> ereal.WpeInv(2.5, 1.5, '0.51')
ereal('5.3518479027559984754E-1')
```

31.5.4 Weierstrass Zeta function $\zeta_e(z, e_1, e_2)$

ctx.**weierstrass_zeta_e**(*z*, *e_1*, *e_2*)

Computes the Weierstrass zeta function $\zeta_g(z; g_2, g_3)$.

We have $\zeta_g(tz; t^{-4}g_2, t^{-6}g_3) = t^{-1}\zeta_g(z; g_2, g_3)$ and $\zeta_g(iz; g_2, g_3) = -i\zeta_g(z; g_2, -g_3)$.

The function is related to $\wp(z; g_2, g_3)$ by $\dfrac{d\zeta(z; g_2, g_3)}{\mathrm{d}z} = -\wp(z; g_2, g_3)$ and $\zeta(z; g_2, g_3) - z^{-1} = \displaystyle\int_0^z \left(\wp(z; g_2, g_3) - z^{-2}\right)$.

See also MathWorld [997], Flint [772].

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2),$$

$$g_3 = 4e_1e_2e_3.$$

31.5.5 Weierstrass Sigma function $\sigma_e(z, e_1, e_2)$

ctx.**weierstrass_sigma_e**(*z*, *e_1*, *e_2*)

Computes the Weierstrass sigma function, $\sigma_g(z; g_2, g_3)$. We have $\sigma_g(tz; t^{-4}g_2, t^{-6}g_3) = t\sigma_g(z; g_2, g_3)$.

The function is related to $\zeta(z; g_2, g_3)$ by $\dfrac{d}{\mathrm{d}z}\log\sigma(z; g_2, g_3) = \zeta(z; g_2, g_3)$.

See also MathWorld [996], Flint [772].

See also: https://dlmf.nist.gov/23.2

$$g_2 = 2({e_1}^2 + {e_2}^2 + {e_3}^2),$$

$$g_3 = 4e_1e_2e_3 = .$$

31.6 Weierstrass elliptic functions, in terms of lattice half-periods ω_1 and ω_2

31.6.1 Weierstrass function $\wp_\omega(z|\omega_1,\omega_2)$

`ctx.weierstrass_o`(*z*, *omega1*, *omega2*)

Computes Weierstrass's elliptic function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\wp(tz|t\omega,\tau) = t^{-2}\wp(z|\omega,\tau)$.

See also MathWorld [994], Flint [772].

See also: https://dlmf.nist.gov/23.2

$$\wp(z,\tau,\omega=1) = \frac{1}{z^2} + \sum_{n^2+m^2\neq 0}\left[\frac{1}{(z+m+n\tau)^2} - \frac{1}{(m+n\tau)^2}\right]$$

which satisfies $\wp(z,\tau,\omega=1) = \wp(z+1,\tau,\omega=1) = \wp(z+\tau,\tau,\omega=1)$. To evaluate the function efficiently, we use the formula (with with $q = e^{\pi i\tau}$)

$$\wp(z,\tau) = \pi^3\theta_2^2(0,q)\theta_3^2(0,q)\frac{\theta_4^2(\pi z,q)}{\theta_1^2(\pi z,q)} - \frac{\pi^3}{3}\left[\theta_2^4(0,q)+\theta_3^4(0,q)\right].$$

$$\wp(tz|t\omega_1,t\omega_2) = t^{-2}\wp(z|\omega_1,\omega_2)$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_p(z, tau); mx = mpm.weierstrass_p(z, tau)
>>> gx = gmp.weierstrass_p(z, tau)
>>> fx = fpm.weierstrass_p(z, tau); ax = apm.weierstrass_p(z, tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

31.6.2 Weierstrass function, first derivative: $\wp'_\omega(z|\omega_1,\omega_2)$

`ctx.weierstrass_p_prime_o`(*z*, *omega1*, *omega2*)

Computes the first derivative of Weierstrass's elliptic function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\wp'(tz|t\omega,\tau) = t^{-3}\wp'(z|\omega,\tau)$.

The Weierstrass elliptic function satisfies the differential equation $[\wp'(z,\tau)]^2 = 4[\wp(z,\tau)]^3 - g_2\wp(z,\tau) - g_3$.

$$\wp'(z,\tau) = \sqrt{4[\wp(z,\tau)]^3 - g_2\wp(z,\tau) - g_3}.$$

See also MathWorld [995], Flint [772].

See also: https://dlmf.nist.gov/23.2

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm

31.6.3 Inverse Weierstrass function $\wp_\omega^{-1}(z|\omega_1,\omega_2)$

`ctx.`**`weierstrass_p_inv_o`**(*z*, *omega1*, *omega2*)

Computes the inverse of the Weierstrass elliptic function in terms of half-period ω_1 and elliptic period ratio τ. It which satisfies $\wp(\wp^{-1}(z,\tau),\tau) = z$. This function is given by the elliptic integral

$$\wp^{-1}(z,\tau) = \frac{1}{2}\int_z^\infty \frac{\mathrm{d}t}{\sqrt{(t-e_1)(t-e_2)(t-e_3)}} = R_F(z-e_1, z-e_2, z-e_3).$$

See also MathWorld [990], Flint [772].

See also: https://dlmf.nist.gov/23.2

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm

31.6.4 Weierstrass Zeta function $\zeta_\omega(z, \omega_1, \omega_2)$

`ctx.weierstrass_zeta_o`(z, *omega1*, *omega2*)

Computes the Weierstrass zeta function in terms of half-period ω_1 and elliptic period ratio τ.

We have $\zeta(tz|t\omega,\tau) = t^{-1}\zeta(z|\omega,\tau)$.

The function can be defined as

$$\zeta(z|\omega,\tau) = \frac{1}{z} + \sum_{n^2+m^2\neq 0}\left[\frac{1}{z-m-n\tau} + \frac{1}{m+n\tau} + \frac{z}{(m+n\tau)^2}\right]$$

and is quasiperiodic with $\zeta(z+1|\omega,\tau) = \zeta(z|\omega,\tau) + \zeta(1/2|\omega,\tau)$ and $\zeta(z+\tau|\omega,\tau) = \zeta(z|\omega,\tau) + \zeta(\tau/2|\omega,\tau)$.

The function is related to $\wp(z|\omega,\tau)$ by $\dfrac{d\zeta(z|\omega,\tau)}{\mathrm{d}z} = -\wp(z|\omega,\tau)$ and $\zeta(z|\omega,\tau) - z^{-1} = \displaystyle\int_0^z \left(\wp(z|\omega,\tau) - z^{-2}\right)$.

See also MathWorld [997], Flint [772].

See also: https://dlmf.nist.gov/23.2

To evaluate the function efficiently, we use the formula

$$\zeta(z|\omega,\tau) = \frac{\pi z}{3}\frac{\theta_1'''(0,q)}{\theta_1'(0,q)} + \frac{\theta_1'(\pi z,q)}{\theta_1(\pi z,q)}$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_zeta(z, tau); mx = mpm.weierstrass_zeta(z, tau)
>>> gx = gmp.weierstrass_zeta(z, tau)
>>> fx = fpm.weierstrass_zeta(z, tau); ax = apm.weierstrass_zeta(z, tau)
>>> mpm.show([\mathrm{d}x, mx, gx, fx, ax])

```

31.6.5 Weierstrass Sigma function $\sigma_\omega(z|\omega_1,\omega_2)$

`ctx.weierstrass_sigma_o(`z, *omega1*, *omega2*`)`

Computes the Weierstrass sigma function in terms of half-period ω_1 and elliptic period ratio τ. We have $\sigma(tz|t\omega,\tau) = t\sigma(z|\omega,\tau)$.

See also MathWorld [996], Flint [772].

See also: https://dlmf.nist.gov/23.2

The function can be defined as

$$\sigma(z|\omega,\tau) = z \prod_{n^2+m^2\neq 0} \left[\left(1-\frac{z}{m+n\tau}\right)\exp\left(\frac{z}{m+n\tau}+\frac{z^2}{2(m+n\tau)^2}\right)\right]$$

and is quasiperiodic with $\sigma(z+1|\omega,\tau) = -e^{2\zeta(1/2|\omega,\tau)(z+1/2)}\sigma(z|\omega,\tau)$ and $\sigma(z+\tau|\omega,\tau) = -e^{2\zeta(\tau/2|\omega,\tau)(z+\tau/2)}\sigma(z|\omega,\tau)$.

The function is related to $\zeta(z|\omega,\tau)$ by $\frac{d}{dz}\log\sigma(z|\omega,\tau) = \zeta(z|\omega,\tau)$.

See also MathWorld [996], Flint [772].

To evaluate the function efficiently, we use the formula

$$\sigma(z,\tau) = \exp\left(-\frac{(\pi z)^2}{6}\frac{\theta_1''(0,q)}{\theta_1'(0,q)}\right)\times\frac{\theta_1(\pi z,q)}{\theta_1'(\pi z,q)}$$

An example with real input for z and with purely imaginary input for τ, producing real output:

```
>>> from xlcalcnet import dec, mpm, gmp, fpm, apm
>>> mpm.dps = 40; z = '0.1'; tau = '0.0 + 0.9j'
>>> \mathrm{d}x = dec.weierstrass_sigma(z, tau); mx = mpm.weierstrass_sigma(z, tau)
>>> gx = gmp.weierstrass_sigma(z, tau)
>>> fx = fpm.weierstrass_sigma(z, tau); ax = apm.weierstrass_sigma(z, tau)

User library: numerical

CHAPTER

THIRTYTWO

ADDITIONAL CLASSES

General concepts

See also: https://en.wikipedia.org/wiki/Power_of_a_test

See also: https://en.wikipedia.org/wiki/Sample_size_determination

32.1 User defined functions based on multiple precision arithmetic (Python)

32.1.1 Overview

High-level code in xlcalcnet is, as in mpmath, implemented as methods on a "context object". The context implements arithmetic, type conversions and other fundamental operations. The context also holds settings such as precision, and stores cache data. A total of 6 different contexts (with a mostly compatible interface) are provided so that the high-level algorithms can be used with different implementations of the underlying arithmetic, allowing different features and speed-accuracy tradeoffs.

32.1.2 Double-precision arithmetic (`fpmlib`)

Although mpmath is generally designed for arbitrary-precision arithmetic, many of the high-level algorithms work perfectly well with ordinary Python `float` and `complex` numbers, which use hardware double precision (on most systems, this corresponds to 53 bits of precision). Whereas the global functions (which are methods of the `mp` object) always convert inputs to mpmath numbers, the `fp` object instead converts them to `float` or `complex`, and in some cases employs basic functions optimized for double precision. When large amounts of function evaluations (numerical integration, plotting, etc) are required, and when `fp` arithmetic provides sufficient accuracy, this can give a significant speedup over `mp` arithmetic.

32.1.3 Binary floating-point in arbitrary-precision and with arbitrary exponent (`mpmlib`)

The `mp` context is what most users probably want to use most of the time, as it supports the most functions, is most well-tested, and is implemented with a high level of optimization. Nearly all examples in this documentation use `mp` functions.

32.1.4 Interval arithmetic in arbitrary-precision and with arbitrary exponent (`ipmlib`)

The `iv.mpf` type represents a closed interval $[a, b]$; that is, the set $\{x : a \le x \le b\}$, where a and b are arbitrary-precision floating-point values, possibly $\pm\infty$. The `iv.mpc` type represents a rectangular complex interval $[a, b] + [c, d]i$; that is, the set $\{z = x + iy : a \le x \le b \wedge c \le y \le d\}$.

Interval arithmetic provides rigorous error tracking. If f is a mathematical function and $\hat{f}$ is its interval arithmetic version, then the basic guarantee of interval arithmetic is that $f(v) \subseteq \hat{f}(v)$ for any input interval v. Put differently, if an interval represents the known uncertainty for a fixed number, any sequence of interval operations will produce an interval that contains what would be the result of applying the same sequence of operations to the exact number. The principal drawbacks of interval arithmetic are speed (`iv` arithmetic is typically at least two times slower than `mp` arithmetic) and that it sometimes provides far too pessimistic bounds.

32.1.5 Decimal floating-point in arbitrary-precision with limited exponent (`dpmlib`)

Additional contexts are used in xlcalcnet to implement its functions for the mpmath data types, and the Decimal data type, which is part of Python.

Both real numbers (mpf) and complex numbers (mpc) are implemented.

In CPython, the `decimal` module provides support for fast correctly-rounded decimal floating point arithmetic. See https://docs.python.org/3.3/library/decimal.html for a decription of the `Decimal` data type.

32.1.6 Rational numbers (quotients) in arbitrary-precision (`qpmlib`)

The `qpm` data type is mostly useful in the context of linear algebra, where it can provide exact results.

Both real numbers (mpf) and complex numbers (mpc) are implemented.

The internal representation dependes on what else is installed on the system:

If `apm` is available, the `fmpq` data type is used; otherwise, if `gpm` is available, the `mpq` data type is used; otherwise, Python's built in `Fraction` data type is used.

32.1.7 Binary floating-point in arbitrary-precision with limited exponent (gpmlib)

gmpy2 is a C-coded Python extension module that supports multiple-precision arithmetic.

https://gmpy2.readthedocs.io/en/latest/

gmpy2 is the successor to the original gmpy module. The gmpy module only supported the GMP multiple-precision library. gmpy2 adds support for the MPFR (correctly rounded real floating-point arithmetic) and MPC (correctly rounded complex floating-point arithmetic) libraries. gmpy2 also updates the API and naming conventions to be more consistent and support the additional functionality. The following libraries are supported:

32.1.8 Binary balls in arbitrary-precision and with arbitrary exponent (apmlib)

The apm context is what most users probably want to use most of the time, as it supports the most functions, is most well-tested, and is implemented with a high level of optimization.

pythonflint is a C-coded Python extension module that supports multiple-precision arithmetic.

32.2 User defined functions based on fixed precision arithmetic (C#)

Various additional numerical context support C# and Python. It is convenient to divide them into groups to make referencing them per function description more efficient.

The following groups of contexts are available:

Note: this has to mention the userlib functions

32.2.1 Scalar functions with `Double` and `Complex`: `m53lib` and `m53libc`

DAMath library.

Double and Complex fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Double-precision_floating-point_format

32.2.2 Binary floating point, single precision: `slib` and `slibc`

sreal and scplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Single-precision_floating-point_format

32.2.3 Binary floating point, double precision: `dlib` and `dlibc`

dreal and dcplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Double-precision_floating-point_format

32.2.4 Binary floating point, extended precision: `elib` and `elibc`

ereal and ecplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Extended_precision

32.2.5 Binary floating point, quadruple precision: `qlib` and `qlib`

qreal and qcplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Quadruple-precision_floating-point_format

32.2.6 Binary floating point, octuple precision: `olib` and `olibc`

oreal and ocplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Octuple-precision_floating-point_format

32.3 User defined functions based on arbitrary precision arithmetic (C#)

32.3.1 Binary floating point, multiple precision: `mlib`, `mlibc`

Some text

arbitrary precision significand, fixed size exponent

32.3.2 Binary floating point, single precision: `sflib` and `sflibc`

sreal and scplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Single-precision_floating-point_format

32.3.3 Binary floating point, double precision: `dflib` and `dflibc`

dreal and dcplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Double-precision_floating-point_format

32.3.4 Binary floating point, extended precision: `eflib` and `eflibc`

ereal and ecplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Extended_precision

32.3.5 Binary floating point, quadruple precision: `qflib` and `qflibc`

qreal and qcplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Quadruple-precision_floating-point_format

32.3.6 Binary floating point, octuple precision: `oflib` and `oflibc`

oreal and ocplx fully support Boost.Math and Eigen.

https://en.wikipedia.org/wiki/Octuple-precision_floating-point_format

32.3.7 Binary floating point, multiple precision: `mflib`, `mflibc`

Some text

arbitrary precision significand, fixed size exponent

32.3.8 Binary arbitrary precision ball: `aflib` and `aflibc`

Some text

arbitrary precision significand and exponent

https://flib.org/

Note: Exponent soft maximum and minimum

32.4 Scalar functions

32.4.1 Real and complex sine

`ctxlib.`**`sin`**(x)

where `ctx` is `ctx_pm` (see *Python contexts* for details), `ctx53`, `ctxcpp`, `ctxflint` (see *.NET contexts* for details). The corresponding `ctx` python lists are `ctxlistreal` and `ctxlistcplx`.

Returns the sine of x, $\sin(x)$. See also Wikipedia [1246], MathWorld [876], NIST [493], Ehrhardt [297] (4.2.55), Flint [748], Flint [738], Mpmath [559].

32.4.2 Quadratic equation

`ctx.eval_quadratic`(x, A, B, C)

Returns the value of a quadratic polynomial, $Ax^2 + Bx + C$.

`ctx.quadratic_equation`(A, B, C)

Returns the roots x_1, x_2 of the quadratic equation $Ax^2 + Bx + C = 0$. See also Wikipedia [1099], Press *et al.* [475].

See also: https://dlmf.nist.gov/1.11#iii

$$x_1 = \frac{Q}{A}, \quad x_2 = \frac{C}{Q}, \quad \text{where } Q = -\frac{1}{2}\left(B + \sqrt{B^2 - 4AC)}\right)$$

The sign of the square root is chosen so as to make $\Re(B^* \sqrt{B^2 - 4AC}) \geq 0$, where the asterisk denotes complex conjugation.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> \mathrm{d}x = dec.nthroot(x, n); mx = mpm.nthroot(x, n); ix = ipm.nthroot(x, n)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  5.0000000000000000000000000000000000000000E+0
mpm:  5.0000000000000000000000000000000000000000e+0
ipm:  5.0000000000000000000000000000000000000000e+0 (2.755e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> fx = fpm.nthroot(x, n); gx = gmp.nthroot(x, n); ax = apm.nthroot(x, n)
>>> mpm.show([fx, gx, ax])
fpm:  5.00000000000000E+00
gmp:  5.0000000000000000000000000000000000000000E+00
apm:  5.0000000000000000000000000000000000000002e+0 (3.673e-39%)
```

32.4.3 Monic cubic equation

`ctx.eval_monic_cubic`(x, a, b, c)

Returns the value of a monic cubic polynomial, $x^3 + ax^2 + bx + c$.

`ctx.cubic_equation_monic`(a, b, c)

Returns the roots x_1, x_2, x_3 of the monic cubic equation $x^3 + ax^2 + bx + c = 0$. See also Wikipedia [1090], Press *et al.* [475].

See also: https://dlmf.nist.gov/1.11#iii

$$Q = \frac{a^2 - 3b}{9}, \quad R = \frac{2a^3 - 9ab + 27c}{54}.$$

If Q and R are real *and* $R^2 < Q^3$, then the cubic equation has three real roots, with $\theta = \arccos\left(RQ^{-3/2}\right)$:

$$x_1 = -2\sqrt{Q}\cos\left(\frac{\theta}{3}\right) - \frac{a}{3}, \quad x_2 = -2\sqrt{Q}\cos\left(\frac{\theta + 2\pi}{3}\right) - \frac{a}{3}, \quad x_3 = -2\sqrt{Q}\cos\left(\frac{\theta - 2\pi}{3}\right) - \frac{a}{3}.$$

Otherwise, $A = -\left(R + \sqrt{R^2 - Q^3})\right)^{1/3}$, where the sign of the square root is chosen so as to make $\Re(R^*\sqrt{R^2 - Q^3}) \geq 0$, and the asterisk denotes complex conjugation. Define $B = 0$ if $A = 0$ and $B = Q/A$ if $A \neq 0$. Then the three roots are given by

$$x_1 = (A + B) - \frac{a}{3}, \quad x_2 = -\frac{1}{2}(A + B) - \frac{a}{3} + i\frac{\sqrt{3}}{2}(A - B), \quad x_3 = -\frac{1}{2}(A + B) - \frac{a}{3} - i\frac{\sqrt{3}}{2}(A - B).$$

Note that x_1 is real if a, b, c are real.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> \mathrm{d}x = dec.nthroot(x, n); mx = mpm.nthroot(x, n); ix = ipm.nthroot(x, n)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  5.0000000000000000000000000000000000000000E+0
mpm:  5.0000000000000000000000000000000000000000e+0
ipm:  5.0000000000000000000000000000000000000000e+0 (2.755e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> fx = fpm.nthroot(x, n); gx = gmp.nthroot(x, n); ax = apm.nthroot(x, n)
>>> mpm.show([fx, gx, ax])
fpm:  5.00000000000000E+00
gmp:  5.0000000000000000000000000000000000000000E+00
apm:  5.0000000000000000000000000000000000000002e+0 (3.673e-39%)
```

32.4.4 Cubic equation

`ctx.eval_cubic`(x, A, B, C, D)

Returns the value of a cubic polynomial, $Ax^3 + Bx^2 + Cx + D$.

`ctx.cubic_equation`(A, B, C, D)

Returns the roots x_1, x_2, x_3 of the cubic equation $Ax^3 + Bx^2 + Cx + D = 0$. See also Wikipedia [1090], Press *et al.* [475].

See also: https://dlmf.nist.gov/1.11#iii

This just calls *CubicEquationMonicRoots(z, a, b, c)* with $a = B/A, b = C/A, c = D/A$.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> \mathrm{d}x = dec.nthroot(x, n); mx = mpm.nthroot(x, n); ix = ipm.nthroot(x, n)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  5.000000000000000000000000000000000000000E+0
mpm:  5.000000000000000000000000000000000000000e+0
ipm:  5.000000000000000000000000000000000000000e+0 (2.755e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> fx = fpm.nthroot(x, n); gx = gmp.nthroot(x, n); ax = apm.nthroot(x, n)
>>> mpm.show([fx, gx, ax])
fpm:  5.00000000000000E+00

```

32.4.5 Quartic equation

`ctx.eval_quartic`(x, A, B, C, D, E)

Returns the value of a quartic polynomial, $Ax^4 + Bx^3 + Cx^2 + Dx + E$.

`ctx.quartic_equation`(A, B, C, D, E)

Returns the roots x_1, x_2, x_3, x_4 of the quartic equation $Ax^4 + Bx^3 + Cx^2 + Dx + E = 0$. See also Wikipedia [1100].

See also: https://dlmf.nist.gov/1.11#iii

Define $a = \frac{-3B^2}{8A^2} + \frac{C}{A}$, $b = \frac{B^3}{8A^3} - \frac{BC}{2A^2} + \frac{D}{A}$, $c = \frac{-3B^4}{256A^4} + \frac{CB^2}{16A^3} - \frac{BD}{4A^2} + \frac{E}{A}$, $V = \frac{B}{4A}$.

If $b = 0$ then

$x_1 = V + Z_1$, $x_2 = V - Z_1$, $x_3 = V + Z_2$, $x_4 = V - Z_2$,

where $W = \sqrt{a^2 - 4c}$, $Z_1 = \sqrt{\frac{1}{2}(-a + W)}$, $Z_2 = \sqrt{\frac{1}{2}(-a - W)}$.

If $b \neq 0$ then

$x_1 = V + \frac{1}{2}(W + Z_1)$, $x_2 = V + \frac{1}{2}(W - Z_1)$, $x_3 = V - \frac{1}{2}(W + Z_2)$, $x_4 = V - \frac{1}{2}(W - Z_2)$,

where $W = \sqrt{a + 2y}$, $Z_1 = \sqrt{-3a - 2y - \frac{2b}{W}}$, $Z_2 = \sqrt{-3a - 2y + \frac{2b}{W}}$,

and y is any root of the monic cubic equation $y^3 + ey^2 + fy + g = 0$, with $e = \frac{5a}{2}$, $f = 2a^2 - c$, $g = \frac{a^3}{2} - \frac{ac}{2} - \frac{b^2}{8}$;

y is calculated as the first root returned by *CubicEquationMonicRoots(y, e, f, g)*.

An example with real input:

```
>>> from xlcalcnet import dec, mpm, ipm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> \mathrm{d}x = dec.nthroot(x, n); mx = mpm.nthroot(x, n); ix = ipm.nthroot(x, n)
>>> mpm.show([\mathrm{d}x, mx, ix])
dec:  5.000000000000000000000000000000000000000E+0
mpm:  5.000000000000000000000000000000000000000e+0
ipm:  5.000000000000000000000000000000000000000e+0 (2.755e-39%)

>>> from xlcalcnet import mpm, fpm, gmp, apm
>>> mpm.dps = 40; x = '125'; n = '3'
>>> fx = fpm.nthroot(x, n); gx = gmp.nthroot(x, n); ax = apm.nthroot(x, n)
>>> mpm.show([fx, gx, ax])
fpm:  5.00000000000000E+00
gmp:  5.000000000000000000000000000000000000000E+00
apm:  5.000000000000000000000000000000000000002e+0 (3.673e-39%)
```

CHAPTER

THIRTYTHREE

DISTRIBUTION FUNCTIONS

Text explaining this chapter

33.1 Distributions related to multiple comparisons of means

33.1.1 Normal maximum distribution, $\rho_{ij,i\neq j} = \rho$: pdf, cdf, qtf, boost class

`math53lib.`**`NmaxRhoPdf`**(*x*, *rho*, *k*)

`math53lib.`**`NmaxRhoCdf`**(*x*, *rho*, *k*)

`math53lib.`**`NmaxRhoQtf`**(*q*, *rho*, *k*)

`math53lib.`**`NmaxRhoDist`**(*rho*, *k*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following the distribution of the maximum of $k \geq 2$ correlated standard normal variates, with common correlation $-1/(k-1) \leq \rho \leq 1$ and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$.

See also Dunnett [292], Bechhofer and Dunnett [26], Grubbs [354], Bechhofer and Dunnett [26], Stoline and Ury [508], and Hahn and Hendrickson [361].

$$\text{pdf}(x) = f_{\text{nmaxrho}}(x, \rho, k) = \frac{k}{b} \int_{-\infty}^{\infty} (\Phi(z_1))^{k-1} \, \phi(z_1) \, \phi(y) \, dy,$$

$$\text{cdf}(x) = F_{\text{nmaxrho}}(x, \rho, k) = \int_{-\infty}^{\infty} (\Phi(z_1))^{k} \, \phi(y) dy,$$

$$\text{sf}(x) = 1 - \int_{-\infty}^{\infty} (\Phi(z_1))^{k} \, \phi(y) dy,$$

where $z_1 = \dfrac{x+a}{b}$, $a = y\sqrt{\rho}$, and $b = \sqrt{1-\rho}$. Note that while z_1 is a complex number for $\rho < 0$, the integral always evaluates to a real number. In the context of the Dunnett t-test with reference sample size n_0 and common comparator sample size n_i, $\rho = \dfrac{1}{1+n_0/n_i}$. In the context of maximum deviation from the common mean (equal sample sizes), $\rho = -\dfrac{1}{k-1}$.

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoPdf(x, rho, k)
ereal('5.2359877559829887307E-1')
```

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoPdf(x, rho, k)
ereal('5.2359877559829887307E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoCdf(x, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoCdf(x, rho, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoQtf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoQtf(q, rho, k)
ereal('5.3518479027559984754E-1')
```

33.1.2 Normal maximum modulus distribution, $\rho_{ij,i\neq j} = \rho$: pdf, cdf, qtf, boost class

`math53lib.NmmRhoPdf`(*x*, *rho*, *k*)

`math53lib.NmmRhoCdf`(*x*, *rho*, *k*)

`math53lib.NmmRhoQtf`(*q*, *rho*, *k*)

`math53lib.NmmRhoDist`(*rho*, *k*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following the distribution of the maximum of the absolute value of $k \geq 2$ correlated standard normal variates, with common correlation $-1/(k-1) \leq \rho \leq 1$ and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$.

See also Dunnett [292], Bechhofer and Dunnett [26], Grubbs [354], Bechhofer and Dunnett [26], Stoline and Ury [508], and Hahn and Hendrickson [361].

$$\text{pdf}(x) = \frac{k}{b} \int_{-\infty}^{\infty} \left(\Phi(z_1) - \Phi(z_2)\right)^{k-1} \left(\phi(z_1) + \phi(z_1)\right) \phi(y)\, dy,$$

$$\text{cdf}(x) = F_{\text{nmaxrho}}(x, \rho, k) = \int_{-\infty}^{\infty} \left(\Phi(z_1) - \Phi(z_2)\right)^{k} \phi(y) dy,$$

$$\text{sf}(x) = 1 - \int_{-\infty}^{\infty} \left(\Phi(z_1) - \Phi(z_2)\right)^{k} \phi(y) dy,$$

where $z_1 = \dfrac{x+a}{b}$, $z_2 = \dfrac{-x+a}{b}$, $a = y\sqrt{\rho}$, and $b = \sqrt{1-\rho}$. Note that while z_1 and z_2 are complex numbers for $\rho < 0$, the integral always evaluates to a real number. In the context of the Dunnett t-test with reference sample size n_0 and common comparator sample size n_i, $\rho = \dfrac{1}{1 + n_0/n_i}$. In the context of maximum deviation from the common mean (equal sample sizes), $\rho = -\dfrac{1}{k-1}$.

There is no known explicit expression for qtf(q) or isf(q): These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NmmRhoPdf(x, rho, k)
ereal('5.2359877559829887307E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.NmmRhoPdf(x, rho, k)
ereal('5.2359877559829887307E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmmRhoCdf(x, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoCdf(x, rho, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmmRhoQtf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoQtf(q, rho, k)
ereal('5.3518479027559984754E-1')
```

33.1.3 Normal maximum distribution, $\rho_{ij,i\neq j} = \lambda_i\lambda_j$: pdf, cdf, qtf, boost class

`math53lib.`**`NmaxRhoijPdf`**(*x*, *lambda_i*, *k*)

`math53lib.`**`NmaxRhoijCdf`**(*x*, *lambda_i*, *k*)

`math53lib.`**`NmaxRhoijQtf`**(*q*, *lambda_i*, *k*)

`math53lib.`**`NmaxRhoijDist`**(*lambda_i*, *k*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following the distribution of the maximum deviate of $k \geq 2$ correlated standard normal variates, with common correlation $0 \leq \rho \leq 1$ and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$. See also Dunnett [292], Bechhofer and Dunnett [26], Grubbs [354], Bechhofer and Dunnett [26], Stoline and Ury [508], and Hahn and Hendrickson [361].

$$\text{pdf}(x) = f_{\text{nmaxrhoij}}(x, \rho, k) = \frac{k}{b}\int_{-\infty}^{\infty} (\Phi(z_1))^{k-1}\,\phi(z_1)\,\phi(y)\,dy, \quad \text{where}$$

$$z_1 = \frac{x+a}{b}, \quad a = y\sqrt{|\rho|}, \quad b = \sqrt{1-\rho}, \rho = -\frac{1}{k-1}.$$

$$\text{cdf}(x) = F_{\text{nmaxrhoij}}(x, \rho, k) = \int_{-\infty}^{\infty}\left[\Phi\left(\frac{x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right)\right]^n \phi(y)dy, \rho = -\frac{1}{k-1}.$$

$$\text{sf}(x) = 1 - \int_{-\infty}^{\infty}\left[\Phi\left(\frac{x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right)\right]^n \phi(y)dy, \rho = -\frac{1}{k-1}.$$

For $\lambda_i = \sqrt{\rho} \geq 0$ for all i, this reduces to the equicorrelated case.

With $\rho_{ij} = \lambda_i\lambda_j$, we have for a one-sided test:

$$F_n(h; \rho_{ij}) = \int_{-\infty}^{\infty}\prod_{i=1}^{n}\left[\Phi\left(\frac{(a_i-\mu_i)/\sigma_i + \lambda_i z}{\sqrt{1-\lambda_i^2}}\right)\right]\phi(y)dz$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoijPdf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoijPdf(q, rho, k)
ereal('5.3518479027559984754E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoijPdf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoijPdf(q, rho, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoijCdf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoijCdf(q, rho, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmaxRhoijQtf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmaxRhoijQtf(q, rho, k)
ereal('5.3518479027559984754E-1')
```

33.1.4 Normal maximum modulus distribution, $\rho_{ij,i\neq j} = \lambda_i\lambda_j$: pdf, cdf, qtf, boost class

`math53lib.NmmRhoijPdf`(*x*, *rho*, *k*)

`math53lib.NmmRhoijCdf`(*x*, *rho*, *k*, *cdf=True*)

`math53lib.NmmRhoijQtf`(*q*, *rho*, *k*, *qtf=True*)

`math53lib.NmmRhoijDist`(*q*, *rho*, *k*, *qtf=True*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following the distribution of the maximum of $k \geq 2$ correlated standard normal variates, with correlation $\rho_{ij,i\neq j} = \lambda_i\lambda_j$ and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$.

See also Dunnett [292], Bechhofer and Dunnett [26], Grubbs [354], Bechhofer and Dunnett [26], Stoline and Ury [508], and Hahn and Hendrickson [361].

$$\text{pdf}(x) = \frac{k}{b}\int_{-\infty}^{\infty} \left(\Phi(z_1) - \Phi(z_2)\right)^{k-1} \left(\phi(z_1) + \phi(z_1)\right) \phi(y)\, dy, \quad \text{where}$$

$$z_1 = \frac{x+a}{b}, z_2 = \frac{-x+a}{b}, \quad a = y\sqrt{|\rho|}, \quad b = \sqrt{1-\rho}, \rho = -\frac{1}{k-1}.$$

$$\text{cdf}(x) = \int_{-\infty}^{\infty} \left[\Phi\left(\frac{x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right) - \Phi\left(\frac{-x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right)\right]^k \phi(y)dy, \rho = -\frac{1}{k-1}.$$

$$\text{sf}(x) = 1 - \int_{-\infty}^{\infty} \left[\Phi\left(\frac{x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right) - \Phi\left(\frac{-x+\sqrt{|\rho|}y}{\sqrt{1-\rho}}\right)\right]^k \phi(y)dy, \rho = -\frac{1}{k-1}.$$

For $\lambda_i = \sqrt{\rho} \geq 0$ for all i, this reduces to the equicorrelated case.

With $\rho_{ij} = \lambda_i\lambda_j$, we have for a two-sided test:

$$F_n(h;\rho_{ij}) = \int_{-\infty}^{\infty} \prod_{i=1}^{n} \left[\Phi\left(\frac{(a_i-\mu_i)/\sigma_i + \lambda_i z}{\sqrt{1-\lambda_i^2}}\right) - \Phi\left(\frac{(b_i-\mu_i)/\sigma_i + \lambda_i z}{\sqrt{1-\lambda_i^2}}\right)\right] \phi(y)dz$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NmmRhoijPdf(x, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoijPdf(x, rho, k)
ereal('5.3518479027559984754E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.NmmRhoijPdf(x, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoijPdf(x, rho, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.NmmRhoijCdf(x, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoijCdf(x, rho, k)
ereal('5.3518479027559984754E-1')
```

(continues on next page)

(continued from previous page)

```
>>> from xlcalcnet import ereal
>>> ereal.NmmRhoijQtf(q, rho, k)
ereal('5.2359877559829887307E-1')
>>> ereal.NmmRhoijQtf(q, rho, k)
ereal('5.3518479027559984754E-1')
```

33.1.5 Normal range distribution: pdf, cdf, qtf, boost class

`math53lib.`**`NrangePdf`**(x, k)

`math53lib.`**`NrangeCdf`**(n, x)

`math53lib.`**`NrangeQtf`**(q, k)

`math53lib.`**`NrangeDist`**(k)

Returns the pdf, cdf, qtf or boost class of a random variable X, following a normal range distribution, with $k \geq 2$ groups, and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$. See also Wikipedia [1220], Harter [364], Team [536].

The density in the central case is given by

$$\text{pdf}(x) = k(k-1) \int_{-\infty}^{\infty} (\Phi(y) - \Phi(y-x))^{k-2} \phi(y)\phi(y-x)dy$$

We have

$$\text{cdf}(x) = k \int_{-\infty}^{\infty} \phi(y) \left(\Phi(y) - \Phi(y-x)\right)^{k-1} dy$$

$$\text{sf}(x) = 1 - k \int_{-\infty}^{\infty} \phi(y) \left(\Phi(y) - \Phi(y-x)\right)^{k-1} dy$$

In the noncentral case, this becomes

$$\text{cdf}(x) = F_s r\left(m, n, x\right) = \sum_{i=1}^{k} \int_{-\infty}^{\infty} \phi(y_i - \mu_i) \left(\prod_{i=1, j \neq i}^{k} (\Phi(y_i - \mu_i) - \Phi(y_i - \mu_i - x) \right) dy_i.$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NrangePdf(x, k)
ereal('5.235987755982988730 7E-1')
>>> ereal.NrangePdfxq, k)
ereal('5.351847902755998475 4E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.NrangePdf(x, k)
ereal('5.235987755982988730 7E-1')
>>> ereal.NrangePdfxq, k)
ereal('5.351847902755998475 4E-1')

>>> from xlcalcnet import ereal
>>> ereal.NrangeCdf(x, k)
ereal('5.235987755982988730 7E-1')
>>> ereal.NrangePdf(x, k)
ereal('5.351847902755998475 4E-1')

>>> from xlcalcnet import ereal
>>> ereal.NrangeQtf(q, k)
ereal('5.235987755982988730 7E-1')
>>> ereal.NrangeQtf(q, k)
ereal('5.351847902755998475 4E-1')
```

33.1.6 Studentized maximum distribution: pdf, cdf, qtf, boost class

`math53lib.SmaxPdf`(*x*, *k*, *nu*)

`math53lib.SmaxCdf`(*x*, *k*, *nu*)

`math53lib.SmaxQtf`(*q*, *k*, *nu*)

`math53lib.SmaxDist`(*k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following a studentized maximum distribution with $k \geq 1$ groups, ν error degrees of freedom, and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$. See also Stoline and Ury [508], Hochberg and Tamhane [373], Narula [423].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nnax}}(sx, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmax}}(\cdot, k)$ is the pdf of the normal maximum with k groups, and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmax}}(sx, k) \cdot \sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nnax}}(\cdot, k)$ is the cdf of the normal maximum with k groups, and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.SmaxPdf(x, k)
ereal('5.2359877559829887307E-1')
>>> ereal.SmaxPdf(x, k)
ereal('5.3518479027559984754E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.SmaxPdf(x, k)
ereal('5.2359877559829887307E-1')
>>> ereal.SmaxPdf(x, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.SmaxCdf(x, k)
ereal('5.2359877559829887307E-1')
>>> ereal.SmaxCdf(x, k)
ereal('5.3518479027559984754E-1')

>>> from xlcalcnet import ereal
>>> ereal.SmaxQtf(q, k)
ereal('5.2359877559829887307E-1')
>>> ereal.SmaxQtf(q, k)
ereal('5.3518479027559984754E-1')
```

33.1.7 Studentized maximum modulus distribution: pdf, cdf, qtf, boost class

`math53lib.SmmPdf`(*x*, *k*, *nu*)

`math53lib.SmmCdf`(*x*, *k*, *nu*)

`math53lib.SmmQtf`(*q*, *k*, *nu*)

`math53lib.SmmDist`(*k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, of a random variable X, following a studentized maximum modulus distribution with $k \geq 1$ groups, ν error degrees of freedom, and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$. See also Stoline and Ury [508], Hochberg and Tamhane [373], Narula [423].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nmm}}(sx, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmm}}(\cdot, k)$ is the pdf of the normal maximum modulus with k groups, and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmm}}(sx, k) \cdot \sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nmm}}(\cdot, k)$ is the cdf of the normal maximum modulus with k groups, and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

```

33.1.8 Dunnett t-distribution, 1-sided: pdf, cdf, qtf, boost class

`math53lib.`**`Dunnett1Pdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett1Cdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett1Qtf`**(*q*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett1Dist`**(*rho*, *k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, of a random variable X, following a 1-sided Dunnett t-distribution with common correlation ρ, $k \geq 2$ groups (including control group), error degrees of freedom ν, and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$. See also Dunnett [292], Bechhofer and Dunnett [26].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nmaxrho}}(sx, \rho, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmaxrho}}(\cdot, \rho, k)$ is the pdf of the normal maximum (equicorrelated case) with common correlation ρ and k groups (see *nmax_rho_pdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmaxrho}}(sx, \rho, k) \cdot \sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nmaxrho}}(\cdot, \rho, k)$ is the cdf of the normal maximum (equicorrelated case) with common correlation ρ and k groups (see *nmax_rho_cdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Dunnett1Pdf(x, rho, k, nu)
ereal('5.2359877559829887307E-1')
>>> ereal.Dunnett1Pdf(x, rho, k, nu)
ereal('5.3518479027559984754E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.Dunnett1Pdf(x, rho, k, nu)
ereal('5.2359877559829887307E-1')

ereal('5.3518479027559984754E-1')
```

33.1.9 Dunnett t-distribution, 2-sided: pdf, cdf, qtf, boost class

`math53lib.`**`Dunnett2Pdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett2Cdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett2Qtf`**(*q*, *rho*, *k*, *nu*)

`math53lib.`**`Dunnett2Dist`**(*rho*, *k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following a 2-sided Dunnett t-distribution with common correlation ρ, $k \geq 2$ groups (including control group), error degrees of freedom ν, and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$. See also Dunnett [292], Bechhofer and Dunnett [26].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nmmrho}}(sx, \rho, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmmrho}}(\cdot, \rho, k)$ is the pdf of the normal maximum modulus (equicorrelated case) with common correlation ρ and k groups (see *nmm_rho_pdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmmrho}}(sx, \rho, k)\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nmmrho}}(\cdot, \rho, k)$ is the cdf of the normal maximum modulus (equicorrelated case) with common correlation ρ and k groups (see *nmm_rho_cdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.Dunnett2Pdf(x, rho, k, nu)
ereal('5.235987755982988730 7E-1')

ereal('5.351847902755998475 4E-1')
```

33.1.10 Nair t-distribution: pdf, cdf, qtf, boost class

math53lib.**NairPdf**(*x*, *rho*, *k*, *nu*)

math53lib.**NairCdf**(*x*, *rho*, *k*, *nu*)

math53lib.**NairQtf**(*q*, *rho*, *k*, *nu*)

math53lib.**NairDist**(*rho*, *k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, of a random variable X, following the Nair t-distribution with common correlation ρ, $k \geq 2$ groups (including control group), error degrees of freedom ν, and the support interval $(-\infty, +\infty)$, and $0 \leq q \leq 1$. See also Dunnett [292], Bechhofer and Dunnett [26].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nmaxrho}}(sx, \rho, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmaxrho}}(\cdot, \rho, k)$ is the pdf of the normal maximum (equicorrelated case) with common correlation ρ and k groups (see *nmax_rho_pdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmaxrho}}(sx, \rho, k) \cdot \sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nmaxrho}}(\cdot, \rho, k)$ is the cdf of the normal maximum (equicorrelated case) with common correlation ρ and k groups (see *nmax_rho_cdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.NairPdf(x, rho, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.NairPdf(x, rho, k, nu)
ereal('5.351847902755998475 4E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.NairPdf(x, rho, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.NairPdf(x, rho, k, nu)
ereal('5.351847902755998475 4E-1')

ereal('5.235987755982988730 7E-1')
>>> ereal.NairCdf(x, rho, k, nu)
ereal('5.351847902755998475 4E-1')

>>> from xlcalcnet import ereal
>>> ereal.NairQtf(q, rho, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.NairQtf(q, rho, k, nu)
ereal('5.351847902755998475 4E-1')
```

33.1.11 Halperin t-distribution: pdf, cdf, qtf, boost class

`math53lib.`**`HalperinPdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`HalperinCdf`**(*x*, *rho*, *k*, *nu*)

`math53lib.`**`HalperinQtf`**(*q*, *rho*, *k*, *nu*)

`math53lib.`**`HalperinDist`**(*rho*, *k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following a Halperin t-distribution with common correlation ρ, $k \geq 2$ groups (including control group), error degrees of freedom ν, and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$. See also Dunnett [292], Bechhofer and Dunnett [26].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nmmrho}}(sx, \rho, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nmmrho}}(\cdot, \rho, k)$ is the pdf of the normal maximum modulus (equicorrelated case) with common correlation ρ and k groups (see *nmm_rho_pdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nmmrho}}(sx, \rho, k)\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nmmrho}}(\cdot, \rho, k)$ is the cdf of the normal maximum modulus (equicorrelated case) with common correlation ρ and k groups (see *nmm_rho_cdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.HalperinPdf(x, rho, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.HalperinPdf(x, rho, k, nu)
ereal('5.351847902755998475 4E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.HalperinPdf(x, rho, k, nu)
ereal('5.235987755982988730 7E-1')

ereal('5.351847902755998475 4E-1')
```

33.1.12 Studentized range distribution: pdf, cdf, qtf, boost class

`math53lib.StdrangePdf`(*x*, *k*, *nu*)

`math53lib.StdrangeCdf`(*x*, *k*, *nu*)

`math53lib.StdrangeQtf`(*q*, *k*, *nu*)

`math53lib.StdrangeDist`(*k*, *nu*)

Returns the pdf, cdf, qtf or boost class of a random variable X, following a studentized range distribution, with $k \geq 2$ groups, ν error degrees of freedom, and the support interval $(0, +\infty)$, and $0 \leq q \leq 1$. See also Wikipedia [1220], Harter [364], Team [536].

$$\text{pdf}(x) = \int_0^\infty f_{\text{nrange}}(sx, k) \cdot s\sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $f_{\text{nrange}}(\cdot, k)$ is the pdf of the normal range with k groups (see *nrange_pdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{cdf}(x) = \int_0^\infty F_{\text{nrange}}(sx, k) \cdot \sqrt{\nu} \cdot f_\chi\left(s\sqrt{\nu}, \nu\right)\ ds$$

where $F_{\text{nrange}}(\cdot, k)$ is the cdf of the normal range with k groups (see *nrange_cdf()*), and $f_\chi(\cdot, \nu)$ is the pdf of the χ-distribution with ν degrees of freedom.

$$\text{sf}(x) = 1 - \text{cdf}(x)$$

There is no known explicit expression for $\text{qtf}(q)$ or $\text{isf}(q)$: These functions are computed with Newton iterations where the starting values are from the corresponding Boost functions (in double precision).

An example in Python

```
>>> from xlcalcnet import ereal
>>> ereal.StdrangePdf(x, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.StdrangePdf(x, k, nu)
ereal('5.351847902755998475 4E-1')
```

```
>>> from xlcalcnet import ereal
>>> ereal.StdrangePdf(x, k, nu)
ereal('5.235987755982988730 7E-1')
>>> ereal.StdrangePdf(x, k, nu)

ereal('5.351847902755998475 4E-1')
```

33.2 Discrete (lattice) distribution functions related to (stratified) rank tests

33.2.1 Kendall S (or tau) distribution (under H_0), pmf vector

`math53lib.KendallTauPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Kendall S (or tau) distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix. See also Wikipedia [1184], Noether [425], vandeWiel [791].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Kendall tau distribution.

The null distribution can be calculated as follows: Let $p_N(t) = \Pr[T_N = t]$. Then the following recurrence relation holds:

$$p_N(t) = p_N(t-1) + [p_{N-1}(t) - p_{N-1}(t-N)]/N,$$

where $p_N(t) = 0$ for $t < 0$ or $t > N(N-1)/2$, and $p_N(0) = 1/N!$.

33.2.2 Mann-Whitney U distribution (under H_0), pmf vector

`math53lib.MannWhitneyUPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Mann-Whitney U distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1187], Murakami and Kamakura [420], Robillard [483], [vandeWiel2000` and Zimmermann [1504].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Mann-Whitney U distribution. The null distribution of the MW test can be calculated as follows: Let $p_{n,m}(u)$ denote the probability that $U = u$ in samples of size n and m. Then (see Zimmermann [1504])

$$(m+n)p_{n,m}(u) = np_{n-1,m}(u-m) + mp_{n,m-1}(u) = np_{n-1,m}(u) + mp_{n,m-1}(u-n)$$

33.2.3 Jonckheere-Terpsta S distribution (under H_0), pmf vector

`math53lib.JTerpstaSPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Jonckheere-Terpsta S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], Murakami and Kamakura [420], Robillard [483], [vandeWiel2000` and Skillings [502].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t-x)$$

where the sum is over all x with positive $p(\cdot)$.

33.2.4 Spearman ρ distribution (under H_0), pmf vector

`math53lib.SpearmanRhoPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Page L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], [vandeWiel2000` and Skillings [502] .

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

33.2.5 Sign test distribution (under H_0), pmf vector

`math53lib.SigntestPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Sign test distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1197], [vandeWiel2000`, Bennett [29] and Zimmermann [1503].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Wilcoxon signed rank T distribution. The null distribution can be calculated as follows: Let $p_N(w)$ denote the probability $\Pr[W_N = w]$ in a sample of size N. Then the following recurrence relation holds (see Zimmermann [1503]) :

$$p_N(w) = \tfrac{1}{2} \left(p_{N-1}(w) + p_{N-1}(w - N) \right).$$

33.2.6 Wilcoxon T distribution (under H_0), pmf vector

`math53lib.WilcoxonPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Wilcoxon distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1197], Fellingham and Stoker [300], [vandeWiel2000`, Bennett [29] and Zimmermann [1503].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Wilcoxon signed rank T distribution. The null distribution can be calculated as follows: Let $p_N(w)$ denote the probability $\Pr[W_N = w]$ in a sample of size N. Then the following recurrence relation holds (see Zimmermann [1503]) :

$$p_N(w) = \tfrac{1}{2} \left(p_{N-1}(w) + p_{N-1}(w - N) \right).$$

33.2.7 Page L distribution (under H_0), pmf vector

`math53lib.PageLPmfVector(x, n, lambda)`

Returns the vector of all pmf values of the Page L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], [vandeWiel2000` and Skillings [502].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$:

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

33.2.8 Quade L distribution (under H_0), pmf vector

`math53lib.QuadeLPmfVector(`*x*, *n*, *lambda*`)`

Returns the vector of all pmf values of the Quade L distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], [vandeWiel2000` and Skillings [502].

Returns pmf(x), the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$:

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

33.3 Discrete (non-lattice) distribution functions related to rank tests

33.3.1 Cochran S distribution (under H_0), pmf vector

math53lib.**cochran_s_pmf_vector**(*x*, *n*, *lambda*)

Returns the vector of all pmf values of the Cochran S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

33.3.2 Friedman S distribution (under H_0), pmf vector

math53lib.**friedman_s_pmf_vector**(*x*, *n*, *lambda*)

Returns the vector of all pmf values of the Friedman S distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also: https://www.statsdirect.com/help/nonparametric_methods/friedman.htm

See also Wikipedia [1183], vandeWiel [791] and Skillings [502].

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

33.3.3 Quade S distribution (under H_0), pmf vector

math53lib.**quade_s_pmf_vector**(*x*, *n*, *lambda*)

Returns the vector of all pmf values of the Quade S distribution distribution under H_0. The vector is returned as a nested list of Decimals or as a mp.matrix or as a iv.matrix.

See also Wikipedia [1183], vandeWiel [791], and Skillings [502] .

Returns $\text{pmf}_X(x)$, the probability mass function (pmf) of a random variable X, following a Jonckheere-Terpsta S distribution. Let $p(n_1, \ldots, n_k; t) = \Pr[J_N = t]$. If J_N is based on k independent samples of sizes $n_1, \ldots, n_k$, then (Skillings 1980):

$$p(n_1, \ldots, n_k; t) = \sum_x p(n_1, \ldots, n_k; x) \times p(n_1, \ldots, n_k; t - x)$$

where the sum is over all x with positive $p(\cdot)$.

CHAPTER

THIRTYFOUR

INFERENTIAL STATISTICS

General concepts

See also: https://en.wikipedia.org/wiki/Power_of_a_test

See also: https://en.wikipedia.org/wiki/Sample_size_determination

34.1 Basic classical statistical tests (stratified)

34.1.1 Student t-test for 1 sample: tests (p-values) and confidence intervals

`ctx.student_t_1sample_test`(*n*, *mu0*, *mean*, *stdev*, *alpha*, ***kwargs*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns tests and/or confidence intervals for Student's t-test for 1 sample with sample size *N* (N), reference mean *mu0* (μ_0), sample mean *mean* ($\overline{x}_1$), sample standard deviation *stdev* (s) and type I error *alpha* (α). See also: Wikipedia [1442].

The following boolean keyword arguments determine the output:

I: if `True`, the input parameters are shown.

D: if `True`, the descriptive statistics is shown.

T: if `True`, the tests are shown.

C: if `True`, the confidence intervals are shown.

Onesided: if `True`, onesided tests and/or confidence intervals are shown.

Twosided: if `True`, onesided tests and/or confidence intervals are shown.

Examples

- Skellam: poisson with same rate back to back
- Laplace: exponential with same rate back to back
- Asymmetric Laplace: exponential with different rates back to back
- Hyperexponential distribution

Examples

1. Skellam: poisson with same rate back to back
2. Laplace: exponential with same rate back to back
3. Asymmetric Laplace: exponential with different rates back to back
4. Hyperexponential distribution

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean μ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)^2$$

be the usual sample estimates of the unkown population mean μ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning μ with regard to a reference value μ_0.

Let $F_t(\cdot, \nu)$ denote the CDF and let $t_{\nu,\alpha}$ denote the α-quantile of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \mu_0}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below:

Test problem	p-value	Reject H_0
$H_{01} : \mu \leq \mu_0$ vs $H_{A1} : \mu > \mu_0$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \mu \geq \mu_0$ vs $H_{A2} : \mu < \mu_0$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \mu = \mu_0$ vs $H_{A3} : \mu \neq \mu_0$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$. Then the confidence intervals at confidence level $1 - \alpha$ can be calculated as follows:

Type	Confidence Interval (Difference of Means)
Left-sided	$-\infty \leq \mu_1 - \mu_0 \leq (\overline{x}_1 - \mu_0) + A_1$
Right-sided	$(\overline{x}_1 - \mu_0) - A_1 \leq \mu_1 - \mu_0 \leq +\infty$
Two-sided	$(\overline{x}_1 - \mu_0) - A_2 \leq \mu_1 - \mu_0 \leq (\overline{x}_1 - \mu_0) + A_2$

Examples

An actual call to the function, requesting Student's t-test for 1 independent sample of size 10 and standard deviation 1 each, with means 2.3 and reference mean = 1.0, and a type I error $\alpha = 0.05$ would be

```
>>> from xlcalcnet import mpm
>>> n = 16; mu0 = 4.05; mean = 5.24; stdev = 1.5; alpha=0.05
>>> mpm.student_t_1sample_test(n, mu0, mean, stdev, alpha, \
  I=True, D=True, T=True, C=True, Onesided=True, Twosided = True)
Student t-test for 1 sample: tests and confidence intervals
                          Parameter  Variable1
                                  n: [16.0]
                               mean: [5.24]
                                mu0: [4.05]
                              stdev: [1.5]
                              alpha: [0.05]
                 degrees of freedom: [15.0]
               difference of means: [1.19]
```

(continues on next page)

(continued from previous page)

```
       rho-tilde = (mean-mu0)/stdev: [0.7933333]
                   t-value (=delta): [3.173333]
                t(1-alpha, 1-sided): [1.75305]
                t(1-alpha, 2-sided): [2.13145]
    test, p-value (H01: mu1 >= mu0): [0.9968508]
    test, p-value (H02: mu1 <= mu0): [0.003149208]
     test, p-value (H03: mu1 = mu2): [0.006298416]
mu1 - mu0, CI upper limit (1-sided): [1.847394]

34.1.2 Student t-test for 1 sample: power calculations

`ctx.student_t_1sample_power`(*n*, *mu0*, *mu1*, *sigma*, *alpha*, ***kwargs*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns power calculations for Student's t-test for 1 sample with sample size *N* (N), reference mean *mu0* (μ_0), population mean *mu1* (μ_1), population standard deviation *sigma* (σ) and type I error *alpha* (α). See also: Wikipedia [1442].

The following boolean keyword arguments determine the output:

I: if `True`, the input parameters are shown.

D: if `True`, the descriptive statistics is shown.

P: if `True`, the power calculations are shown.

E: if `True`, some extra calculations are shown.

Onesided: if `True`, onesided tests are shown.

Twosided: if `True`, twosided tests are shown.

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$ and define $\widetilde{\rho} = \dfrac{\mu_1 - \mu_0}{\sigma}$ and $\delta = \sqrt{N}\widetilde{\rho}$. Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

Test	Null Hypothesis	Alternative	Power
onesided	$H_{01} : \mu \leq \mu_0$	$H_{A1} : \mu > \mu_0$	$F_{t'}\left(-t_{\nu;1-\alpha}, \nu, \delta\right)$
onesided	$H_{02} : \mu \geq \mu_0$	$H_{A2} : \mu < \mu_0$	$F_{t'}\left(t_{\nu;1-\alpha}, \nu, \delta\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A1} : \mu > \mu_0$	$F_{t'}\left(-t_{\nu;1-\alpha/2}, \nu, \delta\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A2} : \mu < \mu_0$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A3} : \mu \neq \mu_0$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right) - F_t\left(-t_{\nu;1-\alpha/2}, \nu\,\delta\right)$

Examples

An actual call to the function, requesting Student's t-test with description, the critical calue for a two-sided test, the power for H_{A3} for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```
>>> from xlcalcnet import mpm
>>> n = 56; mu0 = 4.05; mu1 = 5.24; sigma = 1.5; alpha=0.05
>>> mpm.student_t_1sample_power(n, mu0, mu1, sigma, alpha, \
  I=True, D=True, T=True, C=True, Onesided=True, Twosided = True)
Student t-test for 1 sample: power
                           Parameter  variable1
                                   n: [56.0]
                                 mu0: [4.05]
                                 mu1: [5.24]
                               sigma: [1.5]
                               alpha: [0.05]
                  degrees of freedom: [55.0]
                           mu1 - mu0: [1.19]
                                 rho: [0.6249392]
                               delta: [5.936763]
                t(1-alpha, 1-sided): [1.673034]
```

(continues on next page)

(continued from previous page)

```
                 t(1-alpha, 2-sided): [2.004045]

                               sigma: [1.0 2.0 3.0 4.0]
                               alpha: [0.015 0.015 0.015 0.015]
                 degrees of freedom: [9.0, 19.0, 29.0, 29.0]
                           mu1 - mu0: [3.5, 3.6, 3.6, 3.6]
                                 rho: [0.965173, 0.8793576, 0.7735231, 0.675211]
                               delta: [11.06797, 8.049845, 6.572671, 4.929503]
                t(1-alpha, 1-sided): [2.573804, 2.345648, 2.282175, 2.282175]
                t(1-alpha, 2-sided): [2.998203, 2.674209, 2.585992, 2.585992]
 1-sided test, power (HA1: mu1 < mu2): 7.46e-08
 1-sided test, power (HA2: mu1 > mu2): 0.974564
 2-sided test, power (HA1: mu1 < mu2): 1.65e-08
 2-sided test, power (HA2: mu1 > mu2): 0.943648
2-sided test, power (HA1: mu1 <> mu2): 0.943648
                   Pr(Mean1 < Mean2): 9.92e-05
                   Pr(Mean1 > Mean2): 0.999901
```

34.1.3 Student t-test for 1 sample: sample size calculation

`ctx.student_t_1sample_samplesize`(*mu0*, *mu1*, *sigma*, *alpha*, *beta*, ***kwargs*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns sample size calculations for Student's t-test for 1 sample with reference mean *mu0* (μ_0), population mean *mu1* (μ_1), population standard deviation *sigma* (σ), type I error *alpha* (α), and type II error *beta* (β). See also: Wikipedia [1442].

The following boolean keyword arguments determine the output:

I: if `True`, the input parameters are shown.

D: if `True`, the descriptive statistics is shown.

N: if `True`, the sample size calculations are shown.

P: if `True`, the actual power (for the calculated sample size) is shown.

Onesided: if `True`, onesided tests are shown.

Twosided: if `True`, twosided tests are shown.

Let $N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$ denote the sample size function of the (singly) noncentral t-distribution for a given type I error α, type II error β and noncentrality parameter $\widetilde{\rho} = \dfrac{\mu_1 - \mu_0}{\sigma}$. The required total sample size N can be calculated as summarized below. Note that the returned value of N will in general not be an integer, and rounding up may be required.

Test	Null Hypothesis	Alternative	Minimal sample size
onesided	$H_{01} : \mu \leq \mu_0$	$H_{A1} : \mu > \mu_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
onesided	$H_{02} : \mu \geq \mu_0$	$H_{A2} : \mu < \mu_0$	$N_{t'}\left(\alpha, \beta, -\widetilde{\rho}\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A1} : \mu > \mu_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A2} : \mu < \mu_0$	$N_{t'}\left(\alpha, \beta, -\widetilde{\rho}\right)$
twosided	$H_{03} : \mu = \mu_0$	$H_{A3} : \mu \neq \mu_0$	$N^{(2)}_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$

Examples

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha = 0.95$, $\beta = 0.1$, and standard deviations $\sigma_1 = \sigma_2 = 1$, means $\mu_1 = 2.3$ and $\mu_2 = 4.5$, would be

```
>>> from xlcalcnet import mpm
>>> ereal.StudentT1CI(mu1:=5.24, mu0:=4.05, sd:=1.5, alpha:=0.05, beta:=0.1)
                                    df: 21
                        difference of means: 1.19
                           t-value (=delta): 3.721063
                        t(1-alpha, 1-sided): 1.720743
                        t(1-alpha, 2-sided): 2.079614
  1-sided test, required N (HA1: mu1 < mu2): 18
1-sided test, actual power (HA1: mu1 < mu2): 0.974564
  1-sided test, required N (HA2: mu1 > mu2): 148
1-sided test, actual power (HA2: mu1 > mu2): 0.964564
  2-sided test, required N (HA1: mu1 < mu2): 22
2-sided test, actual power (HA1: mu1 < mu2): 0.954564

34.1.7 Chi-squared-test for the variance of 1 sample: sample size

`ctx.chi2_variance_1sample_samplesize`(*x*, *k*, *n*, *method='default'*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of the Chi-squared-test for the variance of 1 sampl, under H_0.

The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01} : \sigma \leq \sigma_0$	$H_{A1} : \sigma > \sigma_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
1 sided	$H_{02} : \sigma \geq \sigma_0$	$H_{A2} : \sigma < \sigma_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma = \sigma_0$	$H_{A1} : \sigma > \sigma_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma = \sigma_0$	$H_{A1} : \sigma > \sigma_0$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma = \sigma_0$	$H_{A3} : \sigma \neq \sigma_0$	$N2_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

34.2 Basic classical statistical tests for 2 independent samples (stratified)

34.2.1 Student t-test for 2 independent samples: tests (p-values)

`ctx.studentt_2isamples_test`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for Student's t-test for for 2 independent samples.

See also: https://en.wikipedia.org/wiki/Student%27s_t-test#Independent_(unpaired)_samples

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean μ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)$$

be the usual sample estimates of the unkown population mean μ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning μ with regard to a reference value μ_2.

Let $F_t(\cdot, \nu)$ denote the CDF (see section ref{tDistributionCDF}) and let $t_{\nu,\alpha}$ denote the α-quantile (see section ref{tDistributionQuantile}) of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \mu_2}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below

Test problem	p-value	Reject H_0
$H_{01} : \mu_1 \leq \mu_2$ vs $H_{A1} : \mu_1 > \mu_2$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \mu_1 \geq \mu_2$ vs $H_{A2} : \mu_1 < \mu_2$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \mu_1 = \mu_2$ vs $H_{A3} : \mu_1 \neq \mu_2$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of TTest this is $\mu_1 \neq \mu_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```
>>> from xlcalcnet import mpm
>>> ereal.StudentT1Test(means:=[5.24, 4.05], sd:=1.5, n:=22)

Input
Variable Variable 1
Common N 22

test. p-value (H03: μ1 = μ2) 0.150150344
```

34.2.2 Student t-test for 2 independent samples: confidence intervals

`ctx.studentt_2isamples_ci`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for Student's t-test for for 2 independent samples.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$, where s and ν are defined in (ref{eq:TTest1}), and $t_{\nu,\alpha}$ denotes the α-quantile of the (central) t-distribution with ν degrees of freedom (see section ref{tDistributionQuantile}).

Type	Confidence Interval (Difference of Means)
Left-sided	$-\infty \leq \mu_1 - \mu_2 \leq (\overline{x}_1 - \mu_2) + A_1$
Right-sided	$(\overline{x}_1 - \mu_2) - A_1 \leq \mu_1 - \mu_2 \leq +\infty$
Two-sided	$(\overline{x}_1 - \mu_2) - A_2 \leq \mu_1 - \mu_2 \leq (\overline{x}_1 - \mu_2) + A_2$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of textsf{TTest} this is $\mu_1 \neq \mu_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```
>>> from xlcalcnet import mpm

```

34.2.3 Student t-test for 2 independent samples: power

`ctx.studentt_2isamples_power`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of Student's t-test for 2 independent samples: power and sample size.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$. Define

$$\widetilde{\rho} = \frac{\mu_1 - \mu_2}{\sigma} \text{ and } \delta = \sqrt{N}\widetilde{\rho}.$$

Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the (singly) noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

Test	Null Hypothesis	Alternative	Power
1 sided	$H_{01} : \mu_1 \leq \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$F_{t'}\left(-t_{\nu;1-\alpha}, \nu, \delta\right)$
1 sided	$H_{02} : \mu_1 \geq \mu_2$	$H_{A2} : \mu_1 < \mu_2$	$F_{t'}\left(t_{\nu;1-\alpha}, \nu, \delta\right)$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$F_{t'}\left(-t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A3} : \mu_1 \neq \mu_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right) - F_t\left(-t_{\nu;1-\alpha/2}, \nu\, \delta\right)$

An actual call to the function, requesting Student's t-test with description, the critical calue for a two-sided test, the power for H_{A3} (in the case of textsf{TTest} this is $\mu_1 \neq \mu_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

34.2.4 Student t-test for 2 independent samples: sample size calculation

`ctx.studentt_2isamples_samplesize`(*mu*, *sd*, *alpha=0.05*, *beta=0.1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of sample size calculations for Student's t-test for 2 independent samples

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Beta
The beta-level used for power

Let $N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$ denote the sample size function of the (singly) noncentral t-distribution (see section ref{NoncentralTDistributionSampleSize}) for a given confidence level α, power β and noncentrality parameter $\widetilde{\rho}$ (as defined in equation ref{eq:TTestPower1}. The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01}:\mu_1 \leq \mu_2$	$H_{A1}:\mu_1 > \mu_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
1 sided	$H_{02}:\mu_1 \geq \mu_2$	$H_{A2}:\mu_1 < \mu_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\mu_1 = \mu_2$	$H_{A1}:\mu_1 > \mu_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\mu_1 = \mu_2$	$H_{A1}:\mu_1 > \mu_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\mu_1 = \mu_2$	$H_{A3}:\mu_1 \neq \mu_2$	$N2_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha = 0.95$, $\beta = 0.1$, and standard deviations $\sigma_1 = \sigma_2 = 1$, means $\mu_1 = 2.3$ and $\mu_2 = 4.5$, would be

34.2.5 Student t-test for 2 independent samples: power and sample size: failure to stratify

ctx.**studentt_2isamples_power2**(*mean*, *sd*, *n*, *alpha=0.05*)

Returns the results of the F-Test with $\delta > 0$ and $\eta > 0$

See "Butler Paolella 1999 Doubly noncentral F Draft.pdf" in "References B" for an example.

34.2.6 Student t-test for 2 independent samples: equivalence and non-inferiority

`ctx.studentt_2isamples_equivalence`(*x*, *k*, *n*, *method='default'*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of the Sign test, under H_0.

Refer to Schuirman procedure.

See Shieh 2019

See also: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5012670/

34.2.7 F-test for the variances of 2 independent samples: tests (p-values)

`ctx.fratio_variance_2isamples_test`(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for the F-test for the variances of 2 independent samples.

See also: https://en.wikipedia.org/wiki/F-test_of_equality_of_variances

Parameters:

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean σ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)$$

be the usual sample estimates of the unkown population mean σ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning σ with regard to a reference value σ_2.

Let $F_t(\cdot, \nu)$ denote the CDF (see section ref{tDistributionCDF}) and let $t_{\nu,\alpha}$ denote the α-quantile (see section ref{tDistributionQuantile}) of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \sigma_2}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below

Test problem	p-value	Reject H_0
$H_{01} : \sigma_1 \leq \sigma_2$ vs $H_{A1} : \sigma_1 > \sigma_2$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \sigma_1 \geq \sigma_2$ vs $H_{A2} : \sigma_1 < \sigma_2$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \sigma_1 = \sigma_2$ vs $H_{A3} : \sigma_1 \neq \sigma_2$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of TTest this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```
>>> from xlcalcnet import mpm

34.2.8 F-test for the variances of 2 independent samples: confidence intervals

`ctx.fratio_variance_2isamples_ci`(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of the confidence intervals for the F-test for the variances of 2 independent samples.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$, where s and ν are defined in (ref{eq:TTest1}), and $t_{\nu,\alpha}$ denotes the α-quantile of the (central) t-distribution with ν degrees of freedom (see section ref{tDistributionQuantile}).

Type	Confidence Interval (Difference of Means)
Left-sided	$-\infty \leq \sigma_1 - \sigma_2 \leq (\overline{x}_1 - \sigma_2) + A_1$
Right-sided	$(\overline{x}_1 - \sigma_2) - A_1 \leq \sigma_1 - \sigma_2 \leq +\infty$
Two-sided	$(\overline{x}_1 - \sigma_2) - A_2 \leq \sigma_1 - \sigma_2 \leq (\overline{x}_1 - \sigma_2) + A_2$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of textsf{TTest} this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```

34.2.9 F-test for the variances of 2 independent samples: power

`ctx.`**`fratio_variance_2isamples_power`**(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of the power calculation for the F-test for the variances of 2 independent samples.

Parameters:

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$. Define

$$\widetilde{\rho} = \frac{\sigma_1 - \sigma_2}{\sigma} \text{ and } \delta = \sqrt{N}\widetilde{\rho}.$$

Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the (singly) noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

Test	Null Hypothesis	Alternative	Power
1 sided	$H_{01} : \sigma_1 \leq \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(-t_{\nu;1-\alpha}, \nu, \delta\right)$
1 sided	$H_{02} : \sigma_1 \geq \sigma_2$	$H_{A2} : \sigma_1 < \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(-t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A3} : \sigma_1 \neq \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right) - F_t\left(-t_{\nu;1-\alpha/2}, \nu\, \delta\right)$

An actual call to the function, requesting Student's t-test with description, the critical calue for a two-sided test, the power for H_{A3} (in the case of textsf{TTest} this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

34.2.10 F-test for the variances of 2 independent samples: sample size

`ctx.fratio_variance_2isamples_samplesize`(*s2*, *alpha=0.05*, *beta=0.1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of sample size calculations for the variances of 2 independent samples.

Parameters:

Sd
The standard deviation of the sample

Alpha
The alpha-level used for confidence intervals

Beta
The beta-level used for power

Let $N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$ denote the sample size function of the (singly) noncentral t-distribution (see section ref{NoncentralTDistributionSampleSize}) for a given confidence level α, power β and noncentrality parameter $\widetilde{\rho}$ (as defined in equation ref{eq:TTestPower1}. The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01}:\sigma_1 \leq \sigma_2$	$H_{A1}:\sigma_1 > \sigma_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
1 sided	$H_{02}:\sigma_1 \geq \sigma_2$	$H_{A2}:\sigma_1 < \sigma_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\sigma_1 = \sigma_2$	$H_{A1}:\sigma_1 > \sigma_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\sigma_1 = \sigma_2$	$H_{A1}:\sigma_1 > \sigma_2$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\sigma_1 = \sigma_2$	$H_{A3}:\sigma_1 \neq \sigma_2$	$N2_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha = 0.95$, $\beta = 0.1$, and standard deviations $\sigma_1 = \sigma_2 = 1$, means $\sigma_1 = 2.3$ and $\sigma_2 = 4.5$, would be

```

34.3 Basic classical statistical tests for 2 correlated samples (stratified)

34.3.1 Student t-test for 2 correlated samples: tests (p-values)

`ctx.studentt_2csamples_test`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for Student's t-test for for 2 correlated samples.

See also: https://en.wikipedia.org/wiki/Student%27s_t-test#Paired_samples

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean μ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)$$

be the usual sample estimates of the unkown population mean μ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning μ with regard to a reference value μ_2.

Let $F_t(\cdot, \nu)$ denote the CDF (see section ref{tDistributionCDF}) and let $t_{\nu,\alpha}$ denote the α-quantile (see section ref{tDistributionQuantile}) of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \mu_2}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below

Test problem	p-value	Reject H_0
$H_{01} : \mu_1 \leq \mu_2$ vs $H_{A1} : \mu_1 > \mu_2$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \mu_1 \geq \mu_2$ vs $H_{A2} : \mu_1 < \mu_2$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \mu_1 = \mu_2$ vs $H_{A3} : \mu_1 \neq \mu_2$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of TTest this is $\mu_1 \neq \mu_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```

```

34.3.2 Student t-test for 2 correlated samples: confidence intervals

`ctx.studentt_2csamples_ci`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for Student's t-test for for 2 correlated samples.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$, where s and ν are defined in (ref{eq:TTest1}), and $t_{\nu,\alpha}$ denotes the α-quantile of the (central) t-distribution with ν degrees of freedom (see section ref{tDistributionQuantile}).

Type	Confidence Interval (Difference of Means)

34.3.3 Student t-test for 2 correlated samples: power

`ctx.studentt_2csamples_power`(*mean*, *sd*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of Student's t-test for 2 correlated samples: power and sample size.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$. Define

$$\widetilde{\rho} = \frac{\mu_1 - \mu_2}{\sigma} \text{ and } \delta = \sqrt{N}\widetilde{\rho}.$$

Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the (singly) noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

Test	Null Hypothesis	Alternative	Power
1 sided	$H_{01} : \mu_1 \leq \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$F_{t'}\left(-t_{\nu;1-\alpha}, \nu, \delta\right)$
1 sided	$H_{02} : \mu_1 \geq \mu_2$	$H_{A2} : \mu_1 < \mu_2$	$F_{t'}\left(t_{\nu;1-\alpha}, \nu, \delta\right)$

34.3.4 Student t-test for 2 correlated samples: sample size calculation

`ctx.studentt_2csamples_samplesize`(*mu*, *sd*, *alpha=0.05*, *beta=0.1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of sample size calculations for Student's t-test for 2 correlated samples

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Beta
The beta-level used for power

Let $N_{t'}(\alpha, \beta, \widetilde{\rho})$ denote the sample size function of the (singly) noncentral t-distribution (see section ref{NoncentralTDistributionSampleSize}) for a given confidence level α, power β and noncentrality parameter $\widetilde{\rho}$ (as defined in equation ref{eq:TTestPower1}. The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01} : \mu_1 \leq \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$N_{t'}(\alpha, \beta, \widetilde{\rho})$
1 sided	$H_{02} : \mu_1 \geq \mu_2$	$H_{A2} : \mu_1 < \mu_2$	$N_{t'}(\alpha, \beta, \widetilde{\rho})$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$N_{t'}(\alpha, \beta, \widetilde{\rho})$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A1} : \mu_1 > \mu_2$	$N_{t'}(\alpha, \beta, \widetilde{\rho})$
2 sided	$H_{03} : \mu_1 = \mu_2$	$H_{A3} : \mu_1 \neq \mu_2$	$N2_{t'}(\alpha, \beta, \widetilde{\rho})$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha = 0.95$, $\beta = 0.1$, and standard deviations $\sigma_1 = \sigma_2 = 1$, means $\mu_1 = 2.3$ and $\mu_2 = 4.5$, would be

34.3.5 Morgan-Pitman test for the variances of 2 correlated samples: tests (p-values)

`ctx.fratio_variance_2csamples_test`(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results for the Morgan-Pitman test for the variances of 2 correlated samples.

Parameters:

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean σ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)$$

be the usual sample estimates of the unkown population mean σ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning σ with regard to a reference value σ_2.

Let $F_t(\cdot, \nu)$ denote the CDF (see section ref{tDistributionCDF}) and let $t_{\nu,\alpha}$ denote the α-quantile (see section ref{tDistributionQuantile}) of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \sigma_2}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below

Test problem	p-value	Reject H_0
$H_{01} : \sigma_1 \leq \sigma_2$ vs $H_{A1} : \sigma_1 > \sigma_2$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \sigma_1 \geq \sigma_2$ vs $H_{A2} : \sigma_1 < \sigma_2$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \sigma_1 = \sigma_2$ vs $H_{A3} : \sigma_1 \neq \sigma_2$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of TTest this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```

34.3.6 Morgan-Pitman test for the variances of 2 correlated samples: confidence intervals

`ctx.fratio_variance_2csamples_ci`(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of the confidence intervals for the Morgan-Pitman test for the variances of 2 correlated samples.

Parameters:

Mean
The mean of the sample.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$, where s and ν are defined in (ref{eq:TTest1}), and $t_{\nu,\alpha}$ denotes the α-quantile of the (central) t-distribution with ν degrees of freedom (see section ref{tDistributionQuantile}).

Type	Confidence Interval (Difference of Means)
Left-sided	$-\infty \leq \sigma_1 - \sigma_2 \leq (\overline{x}_1 - \sigma_2) + A_1$
Right-sided	$(\overline{x}_1 - \sigma_2) - A_1 \leq \sigma_1 - \sigma_2 \leq +\infty$
Two-sided	$(\overline{x}_1 - \sigma_2) - A_2 \leq \sigma_1 - \sigma_2 \leq (\overline{x}_1 - \sigma_2) + A_2$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of textsf{TTest} this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```

```

34.3.7 Morgan-Pitman test for the variances of 2 correlated samples: power

`ctx.`**`fratio_variance_2csamples_power`**(*s2*, *n*, *alpha=0.05*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of the power calculation for the Morgan-Pitman test for the variances of 2 correlated samples.

Parameters:

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$. Define

$$\widetilde{\rho} = \frac{\sigma_1 - \sigma_2}{\sigma} \text{ and } \delta = \sqrt{N}\widetilde{\rho}.$$

Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the (singly) noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

Test	Null Hypothesis	Alternative	Power
1 sided	$H_{01} : \sigma_1 \leq \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(-t_{\nu;1-\alpha}, \nu, \delta\right)$
1 sided	$H_{02} : \sigma_1 \geq \sigma_2$	$H_{A2} : \sigma_1 < \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(-t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A3} : \sigma_1 \neq \sigma_2$	$F_{t'}\left(t_{\nu;1-\alpha/2}, \nu, \delta\right) - F_t\left(-t_{\nu;1-\alpha/2}, \nu\, \delta\right)$

An actual call to the function, requesting Student's t-test with description, the critical calue for a two-sided test, the power for H_{A3} (in the case of textsf{TTest} this is $\sigma_1 \neq \sigma_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

```

34.3.8 Morgan-Pitman test for the variances of 2 correlated samples: sample size

`ctx.fratio_variance_2csamples_samplesize`(*s2*, *alpha=0.05*, *beta=0.1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of sample size calculations for the Morgan-Pitman test for the variances of 2 correlated samples.

Parameters:

Sd
The standard deviation of the sample

Alpha
The alpha-level used for confidence intervals

Beta
The beta-level used for power

Let $N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$ denote the sample size function of the (singly) noncentral t-distribution (see section ref{NoncentralTDistributionSampleSize}) for a given confidence level α, power β and noncentrality parameter $\widetilde{\rho}$ (as defined in equation ref{eq:TTestPower1}. The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01} : \sigma_1 \leq \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
1 sided	$H_{02} : \sigma_1 \geq \sigma_2$	$H_{A2} : \sigma_1 < \sigma_2$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A1} : \sigma_1 > \sigma_2$	$N_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$
2 sided	$H_{03} : \sigma_1 = \sigma_2$	$H_{A3} : \sigma_1 \neq \sigma_2$	$N2_{t'}\left(\alpha, \beta, \widetilde{\rho}\right)$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha = 0.95$, $\beta = 0.1$, and standard deviations $\sigma_1 = \sigma_2 = 1$, means $\sigma_1 = 2.3$ and $\sigma_2 = 4.5$, would be

```

```

34.3.9 Pearson's rho, 2 correlated samples: tests (p-values)

`ctx.pearson_rho_test`(*rho*, *rh0*, *n*, *alpha=0.05*, *rtype=1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of tests for Pearson's rho, 2 correlated samples.

Parameters:

Mean
The mean of the sample.

Mean0
The reference mean.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $(X_1, X_2, \ldots, X_N)$ denote a random sample of size N from a normal distribution with mean ρ and variance σ^2, and let

$$\overline{x}_1 = \frac{1}{N}\sum_{i=1}^{N} X_i \quad \text{and } s^2 = \frac{1}{N-1}\sum_{i=1}^{N}(X_i - \overline{x}_1)$$

be the usual sample estimates of the unkown population mean ρ and unkown population variance σ^2. Then Student's t-test can be used to test hypotheses concerning ρ with regard to a reference value ρ_0.

Let $F_t(\cdot, \nu)$ denote the CDF (see section ref{tDistributionCDF}) and let $t_{\nu,\alpha}$ denote the α-quantile (see section ref{tDistributionQuantile}) of the t-distribution with ν degrees of freedom. Define

$$t = \frac{\overline{x}_1 - \rho_0}{s}, \quad s = \sqrt{s_1^2/N}, \quad \nu = N - 1.$$

Then p-values and rejection criteria for H_0 can be calculated as summarized below

Test problem	p-value	Reject H_0
$H_{01} : \rho \leq \rho_0$ vs $H_{A1} : \rho > \rho_0$	$F_t(-t, \nu)$	$t > t_{\nu;1-\alpha}$
$H_{02} : \rho \geq \rho_0$ vs $H_{A2} : \rho < \rho_0$	$F_t(t, \nu)$	$t > t_{\nu;\alpha}$
$H_{03} : \rho = \rho_0$ vs $H_{A3} : \rho \neq \rho_0$	$F_t(t, \nu) - F_t(-t, \nu)$	$t > t_{\nu;1-\alpha/2}$ or $t > t_{\nu;\alpha/2}$

The test can also be expressed in terms of a correlation coefficient r between the combined X and an indicator variable, where t and r are related by

$$r = \frac{t}{\sqrt{t^2 + \nu}}, \quad t = \nu\frac{r}{1 - r^2}.$$

An actual call to the function, requesting Student's t-test with description, the critical value for a two-sided test, the p-value for H_{03} (in the case of TTest this is $\rho_1 \neq \rho_2$), for 2 independent samples of size 10 and standard deviation 1 each, with means 2.3 and 4.5, and a type I error $\alpha = 0.05$ would be

34.3.10 Pearson's rho, 2 correlated samples: confidence intervals

`ctx.pearson_rho_ci`(*rho*, *rh0*, *n*, *alpha=0.05*, *rtype=1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns results of confidence intervals for Pearson's rho, 2 correlated samples.

Parameters:

Mean
The mean of the sample.

Mean0
The reference mean.

Sd
The standard deviation of the sample

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $A_1 = t_{\nu,\alpha} \cdot s$ and $A_2 = t_{\nu,\alpha/2} \cdot s$, where s and ν are defined in (ref{eq:TTest1}), and $t_{\nu,\alpha}$ denotes the α-quantile of the (central) t-distribution with ν degrees of freedom (see section ref{tDistributionQuantile}).

34.3.11 Pearson's rho, 2 correlated samples:: power

`ctx.pearson_rho_power`(*rho*, *rho0*, *n*, *alpha=0.05*, *rtype=1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of power calculations for Pearson's rho, 2 correlated samples.

Parameters:

Rho
The mean of the sample.

Rho0
The reference mean.

N
The sample size

Alpha
The alpha-level used for confidence intervals

Let $\sigma_1^2 = \sigma^2$ and $\nu = N - 1$. Define

$$\widetilde{\rho} = \frac{\rho_1 - \rho_0}{\sigma} \text{ and } \delta = \sqrt{N}\widetilde{\rho}.$$

Let $F_{t'}(\cdot, \nu, \delta)$ denote the CDF of the (singly) noncentral t-distribution with ν degrees of freedom and noncentrality parameter δ and let $t_{\nu,\alpha}$ denote the α-quantile of the central t-distribution with ν degrees of freedom. Then the power for accepting H_A at the confidence level α can be calculated as summarized below:

34.3.12 Pearson's rho, 2 correlated samples:: sample size calculation

`ctx.pearson_rho_samplesize`(*rho*, *rho0*, *n*, *alpha=0.05*, *beta=0.1*, *rtype=1*)

where `ctx` is `dec`, `mpm`, or `gmp`.

Returns the results of power calculations for Pearson's rho, 2 correlated samples.

Parameters:

Rho
The mean of the sample.

Rho0
The reference mean.

N
The sample size

Alpha
The alpha-level used for confidence intervals

Beta
The beta-level used for power

Let $N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$ denote the sample size function of the (singly) noncentral t-distribution (see section ref{NoncentralTDistributionSampleSize}) for a given confidence level α, power β and noncentrality parameter $\widetilde{\rho}$ (as defined in equation ref{eq:TTestPower1}. The required total sample size N can be calculated as summarized below

Test	Null Hypothesis	Alternative	Minimal sample size
1 sided	$H_{01}:\rho\leq\rho_0$	$H_{A1}:\rho>\rho_0$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
1 sided	$H_{02}:\rho\geq\rho_0$	$H_{A2}:\rho<\rho_0$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\rho=\rho_0$	$H_{A1}:\rho>\rho_0$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\rho=\rho_0$	$H_{A1}:\rho>\rho_0$	$N_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$
2 sided	$H_{03}:\rho=\rho_0$	$H_{A3}:\rho\neq\rho_0$	$N2_{t'}\left(\alpha,\beta,\widetilde{\rho}\right)$

Note that the returned value of N will in general not be an integer, and rounding up may be required.

An actual call to the function, requesting an upper sample size estimate (and actual power) for $\alpha=0.95$, $\beta=0.1$, and standard deviations $\sigma_1=\sigma_2=1$, means $\rho_1=2.3$ and $\rho_2=4.5$, would be

```
>>> from xlcalcnet import mpm

THIRTYFIVE

DISTRIBUTION FUNCTIONS

Text explaining this chapter

35.1 Introduction to 2D functions plots

35.1.1 Plots of continuous distribution functions

Some text

35.1.1.1 Probability density function (pdf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'pdf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```

35.1.1.2 Cumulative distribution function (cdf)

The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D07_DistPlotContinuous.py, and the XML code in the file D07_DistPlotContinuous.2D.xml.

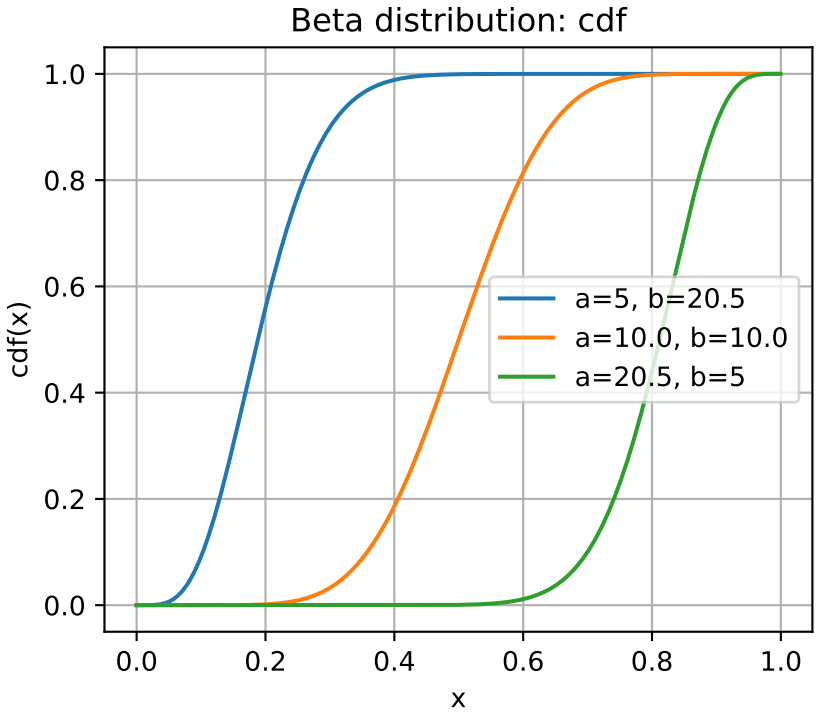
To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None
        target = 'cdf' # pdf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'

        Title = 'Beta distribution'
        a = [5, 10.0, 20.5]
        b = [20.5, 10.0, 5]
        xlim = [0, 0.999]
        if target=='hf': ylim=[0, 100]

        dlist = []
        ltext = []
        for j in range(len(a)):
            dlist.append(dreal.dist_beta(a[j], b[j]))
            ltext.append('a=' + str(a[j]) + ', b=' + str(b[j]))

        DistPlotContinuous(Title = Title, dlist=dlist, xlim = xlim,
            ylim = ylim, target = target, ltext = ltext, marker='o',
            markersize=0)
```



35.1.2 Plots of discrete distribution functions

35.1.2.1 Probability mass function (pmf)

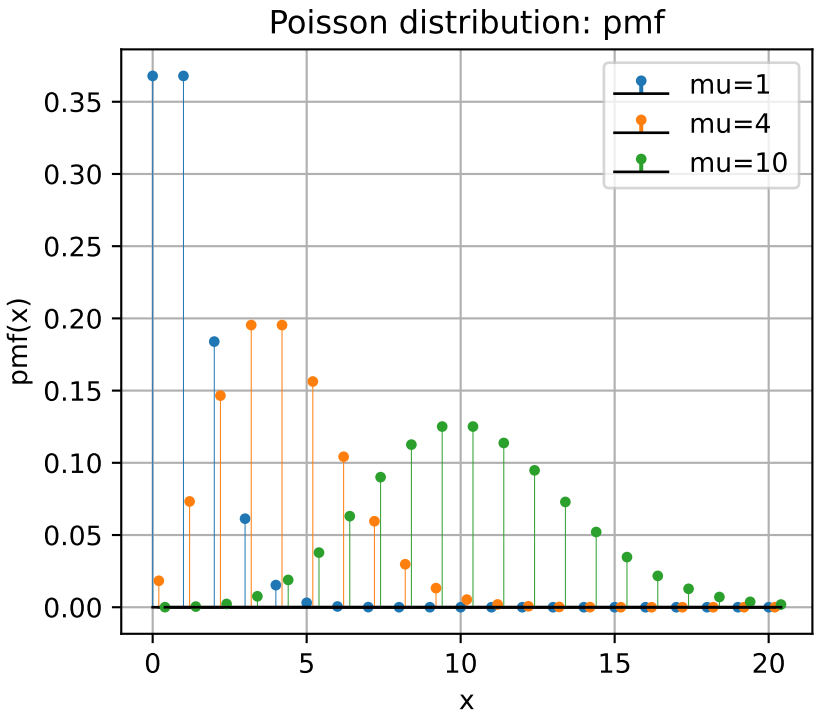
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'pmf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



35.1.2.2 Cumulative distribution function (cdf)

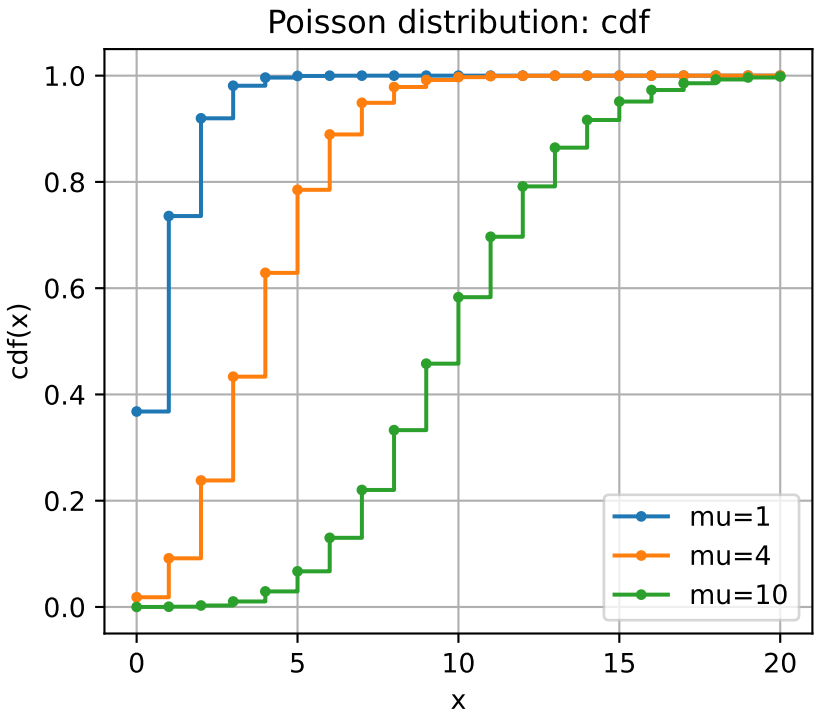
The Python code for the example below can be found online in the `DataXlCalcNet` repository or in the corresponding local `DataXlCalcNet` folder in the file D08_DistPlotDiscrete.py, and the XML code in the file D08_DistPlotDiscrete.2D.xml.

To produce the figure as shown below, the try-block at the end of the file should look like this:

```
try:
    if __name__ == '__main__':
        ylim = None

        Title = 'Poisson distribution'
        target = 'cdf' # pmf, cdf, 'sf', 'hf', 'chf', 'qtf', 'isf'
        mu = [1, 4, 10]
        xlim = [0.0, 20.0]
        ylim = None
        if target=='qtf': ylim=[0, 20]

        dlist = []
        ltext = []
        for j in range(len(mu)):
            dlist.append(dreal.dist_poisson(mu[j]))
            ltext.append('mu=' + str(mu[j]))
        DistPlotDiscrete(Title = Title, dlist=dlist, xlim = xlim,  ylim = ylim,
            target = target, ltext = ltext, lattice=True, marker='o',
            markersize=3, vertical_lines=True)
```



CHAPTER

THIRTYSIX

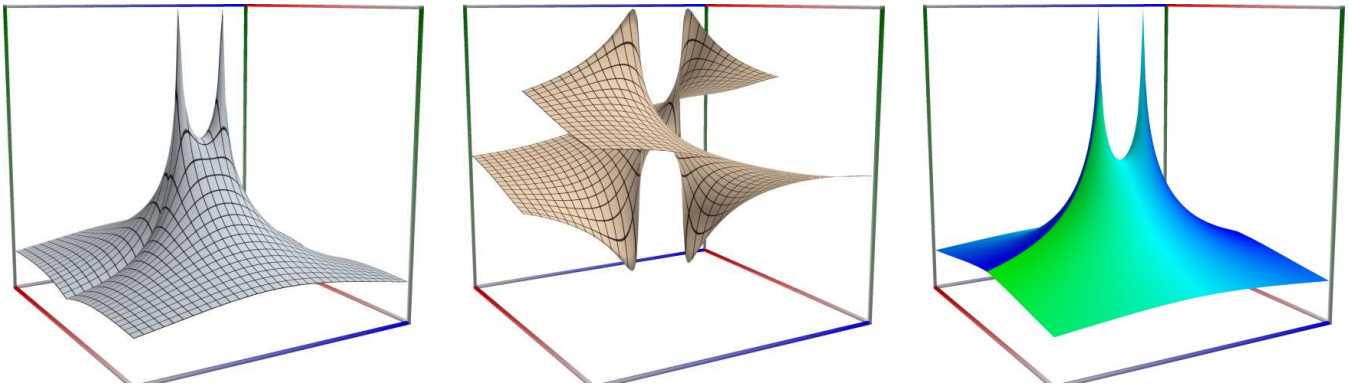
DISTRIBUTION FUNCTIONS

Text explaining this chapter

36.1 Weierstrass elliptic functions, in terms of elliptic period ratio τ

36.1.1 Weierstrass function $\wp(z|\tau)$

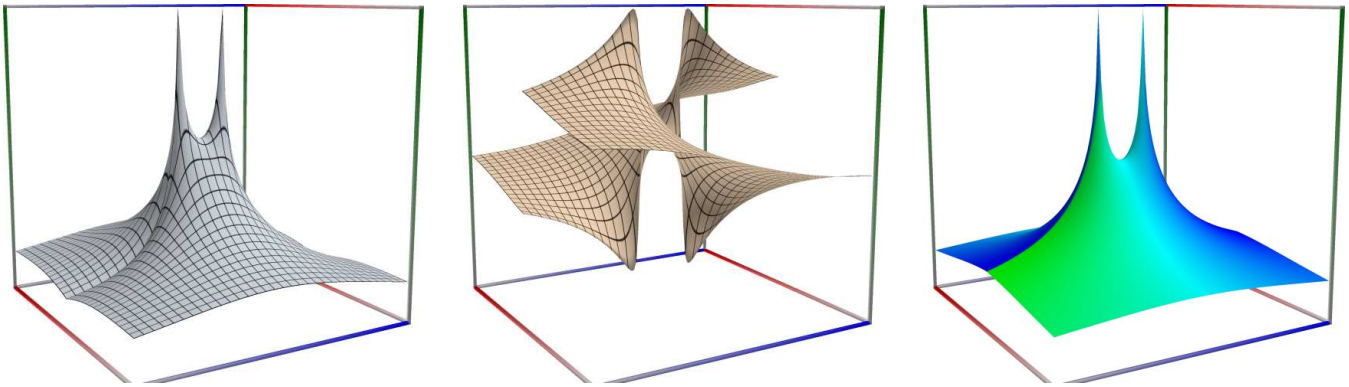
Some Text



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

36.1.2 Weierstrass function, first derivative: $\wp' z|\tau)$

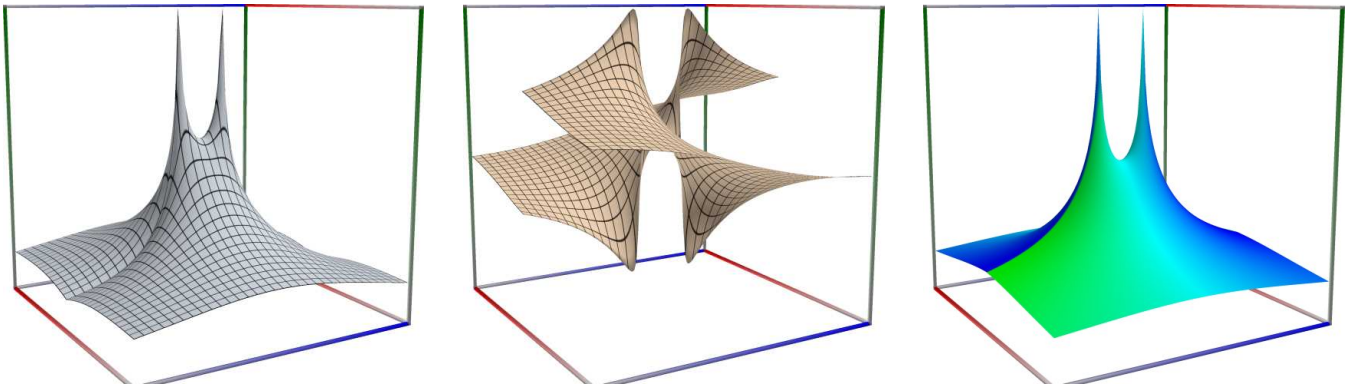
Some Text



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

36.1.3 Inverse Weierstrass function $\wp^{-1}(z|\tau)$

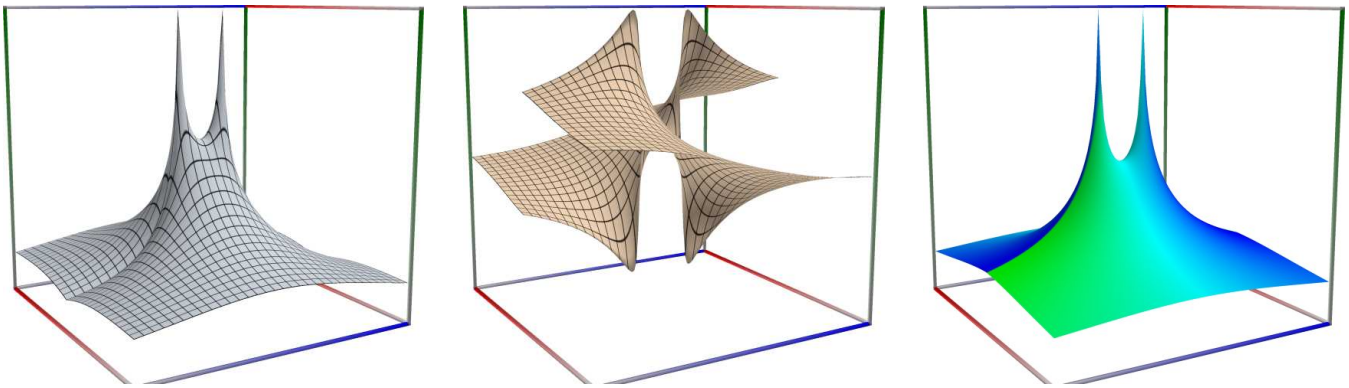
Some Text



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

36.1.4 Weierstrass Zeta function $\zeta(z, \tau)$

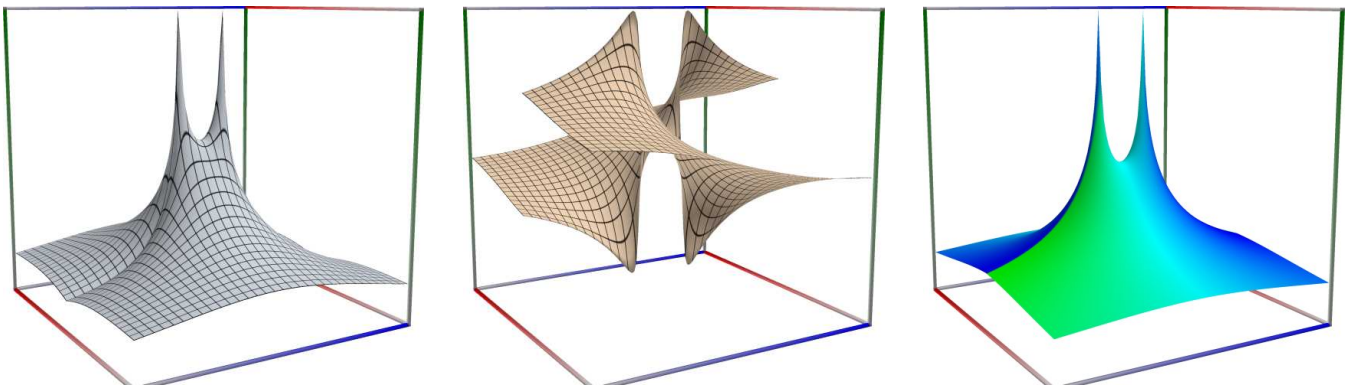
Some Text



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function values are *loglog-transformed*.

36.1.5 Weierstrass Sigma function $\sigma(z|\tau)$

Some Text



3D wpf plot: real part (left figure), imaginary part (middle figure) and absolute value with color-coded phase (right figure) of the complex sine function $z = \sin(x + iy)$, with $-6 \leq x \leq 6$ (blue axis), $-6 \leq y \leq 6$ (red axis), $-10 \leq z \leq 10$ (green axis). Function

values are *loglog-transformed*.

Part IX

Back matter

CHAPTER

THIRTYSEVEN

LICENSE AND HISTORY

37.1 Mozilla Public License Version 2.0

```
1. Definitions
--------------

1.1. "Contributor"
    means each individual or legal entity that creates, contributes to
    the creation of, or owns Covered Software.

1.2. "Contributor Version"
    means the combination of the Contributions of others (if any) used
    by a Contributor and that particular Contributor's Contribution.

1.3. "Contribution"
    means Covered Software of a particular Contributor.

1.4. "Covered Software"
    means Source Code Form to which the initial Contributor has attached
    the notice in Exhibit A, the Executable Form of such Source Code
    Form, and Modifications of such Source Code Form, in each case
    including portions thereof.

1.5. "Incompatible With Secondary Licenses"
    means

    (a) that the initial Contributor has attached the notice described
        in Exhibit B to the Covered Software; or

    (b) that the Covered Software was made available under the terms of
        version 1.1 or earlier of the License, but not also under the
        terms of a Secondary License.

1.6. "Executable Form"
    means any form of the work other than Source Code Form.

1.7. "Larger Work"
    means a work that combines Covered Software with other material, in
    a separate file or files, that is not Covered Software.

1.8. "License"
    means this document.

1.9. "Licensable"
    means having the right to grant, to the maximum extent possible,
    whether at the time of the initial grant or subsequently, any and
    all of the rights conveyed by this License.

1.10. "Modifications"
    means any of the following:
```

(continues on next page)

(continued from previous page)

```
    (a) any file in Source Code Form that results from an addition to,
        deletion from, or modification of the contents of Covered
        Software; or

    (b) any new file in Source Code Form that contains any Covered
        Software.

1.11. "Patent Claims" of a Contributor
    means any patent claim(s), including without limitation, method,
    process, and apparatus claims, in any patent Licensable by such
    Contributor that would be infringed, but for the grant of the
    License, by the making, using, selling, offering for sale, having
    made, import, or transfer of either its Contributions or its
    Contributor Version.

1.12. "Secondary License"
    means either the GNU General Public License, Version 2.0, the GNU
    Lesser General Public License, Version 2.1, the GNU Affero General
    Public License, Version 3.0, or any later versions of those
    licenses.

1.13. "Source Code Form"
    means the form of the work preferred for making modifications.

1.14. "You" (or "Your")
    means an individual or a legal entity exercising rights under this
    License. For legal entities, "You" includes any entity that
    controls, is controlled by, or is under common control with You. For
    purposes of this definition, "control" means (a) the power, direct
    or indirect, to cause the direction or management of such entity,
    whether by contract or otherwise, or (b) ownership of more than
    fifty percent (50%) of the outstanding shares or beneficial
    ownership of such entity.

2. License Grants and Conditions
--------------------------------

2.1. Grants

Each Contributor hereby grants You a world-wide, royalty-free,
non-exclusive license:

(a) under intellectual property rights (other than patent or trademark)
    Licensable by such Contributor to use, reproduce, make available,
    modify, display, perform, distribute, and otherwise exploit its
    Contributions, either on an unmodified basis, with Modifications, or
    as part of a Larger Work; and

(b) under Patent Claims of such Contributor to make, use, sell, offer
    for sale, have made, import, and otherwise transfer either its
    Contributions or its Contributor Version.

2.2. Effective Date

The licenses granted in Section 2.1 with respect to any Contribution
become effective for each Contribution on the date the Contributor first
distributes such Contribution.

2.3. Limitations on Grant Scope

The licenses granted in this Section 2 are the only rights granted under
this License. No additional rights or licenses will be implied from the
distribution or licensing of Covered Software under this License.
Notwithstanding Section 2.1(b) above, no patent license is granted by a
Contributor:
```

(continues on next page)

(continued from previous page)

```
(a) for any code that a Contributor has removed from Covered Software;
    or

(b) for infringements caused by: (i) Your and any other third party's
    modifications of Covered Software, or (ii) the combination of its
    Contributions with other software (except as part of its Contributor
    Version); or

(c) under Patent Claims infringed by Covered Software in the absence of
    its Contributions.

This License does not grant any rights in the trademarks, service marks,
or logos of any Contributor (except as may be necessary to comply with
the notice requirements in Section 3.4).

2.4. Subsequent Licenses

No Contributor makes additional grants as a result of Your choice to
distribute the Covered Software under a subsequent version of this
License (see Section 10.2) or under the terms of a Secondary License (if
permitted under the terms of Section 3.3).

2.5. Representation

Each Contributor represents that the Contributor believes its
Contributions are its original creation(s) or it has sufficient rights
to grant the rights to its Contributions conveyed by this License.

2.6. Fair Use

This License is not intended to limit any rights You have under
applicable copyright doctrines of fair use, fair dealing, or other
equivalents.

2.7. Conditions

Sections 3.1, 3.2, 3.3, and 3.4 are conditions of the licenses granted
in Section 2.1.

3. Responsibilities
-------------------

3.1. Distribution of Source Form

All distribution of Covered Software in Source Code Form, including any
Modifications that You create or to which You contribute, must be under
the terms of this License. You must inform recipients that the Source
Code Form of the Covered Software is governed by the terms of this
License, and how they can obtain a copy of this License. You may not
attempt to alter or restrict the recipients' rights in the Source Code
Form.

3.2. Distribution of Executable Form

If You distribute Covered Software in Executable Form then:

(a) such Covered Software must also be made available in Source Code
    Form, as described in Section 3.1, and You must inform recipients of
    the Executable Form how they can obtain a copy of such Source Code
    Form by reasonable means in a timely manner, at a charge no more
    than the cost of distribution to the recipient; and

(b) You may distribute such Executable Form under the terms of this
    License, or sublicense it under different terms, provided that the
    license for the Executable Form does not attempt to limit or alter
    the recipients' rights in the Source Code Form under this License.
```

(continues on next page)

(continued from previous page)

```
3.3. Distribution of a Larger Work

You may create and distribute a Larger Work under terms of Your choice,
provided that You also comply with the requirements of this License for
the Covered Software. If the Larger Work is a combination of Covered
Software with a work governed by one or more Secondary Licenses, and the
Covered Software is not Incompatible With Secondary Licenses, this
License permits You to additionally distribute such Covered Software
under the terms of such Secondary License(s), so that the recipient of
the Larger Work may, at their option, further distribute the Covered
Software under the terms of either this License or such Secondary
License(s).

3.4. Notices

You may not remove or alter the substance of any license notices
(including copyright notices, patent notices, disclaimers of warranty,
or limitations of liability) contained within the Source Code Form of
the Covered Software, except that You may alter any license notices to
the extent required to remedy known factual inaccuracies.

3.5. Application of Additional Terms

You may choose to offer, and to charge a fee for, warranty, support,
indemnity or liability obligations to one or more recipients of Covered
Software. However, You may do so only on Your own behalf, and not on
behalf of any Contributor. You must make it absolutely clear that any
such warranty, support, indemnity, or liability obligation is offered by
You alone, and You hereby agree to indemnify every Contributor for any
liability incurred by such Contributor as a result of warranty, support,
indemnity or liability terms You offer. You may include additional
disclaimers of warranty and limitations of liability specific to any
jurisdiction.

4. Inability to Comply Due to Statute or Regulation
---------------------------------------------------

If it is impossible for You to comply with any of the terms of this
License with respect to some or all of the Covered Software due to
statute, judicial order, or regulation then You must: (a) comply with
the terms of this License to the maximum extent possible; and (b)
describe the limitations and the code they affect. Such description must
be placed in a text file included with all distributions of the Covered
Software under this License. Except to the extent prohibited by statute
or regulation, such description must be sufficiently detailed for a
recipient of ordinary skill to be able to understand it.

5. Termination
--------------

5.1. The rights granted under this License will terminate automatically
if You fail to comply with any of its terms. However, if You become
compliant, then the rights granted under this License from a particular
Contributor are reinstated (a) provisionally, unless and until such
Contributor explicitly and finally terminates Your grants, and (b) on an
ongoing basis, if such Contributor fails to notify You of the
non-compliance by some reasonable means prior to 60 days after You have
come back into compliance. Moreover, Your grants from a particular
Contributor are reinstated on an ongoing basis if such Contributor
notifies You of the non-compliance by some reasonable means, this is the
first time You have received notice of non-compliance with this License
from such Contributor, and You become compliant prior to 30 days after
Your receipt of the notice.

5.2. If You initiate litigation against any entity by asserting a patent
```

(continues on next page)

(continued from previous page)

```
infringement claim (excluding declaratory judgment actions,
counter-claims, and cross-claims) alleging that a Contributor Version
directly or indirectly infringes any patent, then the rights granted to
You by any and all Contributors for the Covered Software under Section
2.1 of this License shall terminate.

5.3. In the event of termination under Sections 5.1 or 5.2 above, all
end user license agreements (excluding distributors and resellers) which
have been validly granted by You or Your distributors under this License
prior to termination shall survive termination.

************************************************************************
*                                                                      *
*  6. Disclaimer of Warranty                                           *
*  -------------------------                                           *
*                                                                      *
*  Covered Software is provided under this License on an "as is"       *
*  basis, without warranty of any kind, either expressed, implied, or  *
*  statutory, including, without limitation, warranties that the       *
*  Covered Software is free of defects, merchantable, fit for a        *
*  particular purpose or non-infringing. The entire risk as to the     *
*  quality and performance of the Covered Software is with You.        *
*  Should any Covered Software prove defective in any respect, You     *
*  (not any Contributor) assume the cost of any necessary servicing,   *
*  repair, or correction. This disclaimer of warranty constitutes an   *
*  essential part of this License. No use of any Covered Software is   *
*  authorized under this License except under this disclaimer.         *
*                                                                      *
************************************************************************

************************************************************************
*                                                                      *
*  7. Limitation of Liability                                          *
*  --------------------------                                          *
*                                                                      *
*  Under no circumstances and under no legal theory, whether tort      *
*  (including negligence), contract, or otherwise, shall any           *
*  Contributor, or anyone who distributes Covered Software as          *
*  permitted above, be liable to You for any direct, indirect,         *
*  special, incidental, or consequential damages of any character      *
*  including, without limitation, damages for lost profits, loss of    *
*  goodwill, work stoppage, computer failure or malfunction, or any    *
*  and all other commercial damages or losses, even if such party      *
*  shall have been informed of the possibility of such damages. This   *
*  limitation of liability shall not apply to liability for death or   *
*  personal injury resulting from such party's negligence to the       *
*  extent applicable law prohibits such limitation. Some               *
*  jurisdictions do not allow the exclusion or limitation of           *
*  incidental or consequential damages, so this exclusion and          *
*  limitation may not apply to You.                                    *
*                                                                      *
************************************************************************

8. Litigation
-------------

Any litigation relating to this License may be brought only in the
courts of a jurisdiction where the defendant maintains its principal
place of business and such litigation shall be governed by laws of that
jurisdiction, without reference to its conflict-of-law provisions.
Nothing in this Section shall prevent a party's ability to bring
cross-claims or counter-claims.

9. Miscellaneous
----------------
```

(continues on next page)

(continued from previous page)

```
This License represents the complete agreement concerning the subject
matter hereof. If any provision of this License is held to be
unenforceable, such provision shall be reformed only to the extent
necessary to make it enforceable. Any law or regulation which provides
that the language of a contract shall be construed against the drafter
shall not be used to construe this License against a Contributor.

10. Versions of the License
---------------------------

10.1. New Versions

Mozilla Foundation is the license steward. Except as provided in Section
10.3, no one other than the license steward has the right to modify or
publish new versions of this License. Each version will be given a
distinguishing version number.

10.2. Effect of New Versions

You may distribute the Covered Software under the terms of the version
of the License under which You originally received the Covered Software,
or under the terms of any subsequent version published by the license
steward.

10.3. Modified Versions

If you create software not governed by this License, and you want to
create a new license for such software, you may create and use a
modified version of this License if you rename the license and remove
any references to the name of the license steward (except to note that
such modified license differs from this License).

10.4. Distributing Source Code Form that is Incompatible With Secondary
Licenses

If You choose to distribute Source Code Form that is Incompatible With
Secondary Licenses under the terms of this version of the License, the
notice described in Exhibit B of this License must be attached.

Exhibit A - Source Code Form License Notice
-------------------------------------------

  This Source Code Form is subject to the terms of the Mozilla Public
  License, v. 2.0. If a copy of the MPL was not distributed with this
  file, You can obtain one at https://mozilla.org/MPL/2.0/.

If it is not possible or desirable to put the notice in a particular
file, then You may include the notice in a location (such as a LICENSE
file in a relevant directory) where a recipient would be likely to look
for such a notice.

You may add additional accurate notices of copyright ownership.

Exhibit B - "Incompatible With Secondary Licenses" Notice
---------------------------------------------------------

  This Source Code Form is "Incompatible With Secondary Licenses", as
  defined by the Mozilla Public License, v. 2.0.
